2. The effective breadth of the side plate may be taken as $0,16b_R$.

3. For higher tensile steels, the material factor $k = 0,78$ for steels with $\delta_y = 315 \text{ N/mm}^2$ and $k = 0,72$ for steels with $\delta_y = 355 \text{ N/mm}^2$.

Ship Control Systems

Part 3, Chapter 13

Section 2

2.5.2 The rudder is to be dimensioned such that the stresses do not exceed the permissible stresses given in Table 13.2.9.

2.5.3 In way of rudder couplings and heel pintles, the plating thickness is to be suitably increased.

2.5.4 On semi-spade/mariner type rudders the following items are to be complied with:

- The main vertical web forming the mainpiece is to be continuous over the full depth of the rudder.
- The thickness of the main vertical web is to be not less than two times the thickness required by Table 13.2.8(4) from the top of the rudder to the lower pintle. The thickness is to be not less than required by Table 13.2.8(4) from the lower pintle to approximately a point midway between the lower pintle and bottom of the rudder. Below this the thickness, t_2 , is to be not less than the thickness required by Table 13.2.8(2). See Fig. 13.2.6.

- Where an additional continuous main vertical web is arranged to form an efficient box mainpiece structure, the thickness of each web is to be not less than that required by Table 13.2.8(4) from the top of the rudder to approximately a point midway between the lower pintle and bottom of the rudder. Below this the thickness, t_2 , is not to be less than that required by Table 13.2.8(2).
- The internal radius, r , of the cut-out for the rudder pintle is to be as large as practicable. See Fig. 13.2.6.
- To reduce the notch effect at the corners of the cut-out for the lower pintle, an insert plate 1,6 times the Rule thickness of the side plating is to be fitted. The insert plate is to extend aft of the main vertical web and to have well rounded corners.

2.5.5 Adequate hand or access holes are to be arranged in the rudder plating in way of pintles as required, and the rudder plating is to be reinforced locally in way of these openings. Continuity of the modulus of the rudder mainpiece is to be maintained in way of the openings.

Table 13.2.9 Permissible stresses for rudder blade scantlings

Item	Permissible stresses, in N/mm ² (kgf/mm ²)		
	Bending stress	Shear stress	Equivalent stress
Rudder blades clear of cut-outs, see Fig. 13.2.2	$\frac{110}{k} \left(\frac{11,2}{k} \right)$	$\frac{50}{k} \left(\frac{5,1}{k} \right)$	$\frac{120}{k} \left(\frac{12,2}{k} \right)$
Rudder blades in way of cut-outs, see Fig. 13.2.2 and Note	$\frac{75}{k} \left(\frac{7,6}{k} \right)$	$\frac{50}{k} \left(\frac{5,1}{k} \right)$	$\frac{100}{k} \left(\frac{10,2}{k} \right)$
Symbols			
k is as defined in 1.2.1			
NOTE Requirements in way of cut-outs apply to semi-spade/mariner type rudders.			

Fig. 13.2.6 Main vertical web thickness

Ship Control Systems

Part 3, Chapter 13

Section 2

2.5.6 Connection of rudder side plating to vertical and horizontal webs, where internal access for welding is not practicable, is to be by means of slot welds on to flat bars on the webs. The slots are to have a minimum length of 75 mm and, in general, a minimum width of twice the side plating thickness. The ends of the slots are to be rounded. The space between the slots is not to exceed 150 mm and welding is to be based on a weld factor of 0,44.

2.5.7 For testing of rudders, see Table 1.8.1 in Chapter 1.

2.5.8 Where the fabricated mainpiece of a spade rudder is connected to the horizontal coupling flange by welding, a full penetration weld is required.

2.6 Rudder construction – Single plated

2.6.1 The scantlings of a single plated rudder are to be not less than required by Table 13.2.8.

2.6.2 Rudder arms are to be efficiently attached to the mainpiece.

2.7 Rudder couplings

2.7.1 Rudder coupling design is to be in accordance with Table 13.2.10.

2.7.2 Where coupling bolts are required they are to be fitted bolts. Suitable arrangements are to be made to lock the nuts.

2.7.3 For rudders with horizontal coupling arrangements the rudder stock should be forged when the stock diameter exceeds 350 mm. Where the stock diameter does not exceed 350 mm the rudder stock may be either forged or fabricated. Where the upper flange is welded to the rudder stock, a full penetration weld is required and its integrity is to be confirmed by non-destructive examination. The flange material is to be from the same welding materials group as the stock. Such rudder stocks are to be subjected to a furnace post-weld heat treatment (PWHT) after completion of all welding operations. For carbon or carbon manganese steels, the PWHT temperature is not to be less than 600°C.

2.7.4 For a spade rudder, the fillet radius between the rudder stock and the flange is to conform to the requirements of Fig. 13.2.7. Where space permits between the upper face of the flange and the lowest main bearing, it is preferable to use a compound fillet design of the parabolic or Morgenbrod form having similar dimensions to those of Fig. 13.2.7. Alternative arrangements will be specially considered.

2.7.5 The connecting bolts for coupling the rudder to the rudder stock are to be positioned with sufficient clearance to allow the fitting and removal of the bolts and nuts without contacting the palm radius, R , see Fig. 13.2.8(a). The surface forming the palm radius is to be free of hard and sharp corners and is to be machined smooth to the Surveyor's satisfaction. The surface in way of bolts and nuts is to be machined smooth to the Surveyor's satisfaction.

2.7.6 For spade rudders fitted with a fabricated rectangular mainpiece, the mainpiece is to be designed with its forward and aft transverse sections at equal distances forward and aft of the rudder stock transverse axis, see Fig. 13.2.8(b).

2.7.7 Where a rudder stock is connected to a rudder by a keyless fitting, the rudder is to be a good fit on the rudder stock cone. During the fit-up, and before the push-up load is applied, an area of contact of at least 80 per cent of the theoretical area of contact is to be achieved, and this is to be evenly distributed. The relationship of the rudder to stock at which this occurs is to be marked, and the push-up then measured from that point. The upper edge of the upper mainpiece bore is to have a slight radius. After final fitting of the stock to the rudder, positive means are to be used for locking the securing nut to the stock.

2.7.8 Where a keyed conical fitting of a rudder stock to a rudder is proposed, a securing nut is to be provided. Minimum dimensions for the securing nut are given in Table 13.2.10. After final fitting of the stock to the rudder, positive means are to be used for locking this nut.

2.7.9 Guidelines for keys and keyways are given in Table 13.2.10.

2.8 Pintles

2.8.1 Rudder pintles and their bearings are to comply with the requirements of Table 13.2.11.

2.8.2 The distance between the lowest rudder stock bearing and the upper pintle should be as short as possible.

2.8.3 Where liners are fitted to pintles, they are to be shrunk on or otherwise efficiently secured. If liners are to be shrunk on, the shrinkage allowance is to be indicated on the plans. Where liners are formed by stainless steel weld deposit, the pintles are to be of weldable quality steel and details of the procedure are to be submitted, see also 2.9.7.

2.8.4 The bottom pintle on semi-spade (Mariner) type rudders and all pintles over 500 mm in diameter are:

- (a) if inserted into their sockets from below, to be keyed to the rudder or sternframe as appropriate or to be hydraulically assembled, with the nut adequately locked, or
- (b) if inserted into their sockets from above, to be provided with an appropriate locking device, the nut being adequately secured.

2.8.5 Fitting of pintle bearings is to be carried out in accordance with the bearing manufacturer's recommendations to ensure that they remain secure under all foreseen operating conditions.

2.8.6 Where an ***IWS** (In-water Survey) notation is to be assigned (see Pt 1, Ch 2,2.3.11), means are to be provided for ascertaining the rudder pintle and bush clearances and for verifying the security of the pintles in their sockets with the vessel afloat.

Table 13.2.10(a) Rudder couplings to stock – Bolted couplings

Item	Requirement	
	Horizontal coupling	Vertical coupling
Number of bolts in coupling	$n \geq 6$	$n \geq 8$
Diameter of coupling bolts	$\delta_b = 0,62 \sqrt[3]{\frac{\delta_S^3 k_b}{l_a n k_S}}$	$\delta_b = 0,81 \delta_S \sqrt[3]{\frac{k_b}{n k_S}}$
First moment of area of bolts about centre of coupling	$m = 0,00071 n \delta_S \delta_b^2 \sqrt[3]{\frac{k_b}{k_S}}$	$m = 0,00043 \delta_S^3 \sqrt[3]{\frac{k_b}{k_S}}$
Thickness of coupling flange	$t_f = \delta_b \sqrt[3]{\frac{k_b}{k_S}}$ (see Notes 1 and 2)	$t_f = \delta_b$
Stress concentration factor for as built scantlings	$\alpha_{as\ built} \leq \alpha_{max}$ (see Note 3)	—
Maximum allowable stress concentration factor	$\alpha_{max} = (53,82 - 35,29 k_{max}) \frac{\delta_S^3}{h P_L 10^3} - \left(1,8 - 6,3 \frac{R}{\delta_S}\right) \frac{t_f - t_{fa}}{t_{fa}}$ (see Note 3)	—
Width of flange material outside the bolt holes	$w_f = 0,67 \delta_b$	$w_f = 0,67 \delta_b$
Symbols		
<p>$\alpha_{as\ built}$ = stress concentration factor for as built scantlings</p> <p>$= \frac{0,73}{\sqrt[3]{\frac{R}{\delta_S}}}$</p> <p>$\alpha_{max}$ = maximum allowable stress concentration factor</p> <p>δ_b = diameter of coupling bolts, in mm</p> <p>δ_S = basic stock diameter as defined in Table 13.2.3, in mm</p> <p>b_f = breadth of the flange, in mm</p> <p>h = vertical distance, in metres, between the centre of pressure and the centre point of the palm radius, see Fig. 13.2.8</p> <p>k_b = coupling bolt material factor, see 2.4.2</p> <p>k_{max} = the greater of k_S and k_f</p> <p>k_f = upper coupling flange material factor, see 2.4.2</p> <p>k_S = rudder stock material factor, see 2.4.2</p> <p>l_a = the mean of the horizontal distances between the centres of the bolts and the centre of the coupling, in mm</p> <p>m = first moment of area of bolts about a longitudinal axis through centre of coupling, in cm³</p> <p>n = number of bolts in coupling</p> <p>P_L = lateral force on rudder as defined in 2.1.1, in N (tonne-f)</p> <p>R = palm radius, in mm, between the rudder stock and connection flange, see 2.7.4 and 2.7.5.</p> <p>t_f = minimum thickness of coupling flange, in mm</p> <p>t_{fa} = as built flange thickness, in mm</p> <p>w_f = width of flange material outside the bolt holes, in mm</p>		
<p>NOTES</p> <p>1. For spade rudders with horizontal couplings, t_f is not to be less than $0,33 \delta_S \sqrt[3]{k_S}$. The mating plate on the rudder is to have the same thickness as the flange on the stock</p> <p>2. For a twin spade rudder arrangement with single screw where the rudders are within the slipstream of the propeller:</p> <p>(a) the thickness of the palm is not to be less than $0,35 \delta_S \sqrt[3]{k_S}$</p> <p>(b) where the stock is welded to the palm plate, the stock diameter, δ_S is to be increased by 14 %.</p> <p>3 This requirement is applicable only for spade rudders with horizontal couplings, see Fig. 13.2.6.</p>		

2.8.7 For axle type rudder support used with Simplex rudders, see Ch 6,7.

2.9 Ancillary items

2.9.1 Internal surfaces of double plate rudders are to be efficiently coated, and means for draining the rudder are to be provided.

Ship Control Systems

Part 3, Chapter 13

Section 2

Table 13.2.10(b) Rudder couplings to stock – Conical couplings (see continuation)

Item	Requirement
Taper of conical coupling on the diameter	$\theta_t \leq \frac{1}{K_1}$
Length of taper	$l_t \geq 1,5\delta_S$
Required mean grip stress – keyless connection	$p_M = \frac{P_R \theta_t \delta_{CTM} + 4M_T 10^3 \sqrt{K_2 \left(\left[\frac{P_R \delta_{CTM}}{2000M_T} \right]^2 + 1 \right) - \left(\frac{\theta_t}{2} \right)^2}}{5,03\delta_{CTM}^2 l_t \left(K_2 - \left(\frac{\theta_t}{2} \right)^2 \right)}$
Required mean grip stress – keyed connection	$p_M = 20$
Corresponding push-up of rudder stock	$w = \frac{9,6 \cdot 10^{-6} p_M \delta_{CTM}}{\theta_t (1 - f_M^2)} \left(\frac{0,95 \cdot 10^{-4} p_M \delta_{CTM}}{\theta_t (1 - f_M^2)} \right)$
Corresponding push-up load	Approximately equal to $P_U = 0,8\pi p_M l_t \delta_{CTM} \left(K_3 + \frac{\theta_t}{2} \right)$
Corresponding pull-off load	Approximately equal to $P_O = 2,83p_M l_t \delta_{CTM} \left(K_3 - \frac{\theta_t}{2} \right)$
Minimum yield stress of stock and gudgeon	$\sigma_o = \frac{123 \cdot 500 w \theta_t \sqrt{3 + f^4}}{\delta_{CT}} \left(\frac{12600 w \theta_t \sqrt{3 + f^4}}{\delta_{CT}} \right)$
Recommended minimum effective sectional area of the key in shear	$A_{key} = \frac{M_T k_{min}}{3,3\delta_{CTM}} \text{ (see Note)}$
Minimum thickness of key	$\delta_{key} = \frac{67A_{key}}{H}$
Minimum dimensions of securing nut	$\delta_g = 0,65\delta_S$ $\delta_n = 1,2\delta_{SU} \text{ or } 1,5\delta_g \text{ whichever is the greater}$ $h_n = 0,6\delta_g$

2.9.2 Where it is intended to fill the rudder with plastic foam, details of the foam are to be submitted.

2.9.3 Suitable arrangements are to be provided to prevent the rudder from lifting.

2.9.4 Where a bow rudder is fitted for use when navigating astern, a locking device is to be arranged to ensure that the rudder is kept in the central position when the ship is navigating ahead.

2.9.5 Where the weight of the rudder is supported by a carrier bearing attached to the rudder head, the structure in way is to be adequately strengthened. The plating under all rudder head bearings or rudder carriers is to be increased in thickness.

2.9.6 In rudder trunks which are open to the sea, a seal or stuffing box is to be fitted above the deepest load waterline, to prevent water from entering the steering gear compartment and the lubricant from being washed away from the rudder carrier. If the top of the rudder trunk is below the deepest waterline, two separate stuffing boxes are to be provided. Rudder trunk boundaries where exposed to the sea are to have a corrosion protection coating applied in accordance with the manufacturer's instructions.

2.9.7 Where it is proposed to use stainless steel for liners or bearings for rudder stocks and/or pintles, the chemical composition is to be submitted for approval. Synthetic rudder bearing materials are to be of a type approved by Lloyd's Register (hereinafter referred to as 'LR'). When this type of lining material is used, arrangements to ensure an adequate supply of sea-water to the bearing are to be provided.

Table 13.2.10(b) Rudder couplings to stock – Conical couplings (conclusion)

Symbols				
h_n = minimum required length of securing nut, in mm, see Fig. 13.2.9 $f = \frac{\delta_{CT}}{\delta_{GH}}$ $f_M = \frac{\delta_{CTM}}{\delta_{GHM}}$ k_{min} = taken as k_0 , where σ_0 is the minimum nominal upper yield point of the key, stock or coupling material, in N/mm ² , whichever is less k_0 = material factor as defined in Table 13.2.3, for the appropriate item l_t = length of taper, in mm p_M = required mean grip stress, in N/mm ² w = corresponding push-up of rudder stock, in mm A_{key} = recommended minimum effective sectional area of the key in shear, in cm ² H = length of the key, in mm M_T = rudder torque, in Nm, as given in Table 13.2.5 P_R = effective weight of rudder, in N (kgf) P_U, P_O = corresponding push-up, pull-off loads respectively, in N (kgf) δ_g = minimum external thread diameter, in mm, see Fig. 13.2.9 δ_n = minimum outer diameter of nut, in mm, see Fig. 13.2.9 δ_{CT} = diameter of coupling taper in any position, in mm δ_{CTM} = mean diameter of coupling taper, in mm $= \frac{\delta_S + \delta_{SU}}{2}$ δ_{GH} = external diameter of gudgeon housing at any position, in mm δ_{GHM} = mean external diameter of gudgeon housing, in mm δ_{key} = minimum thickness of key. See Fig. 13.2.9 δ_S = basic stock diameter as defined in Table 13.2.3, in mm δ_{SU} = see Fig. 13.2.9, in mm σ_0 = minimum yield stress of stock and gudgeon material, in N/mm ² (kgf/mm ²) σ_0 is not to be taken greater than 70 % of the ultimate tensile strength or 450 N/mm ² (45,9 kgf/mm ²) whichever is the lesser θ_t = taper of conical coupling, on the diameter, e.g. $\frac{1}{15} = 0,067$				
K_1, K_2, K_3 = constants depending on the type of assembly adopted as follows:				
Type of assembly		K_1	K_2	K_3
Oil injection	With key	12	—	0,025
	Without key	15	0,0036	0,025
Dry fit method	With key	8	—	0,170
	Without key	12	0,0072	0,170
NOTE The keyway is to have a smooth fillet at the bottom of the keyway. The radius of the fillet is to be at least 0,0125 of the diameter of the rudder stock at the top of the cone.				

Fig. 13.2.7 Rudder stock horizontal flange fillet radius for spade rudders

Table 13.2.11 Pintle requirements

Item	Requirement	
(1) Pintle diameter	$\delta_{PL} = 0,35 \sqrt{B k_o}$ mm	
(2) Pintle taper	Method of assembly	Taper (on diameter)
	Keyed and other manually assembled pintles	1:8 – 1:12
	Pintles mounted with oil injection and hydraulic nut	1:12 – 1:20
Symbols		
<p> b = distance in metres, from centroid of rudder area to the centre of lowest main bearing, see Fig. 13.2.4 c = distance, in metres, from centre of bearing of lower pintle to the centre of lowest main bearing, see Fig. 13.2.4 k_o = as defined in Table 13.2.3 or 13.2.4 B = bearing force, in N. If direct calculations are not carried out, the bearing force at various positions can be taken as: $B_{1L} = \frac{b}{c} P_L$ for single pintle rudders and lower pintle of semi-spade rudders $B_{1U} = \left(1 - \frac{b}{c}\right) P_L$ at upper pintle on semi-spade rudder. B_{1U} is not to be less than $0,35P_L$ $B = \frac{1}{N_{PL}} P_L$ for rudders with two or more pintles (except semi-spade rudders) N_{PL} = number of pintles on the rudder P_L = rudder force, as defined in 2.1.1 </p>		
<p>NOTE</p> <p>The length of the pintle housing in the gudgeon is not to be less than the maximum pintle diameter.</p>		

Fig. 13.2.9 Conical coupling

Table 13.3.1 Nozzle construction requirements

Item	Requirement
(1) Nozzle numeral	$N_N = 0,01P\delta_p$ ($N_N = 0,00736H\delta_p$)
(2) Shroud plating in way of propeller blade tips	For $N_N \leq 63t_s = (11 + 0,1N_N)$ mm For $N_N > 63t_s = (14 + 0,052N_N)$ mm
(3) Shroud plating clear of blade tips, flare and cone plating, wall thickness of leading and trailing edge members	$t_p = (t_s - 7)$ mm but not less than 8 mm
(4) Webs and ring webs	As item (3) except in way of headbox and pintle support where $t_W = (t_s + 4)$ mm
(5) Nozzle stock	Combined stresses in stock at lower bearing $\leq 92,7$ N/mm ² (9,45 kgf/mm ²) Torsional stress in upper stock $\leq 62,0$ N/mm ² (6,3 kgf/mm ²)
(6) Solepiece and strut	Bending stresses not to exceed 70,0 N/mm ² (7,1 kgf/mm ²)
Symbols	
N_N = a numeral dependent on the nozzle requirements P = power transmitted to the propellers, in kW H = power transmitted to the propellers, in shp δ_p = diameter of the propeller, in metres t_s = thickness of shroud plating in way of propeller tips, in mm t_p = thickness of plating, in mm t_W = thickness of webs and ring webs in way of headbox and pintle support, in mm	
NOTE Thicknesses given are for mild steel. Reductions in thickness will be considered for certain stainless steels.	

Section 3

Fixed and steering nozzles

3.1 General

3.1.1 The requirements for scantlings for fixed and steering nozzles are given, for guidance only, in 3.2 to 3.4 and Table 13.3.1.

3.1.2 The requirements, in general, apply to nozzles with a numeral not greater than 200, see Table 13.3.1. Nozzles exceeding this value will be specially considered.

3.2 Nozzle structure

3.2.1 For basic scantlings of the structure, see Table 13.3.1, in association with Fig. 13.3.1.

3.2.2 The shroud plating in way of the propeller tips is to be carried well forward and aft of this position, due allowance being made on steering nozzles for the rotation of the nozzle in relation to the propeller.

3.2.3 Fore and aft webs are to be fitted between the inner and outer skins of the nozzle. Both sides of the headbox and pintle support structure are to be connected to fore and aft webs of increased thickness. For thicknesses, see Table 13.3.1.

Fig. 13.3.1 Nozzle construction

3.2.4 The transverse strength of the nozzle is to be maintained by the fitting of ring webs. Two ring webs are to be fitted in nozzles not exceeding 2,5 m diameter. Nozzles between 2,5 and 3,0 m in diameter are generally to have two full ring webs and a half-depth web supporting the flare plating. The number of ring webs is to be increased as necessary on nozzles exceeding 3,0 m in diameter. Where ring webs are increased in thickness in way of the headbox and pintle support structure in accordance with Table 13.3.1, the increased thickness is to be maintained to the adjacent fore and aft web.

3.2.5 Local stiffening is to be fitted in way of the top and bottom supports which are to be integrated with the webs and ring webs. Continuity of bending strength is to be maintained in these regions.

3.2.6 Fin plating thickness should be not less than the cone plating, and the fin should be adequately reinforced. Solid fins should be not less than 25 mm thick.

3.2.7 Care is to be taken in the manufacture of the nozzle to ensure its internal preservation and watertightness. The preservation and testing are to be as required for rudders, see 2.6 and Table 1.8.1 in Chapter 1.

3.3 Nozzle stock and solepiece

3.3.1 Stresses, derived using the maximum side load on the nozzle and fin acting at the assumed centre of pressure, are not to exceed the values given in Table 13.3.1, in both the ahead and astern conditions.

3.4 Ancillary items

3.4.1 The diameter and first moment of area about the stock axis of coupling bolts and the diameter of pintles, are to be derived from 2.4 and 2.5.

3.4.2 Suitable arrangements are to be provided to prevent the steering nozzle from lifting.

Section 4 Steering gear and allied systems

4.1 General

4.1.1 For the requirements of steering gear, see Pt 5, Ch 19.

Section 5 Bow and stern thrust unit structure

5.1 Unit wall thickness

5.1.1 The wall thickness of the unit is, in general, to be in accordance with the manufacturer's practice, but is to be not less than either the thickness of the surrounding shell plating plus 10 per cent or 15 mm, whichever is greater.

5.2 Framing

5.2.1 The unit is to be framed to the same standard as the surrounding shell plating.

5.2.2 The unit is to be adequately supported and stiffened.

Section 6 Stabiliser structure

6.1 Fin stabilisers

6.1.1 The box into which the stabilisers retract is to have perimeter plating of the same thickness as the surrounding Rule shell plating plus 2 mm, but is to be not less than 12,5 mm, and is to be stiffened to the same standard as the shell.

6.1.2 The stabiliser machinery and surrounding structure are to be adequately supported and stiffened. Where bending stresses are induced in the structure under fatigue conditions the maximum stress is not to exceed 39,0 N/mm² (4 kgf/mm²).

6.2 Stabiliser tanks

6.2.1 The general structure of the tank is to comply with the Rule requirements for deep tanks. Sloshing forces in the tank structure are to be taken into account. Where such forces are likely to be significant, the scantlings will be required to be verified by additional calculation.

Section 7 Equipment

7.1 General

7.1.1 To entitle a ship to the figure 1 in its character of classification, equipment in accordance with the requirements of Table 13.7.1 is to be provided. The regulations governing the assignment of the character figure 1 for equipment are given in Pt 1, Ch 2,2.

Ship Control Systems

Part 3, Chapter 13

Section 7

Table 13.7.1 Equipment requirements (see continuation)

Ship type	Service	Required equipment
Cargo ships, bulk carriers, tankers, ferries, dredgers, etc. (see 1.1.2)	Unrestricted service	(1) See Tables 13.7.2 and 13.7.3, using N_C
Ferries	Specified coastal service, see Pt 1, Ch 2,2.3.9	<p>(2) See Tables 13.7.2 and 13.7.3, using N_C and N_A as appropriate</p> <p>Mass of bower anchor Chain cable length and diameter } $N_A = \text{one grade below } N_C$</p> <p>Stream anchor may be omitted</p> <p>Anchor chains</p> <p>Where $L < 30$ m, may be replaced with wire ropes of equal minimum breaking strength which should:</p> <p>(a) have a length 1,5 times that for chain cable required by Table 13.7.2 and</p> <p>(b) have a length of Grade U2/U1 chain cable not less than 12,5 m between anchor and wire rope.</p> <p>Where $30 \text{ m} \leq L \leq 40$ m one chain cable may be replaced with wire rope meeting the requirements of $L > 40$ m. The other may be replaced with wire rope meeting the requirements of $L < 30$ m.</p> <p>Where $40 \text{ m} < L \leq 90$ m, both chain cables may be replaced with wire rope of equal minimum breaking strength which should</p> <p>(a) have a length 1,5 times that for chain cable required by Table 13.7.2 and</p> <p>(b) have a minimum mass per unit length of 30% that of Grade U2 chain cable required by Table 13.7.2 and</p> <p>(c) have a length of Grade U2/U1 chain cable not less than 12,5 m between anchor and wire rope.</p>
Dredging and reclamation craft	Extended protected waters service, see Pt 1, Ch 2,2.3.7	<p>(3) See Tables 13.7.2 and 13.7.3, using N_C and N_A as appropriate</p> <p>$N_A = N_C$ reduced by two grades, except for stream anchors, or mooring lines</p> <p>Stream anchor – not required if ship fitted with positioning spuds</p>
	Protected waters service, see Pt 1, Ch 2,2.3.6	<p>(4) See Tables 13.7.2 and 13.7.3 using N_C and N_A as appropriate</p> <p>Mass of bower anchor Chain cable diameter } $N_A = 0,5N_C$</p> <p>Bower anchors { powered ships – two anchors unpowered (manned) ships – one anchor</p> <p>Chain cable length – greater of $2L$ m or $10,07D$ m, but need not exceed requirements for an ordinary cargo ship with anchors of the same mass</p> <p>Mooring lines – as required for N_C</p> <p>Wire ropes – may be substituted for chain cable on bower anchors if breaking strength $\geq 1,5$ times that of the chain cable</p>

7.1.2 For ships intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2,2.3.6 to 2.3.10, equipment differing from these requirements may be approved if considered suitable for the particular service on which the ship is to be engaged, see also Table 13.7.1.

7.1.3 Where the Committee has agreed that anchoring and mooring equipment need not be fitted in view of the particular service of the ship, the character letter **N** will be assigned, see also Pt 1, Ch 2,2.2.2.

7.1.4 Where the ship is intended to perform its primary designed service function only while it is anchored, moored, towed or linked, the character letter **T** will be assigned, see also Pt 1, Ch 2,2.2.2.

Table 13.7.1 Equipment requirements (*continued*)

Ship type	Service	Required equipment
Trawlers, stern trawlers, fishing vessels	Unrestricted service	(5) See Table 13.7.4, and Notes to Table 13.7.3 using N_C Anchor chains Where $L < 30$ m, may be replaced with wire ropes of equal strength. Where $30 \text{ m} \leq L \leq 40$ m, one chain cable may be replaced with wire rope of equal strength provided normal chain cable maintained for the second line. Wire ropes of trawl winches complying with above may be used as anchor cables. Wire ropes substituted for anchor chains should (a) have a length 1,5 times that for chain cable required by Table 13.7.4 and (b) have a length Grade U2/U1 of chain not less than 12,5 m between anchor and wire rope. Hawsers and warps – Sufficient in number and strength for proper working of the ship
		For symbols, see continuation of Table
Tugs	Unrestricted and restricted service	(6) See Table 13.7.2 using N_C except as stated below Stream anchor – not required Towlines – adequate for tug's maximum bollard pull with factor of safety $\geq 2,0$
	Service restricted, see Pt 1, Ch 2,2.3.7 to 2.3.10	(7) See Table 13.7.2 using N_C Mass of bower anchor } reduced to correspond to two Equipment Letters below that required for N_C Chain cable diameter } Anchor chains As item (2) in this Table
	Protected waters service, see Pt 1, Ch 2,2.3.6	(8) See Table 13.7.2 using N_A Mass of bower anchor } $N_A = 0,5N_C$ Chain cable diameter } Chain cable length = 0,5 times length required by N_A Where $N_C < 90$, the requirements for anchors and chain cable will be specially considered Anchor chains As item (2) in this Table
Offshore supply ships	Unrestricted service	(9) See Tables 13.7.2 and 13.7.3, using N_C Chain cable length and diameter – increased to correspond to two Equipment Letters above that required for N_C . Need not be applied for ships with DP(AAA) , DP(AA) or DP(AM) notations
Manned barges and pontoons	Service restricted, see Pt 1, Ch 2,2.3.7 to 2.3.10	(10) As item (3) in this Table

7.1.5 For classification purposes, the character figure **1**, or either of the character letters **N** or **T**, is to be assigned.

7.2 Anchors

7.2.1 Anchors are to be of an approved design. The design of all anchor heads is to be such as to minimise stress concentrations, and in particular, the radii on all parts of cast anchor heads are to be as large as possible, especially where there is considerable change of section.

7.2.2 Anchors which must be specially laid the right way up, or which require the fluke angle or profile to be adjusted for varying types of sea bed, will not generally be approved for normal ship use, but may be accepted for offshore units, floating cranes, etc. In such cases suitable tests may be required.

7.2.3 The mass of each bower anchor given in Table 13.7.2 is for anchors of equal mass. The masses of individual anchors may vary by ± 7 per cent of the masses given in the Table, provided that the total mass of the anchors is not less than would have been required for anchors of equal mass.

Ship Control Systems

Part 3, Chapter 13

Section 7

Table 13.7.1 Equipment requirements (conclusion)

Ship type	Service	Required equipment
Unmanned barges and pontoons	Unrestricted service, or service restricted, see Pt 1, Ch 2,2.3.7 to 2.3.10	<p>(11) See Tables 13.7.2 and 13.7.3, using N_C and N_A as appropriate</p> <p>Anchors $\begin{cases} L < 30 \text{ m, no anchor need be carried} \\ L \geq 30 \text{ m, one anchor to be fitted} \end{cases}$</p> <p>Anchor cable length – greater of 40 m or $2L$ m</p> <p>(a) Unrestricted service: mass of anchors and chain cable diameters as for N_C</p> <p>(b) Protected water service, see Pt 1, Ch 2,2.3.6: mass of anchors and chain cable diameters, $N_A = 0,5N_C$</p> <p>(c) Service restriction, see Pt 1, Ch 2,2.3.7 to 2.3.10: mass of anchor and chain cable diameter, N_A reduced to correspond to two Equipment Letters below N_C</p> <p>Mooring lines $\begin{cases} L < 65 \text{ m, two mooring lines to be fitted} \\ L \geq 65 \text{ m, three mooring lines to be fitted} \end{cases}$ length of mooring lines to be the greater of $2L$ or 80 m, but need not exceed that for manned ships</p> <p>Strength of each line to be that required by N_C</p> <p>Consideration will be given to proposals to omit anchoring equipment in association with the assignment of the character figure 1, see Pt 1, Ch 2,2.2.</p> <p>Where $L < 65$ m consideration will be given to the omission of anchoring and mooring equipment, in which case the character letter N will be assigned in the character of classification, see Pt 1, Ch 2,2.2</p>
Symbols		
<p>L = length of ship as defined in Ch 1,6.1</p> <p>N_A = actual equipment number to be used, if different from N_C</p> <p>N_C = calculated equipment number for ship as required by Ch 1,7</p> <p>T_D = maximum depth at which ship is designed to dredge, in metres</p>		

7.2.4 The mass of the head, including pins and fittings, of an ordinary stockless anchor is to be not less than 60 per cent of the total mass of the anchor.

7.2.5 When stocked bower or stream anchors are to be used, the mass 'ex-stock' is to be not less than 80 per cent of the mass given in Table 13.7.2 for ordinary stockless bower anchors. The mass of the stock is to be 25 per cent of the total mass of the anchor, including the shackle, etc., but excluding the stock.

7.3 High holding power anchors

7.3.1 When high holding power anchors are used as bower anchors, the mass of each such anchor may be 75 per cent of the mass given in the Table for ordinary stockless bower anchors.

7.4 Chain cables

7.4.1 Chain cables may be of mild steel, special quality steel or extra quality steel in accordance with the requirements of Chapter 10 of the Rules for Materials and are to be graded in accordance with Table 13.7.5.

7.4.2 Grade U1 material having a tensile stress of less than 400 N/mm² (41 kgf/cm²) is not to be used in association with high holding power anchors. Grade U3 material is to be used only for chain 20,5 mm or more in diameter.

7.4.3 Where stream anchors are used in association with chain cable, this cable may be either stud link or short link.

7.4.4 The form and proportion of links and shackles are to be in accordance with Chapter 10 of the Rules for Materials.

7.4.5 Where Owners require equipment for anchoring at depths greater than 82,5 m, it is their responsibility to specify the appropriate total length of the chain cable required for this purpose. In such cases, consideration can be given to dividing the chain cable into two unequal lengths.

7.5 Towlines and mooring lines for ships under 90 m in length

7.5.1 **Ships under 90 m** require mooring lines as specified in Table 13.7.3. Towlines are not required for classification and the details given in the Table are for guidance purposes only. Mooring lines may be of wire, natural fibre or synthetic fibre. The diameter, construction and specification of wire or natural fibre mooring lines are to comply with the requirements of Chapter 10 of the Rules for Materials. Where it is proposed to use synthetic fibre ropes, the size and construction will be specially considered.

Ship Control Systems

Part 3, Chapter 13

Section 7

Table 13.7.3 Equipment – Stream anchors, stream wires, towlines and mooring lines (conclusion)

NOTES	
1. Towline specified for guidance only, see 7.5.1. For tugs see Table 13.7.1 item (6).	5. The lengths of individual mooring lines may be reduced by up to seven per cent of the Table length, provided that the total length of mooring lines is not less than would have resulted had all lines been of equal length.
2. The rope used for stream wire is to be constructed of not less than 72 wires, made up into six strands.	6. Tests. See Chapter 10 of the Rules for Materials for wire ropes and fibre ropes respectively.
3. Wire ropes used for towlines and mooring lines are generally to be of a flexible construction with not less than: 144 wires in six strands with seven fibre cores for strengths up to 490 kN (50 tonne-f). 222 wires in six strands with one fibre core for strengths exceeding 490 kN (50 tonne-f). The wires laid round the fibre centre of each strand are to be made up in not less than two layers.	7. For individual mooring lines with breaking strength above 490 kN the breaking strength may be reduced with corresponding increase of the number of the mooring lines and vice versa, provided that the total breaking strength of all lines aboard the ship is not less than the Rule value. In this case the number of lines is not to be less than 6 and no one line is to have a strength of less than 490 kN.
4. Wire ropes for towlines and mooring lines used in association with mooring winches (on which the rope is stored on the winch drum) are to be of suitable construction.	8. Where wire rope is used in lieu of chain cable for anchoring, see Table 13.7.1, galvanised wire rope with an independent wire core in accordance with Ch 10.6 of the Rules for Materials is to be used. Wire rope terminal fittings are to comply with an acceptable code or standard. The strength of terminations, connecting fittings, shackles or links is not to be less than that of the anchor line.

Table 13.7.4 Trawlers, stern trawlers and fishing vessels

Equipment number		Stockless bower anchors		Stud link chain cables for bower anchors		
Exceeding	Not exceeding	Number	Mass of anchor in kg	Total length in metres	Diameter, in mm	
					Mild steel (Grade 1 or U1)	Special quality steel (Grade U2)
50	60	2	120	192,5	12,5	–
60	70	2	140	192,5	12,5	–
70	80	2	160	220,0	14,0	12,5
80	90	2	180	220,0	14,0	12,5
90	100	2	210	220,0	16,0	14,0
100	110	2	240	220,0	16,0	14,0

450	500	2	1440	412,5	38,0	34,0
500	550	2	1590	412,5	40,0	34,0
550	600	2	1740	440,0	42,0	36,0
600	660	2	1920	440,0	44,0	38,0
660	720	2	2100	440,0	46,0	40,0

7.6 Towlines and mooring lines for ships over 90 m in length

7.6.1 **Ships 90 m and over** in length do not require towlines and mooring lines as a classification item. It is recommended, however, that the number, length and strength of mooring lines provided on board the ship not be less than that given in Table 13.7.3.

Table 13.7.5 Chain cable steel grades

Grade	Material	Tensile strength	
		N/mm ²	(kgf/mm ²)
U1	Mild steel	300 – 490	(31 – 50)
U2 (a)	Special quality steel (wrought)	490 – 690	(50 – 70)
U2 (b)	Special quality steel (cast)	490 – 690	(50 – 70)
U3	Extra special quality steel	690 min.	(70 min.)

7.6.2 For ease of handling, fibre ropes are to be not less than 20 mm in diameter. All ropes having breaking strengths in excess of 736,0 kN (75,0 tonne-f) and used in normal mooring operations are to be handled by, and stored on, suitably designed winches. Alternative methods of storing should give due consideration to the difficulties experienced in manually handling ropes having breaking strengths in excess of 490,0 kN (50,0 tonne-f).

7.6.3 Mooring winches should be fitted with drum brakes, the strength of which is sufficient to prevent unreeling of the mooring line when the rope tension is equal to 80 per cent of the breaking strength of the rope as fitted on the first layer on the winch drum.

7.7 Windlass design and testing

7.7.1 A windlass of sufficient power and suitable for the size of chain is to be fitted to the ship. Where Owners require equipment significantly in excess of Rule requirements, it is their responsibility to specify increased windlass power.

Ship Control Systems

Part 3, Chapter 13

Section 7

7.7.2 The following performance criteria are to be used as a design basis for the windlass:

(a) The windlass is to have sufficient power to exert a continuous duty pull over a period of 30 minutes of:

- for specified design anchorage depths up to 82,5 m:
Chain cable grade Duty pull, P , in N (kgf)
U1 36,79 d_c^2 (3,75 d_c^2)
U2 41,68 d_c^2 (4,25 d_c^2)
U3 46,60 d_c^2 (4,75 d_c^2)

- for specified design anchorage depths greater than 82,5 m:

$$P_1 = P + (D_a - 82,5) 0,214d_c^2 \text{ N}$$

$$[P_1 = P + (D_a - 82,5) 0,0218d_c^2 \text{ kgf}]$$

where

d_c is the chain diameter, in mm

D_a is the specified design anchorage depth, in metres

P is the duty pull for anchorage depth up to 82,5 m

P_1 is the duty pull for anchorage depths greater than 82,5 m.

(b) The windlass is to have sufficient power to exert, over a period of at least two minutes, a pull equal to the greater of:

(i) short term pull:

1,5 times the continuous duty pull as defined in 7.7.2(a).

(ii) anchor breakout pull:

$$12,18W_a + \frac{7,0L_c d_c^2}{100} \text{ N}$$

$$\left(1,24W_a + \frac{7,1L_c d_c^2}{1000} \text{ kgf} \right)$$

where:

L_c is the total length of chain cable on board, in metres, as given by Table 13.7.2

W_a is the mass, in kilograms, of bower anchor as given in Table 13.7.2.

(c) The windlass, with its braking system in action and in conditions simulating those likely to occur in service, is to be able to withstand, without permanent deformation or brake slip, a load, applied to the cable, given by:

$$K_b d_c^2 (44 - 0,08d_c) \text{ N}$$

$$(K_b d_c^2 (44 - 0,08d_c) \text{ kgf})$$

where K_b is given in Table 13.7.6.

The performance criteria are to be verified by means of shop tests in the case of windlasses manufactured on an individual basis. Windlasses manufactured under LR's *Type Approval Scheme for Marine Engineering Equipment* will not require shop testing on an individual basis.

Table 13.7.6 Values of K_b

Cable grade	K_b	
	Windlass used in conjunction with chain stopper	Chain stopper not fitted
	N (kgf)	N (kgf)
U1	4,41 (0,45)	7,85 (0,8)
U2	6,18 (0,63)	11,0 (1,12)
U3	8,83 (0,9)	15,7 (1,6)

7.7.3 Where shop testing is not possible and Type Approval has not been obtained, calculations demonstrating compliance with 7.7.2 are to be submitted together with detailed plans and an arrangement plan showing the following components:

- Shafting
- Gearing
- Brakes
- Clutches.

7.7.4 During trials on board ship, the windlass is to be shown to be capable of:

- (a) for all specified design anchorage depths: raising the anchor from a depth of 82,5 m to a depth of 27,5 m at a mean speed of 9 m/min; and
- (b) for specified design anchorage depths greater than 82,5 m: in addition to (a), raising the anchor from the specified design anchorage depth to a depth of 82,5 m at a mean speed of 3 m/min.

Where the depth of the water in the trial area is inadequate, suitable equivalent simulating conditions will be considered as an alternative. Following trials, the ship will be eligible to be assigned a descriptive note **specified design anchorage depth ... metres**, which will be entered in column 6 of the *Register Book*.

7.7.5 Windlass performance characteristics specified in 7.7.2 and 7.7.4 are based on the following assumptions:

- (a) one cable lifter only is connected to the drive shaft;
- (b) continuous duty and short term pulls are measured at the cable lifter;
- (c) brake tests are carried out with the brakes fully applied and the cable lifter declutched;
- (d) the probability of declutching a cable lifter from the motor with its brake in the off position is minimised;
- (e) hawse pipe efficiency assumed to be 70 per cent.

7.7.6 The design of the windlass is to be such that the following requirements or equivalent arrangements will minimise the probability of the chain locker or forecastle being flooded in bad weather:

- (a) a weathertight connection can be made between the windlass bedplate, or its equivalent, and the upper end of the chain pipe, and
- (b) access to the chain pipe is adequate to permit the fitting of a cover or seal, of sufficient strength and proper design, over the chain pipe while the ship is at sea.

7.8 Winch design and testing

7.8.1 A winch of sufficient power and suitable for the size of wire rope and chain cable is to be fitted to the ship. Where owners require equipment significantly in excess of Rule requirements, it is their responsibility to specify increased winching power.

7.8.2 The requirements of 7.7.2 to 7.7.4 are to be applied as performance criteria for winches assuming an equivalent U2 Grade chain cable diameter and Rule length for the same equipment letter. When applying the requirements of 7.7.2(c) the factor K_b is to be taken as specified for when a chain stopper is not fitted.

Ship Control Systems

Part 3, Chapter 13

Section 7

7.9 Testing of equipment

7.9.1 All anchors and chain cables are to be tested at establishments and on machines recognised by the Committee and under the supervision of LR's Surveyors or other Officers recognised by the Committee, and in accordance with Chapter 10 of the Rules for Materials.

7.9.2 Test certificates showing particulars of weights of anchors, or size and weight of cable and of the test loads applied are to be furnished. These certificates are to be examined by the Surveyors when the anchors and cables are placed on board the ship.

7.9.3 Steel wire and fibre ropes are to be tested as required by Chapter 10 of the Rules for Materials.

7.9.4 For holding power testing requirements relating to high holding power anchors, see Ch 10,1.7 of the Rules for Materials

7.10 Structural requirements associated with anchoring

7.10.1 The windlass or winch is to be efficiently bedded and secured to the deck. The thickness of the deck in way of the windlass or winch is to be increased, and adequate stiffening is to be provided, to the Surveyor's satisfaction. The structural design integrity of the bedplate is the responsibility of the Shipbuilder and windlass or winch manufacturer.

7.10.2 An easy lead of the cables from the windlass to the anchors and chain lockers is to be arranged. Where cables pass over or through stoppers, these stoppers are to be manufactured from ductile material and be designed to minimise the probability of damage to, or snagging of, the cable. They are to be capable of withstanding without permanent deformation a load equal to 80 per cent of the Rule breaking load of the cable passing over them.

7.10.3 Hawse pipes and anchor pockets are to be of ample thickness and of a suitable size and form to house the anchors efficiently, preventing, as much as practicable, slackening of the cable or movements of the anchor being caused by wave action. The shell plating and framing in way of the hawse pipes are to be reinforced as necessary. Reinforcing is also to be arranged in way of those parts of bulbous bows liable to be damaged by anchors or cables. Substantial chafing lips are to be provided at shell and deck. These are to have sufficiently large, radiused faces to minimise the probability of cable links being subjected to high bending stresses. Alternatively, roller fairleads of suitable design may be fitted. Where unpocketed rollers are used, it is recommended that the roller diameter be not less than eleven times the chain diameter. Where hawse pipes are not fitted, alternative arrangements will be specially considered.

7.10.4 The chain locker is to be of a capacity and depth adequate to provide an easy direct lead for the cable into the chain pipes, when the cable is fully stowed. Chain or spurling pipes are to be of suitable size and provided with chafing lips. The port and starboard cables are to be separated by a division in the locker.

7.10.5 Where means of access is provided to the chain locker it is to be closed by a substantial cover and secured by closely spaced bolts.

7.10.6 Chain lockers and spurling pipes are to be watertight up to the exposed weather deck and the space is to be efficiently drained. However, bulkheads between separate chain lockers, or which form a common boundary of chain lockers, need not be watertight.

7.10.7 Spurling pipes are to be provided with permanently attached closing appliances to minimise water ingress. It is recommended that steel plates in halves, hooked over the spurling pipe tops, be provided on top of which cement may be laid before lashing a canvas cover. Suitable alternatives will be considered.

7.10.8 Provision is to be made for securing the inboard ends of the cables to the structure. This attachment should have a working strength of not less than 63,7 kN (6,5 tonne-f) or 10 per cent of the breaking strength of the chain cable, whichever is the greater, and the structure to which it is attached is to be adequate for this load. Attention is drawn to the advantages of arranging that the cable may be slipped from an accessible position outside the chain cable locker. The proposed arrangement for slipping the chain cable, if constructed outside the chain locker, must be made watertight.

7.10.9 Satisfactory arrangements are to be made for the stowage and working of the stream anchor, if provided.

7.10.10 On dredging and reclamation craft the following are to be complied with:

- (a) On unpowered ships, the windlass may be hand operated.
- (b) On split type vessels, the arrangements are to be such that jamming of the anchor cable during opening and closing operations of the hull will not occur.

7.10.11 When wire rope instead of chain is used for the anchor cable, it is to be stored on a suitably designed drum or reel. Fairleads intended for use with wire rope cable are to be designed to minimise wear and to avoid kinking or other damage occurring to the rope. Fairleads should, in general, be fitted with rollers having a diameter not less than eleven times the diameter of the anchor cable or as specified/recommended by the rope manufacturer.

7.11 Structural requirements for windlasses on exposed fore decks

7.11.1 Windlasses located on the exposed deck over the forward 0,25L of the rule length, of ships of sea-going service of length 80 m or more, where the height of the exposed deck in way of the item is less than 0,1L or 22 m above the summer load waterline, whichever is the lesser, are to comply with the following requirements. Where mooring winches are integral with the anchor windlass, they are to be considered as part of the windlass.

Ship Control Systems

Part 3, Chapter 13

Section 7

7.11.2 The following pressures and associated areas are to be applied, see Fig. 13.7.1:

- 200 kN/m² normal to the shaft axis and away from the forward perpendicular, over the projected area in this direction;
- 150 kN/m² parallel to the shaft axis and acting both inboard and outboard separately, over the multiple of f times the projected area in this direction;

where

$$f = 1 + B/H, \text{ but not greater than } 2,5$$

B = width of windlass measured parallel to the shaft axis, in metres

H = overall height of windlass, in metres.

7.11.3 Forces in the bolts, chocks and stoppers securing the windlass to the deck are to be calculated. The windlass is supported by N bolt groups, each containing one or more bolts, see Fig. 13.7.2.

7.11.4 The axial force R_i in bolt group (or bolt) i , positive in tension, may be calculated from:

$$R_{xi} = P_x h x_i A_i / I_x \text{ in kN}$$

$$R_{yi} = P_y h y_i A_i / I_y \text{ in kN}$$

and

$$R_i = R_{xi} + R_{yi} - R_{si} \text{ in kN}$$

where

- P_x = force acting normal to the shaft axis, in kN
- P_y = force acting parallel to the shaft axis, either inboard or outboard whichever gives the greater force in bolt group i , in kN
- h = shaft height above the windlass mounting, in cm
- x_i, y_i = x and y coordinates of bolt group i from the centroid of all N bolt groups, positive in the direction opposite to that of the applied force, in cm
- A_i = cross sectional area of all bolts in group i , in cm^2
- $I_x = \Sigma A_i x_i^2$ for N bolt groups, in cm^4
- $I_y = \Sigma A_i y_i^2$ for N bolt groups, in cm^4
- R_{si} = static reaction at bolt group i , due to weight of windlass, in kN.

7.11.5 Shear forces F_{xi}, F_{yi} applied to the bolt group i , and the resultant combined force F_i may be calculated from:

$$F_{xi} = (P_x - \alpha g M) / N \text{ in kN}$$

$$F_{yi} = (P_y - \alpha g M) / N \text{ in kN}$$

and

$$F_i = \sqrt{(F_{xi}^2 + F_{yi}^2)} \text{ kN}$$

where

- α = coefficient of friction (0,5)
- M = mass of windlass, in tonnes
- g = gravity acceleration (9,81 m/sec²)
- N = number of bolt groups.

7.11.6 Tensile axial stresses in the individual bolts in each bolt group i are to be calculated. The horizontal forces F_{xi} and F_{yi} are normally to be reacted by shear chocks. Where 'fitted' bolts are designed to support these shear forces in one or both directions, the von Mises equivalent stresses in the individual bolts are to be calculated, and compared to the stress under proof load. Where pourable resins are incorporated in the holding down arrangements, due account is to be taken in the calculations.

7.11.7 The safety factor against bolt proof strength is to be not less than 2,0.

7.11.8 The windlass is to be efficiently bedded and secured to the deck. The thickness of the deck in way of the windlass is to be increased. Adequate stiffening of the deck in way of the windlass is to be provided. The scantlings of the supporting structure and deck are to be determined by additional calculations applying the weight of the windlass combined with the resultant force on the seat due to the application of the following design loads:

- P_x (as defined in 7.11.4);
- P_y ;
- P_x and P_y combined;
- a load no less than the maximum pull developed by the windlass under normal operating conditions;
- a load no less than the ultimate breaking strength of the chain stopper, but need not be taken greater than the maximum brake holding capacity of the windlass.

Requirements for chain stoppers are described in Section 8.

The allowable stresses given in Table 13.7.7 are not to be exceeded.

Table 13.7.7 Allowable stress in windlass supporting structure

	Bending stress, in N/mm ²	Shear stress, in N/mm ²	Combined stress, in N/mm ²
Allowable stress	$\frac{150}{k}$	$\frac{87}{k}$	$\frac{213}{k}$
k = material factor, see Pt 3, Ch 2,1.2			

7.11.9 The axial tensile and compressive forces in 7.11.4 and the lateral forces in 7.11.5 are also to be considered in the design of the supporting structure.

7.12 Structural requirements associated with towing and mooring

7.12.1 The following requirements are applicable to bollards and bitts, fairleads, stand rollers and chocks used for the normal mooring and towing of the vessel, the supporting structure and their attachment to it. They are also applicable to the supporting structure of capstans, winches and similar items used for the normal mooring and towing of the vessel. Any weld, bolt or equivalent device connecting the shipboard fitting to the supporting structure is part of the shipboard fitting and is subject to the National or International standard applicable to that shipboard fitting.

7.12.2 The design criteria in this sub-Section are to be used to derive the net scantlings of the supporting structure. A corrosion addition of 2 mm is to be added to the net thickness derived.

7.12.3 Shipboard fittings for towing or mooring are to be located on longitudinals, beams and/or girders, which are part of the deck construction so as to facilitate efficient distribution of the load. Other arrangements will be specially considered provided that the strength is confirmed as adequate for the service.

7.12.4 The design load applied to shipboard fittings and supporting hull structure is not to be less than that given in Table 13.7.8.

7.12.5 The design load is to be applied according to the arrangement shown on the towing and mooring arrangement plan. The point of action of the force on the fitting is to be taken as the point of attachment of the mooring line or towline or at a change in its direction. The total design load applied to a fitting need not be more than twice the design load, see Fig. 13.7.3.

Ship Control Systems

Part 3, Chapter 13

Section 7

Table 13.7.8 Minimum design load for deck fittings and supporting structure

Use/Item	Minimum design load ⁽¹⁾
Normal towing (harbour/manoeuvring)	1,25 times the intended maximum towing load as indicated on the towing and mooring arrangements plan
Escort towing	minimum breaking strength of the towline given in Table 13.7.3 for the ship's corresponding equipment number ⁽²⁾
Mooring	1,25 times the breaking strength of the mooring line given in Table 13.7.3 for the ship's corresponding equipment number ⁽²⁾⁽³⁾
Winches, etc.	1,25 times the intended maximum brake holding power
Capstans	1,25 times the maximum hauling in force
NOTES 1. If a greater design load is specified by the designer then this load is to be used. 2. The equipment number calculation is to include the maximum projected area of all deck cargo. 3. Note 7 in Table 13.7.3 is applicable.	

7.12.6 The selection of shipboard fittings is to be made by the shipyard in accordance with an acceptable National or International standard (e.g. ISO3913 Shipbuilding Welded Steel Bollards). If the shipboard fitting is not selected from an acceptable National or International Standard then the design load used to assess its strength and its attachment to the ship is to be in accordance with the design load given in Table 13.7.8 and the design is to be submitted for approval.

7.12.7 The reinforced members beneath shipboard fittings are to be effectively arranged for any variation of the direction, in both the lateral and vertical plane, of the forces acting through the arrangement.

7.12.8 The stress within the supporting structure of fittings is not to exceed that given in Table 13.7.9.

Table 13.7.9 Allowable stress within the supporting structure of shipboard fittings

	Normal stress, in N/mm ²	Shear stress, in N/mm ²
Allowable stress	$\frac{235}{k}$	$\frac{141}{k}$
where $k = \frac{235}{\sigma_0}$ σ_0 = specified minimum yield strength of the material in N/mm ²		

7.12.9 The Safe Working Load (SWL) of a shipboard fitting used for normal towing and mooring is not to be greater than 80 per cent of the design load. The SWL of a shipboard fitting used for escort towing is not to be greater than the design load. For fittings used for both operations, the greater design load is to be used.

7.12.10 The SWL of each shipboard fitting is to be marked, by weld bead or equivalent, on the fitting and relates to a single post basis.

7.12.11 When determining the minimum design load for deck fitting and supporting structure the 'Mooring Equipment Number' is to be calculated as follows:

$$\text{Mooring Equipment Number} = \Delta^{2/3} + 2BH + \frac{A}{10}$$

where

A = area, in m², in profile view of the hull including the projected area of all deck cargo, within the Rule length of the vessel, and of superstructures and houses above the summer load waterline, which are within the Rule length of the vessel, and also having a breadth greater than $\frac{B}{4}$

See also 7.12.12 and 7.12.13

B = greatest moulded breadth, in metres

H = freeboard amidships, in metres, from the summer load waterline to the upper deck, plus the sum of the heights at the centreline, in metres, of each tier of houses having a breadth greater than $\frac{B}{4}$

See also 7.12.12, 7.12.13 and 7.12.14

Δ = moulded displacement, in tonnes, to the summer load waterline.

7.12.12 In the calculation of H and A , sheer and trim are to be ignored. Where there is a local discontinuity in the upper deck, H is to be measured from a notional deckline.

7.12.13 If a house having a breadth greater than $\frac{B}{4}$ is above a house with a breadth of $\frac{B}{4}$ or less, then the wide house is to be included, but the narrow house ignored.

7.12.14 Screens and bulwarks more than 1,5 m in height are to be regarded as parts of houses when determining *H* and *A*. Where a screen or bulwark is of varying height, the portion to be included is to be that length, the height of which exceeds 1,5 m.

8.1.2 A ship provided with mooring arrangements in accordance with the requirements of this Section will be eligible to be assigned the Class notation **SPM4** where a single mooring line arrangement is provided for and **DSPM4** where a dual mooring line arrangement is provided for, see Fig. 13.8.1.

Section 8

Mooring of ships at single point moorings

8.1 General

8.1.1 These requirements are applicable to ships intended to utilise the fittings standardised for single point moorings and include the type, strength and location of the required fittings.

8.2 Arrangements

8.2.1 The ship is to be fitted with bow chain stoppers and/or Smit-Type Brackets, and bow fairleads. In addition, pedestal roller fairleads may be required for alignment purposes but a direct straight lead from the chain stopper to the winch storage drum is the preferred arrangement. However, consideration of safety and protection from risk of injury to mooring personnel should take priority in determining whether pedestal rollers should be fitted as well as their number and positioning.

8.2.2 In order to ensure matching with terminal mooring equipment, the requirements for shipboard fittings are specified in association with ranges of ship deadweight as shown in Table 13.8.1.

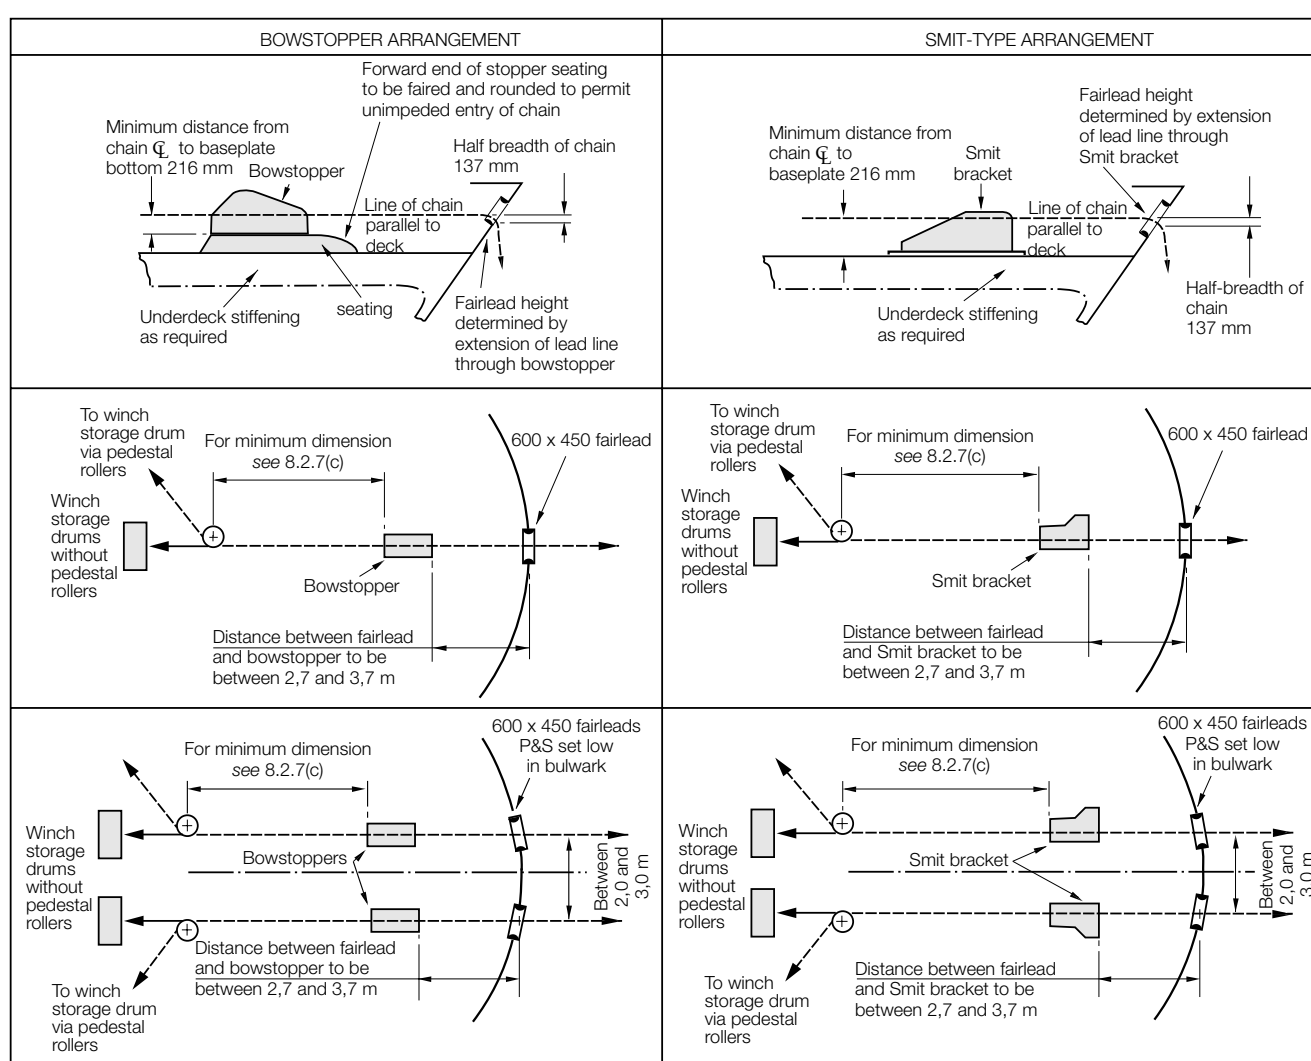

Fig. 13.8.1 Positioning of fairleads, chainstoppers and pedestal roller leads

Ship Control Systems

Part 3, Chapter 13

Section 8

Table 13.8.1 Deadweight group for shipboard fittings requirements

Group	Deadweight in tonnes
I	≤ 100 000
II	> 100 000 ≤ 150 000
III	> 150 000

8.2.3 Bow chain stoppers:

- The number, chain cable size and minimum safe working load of bow chain stoppers should be as given in Table 13.8.2.
- Bow chain stoppers should be located between 2,7 m and 3,7 m aft of the bow fairlead and should be positioned so as to give correct alignment with the bow fairlead and the pedestal fairlead or the storage drum of the winch, see Fig. 13.8.1.
- The leading edge of the stopper base plate is to be suitably faired to allow unimpeded entry of the combination chafe chain into the stopper. The chain referred to, forms part of the standardised SPM equipment.
- The safety factor on yield of bow chain stoppers should be a minimum of 2 when the safe working load is applied.
- Details of bow chain stoppers should be submitted for approval.

Table 13.8.2 Fittings requirements for deadweight group

Group	Chain size, in mm	No. of chain stoppers	SWL, in kN (tonnes)
I	76	1, see Note	1960 (200)
II	76	1, see Note	2450 (250)
III	76	2	3430 (350)

NOTE
Ships in this size range may elect to fit two stoppers to ensure full range terminal acceptance, see 8.1.2.

8.2.4 Smit-Type Brackets:

- Smit-Type Brackets may be fitted in lieu of bow chain stoppers for Group I and II. The fitting of Smit-Type Brackets in lieu of bow chain stoppers for Group III will be specially considered. The required number and safe working load are as given in Table 13.8.2 for bow chain stoppers.
- The scantlings of the pin, connecting brackets and welded attachments to the baseplate are to be determined in association with a horizontal load of 2 x SWL and a permissible shear stress of 78 N/mm² (8 kg/mm²).
- Where fitted, Smit-Type Brackets should be located between 2,7 m and 3,7 m aft of the bow fairlead and should be positioned so as to give correct alignment with the bow fairlead and pedestal fairlead or the storage drum of the winch, see Fig. 13.8.1.

- To facilitate connection to the terminal equipment it is recommended that each Smit-Type Bracket be provided with a length of chain cable comprising a pear link, an open link, and a special shackle, see Fig. 13.8.2. The safe working load should be as given in Table 13.8.2 for bow stoppers.
- Adjacent to each Smit-Type Bracket a lug with a recommended safe working load of 490 kN (50 tonnes) should be attached to the doubler plate. The lug should be provided with a hole of sufficient size to accept the pin of a 490 kN (50 tonnes) SWL shackle and should be used as a securing point for the chafe chain holding stopper.
- Details of Smit-Type Brackets should be submitted for approval.

8.2.5 The forecastle deck in way of bow chain stoppers or Smit-Type Brackets is to have a minimum thickness of 15 mm and is to be suitably reinforced to resist horizontal loads equal to 2 x SWL as given in Table 13.8.2.

8.2.6 Bow fairleads:

- One centrally located bow fairlead should be provided for ships fitted with one bow chain stopper or Smit-Type bracket. Two bow fairleads should be provided for ships fitted with two bow chain stoppers or Smit-type brackets, see Fig. 13.8.1.

- (b) Bow fairlead openings should be at least 600 x 450 mm for 76 mm chafe chain size. Where more than one bow fairlead is installed, the spacing of centres should be between 2 m and 3 m.
- (c) The height of the centre of the bow fairlead opening above the forecastle deck should be determined by the extension, parallel to the deck, of the lead line of the chain cable to the bow chain stopper or Smit-Type Bracket, see Fig. 13.8.1. The fairlead should have a minimum radius equal to seven times the chain radius.
- (d) The scantlings of the fairlead are to be determined in association with a load of 2 x SWL with hawser angles up to 90 degrees from the ship's centre line, both port and starboard in the horizontal plane and to 30 degrees above and below horizontal in the vertical plane.
- (e) Details of bow fairleads and their attachment to the bulwark should be submitted for approval.

8.2.7 Pedestal roller fairleads:

- (a) Pedestal roller fairleads should have a minimum radius equal to 10 times the radius of wire mooring ropes with a fibre core, seven times the radius of wire mooring ropes with a steel core or three times the radius of synthetic mooring ropes.
- (b) The number of pedestal roller fairleads used for each bow chain stopper should not exceed two and the angle subtended by the change of direction of the pick-up rope should be minimal.
- (c) The minimum distance of pedestal roller fairleads from the bow chain stopper or Smit-Type Bracket should be 3,0 m. Any variation in the minimum distance will be specially considered.
- (d) Details of local strengthening of the forecastle deck in way of pedestal roller fairleads should be submitted for approval.

8.2.8 The winch drum used for handling the mooring gear should be capable of exerting a continuous duty pull of not less than 147 kN (15 tonnes) and be of sufficient size to accommodate 150 m of 80 mm diameter rope. Winch drum ends (warping ends) to handle pick-up ropes should be avoided. Remotely-operated winch storage drums are recommended.

9.1.2 Where a ship is provided with an emergency towing arrangement and the supporting structure complies with the requirements of this Section, the ship will be eligible to be assigned the descriptive note **ETA** which will be entered in column 6 of the *Register Book*.

9.1.3 Stresses induced in the supporting structure and welds in way of strongpoints and fairleads, determined using the design loads from 9.1.1, are not to exceed the permissible values given in Table 13.9.1. The capability of the structure to withstand buckling is also to be assessed.

Table 13.9.1 Permissible stress values

	Permissible stress N/mm ² (kgf/mm ²)
Direct stress	σ_o
Shear stress	$\frac{\sigma_o}{\sqrt{3}}$
Combined stress	σ_o
Symbols	
σ_o = specified minimum yield stress, in N/mm ² (kgf/mm ²)	

9.1.4 The structural arrangement is to be such that continuity will be ensured. Abrupt changes of shape or section, sharp corners and other points of stress concentration are to be avoided.

9.2 Chafing chain and wire or fibre rope for Emergency Towing Arrangements

9.2.1 Chafing chains are to be manufactured, tested and certified in accordance with Ch 10,2 of the Rules for Materials Grades U2 and U3.

9.2.2 The outboard end of the chafing chain is to include a pear-shaped link allowing connection to a shackle corresponding to the type of ETA and chain grade. A typical arrangement is shown in Fig. 13.9.1.

9.2.3 The chafing chain is to be able to withstand a breaking load not less than twice the safe working load (SWL). The nominal diameter of common link for chafing chains is to comply with the value indicated in Table 13.9.2.

9.2.4 Steel wire ropes are to be manufactured, tested and certified in accordance with Ch 10,6 of the Rules for Materials.

9.2.5 Fibre ropes are to be manufactured, tested and certified in accordance with Ch 10,7 of the Rules for Materials.

Section 9 Emergency towing arrangements

9.1 Structural requirements

9.1.1 For ships equipped with emergency towing arrangements in accordance with IMO Resolution MSC 35(63), the deck and its supporting structure in way of strongpoints and fairleads are to be suitably reinforced to resist design loads of at least 1,3 x specified breaking strength of the weakest component of the emergency towing arrangement, for angles of tow as specified in IMO Resolution MSC 35(63). The deck in way of strongpoints and fairleads is to have a minimum thickness of 15 mm.

Table 13.9.2 Nominal diameter of common link for chafing chains for ETA

Type of ETA	Nominal diameter of common link, d , min	
	Grade U2	Grade U3
ETA 1000	62 mm	52 mm
ETA 2000	90 mm	76 mm

Cargo Securing Arrangements

- 9 **Strength of container securing arrangements**
- 10 **Surveys**

■ Section 1 General

1.1 Application

1.1.1 All cargo ships, regardless of tonnage, except those engaged solely in the carriage of either liquid or solid bulk cargoes are to be provided with a Cargo Securing Manual approved by the Flag Administration, as required by SOLAS 1974 (as amended). Sections 2, 4 and 10 apply to all ships for which a Cargo Securing Manual is required.

1.1.2 Where the design and construction of the system comply with Sections 2, 4 and 10, and all the proposed fixed cargo securing fittings have been certified by an organisation acceptable to Lloyd's Register (hereinafter referred to as 'LR'), the ship will be eligible to be assigned the descriptive note **fsa** (fixed securing arrangements) and for an entry to be made in column 6 of the *Register Book*.

1.1.3 Where container securing arrangements are fitted, and the design and construction of the system are in accordance with this Chapter, the ship will be eligible to be assigned the special features notation **CCSA** (certified container securing arrangements). Where loose container securing fittings are supplied for part container stowage only, the special features notation will be suitably modified.

1.1.4 Where container securing arrangements are fitted and the design and construction of the system are in accordance with this Chapter, but an Initial Survey in accordance with 10.1.1 has not been requested, the descriptive note **fcsa (plans)** will be entered in column 6 of the *Register Book*.

1.1.5 The requirements for container securing arrangements have been framed in relation to ISO Standard Series 1 Freight Containers. Proposals for the securing of other types of containers will be specially considered.

1.1.6 In general, the containers are to be assumed loaded to their maximum operating gross weight. Where, however, specified loading patterns are proposed, the securing arrangements may be considered on the basis of these loading patterns which are to be clearly indicated on the approved arrangement plan carried on board the ship.

1.1.7 Containers may be approved and certified using LR's *Container Certification Scheme*.

1.2 Plans and information required

1.2.1 For all fixed cargo securing arrangements, except container securing arrangements, the following information and plans are to be submitted:

- (a) Details of certification including safe working load (SWL), of fixed cargo securing fittings.
- (b) Plans of structure in way of fixed cargo securing fittings.
- (c) Direction of loads imposed on the ship's fixed cargo securing fittings.
- (d) A general arrangement of fixed cargo securing fittings.

1.2.2 For container securing arrangements, the following plans and information are to be submitted:

- (a) General arrangement plan showing the disposition and design weights of the containers.
- (b) Details of materials, design, scantlings of cell guides structure, lashing bridges, pedestals, and other container securing arrangements, where fitted.
- (c) Details of certification, including safe working loads, of fixed and loose container securing fittings.
- (d) Plans of structure in way of fixed container securing fittings and arrangements.
- (e) Design values of the following ship parameters for the container load departure and arrival conditions:
 - Moulded draught (T_d)
 - Longitudinal centre of flotation (LCF)
 - Transverse metacentric height (GM)
- (f) Design wind speed.
- (g) Where available, details of the long term distribution of ship motions, particularly roll, pitch and heave, in irregular seas which the ship will encounter during its operating life. Where simplified dynamic response data, or other means of assessing the maximum motions of the ship, are proposed they are to be submitted for consideration. In other cases the motions defined in Section 8 will be used.

Cargo Securing Arrangements

Part 3, Chapter 14

Sections 1 & 2

1.2.3 Where containers of types other than ISO containers are to be incorporated in the stowage arrangement, the container stowage plan is to indicate clearly the locations where these containers are stowed. The plan is also to indicate the container weights and required securing arrangements for stacks composed entirely of ISO standard containers.

1.3 Securing systems

1.3.1 Containers are to be secured by one, or a combination, of the following systems:

- Corner locking devices.
- Rod, wire or chain lashings.
- Buttresses, shores or equivalent structural restraint.
- Cell guides.

Alternative systems will be considered on the basis of their suitability for the intended purpose.

1.3.2 Dunnage is not to be used in association with approved container securing systems except where forming part of an approved line load stowage, see 5.5.

1.4 Symbols and definitions

1.4.1 The following definitions are applicable to this Chapter, except where otherwise stated:

- a = breadth of the container, in metres
- b = length of the container, in metres
- e = base of natural logarithms, 2,7183
- GM = transverse metacentric height of the ship in the container load condition, in metres. It is recommended that for the purpose of design of the container securing system, GM should be taken as not less than $0,05B$ m.
- x = longitudinal horizontal distance from O_m to the centre of the container, in metres
- y = transverse horizontal distance from the centreline of the ship to the centre of the container, in metres
- z_m = vertical distance from O_m to the centre of gravity of the container, in metres
- A = projected side area of the container, in m^2
- B = moulded breadth of the ship, in metres
- D = moulded depth of the ship, in metres
- L_{pp} = length between perpendiculars of the ship, in metres
- O_m = centre of motion, to be taken on the centreline at the longitudinal centre of flotation of the ship and at a distance T_c or $D/2$, whichever is the greater, above the keel
- R = the rating, or maximum operating gross weight for which the container is certified, and is equal to the tare weight plus payload of the container, in tonnes
- T_c = moulded draught in the container load condition, in metres
- T_h = full period of heave of the ship, in seconds
- T_p = full period of pitch of the ship, in seconds
- T_r = full period of roll of the ship, in seconds
- V = wind speed, in m/s
- W = design weight of the container and contents. In general W is to be taken as R unless reduced maximum weights are specified

- ϕ = maximum single amplitude of roll, in degrees
- ψ = maximum single amplitude of pitch, in degrees.

Section 2 Fixed cargo securing fittings, materials and testing

2.1 General

2.1.1 Randomly selected samples of fixed cargo securing fittings are to be subjected to prototype testing and, upon satisfactory completion, will be granted General Approval.

2.1.2 Randomly selected samples drawn from production runs are to be subjected to production testing prior to delivery to the ship.

2.1.3 Cargo securing fittings, certified by an organization other than LR, will be accepted where the certification scheme is to the satisfaction of LR.

2.2 Materials and design

2.2.1 Steel used for the construction of the fixed cargo securing fittings is to comply with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials) or with an equivalent specification acceptable to LR. Due account is to be taken of the grade and tensile strength of the hull material in way of the attachment. The chemical composition of the steel is to be such as to ensure acceptable qualities of weldability. Where necessary, tests are to be carried out to establish specific welding procedures.

2.2.2 Where securing arrangements are intended to operate at low ambient temperatures, special consideration is to be given to the specification of the steel.

2.2.3 Proposals for the use of materials other than steel will be specially considered.

2.2.4 Attention is drawn to the need for measures to be taken to prevent water accumulation in pockets or recesses that could lead to excessive corrosion.

2.3 Prototype testing

2.3.1 Prototype tests to determine the breaking or failure loads are to be carried out on at least two randomly selected samples of each item used in the securing system. The relationship between design breaking load and safe working load (SWL) is to be as indicated in Table 14.2.1.

2.3.2 The Surveyor is to be satisfied that the design and materials of the fittings are in accordance with the approved plans.

Cargo Securing Arrangements

Part 3, Chapter 14

Section 2

Table 14.2.1 Design breaking loads and proof loads for fixed cargo securing fittings

Minimum design breaking load		Minimum proof load	
SWL ≤ 40 tonnes	SWL > 40 tonnes	SWL ≤ 40 tonnes	SWL > 40 tonnes
2 x SWL	SWL + 40 tonnes	1,5 x SWL	SWL + 20 tonnes
NOTE Breaking and proof loads for fixed cargo securing fittings of a material other than steel will be specially considered.			

2.3.3 For acceptance, no permanent deformation (other than due to initial embedding of component parts) is to be induced by test loads up to the proof load given in Table 14.2.1.

2.3.4 When considering the test modes, all expected directions of operation are to be taken into account. Jigs are to be employed, where necessary, in order that satisfactory simulation is obtained.

2.3.5 In the interests of standardisation of the strength of container securing fittings, safe working loads in accordance with Table 14.2.2 are recommended.

2.3.6 Where one of the required two randomly selected test samples required fails before the design breaking load is reached, this can be accepted provided that:

- the failure is not less than 95 per cent of the design breaking load;
- an additional randomly selected sample is tested satisfactorily; and
- the average failure load of the three randomly selected samples is equal to or greater than the design breaking load.

2.4 Production testing

2.4.1 The nature and extent of proposed production testing will be considered by LR, but the arrangements are to be at least equivalent to one of the following testing procedures:

- One randomly selected sample from every 50 pieces, or from each batch if less than 50 pieces, is to be proof loaded in accordance with Table 14.2.1.
- All fittings are to be proof loaded to the SWL of the item.

2.4.2 Consideration will be given to a reduced frequency of the mechanical production testing proposed in 2.4.1, provided that:

- the prototype test results indicate a breaking load at least 50 per cent greater than that required by Table 14.2.1; and
- a suitable non-destructive inspection procedure is agreed.

Table 14.2.2 Test loads and test modes for fixed container securing fittings

Item No.	Description	Required test modes	Recommended minimum, in tonnes		
			SWL	Proof load	Breaking load
1	Flush socket	 Pull-out load	20	30	40
2	Pedestal socket	 Pull-out load	20	30	40
		 Tangential load	15	22,5	30
3	'D' ring	 45° Tensile load	18	27	36
4	Lashing plate	 45° Tensile load	18	27	36

NOTES

- For items 3 and 4, where specially designed for use with chain or steel wire rope (SWR) lashings, a lesser SWL may be considered. A greater SWL will be required for use with item 2 in Table 14.3.2.
- For items 1 and 2, where multiple flush sockets or pedestal sockets are involved, test loads are to be applied simultaneously to each socket opening which can be loaded simultaneously in service.
- For item 4, where multiple lashing points are fitted in one deck plate fitting, testing is to be similarly arranged as for Note 2.
- Where containers with strength higher than required for ISO containers are used, consideration will be given to the required minimum loads.
- The test modes illustrated above are diagrammatic only.

Cargo Securing Arrangements

Part 3, Chapter 14

Sections 2 & 3

2.4.3 Permanent deformation (other than that due to initial embedding of component parts) will not be accepted unless tests are conducted in accordance with 2.4.1(a) and the SWL of the sample is 25 tonnes or greater. In this case, consideration may be given to acceptance of permanent deformation in the load range between SWL + 12,5 tonnes and the proof load, provided that satisfactory manual operation can be achieved after completion of tests.

2.4.4 In the event of premature failure or serious plastic deformation occurring in a test sample, a further randomly selected sample is to be selected for testing. In the event that this sample is found to be unsatisfactory, the associated batch will be rejected.

Section 3 Loose container securing fittings, materials and testing

3.1 General

3.1.1 Randomly selected samples of loose container securing fittings are to be subjected to prototype testing and, upon satisfactory completion, will be granted General Approval.

3.1.2 Randomly selected samples drawn from production runs are to be subjected to production testing prior to delivery to the ship in accordance with 3.4.

3.1.3 Loose container securing fittings, certified by an organization other than LR, will be accepted where the certification scheme is to the satisfaction of LR.

3.2 Materials and design

3.2.1 Steel used for loose container securing fittings is to comply with the requirements of the Rules for Materials or with an equivalent specification acceptable to LR.

3.2.2 Where loose container securing fittings are intended to operate at low ambient temperatures, special consideration is to be given to the specification of the steel.

3.2.3 Proposals for the use of materials other than steel will be specially considered.

3.2.4 Locking devices are to be such as to minimise the risk of working loose under the effects of vibration.

3.3 Prototype testing

3.3.1 Prototype tests are to be in accordance with 2.3.1 to 2.3.6, except that Tables 14.3.1 and 14.3.2 are to be applied in lieu of Tables 14.2.1 and 14.2.2 respectively.

3.4 Production testing

3.4.1 The nature and extent of proposed production testing will be considered by LR, but the arrangements are to be at least equivalent to one of the following testing procedures:

- (a) For:
 - (i) **Loose container securing fittings except chain or wire rope lashings.** One randomly selected sample from every 50 pieces, or from each batch if less than 50 pieces, is to be proof loaded in accordance with Table 14.3.1.
 - (ii) **Chain or wire rope lashings.** One randomly selected sample from every 50 pieces or from each batch if less than 50 pieces, is to be tested to breaking.
- (b) All fittings, securing devices and lashings are to be proof loaded to the SWL of the item and in addition, one randomly selected sample from every batch of chain or wire rope lashings is to be tested to breaking.

3.4.2 Permanent deformation (other than that due to initial embedding of component parts) will not be accepted unless tests are conducted in accordance with 3.4.1(a)(i) and the SWL of the sample is 25 tonnes or greater. In this case, consideration may be given to acceptance of permanent deformation in the load range between SWL + 12,5 tonnes and the proof load, provided that satisfactory manual operation can be achieved after completion of tests.

3.4.3 In the event of premature failure or serious plastic deformation occurring in a test sample a further randomly selected sample is to be selected for testing. In the event that this sample is found to be unsatisfactory, the associated batch will be rejected.

Table 14.3.1 Design breaking loads and proof loads for loose container securing fittings

Item	Min. design breaking load		Min. proof load	
	SWL ≤ 40 tonnes	SWL > 40 tonnes	SWL ≤ 40 tonnes	SWL > 40 tonnes
Lashings				
Wire rope	3 x SWL		1,5 SWL	
Rod: higher tensile steel	2 x SWL			
Chain: mild steel	3 x SWL			
higher tensile steel	2,5 x SWL			
Other loose container securing fittings	2 x SWL	SWL + 40 t	1,5 x SWL	SWL + 20 t
NOTES				
1. Higher tensile steel is defined for this purpose as steel having a yield stress not less than 315 N/mm ² (32 kgf/mm ²).				
2. Breaking and proof loads for lashings of material other than steel will be considered.				

Cargo Securing Arrangements

Part 3, Chapter 14

Sections 3 & 4

Table 14.3.2 Test loads and test modes for loose container securing fittings

Item No.	Description	Required test modes	Recommended minimum, in tonnes		
			SWL	Proof load	Breaking load
1	Lashing rod (HTS)	 Tensile load	18	27	36
2	Lashing rod (high strength)		25	37,5	50
3	Lashing chain (HTS)		8	—	20
4	Lashing chain (M.S.)		10	—	30
5	Lashing steel wire rope		12	—	36
6	Turnbuckle	 Tensile load	18	27	36
7	Twistlock (single)	 Shear load	15	22,5	30
		 Tensile load	20	30	40
8	Twistlock (double)	 As for item 7 + Tensile load	5	7,5	10
9	Stacker (single)	 Shear load	15	22,5	30
10	Stacker (double)	 As for item 9 + Tensile load	5	7,5	10
11	Penguin hook	 Tangential load	18	27	36
12	Bridge fitting	 Tensile load	5	7,5	10
13	Buttress	 Tensile load	See Note 3		

NOTES

- For items 6 and 11, where specially designed for use with chain or SWR lashings, a lesser SWL may be considered.
- For items 8, 10 and 12, the recommended minimum loads quoted in the Table refer to the fittings when employed in a location in container stacks which do not transfer load to an adjacent stack. Where items 8, 10 and 12 are fitted in line with a buttress/shore support at stowage sides, then test loads are to be determined in association with Note 3.
- For item 13, test loads for buttress fittings are to be determined by detailed consideration of the individual stowage arrangement proposed in association with Table 14.3.1.
- Where containers with strength higher than required for ISO containers are used, consideration will be given to the required minimum loads.
- The test modes illustrated above are diagrammatic only.
- HTS denotes high tensile steel.

Section 4 Ship structure

4.1 General

4.1.1 The ship structure and hatch covers in way of fixed cargo securing fittings are to be strengthened as necessary.

4.2 Strength

4.2.1 The SWL of the fixed cargo securing fitting is to be used as the design load when approving the weld attachments and the support structure of the fixed cargo securing fitting.

4.2.2 For container securing arrangements, the design load when approving the weld attachment and supporting structure is to be calculated in accordance with Section 9.

4.2.3 When considering the loads, all expected directions of operation are to be taken into account.

Cargo Securing Arrangements

Part 3, Chapter 14

Sections 4 & 5

4.2.4 Stresses induced in the weld attachments, supporting structure, cell guides, lashing bridges and other structures serving as fixed cargo securing points, determined using the design loads from 4.2.1 to 4.2.3, are not to exceed the permissible values given in Table 14.4.1.

Table 14.4.1 Permissible stress values

	Permissible stress, N/mm ² (kgf/mm ²)
Normal stress (bending, tension, compression)	$0,67\sigma_0$
Shear stress	$0,4\sigma_0$
Combined stress	$0,86\sigma_0$
Symbols	
σ_0 = specified minimum yield stress, in N/mm ² (kgf/mm ²)	

Section 5

Container securing arrangements for stowage on exposed decks without cell guides

5.1 General

5.1.1 Containers stowed on deck or on hatch covers are generally to be aligned in the fore and aft direction, but alternative arrangements will be considered.

5.1.2 Containers are to be stowed so that they do not extend beyond the ship's side. Adequate support is to be provided where they overhang hatch coamings or other deck structures. The stowage arrangements are to be such as to permit safe access for personnel in the necessary working of the ship, and to provide sufficient access for operation and inspection of the securing devices.

5.1.3 Where containers are stowed on hatch covers, the covers are to be effectively restrained against sliding by approved type stoppers or equivalent. Details of the locations of stoppers relative to the supporting structure are to be submitted at as early a stage as possible.

5.1.4 Stanchions and similar structure supporting containers and securing devices such as D-rings for lashings, are to be of adequate strength for the imposed loads and of sufficient stiffness to minimise any deflection which could lead to a reduction in the effectiveness of the securing device.

5.1.5 In the region forward of $0,25L_{pp}$ abaft the fore perpendicular additional securing devices may be required, see 8.1.8.

5.2 Containers in one tier

5.2.1 Containers are to be secured at their lower corners by approved locking devices.

5.2.2 Alternatively, containers may be secured by lashings fitted diagonally or vertically at both ends of each container, in association with cone fittings at each container corner.

5.3 Containers in two tiers

5.3.1 Containers are to be secured at their lower corners at each tier by approved locking devices.

5.3.2 Where the calculations indicate that separation forces will not occur at any point in the stack, double stacking cones may be fitted at all internal corners of the stack and bridge fittings used to connect the tops of the rows in the transverse direction. Locking devices are to be fitted at all external corners.

5.3.3 Alternatively, containers may be secured by lashings in association with stacking cones or, where the calculations indicate that separation forces may occur, with locking devices.

5.4 Containers in more than two tiers

5.4.1 Containers are to be secured at their lower corners at each tier by approved locking devices.

5.4.2 Alternatively, containers may be secured by lashings. One or two tiers of lashings may be fitted in association with stacking cones or, where the calculations indicate that separation forces may occur, with locking devices.

5.4.3 Proposals to use lashings in pairs will be considered. Lashings in pairs are generally to be attached one to the bottom corner fitting of the upper tier and the other to the top corner fitting of the lower tier container. Suitable connections are to be provided at the lower ends. The effectiveness of paired lashings is to be taken as equal to 1,5 times that of a single lashing, unless a suitable load-equalising device is fitted.

5.4.4 Where a fourth tier of containers is fitted, it is generally to be secured to the third tier by locking devices at each corner.

5.4.5 Proposals to stow more than four tiers will be specially considered.

5.5 Line Load stowage

5.5.1 Where the containers are supported on bearers placed to distribute the stackweight as uniform Line Loads, the following requirements are to be complied with:

- The stack is, in general, to comprise a maximum of two tiers of loaded containers.

Cargo Securing Arrangements

Part 3, Chapter 14

Sections 5, 6 & 7

- (b) The load from the upper tier is to be transferred through the container corners. Line Loading is not to be used between tiers.
- (c) The load on each vertical corner post of the bottom tier, calculated in accordance with Section 9, is not to exceed one half the Rated Load of the container.
- (d) Where the calculations indicate that lifting forces may occur, locking devices are to be fitted at the container corners.
- (e) The clearance below the bottom container corner casting is to be such that the stacking cone or equivalent cannot be dislodged under shear loading.

5.5.2 Where an approved Line Load stowage system is installed the special features notation will be suitably modified.

5.6 Systems incorporating structural restraint

5.6.1 Containers may be secured by the use of a fixed structure providing permanent buttresses in association with portable frameworks. Proposals to adopt such systems will be considered on the basis of the loads developed in the structure and the corresponding stresses.

5.6.2 The framework or other devices securing the containers are to be aligned with the container corner fittings and any clearance gap is to be kept to the minimum to reduce shifting.

Section 6 Container securing arrangements for underdeck stowage without cell guides

6.1 General

6.1.1 Containers are generally to be stowed in holds and 'tween decks in the fore and aft direction, but alternative arrangements will be considered. The securing arrangements are to be designed on the basis of the most severe distribution of loads which may arise in the container stack.

6.1.2 Containers may be secured by locking devices only or by a combination of locking devices, buttresses, shores or lashings. Containers are, in general, to be restrained at every corner at the base of the stack and at all intermediate levels.

6.1.3 Where stacks consist of one or two tiers only, consideration will be given to the omission of corner locking devices. Containers must, however, be secured by a minimum of two corner locking devices.

6.1.4 Where the calculations indicate that separation forces could occur at any particular level, twistlocks or equivalent means of securing are to be fitted at that level. Elsewhere, consideration will be given to the use of double stacking cones.

6.1.5 Where the calculations indicate that separation forces will not occur between containers at any level, consideration will be given to the use of stacking cones in lieu of locking devices throughout.

6.1.6 Buttresses are generally to be of the tension and compression type and are to be provided with means of adjustment to ensure tightness when fitted in place. Where applicable, the attachment to the ship's structure is also to include means for vertical adjustment of the buttress to match container stacks of different heights.

6.1.7 Shores of the compression only type may be permanently attached to the ship structure or they may be hinged or portable. When in place they are to abut the container corner fittings with minimal clearance. Means are to be provided to prevent slackening of the device.

6.1.8 Adjacent stacks of containers are to be linked in line with buttresses or shores in order to transmit lateral loads. The fittings used for these linkages are to be of adequate strength to transmit the loads imposed.

6.1.9 The ship's structure supporting shores and buttresses is to be reinforced as necessary.

6.1.10 Proposals for alternative securing systems, including systems relying on minimal clearance between containers and hull structure, will be specially considered.

Section 7 Container securing arrangements for stowage using cell guides

7.1 General

7.1.1 Cell guide systems may be fitted to support containers stowed in holds or on exposed decks.

7.1.2 The cell guides are not to form an integral part of the ship's structure. The guide system is generally to be so designed as to keep it free of the main hull stresses.

7.1.3 Cell guides are to be designed to resist loads caused by loading and unloading of the containers, to prevent shifting of the containers and to transmit the loads caused by motions of the ship into the main hull structure.

7.2 Arrangement and construction

7.2.1 Cell guides are to be of robust construction and generally fabricated from steel plate and rolled sections. They are to have sufficient vertical extent and continuity to provide efficient support to containers. Guide bars are to be effectively attached to the supporting structure to prevent tripping or distortion resulting from container loading.

7.2.2 The intersection between cell guide and cross-ties is to provide adequate torsional stability.

Cargo Securing Arrangements

Part 3, Chapter 14

Section 7

7.2.3 Intermediate brackets are to be fitted to vertical cell guides at suitable intervals, see Fig. 14.7.1.

Fig. 14.7.1 Typical arrangement of cell guides

7.2.4 The cell guides are to give a total clearance between the container and guide bars not exceeding 25 mm in the transverse direction and 40 mm in the longitudinal direction. The deviation of the cell guide bar from its intended line is not generally to exceed 4 mm in the transverse direction and 5 mm in the longitudinal direction.

7.2.5 Athwartship cross-ties are to be fitted between cell guides at a spacing determined from the loading on the guides but, generally, not more than 5 m apart. Wherever possible, cross-ties are to be arranged in line with the corners of the containers as stowed and are to be supported against fore and aft movement at a minimum of two points across the breadth of the hold. Where, however, the maximum fore and aft deflection in the cross-tie can be shown not to exceed 20 mm, then one support point may be accepted.

7.2.6 Longitudinal tie bars may be required to be fitted where shown necessary by the force calculations for the structure. Where fitted they are to comply with the requirements of 7.2.5.

7.2.7 Where, at the sides or ends of holds, the guide rails are fitted to transverse or longitudinal bulkheads, the bulkhead is to be locally reinforced to resist the additional loads.

7.3 Mixed stacks of 20 ft and 40 ft containers

7.3.1 Where the cell guides are arranged for the carriage of 40 ft containers, provision may be made for the installation of temporary intermediate cell guides for 20 ft containers. The permanent structure is to be designed such that it is suitable for either loading pattern.

7.3.2 Alternatively, permanent means for the support of 20 ft containers at the mid-length of a cell arranged for 40 ft containers will be considered. Such means may include the following:

- (a) A pillar (inboard) and vertical rest bar (on the longitudinal bulkhead) against which the container stack may rest. The pillar is to be supported laterally by the deck structure over and is to be sufficiently stiff to control lateral deflection of the container stacks.
- (b) Guide bars supported transversely by slim structure within the gap between containers and with longitudinal ties as necessary.

Details of proposals will be individually considered, taking into account the loads on the support structure and the resulting deflections.

7.3.3 Where it is desired to stow 20 ft containers in the lower tiers without external support at the mid-bay location, arrangements meeting the following requirements will be considered:

- (a) Maximum container weights for 20 ft containers stowed in cell guides with no 40 ft container over-stowed, can be derived from Tables 14.7.1 and 14.7.3 depending on the transverse acceleration and the number of tiers in the stack.
- (b) Maximum container weights for 20 ft containers stowed in cell guides with at least one 40 ft container over-stowed, can be derived from Tables 14.7.2 and 14.7.4 depending on the transverse acceleration and the number of tiers in the stack.
- (c) Where a mixed stack not covered by Tables 14.7.1 to 14.7.4 is proposed, two-thirds of the transverse components of forces acting on 20 ft containers are to be assumed to be transmitted to the cell guides and one-third transmitted as a racking force through the unsupported end wall. The container weights are to be such that the racking force on the container end walls does not exceed 15 tonnes at the mid-hold end of the stack of 20 ft containers.
The allowable compressive forces in the container corner posts are not to be exceeded, taking due account of 40 ft containers above as per 7.3.3(e), if applicable. The container weights are to be defined to ensure separation is minimised.
- (d) Means are to be provided to prevent transverse sliding of the bottom of the stacks of 20 ft containers at the mid-hold end. This is to be in the form of permanently attached chocks at the inner bottom or equivalent.
- (e) Stacking cones are to be fitted between each tier of the 20 ft containers to prevent transverse sliding. In addition, where a 40 ft container is required to be stowed above 20 ft containers, stacking cones are to be fitted at the ends of the 40 ft container between the 40 ft container and the 20 ft containers below.
- (f) The 20 ft containers are to have steel walls and top (no open frame containers) and are to be of specially strengthened design, where necessary, to correspond to the vertical compressive load at the cell guide end of the 40 ft containers above.

Cargo Securing Arrangements

0,545	24,0	17,8	13,8	11,2	9,0	7,1
0,55	24,0	17,6	13,6	11,1	9,0	7,0

(g) Where fore and aft tension/pressure approved adapter cones are used to link two 20 ft containers to equate to a 40 ft container, the storage of 40 ft containers above is not required. Special consideration is to be given to the maximum stack weight which is stowed in association with this method of securing. In general, each stack of 20 ft containers is not to exceed 120 tonnes.

Proposals for stowage arrangements other than the above will be individually considered and are to be accompanied by supporting calculations.

7.4 Cell guide systems on exposed decks

7.4.1 Analysis methods for the strength of the cell guide structure are to take due account of the interactive effects between guide structure and supporting deck structure and also of the deformation of the hull girder.

7.4.2 At its lower end the guide structure is to be efficiently connected to the deck structure. Cross-ties are to be arranged between guides in a transverse direction at a spacing determined by the loading on the guides but in general not more than 3 m apart. Cross-bracing members of adequate strength and sufficient number are to be fitted in the transverse and longitudinal directions to prevent excessive deflection of the guide structure.

7.4.3 The height of guide bars above the deck is to be sufficient to ensure adequate restraint to the uppermost container tiers.

7.4.4 Where the cell guide structure is attached to highly stressed hull or deck elements, such as sheerstrake, special attention is to be given to the design of the connection and the grade and quality of steel utilised.

NOTE 40 ft overstay containers not included in the number of tiers.						

7.5 Entry guide devices

7.5.1 A device to pre-centre the container and direct it into the cell guides is normally to be fitted at the top of the guide bars. Such devices include:

- fixed even peaks;
- fixed high and low peaks;
- 'flip-flop' systems;

but other devices will be considered. The device is to be of robust construction.

Section 8

Determination of forces for container securing arrangements

8.1 General

8.1.1 The forces acting in the securing system are to be determined for each loading condition and associated set of motions of the ship.

8.1.2 The following forces are to be taken into account:

- Static gravity forces.
- Inertial forces generated by accelerations due to roll, pitch and heave motions of the ship.
- Wind forces.
- Forces imposed by the securing arrangements.
- Wave impact forces.

8.1.3 Where ship response data is not available the values for roll, pitch and heave as given in Table 14.8.1 will be used for the calculation.

Table 14.8.1 Ship motions

Motion	Maximum single amplitude	Periods, in seconds
Roll	$\phi = \sin^{-1} \theta$ degrees but need not exceed 30° and is not to be taken less than 22° where $\theta = \sin \phi$ $= \left(0,45 + 0,1 \frac{L}{B}\right) \left(0,54 - \frac{L}{1270}\right)$	$T_r = \frac{0,7B}{\sqrt{GM}}$
Pitch	$\psi = 12e^{-0,0033L_{pp}}$ but need not exceed 8°	$T_p = 0,5\sqrt{L_{pp}}$
Heave	$\frac{L_{pp}}{80}$ m	$T_h = 0,5\sqrt{L_{pp}}$

Cargo Securing Arrangements

Part 3, Chapter 14

Section 8

8.1.4 Wind forces are generally to be based on a maximum wind speed of 40 m/s.

8.1.5 Wind forces are to be taken as acting athwartships on the exposed faces of the container stack so as to increase the transverse force. Where the air gap between adjacent rows of containers does not exceed one metre, wind forces on the adjacent inner stack may be taken as zero. Where the air gap is five metres or more, the adjacent inner stack is to be treated as fully exposed. Wind forces on the inner stack for intermediate air gaps may be obtained by linear interpolation.

8.1.6 The individual components of force due to gravity, wind and ship motions acting on a particular container are to be determined in accordance with Table 14.8.2.

8.1.7 Forces due to pretensioning the securing devices need not, in general, be included in the calculation provided they do not exceed 500 kg in any one item. Special consideration will be given to cases where forces obtained from pre-stressing are an integral part of the design of the system.

8.1.8 Consideration is to be given to the forces from wave impact and shipping green seas where the form and proportions of the ship are such that these may occur. In general the strength of containers and the strength of the securing arrangements in the forward $0,25L_{pp}$ are to be suitable for forces increased by 20 per cent above the values calculated from these requirements, except where it can be shown that the containers are adequately protected by breakwaters or similar structure.

Table 14.8.2 Components of forces

Source	Component of force, in tonnes		
	Pressure (normal to deck)	Sliding (parallel to deck)	
		transverse	longitudinal
STATIC			
Roll	$W \cos \phi$	$W \sin \phi$	
Pitch	$W \cos \psi$		$W \sin \psi$
Combined	$W \cos (0,71\phi) \cos (0,71\psi)$	$W \sin (0,71\phi)$	$W \sin (0,71\psi)$
DYNAMIC

Heave:			
Roll	$0,05W \frac{L_{pp}}{T_h^2} \cos \phi$	$0,05W \frac{L_{pp}}{T_h^2} \sin \phi$	
Pitch	$0,05W \frac{L_{pp}}{T_h^2} \cos \psi$		$0,05W \frac{L_{pp}}{T_h^2} \sin \psi$
WIND		$8,25AV^2 \cos \phi \times 10^{-5}$	
NOTES			
1. For definition of terms, see 1.4.1 and Fig. 14.8.1.			
2. The appropriate signs are to be used in calculating vector components of forces.			

Fig. 14.8.1 Diagrammatic representation of symbols used in Table 14.8.2

Cargo Securing Arrangements

Part 3, Chapter 14

Section 8

8.2 Resultant forces

8.2.1 The resultant force acting on the container is the vectorial summation of the individual directional components of all forces acting at a given instant, see Fig. 14.8.2. The securing system is to be designed on the basis of the most severe combination of these forces in such a manner that the forces on the containers and securing devices are within allowable limits. Where different arrangements of securing devices are proposed for different locations on the ship, the forces are to be calculated for the most severe condition applicable to each arrangement.

8.2.2 The instantaneous maximum value of the resultants of the forces depends upon the phase relationship between the ship motions. This relationship may be derived from model testing where carried out for the specific ship, from strip theory or from full scale measurements if carried out for a ship of similar geometry.

8.2.3 Alternatively, the resultants in each of the three co-ordinate axes may be derived from the individual components of force determined from Table 14.8.2 for the instantaneous positions in the motion cycle as follows:

- (a) Rolling condition:
- Maximum roll (descending) with maximum heave (descending).
 - Maximum roll (ascending) with maximum heave (ascending).

- (b) Pitching condition:
- Maximum pitch (descending) with maximum heave (descending).
 - Maximum pitch (ascending) with maximum heave (ascending).
- (c) Combined condition:
- 0,71 [Maximum roll (descending) with maximum pitch (descending)].
 - 0,71 [Maximum roll (ascending) with maximum pitch (ascending)].

8.2.4 The summation of the individual components of force for one container above or below the centre of motion is shown for the Rolling condition in Fig. 14.8.2, and the resultants are obtained from the following expressions:

- (a) Bottom of motions, see 8.2.3 (a)(i):

Pressure

$$P_{\max} = W \left[\left(1 + \frac{0,05L_{pp}}{T_h^2} \right) \cos\phi + \frac{0,07024\phi}{T_r^2} y \right]$$

Sliding (transverse)

$$H_{\max} = W \left[\left(1 + \frac{0,05L_{pp}}{T_h^2} \right) \sin\phi + \frac{0,07024\phi}{T_r^2} z_m \right]$$

- (b) Top of motions, see 8.2.3(a)(ii):

Pressure

$$P_{\min} = W \left[\left(1 - \frac{0,05L_{pp}}{T_h^2} \right) \cos\phi - \frac{0,07024\phi}{T_r^2} y \right]$$

Cargo Securing Arrangements

Part 3, Chapter 14

Sections 8 & 9

Sliding (transverse)

$$H_{\min} = W \left[\left(1 - \frac{0,05L_{pp}}{T_h^2} \right) \sin \phi + \frac{0,07024\phi}{T_r^2} z_m \right]$$

The corresponding summations for the Pitching and Combined conditions may be written similarly.

Section 9 Strength of container securing arrangements

9.1 Resultant applied forces

9.1.1 The resultant forces derived for each container in the stack in accordance with Section 8 are assumed to be divided equally between the walls of the container as follows:

$$H_i = \text{sliding force in one transverse end} = \frac{H}{2} \text{ tonnes}$$

$$J_i = \text{sliding force in one longitudinal side} = \frac{J}{2} \text{ tonnes}$$

$$P_i = \text{vertical force in each corner post} = \frac{P}{4} \text{ tonnes}$$

$$Q_i = \text{wind force in one transverse end} = \frac{Q}{2} \text{ tonnes}$$

The subscript i refers to any particular container.

9.1.2 The sliding forces H_i and J_i are taken to act at a mean height of one third the height of the container above its base. That is, the force may be distributed as to $\frac{H_i}{3}$ (or $\frac{J_i}{3}$)

acting at the top of the container and $\frac{2H_i}{3}$ (or $\frac{2J_i}{3}$) acting

at the bottom, see Fig. 14.9.1.

9.1.3 Wind force is taken as uniformly distributed over the side of the container and is therefore divided equally between the top and bottom of the container, see Fig.14.9.1.

9.2 Forces in an unlashd stack

9.2.1 Where the stack is supported only by approved devices between the tiers of containers and at the base of the stack, the forces in the stack are determined from Table 14.9.1.

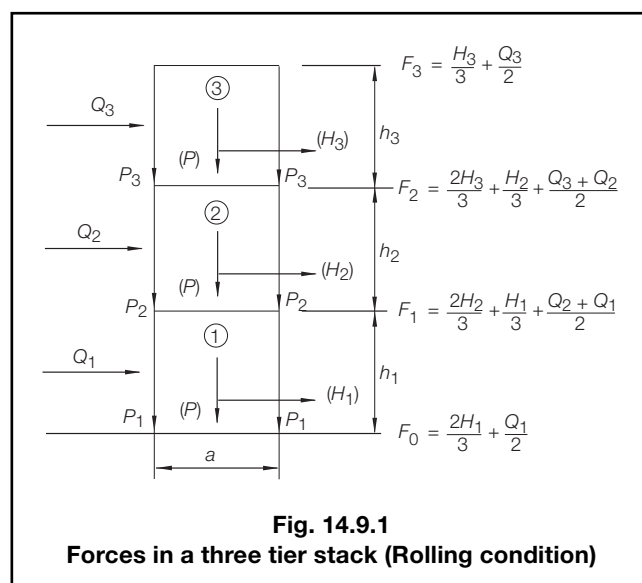

9.2.2 To illustrate this calculation, the equations for the three tier stack shown in Fig. 14.9.1 are listed below for the Rolling condition. In these equations the values of P and H are the maxima or minima derived from 8.2.4 as appropriate. Similar equations may be written for the Pitching and for the Combined conditions.

(a) Racking force, per end wall:

Tier 3: F_3

Tier 2: $F_3 + F_2$

Tier 1: $F_3 + F_2 + F_1$

(b) Shear force, per corner:

Tier 3: $0,55 (H_3 + Q_3)$

Tier 2: $0,55 (H_3 + H_2 + Q_3 + Q_2)$

Tier 1: $0,55 (H_3 + H_2 + H_1 + Q_3 + Q_2 + Q_1)$

(c) Maximum compressive force per bottom corner (i.e. force on the container below):

$$\text{Tier 3: } P_3 + \frac{F_3}{a} h_3$$

$$\text{Tier 2: } P_3 + P_2 + \frac{F_3}{a} (h_3 + h_2) + \frac{F_2}{a} h_2$$

Tier 1:

$$P_3 + P_2 + P_1 + \frac{F_3}{a} (h_3 + h_2 + h_1) + \frac{F_2}{a} (h_2 + h_1) + \frac{F_1}{a} h_1$$

(d) Minimum compressive force per bottom corner:
Case (i) (maximum amplitude descending):

$$\text{Tier 3: } P_3 - \frac{F_3}{a} h_3$$

$$\text{Tier 2: } P_3 + P_2 - \frac{F_3}{a} (h_3 + h_2) - \frac{F_2}{a} h_2$$

Tier 1:

$$P_3 + P_2 + P_1 - \frac{F_3}{a} (h_3 + h_2 + h_1) - \frac{F_2}{a} (h_2 + h_1) - \frac{F_1}{a} h_1$$

Case (ii) (maximum amplitude ascending):

$$\text{Tier 3: } P_3 - \frac{F_3}{a} h_3$$

$$\text{Tier 2: } P_3 + P_2 - \frac{F_3}{a} (h_3 + h_2) - \frac{F_2}{a} h_2$$

Tier 1:

$$P_3 + P_2 + P_1 - \frac{F_3}{a} (h_3 + h_2 + h_1) - \frac{F_2}{a} (h_2 + h_1) - \frac{F_1}{a} h_1$$

A negative value in these equations indicates a separation force at that level. The minimum is the lesser value from the two cases.

9.2.3 The resultant forces calculated from 9.2.1 are not to exceed the allowable loads for which the container is suitable, see 9.7.

Cargo Securing Arrangements

Part 3, Chapter 14

Section 9

Table 14.9.1 Forces in an unlashed stack

Force	Symbol	Expression	Unit
Racking force per container wall:			
transverse	F	$\sum_{i=1}^i F_i$	t
longitudinal	G	$\sum_{i=1}^i G_i$	t
Shear force per corner:			
transverse	S_{yz}	$0,55 \sum_{i=1}^i H_i + Q_i$	t
longitudinal	S_{xz}	$0,55 \sum_{i=1}^i J_i$	t
Vertical reaction to tipping per corner:			
transverse	R_{yz}	$\frac{1}{a} \sum_{i=1}^i F_i z_i$ See Notes 1 and 2	t
longitudinal	R_{xz}	$\frac{1}{b} \sum_{i=1}^i G_i z_i$ See Notes 1 and 2	t
Vertical pressure per corner	P_i	$\sum_{i=1}^i P_i$ See Note 2	t
Resultant compressive force per corner:			
Maximum transverse		$P_i \text{ max.} + R_{yz} \text{ max.}$	t
Minimum transverse		$P_i \text{ max.} - R_{yz} \text{ max.}$ or $P_i \text{ min.} - R_{yz} \text{ min.}$ See Note 3	t
Maximum longitudinal		$P_i \text{ max.} + R_{xz} \text{ max.}$	t
Minimum longitudinal		$P_i \text{ max.} - R_{xz} \text{ max.}$ or $P_i \text{ min.} - R_{xz} \text{ min.}$ See Note 3	t
NOTES			
1. z_i is the distance from the level under consideration to the top of each container above that level, in metres.			
2. Both the maximum and the minimum values are to be calculated.			
3. Whichever is the lesser. A negative value indicates separation.			

9.2.4 The resultant forces in the securing devices and supports are not to exceed the allowable working loads for which the device has been approved, see Section 3.

9.2.5 For exposed stacks in the forward $0,25L_{pp}$, see 8.1.7.

9.3 Arrangements incorporating lashings or buttresses

9.3.1 Where the securing arrangements incorporate lashings, proper allowance is to be made for flexibility of the system. For this purpose, the following values may be adopted:

(a) **Racking deformation of the container.** Full scale testing of containers indicates that values of the spring constant (see Fig. 14.9.3) may be taken as in Table 14.9.2.

(b) **Horizontal movement of the containers.** Initial displacement of containers due to tolerances in container fittings will be considered in conjunction with the stowage arrangement proposed. Generally, initial displacement may be neglected in calculation procedures for conventional stowages.

(c) **Elongation of lashings.** Elongation is to be determined by reference to the effective modulus of elasticity of the lashing (allowance for straightening and stretching) which, in the absence of actual test values, may be taken as:

steel rod lashings	9,8 t/mm ²
steel wire rope lashings	9,0 t/mm ²
steel chain lashings	8,0 t/mm ²
(based on the nominal diameter of the chain)	

Cargo Securing Arrangements

Part 3, Chapter 14

Section 9

Adjustable tension/ compression buttress	12,0 t/mm ²
Aluminium or other materials	To be considered.

Table 14.9.2 Spring constants for containers

Height (m)	Door end (t/mm)	Closed end (t/mm)	Side wall (t/mm)
2,438	0,37	1,67	0,61
2,591	0,35	1,54	0,57
2,743	0,33	1,43	0,54
2,896	0,32	1,33	0,51

9.3.2 Any other element introducing flexibility into the structure between the lashing point and the base of the container stack is to be evaluated and taken into account, if necessary. Examples of this could be flexibility of a lashing bridge, sliding of a hatch cover, or torsional deformations of the hull.

9.3.3 When paired lashings are used, a cross-sectional area equal to 150 per cent of the cross-sectional area of one lashing is to be used unless an equalising system is fitted. If an equalising system is fitted, the sum of the cross-sectional areas is to be used.

9.3.4 The resultant applied forces are determined in accordance with 9.1. The distribution of forces in the stack is obtained by equating the total movement of the containers with the corresponding component of elongation of the associated support element under the influence of the imposed forces.

9.3.5 The calculations are to be made for each end of the container stack, that is with all door ends together and with all closed ends together.

9.3.6 The load system for a four tier stack of containers with upper and lower lashings is illustrated in Fig. 14.9.2. The containers and lashings are modeled as a system of springs whose stiffness may be calculated and hence the equilibrium condition for the system may be found, see Fig. 14.9.3.

9.3.7 Having established the tension in the lashings, the residual forces in the containers are transmitted through the stack in accordance with the method given in 9.5. The model assumes that the securing devices between tiers of containers are capable of resisting negative (separation) forces. That is, where separation forces are found, suitable locking devices are assumed to be fitted and transmitting load.

9.3.8 A buttress or shore may be modeled in a similar way to a lashing. Where, however, more than one stack is supported by the use of linkages between adjacent containers in line with the buttress or shore, the model is to take this into account.

Fig. 14.9.2 Container stack load system

Fig. 14.9.3 Container stack load system

Cargo Securing Arrangements

Part 3, Chapter 14

Section 9

9.4 Tensions in the lashing rods

9.4.1 For conventional arrangements, the spring constant for the lashing rod may be determined using the expression:

$$k_L = \frac{E \cdot A \cdot \cos^2 \theta_L}{l_L}$$

However, some stowage arrangements may result in considerable longitudinal displacement between the base of the lashing and the fitting in the container corner, i.e. 40' container in a 45' bay. In such cases the spring constant of the lashing rod should be determined using the following expression:

$$k_L = \frac{E \cdot A \cdot l_y^2}{l_L^3}$$

where

- y = transverse span of lashing, in mm
- E = Effective Modulus of Elasticity (t/mm²)
- A = cross-section area of lashing rod, in mm²
- l_L = length of lashing (mm) given by
- $l_L = \sqrt{l_x^2 + l_y^2 + l_z^2}$
- l_x = longitudinal separation of lashing ends measured parallel to ship's X axis, in mm
- l_y = transverse separation of lashing ends measured parallel to ship's Y axis, in mm
- l_z = vertical separation of lashing ends measured parallel to ship's Z axis, in mm
- θ_L = lashing angle, in degrees.

9.4.2 The expressions for the tensions in the lashing rods will vary with the lashing arrangement used, however, for the three cases below the expressions for the lashing rod tensions are summarised in Table 14.9.4:

- (a) Single cross lashed stack.
- (b) Double cross lashed stack.
- (c) Double cross lashed stack to lashing bridge.

9.5 Residual forces

9.5.1 The residual transverse force in the containers at the level of the lashing is:

$$\text{Lower } F_{1,RES} = F_1 - T_{L1} \cos \alpha \text{ (tonnes)}$$

$$\text{Upper } F_{2,RES} = F_2 - T_{L2} \cos \beta \text{ (tonnes)}$$

The racking and shearing forces in the container stack may then be determined in accordance with 9.2.2 using the residual transverse forces. The maximum and minimum vertical forces in the corner posts may be determined similarly taking due account of the vertical component of lashing tension where applicable.

9.5.2 The resultant forces in the containers are not to exceed the allowable values given in 9.7.

9.5.3 The lashing tensions are not to exceed the allowable working loads of the lashings as determined from Section 3.

9.5.4 Where external support is provided by a buttress or shore the load is to be transmitted between adjacent stacks by linkages in line with the support. The force in the transverse end frame members of the containers adjacent to the support is given by:

$$F_b \left(\frac{2N-1}{2N} \right) \text{ tonnes and the force in the linkage to the}$$

adjacent container is $F_b \left(\frac{N-1}{N} \right)$ tonnes

where

- F_b = calculated force in the buttress or shore, in tonnes
- N = number of rows of containers supported by the buttress or shore.

9.6 Structural restraint systems

9.6.1 Where open framework systems are fitted on deck to provide structural restraint, they are to be designed to absorb the full horizontal component of force at that level and to prevent movement of the container stack. For the purpose of these calculations the deformation of the ship's structure in way of supports may be neglected.

9.7 Allowable forces on containers

9.7.1 For ISO containers, the securing arrangements are to be designed so that the forces on the containers do not exceed the values shown in Table 14.9.4. The maximum forces for ISO 1496-1: 1984 containers are illustrated in Fig. 14.9.4.

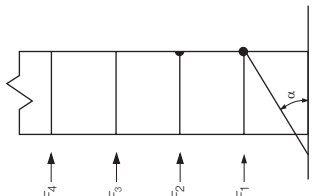

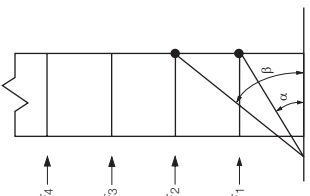

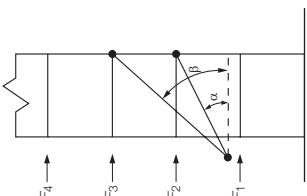

9.7.2 The allowable forces for containers of other dimensions will be determined on the basis of the values in Table 14.9.3 and of the forces for which the container has been certified.

Cargo Securing Arrangements

Part 3, Chapter 14

Section 9

Table 14.9.3 Summary of container securing methods

Arrangement	F'_x	Tension in lashing	Residual transverse Forces at lashing level
	$F'_1 = \sum_{i=1}^n F_i$	$T_{L1} = \frac{k_{L1} \cdot F'_1}{(k_{C1} + k_{L1}) \cos \alpha}$	$F_{1,RES} = F_1 - T_{L1} \cdot \cos \alpha$
	$F'_2 = \sum_{i=2}^n F_i$	$T_{L1} = \frac{k_{L1}}{\cos \alpha} \cdot \frac{(k_{C2} + k_{L2}) F'_1 + k_{C2} \cdot F_2}{(k_{C1} + k_{C2} + k_{L1}) (k_{C2} + k_{L2}) - k^2_{C2}}$ $T_{L2} = \frac{k_{L2}}{\cos \beta} \cdot \frac{k_{C2} \cdot F_1 + (k_{C1} + k_{C2} + k_{L1}) F_2}{(k_{C1} + k_{C2} + k_{L1}) (k_{C2} + k_{L2}) - k^2_{C2}}$	$F_{1,RES} = F_1 - T_{L1} \cdot \cos \alpha$ $F_{2,RES} = F_2 - T_{L2} \cdot \cos \beta$
	$F'_3 = \sum_{i=3}^n F_i$	$T_{L1} = \frac{k_{L1}}{\cos \beta} \cdot \frac{F_1 [(k_{C3} + k_{L2, \gamma}) k_{C2}] + F_2 [(k_{C1} + k_{C2}) (k_{C3} + k_{L2, \gamma})] + F_3 [(k_{C1} + k_{C2}) k_{C3}]}{(k_{C1} + k_{C2}) [(k_{C2} + k_{C3} + k_{L1, \gamma}) (k_{C3} + k_{L2, \gamma}) - k^2_{C3}] - k^2_{C2} (k_{C3} + k_{L2, \gamma})}$ $T_{L2} = \frac{k_{L2}}{\cos \beta} \cdot \frac{F_1 (k_{C2} \cdot k_{C3}) + F_2 [(k_{C1} + k_{C2}) k_{C3}] + F_3 [(k_{C1} + k_{C2}) (k_{C2} + k_{C3} + k_{L1, \gamma}) - k^2_{C2}]}{(k_{C1} + k_{C2}) [(k_{C2} + k_{C3} + k_{L1, \gamma}) (k_{C3} + k_{L2, \gamma}) - k^2_{C2}] - k^2_{C2} (k_{C3} + k_{L2, \gamma})}$	$F_{2,RES} = F_2 - T_{L1} \cdot \cos \alpha$ $F_{3,RES} = F_3 - T_{L2} \cdot \cos \beta$

Cargo Securing Arrangements

Section 9

Table 14.9.4 Allowable forces on ISO containers

	ISO 1496-1:1984		ISO 1496-1:1990	
	20 ft	40 ft	20 ft	40 ft
	in tonnes			
Horizontal force from lashing on container fitting acting parallel to the side face, see Note 1	15,0	15,0	15,0	15,0
Horizontal force from lashing on container fitting acting parallel to the end face, see Note 1	22,5	22,5	22,5	22,5
Vertical force from lashing on container fitting acting parallel to the end or side face, see Note 1	30,0	30,0	30,0	30,0
Racking force on container end	15,0	15,0	15,0	15,0
Racking force on container side	10,0	10,0	10,0	10,0
Vertical forces at each top corner, tension	15,0	15,0	25,0	25,0
Vertical forces at each bottom corner, tension	20,0	20,0	25,0	25,0
Vertical forces at each corner post, compression	2,25 <i>R</i>	2,25 <i>R</i>	86,4	86,4
Transverse forces acting at the level of and parallel to the top face, tension or compression, see Note 2	22,5	34,0	34,0	34,0
Transverse forces acting at the level of and parallel to the bottom face, tension or compression, see Note 2	35,0	50,0	50,0	50,0
NOTES 1. In no case is the resultant of the horizontal and the vertical forces to exceed the limiting value derived from Fig. 14.9.3(a). 2. Where a buttress supports the stack at an intermediate level, the total transverse force in the containers at the level is not to exceed the sum of the appropriate top and bottom forces.				

■ Section 10
Surveys**10.1 Initial Survey**

10.1.1 The Surveyor is to be satisfied that the materials, workmanship and arrangements are satisfactory and in accordance with the requirements and the approved plans. Any items found not to be in accordance with the requirements or the approved plans, or any material, workmanship or arrangements found to be unsatisfactory are to be rectified.

10.1.2 A Register of fixed and loose cargo securing fittings, when approved, is to be kept on board and up to date, and is to be made available to the Surveyor upon request. The Register is to contain sufficient details to enable all the fixed and loose cargo securing fittings to be identified, including:

- a simple sketch;
- the name of the item;
- the number supplied;
- the manufacturer's mark or code; and
- the safe working load with the corresponding breaking load.

10.1.3 For container securing arrangements, a suitable container stowage arrangement plan is to accompany the Register. Where containers of types other than ISO containers are proposed to be carried, their stowage locations are to be clearly indicated on the plan.

10.1.4 The Register and stowage plans, if applicable, may be included in the Cargo Securing Manual.

10.2 Periodical Surveys

10.2.1 For the requirements for Periodical Surveys see Pt 1, Ch 3,2.2.33 and Pt 1, Ch 3,5.3.19.

Quality Assurance Scheme for the Hull Construction of Ships

Part 3, Chapter 15

Sections 1 & 2

Section

1	General
2	Application
3	Particulars to be submitted
4	Requirements of Parts 1 and 2 of the Scheme
5	Additional requirements for Part 2 of the Scheme
6	Initial assessment of the shipyard
7	Approval of the shipyard
8	Maintenance of approval
9	Suspension or withdrawal of approval

■ Section 1 General

1.1 Definitions

1.1.1 Quality Assurance Scheme. Lloyd's Register's (hereinafter referred to as 'LR') Quality Assurance requirements for the hull construction of ships are defined as follows:

- **Quality Assurance.** All activities and functions concerned with the attainment of quality including documentary evidence to confirm that such attainment is met.
- **Quality system.** The organisation structure, responsibilities, activities, resources and events laid down by Management that together provide organised procedures (from which data and other records are generated) and methods of implementation to ensure the capability of the shipyard to meet quality requirements.
- **Quality programme.** A documented set of activities, resources and events serving to implement the quality system of an organisation.
- **Quality plan.** A document derived from the quality programme setting out the specific quality practices, special processes, resources and activities relevant to a particular ship or series of sister ships. This document will also indicate the stages at which, as a minimum, direct survey and/or system monitoring will be carried out by the Classification Surveyor.
- **Quality control.** The operational techniques and activities used to measure and regulate the quality of hull construction to the required level.
- **Inspection.** The process of measuring, examining, testing, gauging or otherwise comparing the item with the approved drawings and the shipyard's written standards including those which have been agreed by LR for the purposes of classification of the specific ship type concerned.
- **Assessment.** The initial comprehensive review of the shipyard's quality systems, prior to the granting of approval, to establish that all the requirements of these Rules have been met.

- **Audit.** A documented activity aimed at verifying by examination and evaluation that the applicable elements of the quality programme continue to be effectively implemented.
- **Hold point.** A defined stage of manufacture beyond which the work must not proceed until the inspection has been carried out by all the relevant personnel.
- **System monitoring.** The act of checking, on a regular basis, the applicable processes, activities and associated documentation that the Shipbuilder's quality system continues to operate as defined in the quality programme.
- **Special process.** A process where some aspects of the required quality cannot be assured by subsequent inspection of the processed material alone. Manufacturing special processes include welding, forming and the application of protective treatments. Inspection and testing processes classified as special processes include non-destructive examination and pressure and leak testing.

1.2 Scope of the Quality Assurance Scheme

1.2.1 This Chapter specifies the minimum Quality System requirements for a shipyard to construct ships under LR's Quality Assurance Scheme.

1.2.2 For the purposes of this Chapter of the Rules, hull construction comprises the hull structure; containment systems, including those which are independent of the main hull structure; appendages; superstructures; deckhouses; and closing appliances all as required by the Rules.

1.2.3 Although the requirements of this Scheme are, in general, for steel ships of all welded construction, other materials for use in hull construction will be considered.

■ Section 2 Application

2.1 Certification of the shipyard

2.1.1 LR will give consideration to a shipyard's Quality Assurance System provided, at all times, there is full commitment by all the shipyard personnel to the implementation and maintenance of this system. On satisfactory completion of assessments and audits LR will issue certificates of approval to the shipyard as indicated in 2.1.2.

2.1.2 LR's Quality Assurance Scheme comprises:
Part 1 The requirements of the Quality System for hull construction which are applicable to shipyards operating a quality programme but not necessarily constructing to LR's Class. Certificates of approval valid for three years will be issued, with intermediate audits at intervals of 6 months.

Quality Assurance Scheme for the Hull Construction of Ships

Part 3, Chapter 15

Sections 2, 3 & 4

Part 2 The Quality System requirements for hull construction for application to ships under construction to LR's Class as part of the Special Survey. LR's particular requirements for construction of ships to its Class, and the continuous involvement in the hull construction process by a combination of direct survey and systems monitoring by LR's Surveyors, are provided for by Part 2. Where LR considers that there is a stage in construction at which a high degree of direct inspection by the Surveyors is desirable, this stage will be described on the Part 2 Approval Certificate.

Certificates of approval for Part 2 will be valid for one year, and will be issued after satisfactory assessment/audit carried out at a suitable stage during construction to LR's Class. Part 1 certification will automatically be issued, or re-issued as applicable, on attainment of Part 2 approval.

2.1.3 Chemical carriers with cargo tank structure of material other than carbon manganese steel and the cargo containment system on ships for liquefied gases will be specially considered. The procedure relating to the construction of such structure on chemical carriers and liquefied gas containment systems is to be separately prescribed in the Quality Plan which will be subject to approval by LR.

2.1.4 The Quality System at a shipyard will be examined for compliance with these Rules by the assessments and audits as laid down in Sections 4, 5 and 6. Initial and periodical approval of the system will be considered by the Committee on receipt of satisfactory assessment and audit reports.

2.1.5 All information and data submitted by a Shipbuilder for approval under this Scheme and for maintenance of approval will be treated by LR in strict confidence and will not be disclosed to any third party without the prior written consent of the Shipbuilder.

2.1.6 A list of shipyards approved under the Scheme will be held in the *List of Shipyards Approved to the Requirements of the Quality Assurance Scheme*.

■ Section 3 Particulars to be submitted

3.1 Documentation and procedures

3.1.1 Under either Part of the Scheme, the documentation to meet the requirements of Section 4 is to be submitted. This documentation includes the Quality Manual, Quality Plans, documented procedures and work instructions.

3.1.2 Additionally, under Part 2 of the Scheme the documentation to meet the requirements of Section 5 is to be submitted for approval. Construction plans and all necessary particulars are also to be submitted for approval in accordance with the relevant requirements of the Rules, see Pt 1, Ch 2,3.2.1.

3.2 Amendments

3.2.1 Any major changes to the documentation or procedures required by Sections 4 or 5 are to be re-submitted.

■ Section 4 Requirements of Parts 1 and 2 of the Scheme

4.1 General

4.1.1 The requirements of this Section are applicable to shipyards seeking approval under Parts 1 and 2 of the Scheme.

4.2 Policy statement

4.2.1 A policy statement, signed by the Chief Executive of the shipyard concerned, confirming the full commitment of all levels of personnel in the shipyard to the implementation and sustained operation of quality assurance methods is to be included in the Quality Manual.

4.3 Responsibility

4.3.1 Personnel responsible for functions affecting quality are to have defined responsibility and authority to identify, control and evaluate quality.

4.4 Management Representative

4.4.1 The Shipbuilder is to appoint a Management Representative, who is to be independent of other functions unless specifically agreed otherwise by LR, and who is to have the necessary authority and responsibility for ensuring that the requirements of the Scheme are complied with.

4.4.2 The Management Representative is to have the authority to stop production if serious quality problems arise.

4.5 Quality control and testing personnel

4.5.1 The Shipbuilder is to utilise quality control and testing personnel whose performance and continued freedom of influence from production pressures is to be systematically confirmed by the Management Representative.

4.6 Resources

4.6.1 Sufficient resources shall be provided by the shipyard to enable the requirements identified by the Quality Management System to be effectively implemented.

Quality Assurance Scheme for the Hull Construction of Ships

Part 3, Chapter 15

Section 4

4.7 The Quality Management System

4.7.1 The Shipbuilder is to establish, document and maintain an effective Quality Management System that will ensure and demonstrate that materials and consumables used, and working processes employed, conform to the requirements for hull construction.

4.7.2 **Quality Manual.** The basic documentation is to be in the form of a Quality Manual which sets out the general quality policies and which references the detailed procedures, standards, etc., and includes the requirements of 4.2 to 4.24 and, where appropriate, 5.1 to 5.10.

4.7.3 **Procedures.** The Shipbuilder is to establish, document and maintain an adequate and defined control of the hull construction process comprising:

- (a) defined and documented controls, processes, procedures, tolerances, acceptance/rejection criteria and workmanship standards; and
- (b) the provision of Quality Plans for each ship or series of sister ships for the processes and procedures for manufacture, inspection and testing involved from receipt of material through to completion of the hull construction process.

4.7.4 **Work instructions.** The Shipbuilder is to develop and maintain clear and complete documented work instructions for the processes and standards involved in the construction of the hull. Such instructions are to provide directions to various levels of personnel.

4.8 Regulatory requirements

4.8.1 The Shipbuilder is to establish that the requirements of all applicable Regulations are clearly specified and agreed with the Owner/Classification Society/Regulatory Authority. These Regulations are to be made available for all functions that require them and their suitability is to be reviewed.

4.8.2 The Shipbuilder is to establish a design verification procedure to ensure that the regulatory requirements have been incorporated into the design output.

4.9 Control of hull drawings

4.9.1 The Shipbuilder is to establish, document and maintain a procedure for the submission to the Classification Society and other regulatory bodies of all the necessary drawings required for approval sufficiently early and in such a manner that the requirements of the Classification Society and other regulatory bodies can be included in the design before construction commences. This procedure is to include a provision which ensures that all amendments to approved drawings are incorporated in the working drawings and that design revisions are re-submitted for approval.

4.10 Documentation and change control

4.10.1 The Shipbuilder is to establish a procedure to ensure that:

- (a) valid drawings, specifications, procedures, work instructions and other documentation necessary for each phase of the fabrication process are prepared;
- (b) all necessary documents and data are made readily available at all appropriate work, testing and inspection locations;
- (c) all amended drawings and changes to documentation are processed in a timely manner to ensure inclusion in the production process;
- (d) records are maintained of amendments and changes to documentation; and
- (e) provision is made for the prompt removal or immediate identification of all superseded drawings and documentation throughout the shipyard.

4.11 Purchasing data and receipt

4.11.1 The Shipbuilder is to maintain purchasing documents containing a clear description of the materials ordered for use in hull construction and the standards to which material must conform, and the identification and certification requirements.

4.11.2 For the requirements for receiving inspection of purchased items, see 4.15.

4.12 Owner supplied material

4.12.1 The Shipbuilder is to have procedures for the inspection, storage and maintenance of Owner supplied materials and equipment.

4.13 Identification and traceability

4.13.1 The Shipbuilder is to establish and maintain a procedure to ensure that materials and consumables used in the hull construction process are identified (by colour-coding and/or marking as appropriate) from arrival at the shipyard through to erection in such a way as to enable the type and grade to be readily recognised. The procedure is to ensure that the Shipbuilder has the ability to identify material in the completed vessel and ensure traceability to the mill sheets.

4.14 Fabrication control

4.14.1 The Shipbuilder is to establish, document and maintain suitable procedures to ensure that fabrication and construction operations are carried out under controlled conditions. Controlled conditions are to include:

- (a) clearly documented work instructions defining material treatment, marking, cutting, forming, sub-assembly, assembly, erection, fitting of closing appliances, use of fabrication aids and associated fit-up, weld preparation, welding and dimensional control procedures;

Quality Assurance Scheme for the Hull Construction of Ships

Part 3, Chapter 15

Section 4

- (b) criteria for workmanship and manufacturing tolerances. These are to be documented in a clear manner and made available to the appropriate workforce, and are to include acceptance/rejection criteria; and
- (c) documented instructions for the control of equipment and machines used in fabrication. These are to be made available to the appropriate workforce and supplied to individuals where necessary.

4.14.2 The Shipbuilder is to establish and control welding, non-destructive examination and painting which are part of the fabrication system, the equipment used in such processes and the environment in which they are employed. Operators of these special processes are to be properly qualified. Details of these processes are to be included in the relevant Quality Plans.

4.14.3 A list of approved welding procedures is to be maintained and made available to relevant personnel. Records of the results of testing for approval are also to be maintained. Lists of appropriately qualified welders are to be maintained. Procedures for distribution and recycling of welding consumables are to be implemented.

4.14.4 The Shipbuilder is to establish, document and maintain adequate maintenance schedules and standards for all equipment associated with the hull construction process.

4.15 Control of inspection and testing

4.15.1 The Shipbuilder is to be responsible for ensuring that all incoming plates, sections, castings, components, fabrications and consumables and other materials used in the hull construction process are inspected or otherwise verified as conforming to purchase order requirements.

4.15.2 The Shipbuilder is to provide an inspection system at suitable stages of the fabrication process from the material delivery to the completion of hull construction. The inspection system is to confirm and record the inspections carried out.

4.16 Indication of inspection status

4.16.1 The Shipbuilder is to establish and maintain a system for identifying the inspection status of structural components at appropriate stages of the fabrication process. This may include the direct marking of components. Records of inspection and measurements are to be identifiable to components to which they refer and be readily accessible to production and inspection personnel and to Classification Surveyors.

4.17 Inspection, measuring and test equipment

4.17.1 The Shipbuilder is to be responsible for the control, calibration, and maintenance of the inspection, measuring and test equipment used in the fabrication and non-destructive examination of the hull structure.

4.17.2 The calibration system is to allow traceability back to appropriate National Standards. Where these do not exist the basis of calibration is to be defined.

4.18 Non-conforming materials and corrective action

4.18.1 The Shipbuilder is to establish and define procedures to provide for:

- (a) the clear identification and segregation from production areas of all plates, sections, castings, components, fabrications, consumables and other materials which do not conform to the agreed specification; and
- (b) the initiation of authorised corrective or alternative action.

4.19 Protection and preservation of quality

4.19.1 The Shipbuilder is to establish and maintain a procedure to control handling and preservation processes for both the material used in fabrication and the structural components at all stages of the fabrication process. This procedure is to ensure conformance to specified requirements and established standards.

4.19.2 Welding consumables are to be stored, handled and recycled according to maker's recommendations.

4.20 Records

4.20.1 The Shipbuilder is to develop and maintain records that demonstrate achievement of the required quality and the effective operation of the Quality System. Records demonstrating sub-contractor achievement of these requirements are to be maintained. These records are to be retained and available for a defined period. These records are to include identification of materials and consumables used in fabrication, the number and class of defects found during fabrication and information regarding corrective action taken. Records of particular processes, e.g. plate surface preparation and priming, marking, cutting, forming, accuracy control, non-destructive examination, audits and all other records pertaining to the operation of the Quality System are also to be maintained.

4.21 Internal audit and management review

4.21.1 Internal audits of the performance of all aspects of the systems relating to design, production and testing are to be carried out systematically by appointed staff and recorded under the authority of the Management Representative. These staff members will not normally audit functions for which they are directly responsible.

4.21.2 Using data obtained from the audits and any other available relevant information, management reviews are to take place at specified intervals or more frequently as deemed necessary in order to review the performance of the Quality System.

Quality Assurance Scheme for the Hull Construction of Ships

Part 3, Chapter 15

Sections 4 & 5

4.21.3 The Shipbuilder is to establish, document and maintain a procedure for corrective application of data feed-back from previous construction, including previous ships during the guarantee period.

4.21.4 The Shipbuilder is to establish, document and maintain a procedure to provide for the analysis of departures from manufacturing standards, steel material scrapped, reworked or repaired during the fabrication and construction process in order to detect trends, investigate the cause to determine the action needed to correct the processes and work procedures, or to identify the further training of operators as appropriate.

4.21.5 Agreed improvements to the Quality System are to be implemented within a time scale appropriate to the nature of the improvement.

4.22 Training

4.22.1 The Shipbuilder is to establish and maintain a system to identify training needs and ensure that all personnel involved in the fabrication, erection and quality-involved functions have adequate experience, training and qualifications. This requirement extends to sub-contractor personnel working within the shipyard. Records are to be available to the Classification Surveyor.

4.23 Sampling

4.23.1 Any sampling processes used by the Shipbuilder are to be in accordance with specified or Statutory Requirements or to the satisfaction of the Classification Surveyor as applicable.

4.24 Sub-contracted personnel, services and components

4.24.1 The requirements of the Scheme are applicable, as appropriate, to all sub-contractor personnel and sub-contracted services operating within the shipyard.

4.24.2 The requirements of the Scheme are not applicable to sub-contractor personnel or sub-contracted services operating at locations outside the shipyard. In these circumstances it will be necessary for inspections to be carried out by the LR Surveyor using conventional survey methods.

5.2 Quality Plans

5.2.1 Quality Plans for ships which are to be classed by LR are to be submitted for approval well in advance of commencement of work, irrespective of any submissions that may have been made for sister ships under Part 1 of the Scheme. Such Quality Plans are to outline all of the manufacturing, testing and inspection operations to be performed by the Shipbuilder and by which personnel they will be carried out. The Quality Plans are then to be submitted to the LR Surveyors who will indicate all the stages at which they will perform system monitoring, carry out direct inspection and participate in hold point inspections. These hold points will include, but not be limited to, the following:

- (a) Radiographs and other test records of non-destructive examinations as required for Classification purposes, see Ch 13,2.12 of the Rules for Materials.
- (b) The items described in Ch 1,8 relevant to the scope of this Chapter.

5.2.2 Notwithstanding what may have been agreed in the Quality Plans, the LR Surveyors have the discretion to increase their involvement, see also 8.1.5.

5.3 Material supplier approval

5.3.1 The Shipbuilder is to ensure that hull construction materials and consumables used are selected from manufacturers who are approved by LR.

5.4 Identification and traceability

5.4.1 The procedure required by 4.13.1 is to be submitted for approval.

5.5 Fabrication control

5.5.1 The information required by 4.14.1(b) will be examined for acceptability.

5.5.2 Procedures for material treatment, forming, weld preparation and welding are to be submitted for approval.

5.5.3 Procedures required by 4.14.3 are to be submitted to the LR Surveyors for approval.

■ Section 5 Additional requirements for Part 2 of the Scheme

5.1 Quality System procedures

5.1.1 The procedures detailed in 4.7 are to be submitted for approval.

Quality Assurance Scheme for the Hull Construction of Ships

Part 3, Chapter 15

Sections 5, 6 & 7

5.6 Control of inspection and testing

5.6.1 The inspection stages incorporated into the Scheme are to include specific checks for fit-up and welding which are to be carried out at each sub-assembly, assembly, pre-erection and erection stage as well as self-checking by the operator. The number of recorded checks at each stage will be agreed with the LR Surveyor, after consideration of documentary evidence of quality being achieved. Repairs, where required, are to be effected after each check. Collated Quality Control data to demonstrate the efficiency of the above self-check system are to be made available to the LR Surveyor by the Shipbuilder. The Quality Plans referred to in 4.7.3(b) provide the opportunity for the Shipbuilder and the LR Surveyor to consider the structural design and ship type fully in order to determine the most efficient and effective inspection stages.

5.7 Control of non-conforming materials and corrective action

5.7.1 All predetermined repair procedures are to be consistent with the requirements of 4.7.3(a) and are to be to the satisfaction of the LR Surveyor. Where a defect is found, whether by the LR Surveyor or through shipyard inspection, for which no agreed repair procedure exists, approval is to be obtained from the LR Surveyor before any corrective action is effected.

5.8 Records

5.8.1 The shipyard is to make data available to the LR Surveyor, to demonstrate the efficiency of the inspection system, see 5.6.1.

5.9 Training

5.9.1 The competence of the welding operators, non-destructive examination and other personnel involved in special processes and inspection are to be to the satisfaction of the LR Surveyor.

5.10 Sub-contracted personnel, services and components

5.10.1 The requirements of the Scheme are not applicable to those services operating at locations outside the shipyard. It will be necessary for inspections to be carried out by the LR Surveyor using conventional survey methods.

5.10.2 The methods of control for the requirements of 4.24.1 are to be submitted to the LR Surveyor.

Section 6

Initial assessment of the shipyard

6.1 General

6.1.1 In the first instance applications for approval under this Scheme will be considered on the recommendation of the local Surveyors.

6.1.2 After receipt and appraisal of the main quality documentation, an assessment of the shipyard is to be carried out by the Surveyors to examine all aspects of the Quality System applicable to hull construction.

6.1.3 The Surveyors will review the quality arrangements proposed by the Shipbuilder at the shipyard. They may advise as to how the proposed Quality System might be improved and where it is considered inadequate, advise how it might be revised to be acceptable to LR.

6.1.4 For assessment to Part 1 of the Scheme, the Surveyors will review the Quality System in association with the quality documentation and will check that all aspects of the System are established and in accordance with the requirements of Section 3.

6.1.5 For assessment of Part 2 of the Scheme, the Surveyors will confirm that the requirements given in Section 3 have been fully implemented and are complied with by a detailed examination of work in progress and by confirming that workmanship and the quality level being consistently achieved are to their satisfaction.

Section 7

Approval of the shipyard

7.1 General

7.1.1 If the initial assessment confirms that the shipyard's quality arrangements are satisfactory, the Committee will issue Part 1 or Part 2 and Part 1 of LR's Quality Assurance Approval Certificates as appropriate. Maintenance of approval will be subject to the provisions of Section 8.

7.1.2 Approval by another organisation will not be accepted as sufficient evidence that the arrangements for hull construction comply with these requirements.

Quality Assurance Scheme for the Hull Construction of Ships

Part 3, Chapter 15

Sections 8 & 9

■ Section 8 Maintenance of approval

8.1 General

8.1.1 For Part 2 of the Scheme, the arrangements approved at the shipyard are to be kept under review by the Surveyors to ensure that the approved Quality System is being maintained in a satisfactory manner. This is to be carried out by:

- (a) Regular and systematic audits by the LR Surveyor.
- (b) Comprehensive Annual Audits. The audit team leader will be formally nominated by LR.

8.1.2 Where a comprehensive audit cannot be carried out due to lack of a current building programme to Class, demonstration that the requirements of Part 1 of the Scheme are being maintained may be confirmed by audit review at intervals of six months, normally by the local Surveyors. Where necessary a comprehensive triennial audit would be carried out by a Surveyor formally nominated by LR. The degree of re-assessment for re-approval at the recommencement of building to LR's Class would be at the discretion of the Committee.

8.1.3 All documentation, including reports, is to be available to the Surveyors.

8.1.4 Minor alterations in the approved procedures may be permitted provided that the Surveyors are advised and their prior concurrence obtained. Major alterations would need to be submitted for approval and may require an additional audit.

8.1.5 In a shipyard constructing ships to LR's Class, the following are applicable:

- (a) The LR Surveyor is to be allowed access at all reasonable times to all records pertaining to quality and to all parts of the shipyard involved in the implementation and maintenance of the Quality Assurance Programme.
- (b) The LR Surveyor is immediately to advise the Management Representative of any matter pertaining to the Quality System with which he is not satisfied.
- (c) When minor deficiencies in the approved procedures are discovered during audits, or if workmanship is considered unsatisfactory, the LR Surveyor will apply more intensive auditing and inspection.
- (d) Notwithstanding any of the provisions of the Quality System, all work related to Classification of ships with LR is to be to the satisfaction of the LR Surveyor.

■ Section 9 Suspension or withdrawal of approval

9.1 General

9.1.1 When the Surveyors have drawn attention to significant faults or deficiencies in the Quality System or its operation and these have not been rectified within a period of time acceptable to LR, the approval of the system, together with the associated certification, will be withdrawn and the shipyard's name deleted from the *List of Shipyards Approved to the Requirements of the Quality Assurance Scheme*.

9.1.2 If a significant period of time elapses between such withdrawal and any application for reinstatement, the reapproval procedures, if agreed to by the Committee, may require a restructuring of the Quality Management System and will always require a complete re-examination as for an initial assessment.

ShipRight Procedures for the Design, Construction and Lifetime Care of Ships

Part 3, Chapter 16

Sections 1, 2 & 3

Section

1	General
2	Structural design assessment
3	Fatigue design assessment
4	Construction monitoring
5	Ship Event Analysis
6	Enhanced scantlings
7	Protective coating in water ballast tanks
8	Hull planned maintenance
9	Ship Emergency Response Service
10	Assessment of Ballast Water Management Plans

■ Section 1 General

1.1 Application

1.1.1 This Chapter is applicable to all ship types and components with the exception of Sections 2 and 3 which are not applicable to Bulk Carriers or Double Hull Oil Tankers with a **CSR** notation, see Pt 1, Ch 2,2.3. The requirements are to be applied in conjunction with the relevant Chapters of Parts 3 and 4 applicable to the particular ship type, and the ShipRight procedures.

1.1.2 Details of Lloyd's Register's (hereinafter referred to as 'LR') ShipRight procedures are given in the *ShipRight Procedures Manual* and in this Chapter where related to particular items and notations.

1.1.3 Details of machinery ShipRight procedures are to be found in Pt 5, Ch 21.

1.2 Classification notations and descriptive notes

1.2.1 In addition to the hull class notations defined in Pt 1, Ch 2, ships complying with the requirements of this Chapter will be eligible to be assigned the additional class notations defined in Pt 1, Ch 2,2.1 and Ch 2,2.3 or descriptive notes as defined in Pt 1, Ch 2,2.7 and associated with the ShipRight procedures.

1.3 Information and plans required to be submitted

1.3.1 The information and plans required to be submitted are as specified in the relevant Chapters of Parts 3 and 4 applicable to the particular ship type and in this Chapter where related to particular items and notations.

■ Section 2

Structural design assessment

2.1 Structural Design Assessment notation – SDA

2.1.1 The ship structure is to be examined using finite plate element methods to assess both the overall and detailed structural capability to withstand static and dynamic loadings. See:

- the applicable *ShipRight SDA Procedures Manual* for the procedure for each ship type; and
- the Section dealing with direct calculations in the relevant Chapter of Part 4 applicable to the particular ship type.

2.1.2 This procedure is mandatory, and additional to normal Rule structural design approval, for:

- bulk carriers and oil tankers without a **CSR** notation (see 1.1.1) greater than 190 m in length;
- container ships with a beam of Panamax size or greater;
- The primary structure of LNG ships;
- The primary structure of Type A LPG ships;
- Other ships of Type B and C where the type, size and structural configuration demand;
- passenger ships where it is considered that the superstructure will be subjected to a significant load from flexure of the hull girder; or, where it is required to utilise the load carrying capability of the superstructure for longitudinal strength; and
- other ships where type, size and structural configuration demand, see also Pt 1, Ch 2,2.3 and Ch 2,2.7.

2.1.3 In addition, and where applicable, the ship structure is to be examined for the structural capability to withstand dynamic loadings from partially filled tanks or the influence of thermal loadings.

■ Section 3

Fatigue design assessment

3.1 Fatigue Design Assessment notation – FDA

3.1.1 The ShipRight FDA procedure is to be applied in conjunction with the construction control tolerances and limits, in addition to the normal Rule structural detail design appraisal. These procedures are mandatory for bulk carriers and oil tankers (see 1.1.1) greater than 190 m in length and for other ships where the type, size, and structural configuration demand, see also Pt 1, Ch 2,2.3 and Ch 2,2.7.

ShipRight Procedures for the Design, Construction and Lifetime Care of Ships

Part 3, Chapter 16

Sections 4 to 8

■ Section 4 Construction monitoring

4.1 Construction Monitoring notation – CM

4.1.1 Extended controls on structural alignment, fit up and workmanship standards will be applied to areas, shown by the structural design assessment and fatigue design assessment procedures specified in Sections 2 and 3, to be in need of particular attention. This procedure is mandatory for all ship types where either the SDA and/or FDA procedures have been applied on a mandatory basis. The procedure may also be applied on a voluntary basis in conjunction with the voluntary application of SDA and FDA procedures to ensure that the ship is designed and constructed to an enhanced structural standard. The requirements of Chapter 10, and the relevant procedures contained in the *Construction Monitoring Procedure* are to be complied with, see also Pt 1, Ch 2,2.3 and Ch 2,2.7.

4.1.2 The procedure is mandatory for all Bulk Carriers or Double Hull Oil Tankers greater than 190 m in length with a CSR notation, see Pt 1, Ch 2,2.3.

■ Section 5 Ship Event Analysis

5.1 Ship Event Analysis – Descriptive notes SEA(HSS-n)

5.1.1 At the Owner's request, and in order to enhance safety and awareness on board during ship operation, provisions can be made for a hull surveillance system that monitors the hull girder stresses and motions of the ship and warns the ship's personnel that these levels or the frequency and magnitude of slamming motions are approaching a level where corrective action is advisable.

5.1.2 Where a hull surveillance system is fitted, the descriptive note **SEA(HSS-n)** will be assigned. The extension **-n** signifies the number of fitted strain gauges connected to the system. The following option extensions will be added to the descriptive note:

- L** The display of the relevant information in the cargo control area.
- M** The display and recording of the ship's motion.
- N** The facility to display and record navigational information.
- VDR** An interface with the ship's voyage data recorder system to enable the recording of hull stress, ship motion and hull pressure information.

The appropriate descriptive note will be entered in column 6 of the *Register Book*, see also Pt 1, Ch 2,2.7.

5.1.3 For the requirements, see the ShipRight Procedures and the *Provisional Rules for the Classification of Ship Event Analysis Systems*.

■ Section 6 Enhanced scantlings

6.1 Enhanced Scantlings – Descriptive note ES

6.1.1 Where scantlings in excess of the approved Rule minimum are fitted at defined locations, a descriptive note **ES**, Enhanced Scantlings, will be entered in column 6 of the *Register Book*. For example, the note **ES+1** will indicate that an extra 1 mm has been fitted to the hull envelope plating (i.e. deck, side and bottom).

■ Section 7 Protective coating in water ballast tanks

7.1 Protective Coating in Water Ballast Tanks – Descriptive note PCWBT

7.1.1 It is mandatory for all ship types that all salt water spaces having boundaries formed by the hull envelope are to have a corrosion protection coating applied, see Ch 2,3.

7.1.2 If the Owner so wishes, a descriptive note **PCWBT**, 'Protective Coating in Water Ballast Tanks', will be entered in column 6 of the *Register Book* to indicate that the ship's water ballast tanks are coated with a recognised corrosion control coating and that the coating remains efficient and is maintained in good condition. If the coatings have broken down, particularly at more critical areas, and no effort is being made to maintain the coatings, then this note will be placed in parentheses, i.e. (**PCWBT**). In either case the date of the last survey will be placed in parentheses after the note.

7.1.3 Recognised corrosion control coatings are listed in the *List of Paints, Resins, Reinforcements and Associated Materials*, which is published on LR's website, <http://www.lr.org>, and on the CD-Rom version of the *Rules and Regulations for the Classification of Ships* by LR. Guidance on coating condition is given in Chapter 1 of this List.

■ Section 8 Hull planned maintenance

8.1 Descriptive note HPMS

8.1.1 Where an Owner operates an approved Planned Maintenance Scheme as part of the Continuous Survey Hull (CSH) Cycle, the descriptive note **HPMS** will, at the Owner's request, be entered in column 6 of the *Register Book*.

ShipRight Procedures for the Design, Construction and Lifetime Care of Ships

Part 3, Chapter 16

Sections 8, 9 & 10

8.1.2 The descriptive note will indicate that procedures and documentation are in place to control and record the inspection of selected hull survey items by suitably qualified and trained personnel.

8.1.3 For the requirements and approval procedures, see the appropriate procedures in the *ShipRight Procedures Overview*.

■ Section 9 Ship Emergency Response Service

9.1 Ship Emergency Response Service – Descriptive note SERS

9.1.1 This service, offered by LR, provides a rapid computer assisted analysis of a damaged ship's stability and damaged longitudinal strength in the event of a casualty to the ship.

9.1.2 Where an Owner adopts this service, the descriptive note **SERS**, 'Ship is registered with LR's Ship Emergency Response Service', will be entered in column 6 of the *Register Book*.

■ Section 10 Assessment of Ballast Water Management Plans

10.1 Ballast Water Management Plan – Descriptive note BWMP

10.1.1 Compliance with this procedure is optional. A ship meeting the requirements of this procedure will be eligible for an appropriate **ShipRight BWMP** descriptive note, which will be recorded in column 6 of the *Register Book*.

RULES AND REGULATIONS FOR THE CLASSIFICATION OF SHIPS

PART 4 SHIP STRUCTURES (SHIP TYPE)

JULY 2009

Lloyd's Register is an exempt charity under the UK Charities Act 1993

Lloyd's Register, its affiliates and subsidiaries and their respective officers, employees or agents are, individually and collectively, referred to in this clause as the 'Lloyd's Register Group'. The Lloyd's Register Group assumes no responsibility and shall not be liable to any person for any loss, damage or expense caused by reliance on the information or advice in this document or howsoever provided, unless that person has signed a contract with the relevant Lloyd's Register Group entity for the provision of this information or advice and in that case any responsibility or liability is exclusively on the terms and conditions set out in that contract.

General Cargo Ships

Part 4, Chapter 1

Section 1

Section

- 1 **General**
- 2 **Materials and protection**
- 3 **Longitudinal strength**
- 4 **Deck structure**
- 5 **Shell envelope plating**
- 6 **Shell envelope framing**
- 7 **Single bottom structure**
- 8 **Double bottom structure**
- 9 **Bulkheads**

■ Section 1 General

1.1 Application

1.1.1 This Chapter applies to sea-going ships designed primarily for the carriage of general cargo. The requirements are intended to cover the midship region, but may also apply with suitable modification to the taper regions forward and aft in way of cargo spaces.

1.2 Structural configuration

1.2.1 The Rules provide for a basic structural configuration of a multi-deck or a single deck hull which includes a double bottom, or a single bottom arrangement. The structural configuration may also include a single or multiple arrangement of cargo hatch openings, and side tanks.

1.2.2 Individual consideration may be required where the ship incorporates double hull construction, large deck openings or other special design features.

1.2.3 Longitudinal framing is, in general, to be adopted at the strength deck outside line of openings and at the bottom, but special consideration will be given to proposals for transverse framing in these regions.

1.3 Class notations

1.3.1 In general, ships complying with the requirements of this Chapter will be eligible to be classed **100A1**.

1.3.2 Where a ship has been specially strengthened for heavy cargoes in accordance with the requirements listed in Ch 7,8.2, it will be eligible to be classed **100A1 strengthened for heavy cargoes**.

1.3.3 The following additional notations and annotations can be appended to the main class notation giving further detailed description of the loading criteria incorporated into the design:

(a) **RD** (Relative density):

Where a ship has tanks appraised for a maximum permissible relative density greater than 1,025, the notation **RD(specified tank names, density)** may be added.

(b) **WDL(+)** (Weather deck load):

The notation **WDL(+)** may be added. If requested, the maximum permissible weather deck load and extent can be identified in the notation, e.g. **WDL(5,0 t/m² from Aft to Fr. 26)**.

1.3.4 Ships intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2,2.3.6 to 2.3.10, will receive individual consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval.

1.3.5 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2, to which reference should be made.

1.4 Information required

1.4.1 For the information required, see Pt 3, Ch 1,5. In addition the following are to be supplied:

- (a) Cargo loadings on decks, hatchways and inner bottom if these are to be in excess of Rule. Where concentrated or point loads occur, their magnitude and points of application are to be defined.
- (b) The maximum pressure head in service on tanks, also details of any double bottom tanks interconnected with side tanks.
- (c) Details of the proposed depths of any partial fillings where water ballast or liquid cargo is intended to be carried in the holds, or large deep tanks.

1.5 Symbols and definitions

1.5.1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

L, B, D, T and V as defined in Pt 3, Ch 1,6

k_L, k = higher tensile steel factor, see Pt 3, Ch 2,1

e = base of natural logarithms, 2,7183

l = overall length of stiffening member, or pillar, in metres, see Pt 3, Ch 3,3

l_e = effective length of stiffening member, or pillar, in metres, see Pt 3, Ch 3,3

t = thickness of plating, in mm

s = spacing of secondary stiffeners, in mm

A = cross-sectional area of stiffening member, in cm²

C = stowage rate, in m³/tonne, see Pt 3, Ch 3,5

C_w = a wave head in metres

$= 7,71 \times 10^{-2} L e^{-0,0044L}$

I = inertia of stiffening member, in cm⁴, see Pt 3, Ch 3,3

S = spacing or mean spacing of primary members, in metres

General Cargo Ships

Part 4, Chapter 1

Sections 1, 2 & 3

- Z = section modulus of stiffening member, in cm^3 , see Pt 3, Ch 3,3
 ρ = relative density (specific gravity) of liquid carried in a tank but is not to be taken less than 1,025.

Section 2 Materials and protection

2.1 Materials and grades of steel

2.1.1 Materials and grades of steel are to comply with the requirements of Pt 3, Ch 2.

2.2 Protection of steelwork

2.2.1 For the protection of steelwork, in addition to the requirements specified in Pt 3, Ch 2,3 the requirements of 2.2.2 to 2.2.4 are to be complied with.

2.2.2 Ceiling is to be laid on the inner bottom under cargo hatchways, but may be omitted provided that the inner bottom plating is increased by 2 mm. In any ship which is regularly to be discharged by grabs, ceiling is to be laid on the inner bottom, and the inner bottom plating increased by 3 mm. Alternatively, the ceiling may be omitted provided that the inner bottom plating is increased in thickness by a minimum of 5 mm. The ceiling is to be 76 mm thick in softwood or 65 mm thick in hardwood, and is to be laid at right angles to the inner bottom stiffening. Where it is intended to use plywood or other forms of ceiling of an approved type instead of planking, the thickness will be considered for each case. Ceiling is also to be laid over bilges, and fitted with portable sections which are to be readily removable. The spaces between the frames at the top of the bilge ceiling are to be closed by steel plates, wood chocks, cement or other suitable means. Inner bottom manhole covers or fittings, where projecting above the inner bottom plating, are to be provided with a steel protection coaming around each manhole, and a wood or steel cover is to be fitted.

2.2.3 Where plated decks are sheathed with wood or approved compositions, the minimum thicknesses given in 4.2, Pt 3, Ch 5,2 and Pt 3, Ch 6,2 may be reduced by 10 per cent for a 50 mm sheathing thickness or five per cent for 25 mm, with intermediate values in proportion. The steel deck is to be coated with a suitable material in order to prevent corrosive action, and the sheathing or composition is to be effectively secured to the deck. See also the fire protection requirements relating to deck coverings in the relevant SOLAS Regulations or Pt 6, Ch 4,3 as applicable.

2.2.4 Where cargo battens or equivalent are fitted in the holds of dry cargo ships, the descriptive note 'SF' will be entered in the *Register Book*. The battens, when fitted, are to extend from above the upper part of the bilge to the underside of beam knees in the holds, and in all cargo spaces in the 'tween decks and superstructures, up to the underside of beam knees. Wood cargo battens are to be not less than 50 mm in thickness, and the clear space between adjacent rows is, in general, not to exceed 230 mm. The dimensions and spacing of battens made of other materials will be considered. Nets may be adopted in lieu of battens, and other alternative proposals will be specially considered. For arrangements in way of a refrigerated hold, see Pt 6, Ch 3,4.

Section 3 Longitudinal strength

3.1 General

3.1.1 Longitudinal strength calculations are to be made in accordance with the requirements given in Pt 3, Ch 4.

3.1.2 The requirements of Pt 3, Ch 4,8.3 regarding loading instruments are not applicable to general cargo ships under 120 m.

3.2 Fast cargo ships

3.2.1 The hull section modulus for ships of length, L , between 120 m, and 170 m, and maximum service speed greater than 17,5 knots in association with a bow shape factor, ψ , of more than 0,15, is to comply with the requirements of this sub-Section.

3.2.2 The bow shape factor is defined as:

$$\Psi = \frac{100 \Sigma A_b}{L^{1,5} B}$$

where

- a_0 = projection of upper deck at waterline (F.P.), in metres
 a_1 = projection of upper deck at waterline (0,1L from F.P.), in metres
 a_2 = projection of upper deck at waterline (0,2L from F.P.), in metres
 b = projection of upper deck at waterline (F.P. to bow line), in metres

$$\Sigma A_b = \frac{ba_0}{2} + 0,1L (a_1 + a_2) \text{ m}^2$$

See also Fig. 1.3.1.

3.2.3 For longitudinal strength requirements, the Rule minimum hull midship section modulus and the distribution of longitudinal material in the forward half-length will be considered. In general, the following requirements are to be complied with:

General Cargo Ships

Part 4, Chapter 1

Section 3

Fig. 1.3.1 Derivation of bow shape factor

- The vertical hull midship section modulus, about the horizontal neutral axis, at deck is to be not less than $331Lk\Sigma A_b \text{ cm}^3$, or that required by Pt 3, Ch 4,5, whichever is the greater. ΣA_b is defined in 3.2.2.
- The horizontal hull midship section modulus, about a vertical axis through the ship centreline, is to be not less than $32,5L^2D \text{ cm}^3$.
- In the forward half-length, the hull section modulus is not to be a lesser percentage of the midship value than that shown in Table 1.3.1.
- Any load or ballast condition resulting in a sagging still water bending moment, or a hogging moment less than 80 per cent of the Rule value of still water bending moment, will be specially considered with a view to minimising the compressive stresses in the deck in waves.

Table 1.3.1 Fast cargo ships

Position	Percentage of midship vertical modulus (modulus about horizontal axis)	Percentage of midship horizontal modulus (modulus about vertical axis)
Station 10 (mid- L_{pp})	100	100
12	98	87
14	95	62
16	81	38
18	44	17
20 (F.P.)	0	0

NOTES

- Intermediate values to be obtained by interpolation.
- L_{pp} as defined in Pt 3, Ch 1,6.

3.2.4 For local strength, in general the following requirements are to be complied with:

- Longitudinal deck stiffening is to be carried forward to the fore peak bulkhead or as far forward as practical. Where a long forecastle is fitted, the buckling strength of the proposed structure will be specially considered.
- Substantial web frames in way of deck transverses are to be fitted in the forward half-length. Scantlings of webs and frames are to be based on actual lengths, not 'tween deck heights, and collars are to be fitted at ends of members in way of high shear.
- Scantlings of bottom structure in forward part are to be specially considered.
- Deck and side shell panels forward of $0,5L$ from F.P. are to be examined to establish the critical buckling stress from the following formula:

$$\sigma_c = \frac{\pi^2 E}{12(1-\nu^2)} \left(\frac{t}{s} \right)^2 K_C \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$$

where

s = length of shorter edge, in mm

t = thickness of plating, in mm

E = Young's modulus, in N/mm^2 (kgf/mm^2)

K_C = a factor depending on aspect ratio and boundary restraint

= 4 for longitudinally stiffened plating or as shown in Fig. 1.3.2 for transversely stiffened plating

ν = Poisson's ratio (0,3 for steel and aluminium alloy).

Where the buckling stresses, as evaluated, exceed 50 per cent of yield stress, the actual critical buckling stress is given by:

$$\sigma_{ac} = \sigma_o \left(1 - \frac{\sigma_o}{4\sigma_c} \right) \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$$

where

σ_{ac} = corrected critical buckling stress, in N/mm^2 (kgf/mm^2)

σ_o = yield stress, in N/mm^2 (kgf/mm^2)

The critical buckling stress from the above formulae must be not less than $176,6 \text{ N/mm}^2$ ($18,0 \text{ kgf/mm}^2$) within $0,4L$ amidships, nor less than $147,2 \text{ N/mm}^2$ ($15,0 \text{ kgf/mm}^2$) for the deck forward of this, nor less than $117,7 \text{ N/mm}^2$ ($12,0 \text{ kgf/mm}^2$) for the side shell between the first and second deck forward of $0,5L$ from F.P. For higher tensile steel plating, the above permissible stresses are to be divided by k .

Fig. 1.3.2 Plate factor, K_C

General Cargo Ships

Part 4, Chapter 1

Sections 3 & 4

- (e) In order to obtain the necessary critical buckling strength, either of the following is to be applied:
- (i) plate thickness to be increased, or
 - (ii) panel aspect ratio to be altered by the fitting of additional panel stiffening.

Section 4

Deck structure

4.1 General

4.1.1 Longitudinal framing is, in general, to be adopted at the strength deck outside line of openings, but special consideration will be given to proposals for transverse framing. Requirements are given in this Section for longitudinal and transverse framing systems of all deck structure, except decks in way of erections. For erection decks, see Pt 3, Ch 8.

4.2 Deck plating

4.2.1 The thickness of strength/weather deck plating in the midship region is to comply with the requirements of Table 1.4.1. Outside the line of openings the thickness is also to be that necessary to give the hull section modulus required by Pt 3, Ch 4,5.

4.2.2 The thickness of lower deck plating in the midship region is to comply with the requirements of Table 1.4.2.

4.2.3 The thickness of the strength deck stringer plate is to be increased by 20 per cent at the ends of bridges, poop and forecastle.

4.2.4 The deck plating thickness and supporting structure are to be suitably reinforced in way of cranes, masts, derrick posts and deck machinery.

4.2.5 Where long, wide hatchways are arranged on lower decks, it may be necessary to increase the deck plating thickness to ensure effective support for side framing.

4.3 Deck stiffening

4.3.1 The scantlings of strength/weather deck longitudinals in the midship region are to comply with the requirements of Table 1.4.3.

4.3.2 The lateral and torsional stability of longitudinals together with web and flange buckling criteria are to be verified in accordance with Pt 3, Ch 4,7.

4.3.3 The scantlings of cargo and accommodation deck longitudinals are to comply with the requirements of Table 1.4.4.

4.3.4 End connections of longitudinals to bulkheads are to provide adequate fixity and, so far as is practicable, direct continuity of longitudinal strength. Where L exceeds 215 m, the deck longitudinals are to be continuous through transverse structure, including bulkheads, but alternative arrangements will be considered. Higher tensile steel deck longitudinals are to be continuous irrespective of the ship length.

Table 1.4.1 Strength/weather deck plating

Location	Minimum thickness, in mm <i>see also</i> 4.2.1	
	Longitudinal framing	Transverse framing
(1) Outside line of openings (see Notes 1 and 2)	The greater of the following: (a) $t = 0,001s_1 (0,059L_1 + 7) \sqrt{\frac{F_D}{k_L}}$ (b) $t = 0,00083s_1 \sqrt{Lk} + 2,5$	The greater of the following: (a) $t = 0,001s_1 f_1 (0,083L_1 + 10) \sqrt{\frac{F_D}{k_L}}$ (b) $t = 0,001s_1 \sqrt{Lk} + 2,5$
(2) Inside line of openings (see Note 2)	$t = 0,00083s_1 \sqrt{Lk} + 2,5$ but not less than 6,5	$t = 0,00083s_1 \sqrt{Lk} + 1,5$ but not less than 6,5
(3) In way of the crown of a tank	$t = 0,004sf \sqrt{\frac{\rho kh_4}{1,025}} + 3,5$ or as (1) or (2), whichever is the greater, but not less than 7,5 mm where $L \geq 90$ m, or 6,5 mm where $L < 90$ m	
Symbols		
L, k_L, k, ρ, s, S as defined in 1.5.1 $f = 1,1 - \frac{s}{2500S}$ but not to be taken greater than 1,0 $f_1 = \frac{1}{1 + \left(\frac{s}{1000S}\right)^2}$	$h_4 =$ tank head, in metres, as defined in Pt 3, Ch 3,5 $s_1 = s$ but is not to be taken less than the smaller of $470 + \frac{L}{0,6}$ mm or 700 mm $F_D =$ as defined in Pt 3, Ch 4,5,6 $L_1 = L$ but need not be taken greater than 190 m	
NOTES 1. The thickness derived in accordance with (1) is also to satisfy the buckling requirements of Pt 3, Ch 4,7. 2. The deck thickness is to be not less than the basic end deck thickness as given in Pt 3, Ch 5 and Ch 6.		

General Cargo Ships

Part 4, Chapter 1

Section 4

Table 1.4.2 Lower deck plating

Symbols	Location	Minimum thickness, in mm	
		Second deck	Third or platform decks
s, S, k, ρ as defined in 1.5.1 b = breadth of increased plating, in mm $f = 1,1 - \frac{s}{2500S}$ but not to be taken greater than 1,0 h_4 = tank head, in metres, as defined in Pt 3, Ch 3,5 $s_1 = s$ but is not to be taken less than the smaller of $470 + \frac{L}{0,6}$ mm or 700 mm A_f = girder face area, in cm^2 $K_1 = 2,5$ mm at bottom of tank = 3,5 mm at crown of tank	(1) Outside line of openings	$t = 0,012s_1 \sqrt{k}$ but not less than 6,5	$t = 0,01s_1 \sqrt{k}$ but not less than 6,5
	(2) Inside line of openings	$t = 0,01s_1 \sqrt{k}$ but not less than 6,5	
	(3) In way of the crown or bottom of a tank	$t = 0,004sf \frac{\rho kh_4}{1,025} + K_1$ but not less than 7,5 where $L \geq 90$ m, or 6,5 where $L < 90$ m	
	(4) Plating forming the upper flange of underdeck girders	Clear of deck openings, $t = \sqrt{\frac{A_f}{1,8k}}$ In way of deck openings, $t = 1,1 \sqrt{\frac{A_f}{1,8k}}$ Minimum breadth, $b = 760$ mm	
NOTE Where a deck loading exceeds $43,2 \text{ kN/m}^2$ (4,4 tonne-f/m ²), the thickness of plating will be specially considered.			

Table 1.4.3 Strength/weather deck longitudinals

Symbols	Location	Modulus, in cm^3	Inertia, in cm^4
L, s, k_L, k, ρ as defined in 1.5.1 $b = 1,4$ for rolled or built sections = 1,6 for flat bars $c_1 = \frac{60}{225 - 165 F_D}$ d_w = depth of longitudinal, in mm $F_1 = 0,25c_1$ h_1 = weather head, in metres, as defined in Pt 3, Ch 3,5 h_4 = tank head, in metres, as defined in Pt 3, Ch 3,5 l_e = as defined in 1.5.1, but not to be taken less than 1,5 m F_D = as defined in Pt 3, Ch 4,5.6 $h_{T1} = \frac{L_1}{56}$ for Type 'B-60' ships = the greater of $\frac{L_1}{70}$ or 1,20 m for Type 'B' ships $L_1 = L$ but need not be taken greater than 190 m $L_2 = L$ but need not be taken greater than 215 m	(1) In way of dry cargo spaces, see Note 1		
	(a) Outside line of openings	$Z = 0,043 s k h_{T1} l_e^2 F_1$	—
	(b) Inside line of openings	$Z = s k (400h_1 + 0,005 (l_e L_2)^2) \times 10^{-4}$	—
	(2) In way of the crown or bottom of a tank	$Z = \frac{0,0113 \rho s k h_4 l_e^2}{b}$ or as (1)(a) or (1)(b) above, whichever is the greater	$I = \frac{2,3}{k} l_e Z$
	(3) In way of superstructure	To be specially considered	—
NOTES 1. Where weather decks are intended to carry deck cargo and the load is in excess of $8,5 \text{ kN/m}^2$ ($0,865 \text{ tonne-f/m}^2$), the scantlings of longitudinals may be required to be increased to comply with the requirements for location (1) Table 1.4.4 using the equivalent design head, for specified cargo loading, for weather decks given in Table 3.5.1 in Pt 3, Ch 3. 2. The buckling requirements of Pt 3, Ch 4,7 are to be complied with. The ratio of the web depth d_w to web thickness t is to comply with the following requirements: (a) Built up profiles and rolled angles: $\frac{d_w}{t} \leq 60 \sqrt{k_L}$ (b) Flat bars: $\frac{d_w}{t} \leq 18 \sqrt{k_L}$ when continuous at bulkheads $\frac{d_w}{t} \leq 15 \sqrt{k_L}$ when non-continuous at bulkheads 3. The web depth of longitudinals, d_w is to be not less than 60 mm.			

General Cargo Ships

Part 4, Chapter 1

Section 4

Table 1.4.4 Cargo and accommodation deck longitudinals

Symbols	Location	Modulus, in cm ³	Inertia, in cm ⁴
L, s, k, ρ as defined in 1.5.1 d_w = web depth of longitudinal, in mm, see Note 2 h_2 = cargo head, in metres, as defined in Pt 3, Ch 3,5 h_3 = accommodation head, in metres, as defined in Pt 3, Ch 3,5 h_4 = tank head, in metres, as defined in Pt 3, Ch 3,5 l_e = as defined in 1.5.1, but not to be taken less than 1,5 m L_1 = L but need not be taken greater than 190 m γ = 1,4 for rolled or built sections = 1,6 for flat bars	(1) Cargo decks		
	(a) $L \geq 90$ m	$Z = sk(5,9L_1 + 25h_2 l_e^2) \times 10^{-4}$	—
	(b) $L < 90$ m	$Z = 0,005s k h_2 l_e^2$	—
	(2) Accommodation decks		
	(a) $L \geq 90$ m	$Z = sk(5,1L_1 + 25h_3 l_e^2) \times 10^{-4}$	—
	(b) $L < 90$ m	$Z = 0,00425s k h_3 l_e^2$ See Note 1	—
	(3) In way of the crown or bottom of a tank	As in (1) or (2) as applicable, or $Z = \frac{0,0113p s k h_4 l_e^2}{\gamma}$ whichever is the greater	$I = \frac{2,3}{k} l_e Z$
NOTES 1. The section modulus of accommodation deck longitudinals need not be taken greater than the value required by location (1)(a), in Table 1.4.3 . 2. The web depth of longitudinals, d_w , to be not less than 60 mm.			

Table 1.4.5 Strength/weather, cargo and accommodation deck beams

Symbols	Location	Modulus, in cm ³	Inertia, in cm ⁴
B, D, T, s, k, ρ as defined in 1.5.1 d_w = depth of beam, in mm h_1 = weather deck head h_2 = cargo head h_3 = accommodation head h_4 = tank head l_e as defined in 1.5.1, but to be taken as not less than 1,83 m B_1 = B , but need not be taken greater than 21,5 m K_1 = a factor dependent on the number of decks (including poop and bridge superstructures) at the position of the beam under consideration: 1 deck 20,0 3 decks 10,5 2 decks 13,3 4 or more 9,3 K_2 = a factor dependent on the location of the beam: at short bridge and poops 133 elsewhere 530 K_3 = a factor dependent on the location of the beam: span adjacent to the ship side 3,6 elsewhere 3,3 γ = 1,4 for rolled or built sections = 1,6 for flat bars	(1) Strength/weather decks	The lesser of the following: (a) $Z = (K_1 K_2 T D + K_3 B_1 s h_1 l_e^2) k \times 10^{-4}$ (b) $Z = 2K_3 B_1 s k h_1 l_e^2 \times 10^{-4}$	—
	(2) Cargo decks	$Z = (400K_1 T D + 38,8s h_2 l_e^2) k \times 10^{-4}$	—
	(3) Accommodation decks	$Z = (530K_1 T D + 38,8s h_3 l_e^2) k \times 10^{-4}$	—
	(4) In way of the crown or bottom of a tank	As (1), (2) or (3) as applicable, or $Z = \frac{0,0113p s k h_4 l_e^2}{\gamma}$ whichever is the greater	$I = \frac{2,3}{k} l_e Z$
	NOTES 1. Where weather decks are intended to carry deck cargo and the load is in excess of 8,5 kN/m ² (0,865 tonne-f/m ²), the scantlings of beams may be required to be increased to comply with the requirements for location (2) using the equivalent design head, for specified cargo loading, for weather decks given in Table 3.5.1 in Pt 3, Ch 3. 2. The web depth of beams, d_w , is to be not less than 60 mm.		

4.3.5 The scantlings of strength/weather, cargo and accommodation deck transverse beams are to comply with the requirements of Table 1.4.5.

4.3.6 The end connections of beams are to be in accordance with the requirements of Pt 3, Ch 10,3.

4.4 Deck supporting structure

4.4.1 Girders and transverses supporting deck longitudinals and beams, also hatch side girders and hatch end beams, are to comply with the requirements of Table 1.4.6. In general, transverses, webs or frames of increased scantlings, see Table 1.6.2, are to be arranged in way of hatch end beams and deck transverses, and these are to be in line with the double bottom floors where practicable. Equivalent transverse ring scantling arrangements will be considered.

General Cargo Ships

Part 4, Chapter 1

Section 4

Table 1.4.6 Deck girders, transverses and hatch beams

Location and arrangements	Modulus, in cm ³	Inertia, in cm ⁴
(1) Girders and transverses in way of dry cargo spaces and clear of hatch openings: (a) supporting up to three point loads (b) supporting four or more point loads or a uniformly distributed load	See <i>also</i> Note Z to be determined from calculations using Note and stress $\frac{123,5}{k}$ N/mm ² $\left(\frac{12,6}{k}$ kgf/mm ²) and assuming fixed ends $Z = 4,75k S H_g l_e^2$	$I = \frac{1,85}{k} l_e Z$
(2) Hatch side girders in way of dry cargo spaces at weather decks (with deep coamings): (a) supporting up to three point loads (b) supporting four or more point loads or a uniformly distributed load	Z to be determined from calculations using Note and stress $\frac{100,4}{k}$ N/mm ² $\left(\frac{10,25}{k}$ kgf/mm ²) and assuming fixed ends $Z = 5,85k S_1 H_g l_e^2$	$I = \frac{2,3}{k} l_e Z$
(3) Hatch side girders in way of dry cargo spaces at lower decks (without deep coamings): (a) supporting up to three point loads (b) supporting four or more point loads or a uniformly distributed load	Z to be determined from calculations using stress $\frac{112,5}{k}$ N/mm ² $\left(\frac{11,5}{k}$ kgf/mm ²) $Z = 5,20k S_1 H_g l_e^2$	$I = \frac{1,85}{k} l_e Z$
(4) Hatch end beams in way of dry cargo spaces and supported at centreline, see Fig. 1.4.1: (a) In association with longitudinal framing when there is no transverse between the hatch end beam and adjacent transverse bulkhead or equivalent supporting structure (b) In association with longitudinal framing where there is one or more transverse between the hatch end beam and adjacent transverse bulkhead or equivalent supporting structure (c) In association with transverse framing when the hatch end beam supports the hatch side girder and in line girder only (d) In association with transverse framing when the hatch end beam supports the hatch side girder, an in line girder and an additional girder between the hatch side and the centreline	$Z = 19k K_1 H_g l_e S_1 l_1 + 2,37k S_e H_g l_e^2$ $Z = 19k K_1 H_g l_e (S_1 l_1 + S_2 l_2)$ $Z = 19k K_1 H_g l_e (S_1 l_1 + S_3 l_3)$ $Z = 19k H_g l_e (K_1 (S_1 l_1 + S_4 l_4) + K_2 S_5 l_5)$	$I = \frac{2,8}{k} l_e Z$
(5) Girders and transverses in way of the crown or bottom of a tank	$Z = 11,7\rho k h_4 S l_e^2$	$I = \frac{2,8}{k} l_e Z$

NOTE In single deck ships the section modulus of deck transverses is to be increased by 15 per cent.		

General Cargo Ships

Part 4, Chapter 1

Section 4

Fig. 1.4.1 Hatch end beam arrangements

4.4.2 **Transverses** supporting deck longitudinals are, in general, to be spaced not more than 3,8 m apart where the length, L , is 100 m or less, and $(0,006L + 3,2)$ m apart where L is greater than 100 m.

4.4.3 The web thickness, stiffening arrangements and end connection of primary supporting members are to be in accordance with Pt 3, Ch 10,4.

4.4.4 Where a girder is subject to concentrated loads, such as pillars out of line, the scantlings are to be suitably increased. Also, where concentrations of loading on one side of the girder may occur, the girder is to be adequately stiffened against torsion. Reinforcements may be required in way of localised areas of high stress.

4.4.5 **Pillars** are to comply with the requirements of Table 1.4.7.

4.4.6 Pillars are to be fitted in the same vertical line wherever possible, and effective arrangements are to be made to distribute the load at the heads and heels of all pillars. Where pillars support eccentric loads, they are to be strengthened for the additional bending moment imposed upon them.

4.4.7 Tubular and hollow square pillars are to be attached at their heads to plates supported by efficient brackets, in order to transmit the load effectively. Doubling or insert plates are to be fitted to the inner bottom under the heels of tubular or hollow square pillars, and to decks under large pillars. The pillars are to have a bearing fit and are to be attached to the head and heel plates by continuous welding. At the heads and heels of pillars built of rolled sections, the load is to be well distributed by means of longitudinal and transverse brackets.

4.4.8 In double bottoms under widely spaced pillars, the connections of the floors to the girders, and of the floors and girders to the inner bottom, are to be suitably increased. Where pillars are not directly above the intersection of plate floors and girders, partial floors and intercostals are to be fitted as necessary to support the pillars. Manholes are not to be cut in the floors and girders below the heels of pillars. Where longitudinal framing is adopted in the double bottom, equivalent stiffening under the heels of pillars is to be provided, and where the heels of pillars are carried on a tunnel, suitable arrangements are to be made to support the load.

4.4.9 Where pillars are fitted inside tanks or under watertight flats, the tensile stress in the pillar and its end connections is not to exceed 108 N/mm^2 ($11,0 \text{ kgf/mm}^2$) at the test heads. In general, such pillars should be of built sections, and end brackets may be required.

4.4.10 Pillars are to be fitted below deckhouses, windlasses, winches, capstans and elsewhere where considered necessary.

4.4.11 **Non-watertight pillar bulkheads** are to comply with the requirements of Table 1.4.8.

4.4.12 **Cantilevers** and their supporting frames are to comply with the requirements of Table 1.4.9.

General Cargo Ships

Part 4, Chapter 1

Section 4

Table 1.4.7 Pillars

Symbols	Parameter	Requirement
<p> b = breadth of side of a hollow rectangular pillar or breadth of flange or web of a built or rolled section, in mm d_p = mean diameter of tubular pillars, in mm k = local scantling higher tensile steel factor, see Pt 3, Ch 2, 1.2.3, but not less than 0,72 l = overall length of pillar, in metres l_e = effective length of pillar, in metres, and is taken as: for hold pillars 0,65/ for 'tween deck pillars 0,80/ distance, in metres, between centres of the two adjacent spans of girder, or transverse, supported by the pillar r = least radius of gyration of pillar cross-section, in mm, and may be taken as: $r = 10 \sqrt{\frac{I}{A_p}}$ mm A_p = cross-sectional area of pillar, in cm² C, S as defined in 1.5.1 H_g as defined in Table 1.4.6 I = least moment of inertia of cross-section, in cm⁴ P = load, in kN (tonne-f), supported by the pillar and is to be taken as $\frac{9,81 SH_g l_p}{C} + P_a \left(\frac{SH_g l_p}{C} + P_a \right)$ but not less than 19,62 kN (2 tonne-f) P_a = load, in kN (tonne-f), from pillar or pillars above (zero if no pillars over) </p>	(1) Cross-sectional area of all types of pillar	$A_p = \frac{k P}{12,36 - 51,5 \frac{l_e}{r \sqrt{k}}} \text{ cm}^2$ $\left(A_p = \frac{k P}{1,26 - 5,25 \frac{l_e}{r \sqrt{k}}} \text{ cm}^2 \right)$ <p>See Note</p>
	(2) Minimum wall thickness of tubular pillars	<p>The greater of the following:</p> <p>(a) $t = \frac{P}{d_p \left(0,392 - 1,53 \frac{l_e}{r} \right)} \text{ mm}$</p> <p>(a) $\left(t = \frac{P}{d_p \left(0,04 - 0,156 \frac{l_e}{r} \right)} \right) \text{ mm}$</p> <p>(b) $t = \frac{d_p}{40} \text{ mm}$</p> <p>but not to be less than $t = 5,5 \text{ mm}$ where $L < 90 \text{ m}$, or $t = 7,5 \text{ mm}$ where $L \geq 90 \text{ m}$</p>
	(3) Minimum wall thickness of hollow rectangular pillars or web plate thickness of I or channel sections	<p>The lesser of (b) and (c), but not to be less than (a):</p> <p>(a) $t = \frac{P}{b \left(0,5 - 1,95 \frac{l_e}{r} \right)} \text{ mm}$</p> <p>(a) $\left(t = \frac{P}{b \left(0,05 - 0,2 \frac{l_e}{r} \right)} \right) \text{ mm}$</p> <p>(b) $t = \frac{br}{600 l_e} \text{ mm}$</p> <p>(c) $t = \frac{b}{55} \text{ mm}$</p> <p>but to be not less than $t = 5,5 \text{ mm}$ where $L < 90 \text{ m}$, or $t = 7,5 \text{ mm}$ where $L \geq 90 \text{ m}$</p>
	(4) Minimum thickness of flanges of angle or channel sections	<p>The lesser of the following:</p> <p>(a) $t_f = \frac{br}{200 l_e} \text{ mm}$</p> <p>(b) $t_f = \frac{b}{18} \text{ mm}$</p>
	(5) Minimum thickness of flanges of built or rolled I sections	<p>The lesser of the following:</p> <p>(a) $t_f = \frac{br}{400 l_e} \text{ mm}$</p> <p>(b) $t_f = \frac{b}{36} \text{ mm}$</p>

NOTE

As a first approximation A_p may be taken as $\frac{\sqrt{k} P}{9,32} \left(\frac{\sqrt{k} P}{0,95} \right)$ and the radius of gyration estimated for a suitable section having this area.

If the area calculated using this radius of gyration differs by more than 10 per cent from the first approximation, a further calculation using the radius of gyration corresponding to the mean area of the first and second approximation is to be made.

General Cargo Ships

Part 4, Chapter 1

Section 4

Table 1.4.8 Non-watertight pillar bulkheads

Symbols	Parameter	Requirement	
		Ships with $L < 90$ m	Ships with $L \geq 90$ m
d_w, t_p, b, c as defined in Pt 3, Ch 3,3 r = radius of gyration, in mm, of stiffener and attached plating $= 10 \sqrt{\frac{I}{A}}$ mm for rolled, built or swedged stiffeners $= d_w \sqrt{\frac{3b+c}{12(b+c)}}$ mm I = moment of inertia, in cm^4 , of stiffener and attached plating s = spacing of stiffeners, in mm A = cross-sectional area, in cm^2 , of stiffener and attached plating $A_1 = \frac{P}{12,36 - 51,5 \frac{l_e}{r}}$ cm^2 $\left(A_1 = \frac{P}{1,26 - 5,25 \frac{l_e}{r}} \text{ cm}^2 \right)$ As a first approximation A_1 may be taken as $\frac{P}{9,32} \left(\frac{P}{0,95} \right)$ $A_2 = \frac{P}{4,9 - 14,7 \frac{l_e}{r}}$ cm^2 $\left(A_2 = \frac{P}{0,5 - 1,5 \frac{l_e}{r}} \text{ cm}^2 \right)$ As a first approximation A_2 may be taken as $\frac{P}{3,92} \left(\frac{P}{0,4} \right)$ P, l_e as defined in Table 1.4.7 $\lambda = \frac{b}{c}$	(1) Minimum thickness of bulkhead plating	5,5 mm in holds and 'tween decks	7,5 mm in holds 6,5 mm in 'tween decks
	(2) Maximum stiffener spacing	1500 mm	1500 mm
	(3) Minimum depth of stiffeners or corrugations	100 mm in holds	150 mm in holds
		75 mm in 'tween decks	100 mm in 'tween decks
	(4) Cross-sectional area (including plating) for rolled, built or swedged stiffeners supporting beams, longitudinals, girders or transverses	(a) Where $\frac{s}{t} \leq 80$	$A = A_1$
		(b) Where $\frac{s}{t} \geq 120$	$A = A_2$
		(c) Where $80 < \frac{s}{t} < 120$	A is obtained by interpolation between A_1 and A_2
	(5) Cross-sectional area (including plating) for symmetrical corrugation	(a) Where $\frac{b}{t_p} \leq \frac{750 \lambda l_e}{(\lambda + 0,25) r}$	$A = A_1$
		(b) Where $\frac{b}{t_p} > \frac{750 \lambda l_e}{(\lambda + 0,25) r}$	$A = A_2$

4.5 Deck openings

4.5.1 The corners of main cargo hatchways in the strength deck within $0,5L$ amidships are to be elliptical, parabolic or rounded, with a radius generally not less than $1/24$ of the breadth of the opening. Rounded corners are to have a minimum radius of 300 mm if the deck plating extends inside the coaming, or 150 mm if the coamings are welded to the inner edge of the plating in the form of a spigot. Where elliptical corners are arranged, the major axis is to be fore and aft, the ratio of the major to minor axis is to be not less than 2 to 1 nor greater than 2,5 to 1, and the minimum half-length of the major axis is to be defined by l_1 in Fig. 1.4.5. Where parabolic corners are arranged, the dimensions are also to be as shown in Fig. 1.4.5.

4.5.2 Where the corners of large openings in the strength deck are parabolic or elliptical, insert plates are not required. For other shapes of corner, insert plates of the size and extent shown in Fig. 1.4.6 will, in general, be required. The required thickness of the insert plate is to be not less than 25 per cent greater than the adjacent deck thickness, outside line of openings with a minimum increase of 4 mm. The increase need not exceed 7 mm.

4.5.3 Welded attachments close to or on the free edge of the hatch corner plating are to be avoided (e.g. welded protection strips or shedder plates) and the butt welds of corner insert plates to the adjacent deck plating are to be located well clear of butts in the hatch coaming.

General Cargo Ships

Part 4, Chapter 1

Section 4

Table 1.4.9 Cantilever beams (see continuation)

Location and supporting arrangements	Required modulus, in cm ³ , see Notes	
	Cantilever beam	Supporting frame
(1) Any position – no support from end girders	$Z_0 = 8,67kM_0$ ($Z_0 = 85kM_0$)	$Z_v = \frac{v}{H_1} \left(\frac{fZ_0}{u} - kZ_t \right)$
(2) At hatch side – uniform loading, partial support received from hatch side girder, see Fig. 1.4.3: (a) Hatch side girder supported by Rule hatch end beams or pillars at hatch corners (b) Hatch side girder supported by end bulkheads of hold – no Rule hatch end beams or pillars (c) No transverse bulkheads between hatchways, no Rule hatch end beams or pillars, see Notes (d) At hatch side – concentrated loading	$Z_u = 0,9Z_0 - kG$ Z_u as in (a) or the following formula, whichever is the greater: $\left(\frac{n+1}{n} \right) \left(0,45 \left(1 + \frac{1}{\beta} \right) Z_0 - k\beta G - (1 - \beta) kE \right)$ Z_u as in (a) or the following formula, whichever is the greater: $\left(\frac{n+1}{n} \right) \left(\frac{Z_0}{\beta} - 0,5kE \right)$ Z_u as in (a), (b) or (c), whichever is applicable, or as the following formula, whichever is the greater: $Z_0 - kG_1$	$Z_v = \frac{v}{H_1} \left(\frac{fZ_u}{u} - kZ_t \right)$
Case (1) or (2)	Required inertia, in cm ⁴	
	$I_u = \frac{9u}{k} Z_u$	—
<p>NOTES</p> <ol style="list-style-type: none"> Where a transverse bulkhead is fitted at only one end of a hatchway the section modulus of cantilever beams is to be a mean of the values obtained from (2)(b) and (2)(c). Where only cantilevers in the length of a hatchway consist of two or three close together at the mid-length of hatchway, their modulus is to be determined by calculating the modulus of a single cantilever at mid-length and dividing this by the actual number of cantilevers. If a negative value is obtained for the required section modulus, cantilevers are not necessary for the arrangement considered. In calculating the actual section modulus of a cantilever or supporting frame, the effective area of attached plating is to be as given in Pt 3, Ch 3.3. Intermediate beams or frames within the effective breadth may be included in the calculation. Rule hatch end beams are those with scantlings determined from Table 1.4.6, assuming that the hatch side girder has a span between hatch end beams. The section modulus of cantilever beams is to be not less than that determined from Table 1.4.5 for beams in the same position. The section modulus of side frames, pillars or pillar bulkhead stiffeners supporting cantilevers is to be not less than that required for ordinary side frames, pillars or pillar bulkhead stiffeners, as determined from the appropriate Sections of the Rules. The scantlings of the cantilever bracket within the shaded area shown in Fig. 1.4.2 are to be as follows: (a) Where tripping brackets are not fitted: $t = (0,0075d_c + 5) \sqrt{k} \text{ mm}$ $A_f = \left(\frac{27Z_d}{e} \left(1 - \frac{e}{1420f} \right) - \frac{et}{300} \right) k \text{ cm}^2$ (b) Where tripping brackets are fitted at the positions indicated in Fig. 1.4.2: $t = (0,0075d_c + 5) \sqrt{k} \text{ mm}$ $A_f = \left(\frac{20Z_d}{e} \left(1 - \frac{e}{1420f} \right) - \frac{et}{200} \right) k \text{ cm}^2$ In general the radius at the throat of the cantilever bracket is to be not less than d_c. The cantilever beam and supporting frame face plates may be gradually tapered from the limits of the shaded area shown in Fig. 1.4.2. The web depth of the supporting frame may be tapered to a minimum of $0,5d_f$ at the base. Where the web thickness of cantilevers or supporting frames is less than $\frac{d_w}{60\sqrt{k}}$ transverse web stiffeners are to be fitted spaced approximately $1,5d_w$ apart. In no case is the web thickness outside the limits of the cantilever brackets to be less than $\frac{d_w}{85\sqrt{k}}$ Where stiffeners are fitted parallel to the face plates, the stiffening arrangements will be specially considered. 		

General Cargo Ships

Part 4, Chapter 1

Section 4

Table 1.4.9 Cantilever beams (conclusion)

Symbols	
f = overall length of cantilever, in metres k = higher tensile steel factor as defined in 1.5.1 l_b = distance, in metres, between transverse bulkheads, see Fig. 1.4.4. Where there is no bulkhead midway between hatchways, l_b is to be measured to a point midway between hatchways l_h = length of hatchway, in metres, see Fig. 1.4.4 C = cargo stowage rate in m ³ /tonne as defined in Pt 3, Ch 3,5, and is to be taken as 1,39 m ³ /tonne unless specified otherwise Z_a = section modulus, in cm ³ , of hatch side girder which is to be not less than that calculated from Table 1.4.6, taking the span between cantilevers Z_b = mean of section moduli, in cm ³ , of longitudinal girders in line with hatch side girder (Z_b is to be taken not greater than Z_a) $Z_d = \frac{fZ_u}{u}$ Z_o = section modulus, in cm ³ , of cantilever beam, not supported by end girder, at distance u from outer end Z_t = section modulus, in cm ³ , of frame or stiffener above cantilever, see Fig. 1.4.2. (Where there is no frame or stiffener above cantilever $Z_t = 0$) Z_u = section modulus, in cm ³ , of cantilever beam, partially supported by hatch side girder at end, at distance u from outer end Z_v = section modulus, in cm ³ , of supporting frame, at distance v from lower end Z_1, Z_2, Z_3 = mean of section moduli, in cm ³ , of hatch end beams calculated for the positions shown in Fig. 1.4.3. Z_2 is to be taken as the smaller modulus of the two sections adjacent to the hatch side $\beta = \frac{l_h}{l_b}$ E is determined as follows: When centreline bulkheads or pillars are fitted: $E = \frac{4}{n+1} \left((Z_1 + Z_2) + \frac{2u}{B_h} (Z_2 + Z_3) \right)$	Where there is no centreline support: d_c = web depth of cantilever, at root of bracket, in mm, see Fig. 1.4.2 d_f = web depth of frame at root of bracket, in mm, see Fig. 1.4.2 d_w = web depth of cantilever or frame, in mm e = web depth, in mm, as shown in Fig. 1.4.2 n = number of cantilevers between the hatch end beams t = thickness of cantilever bracket, in mm u, v = lever arms, in metres, as shown in Fig. 1.4.2 A_f = sectional area, in cm ² , of cantilever bracket face plate B_h = breadth of hatch, in metres, see Fig. 1.4.4 $E = \frac{4}{n+1} (Z_1 + Z_2)$ $G = \frac{7u}{(n+1)l_h} (Z_a + Z_b)$ $G_1 = \frac{3,5uZ_a}{S_c}$ H_1, H_2, H_3 = mean height of hold or 'tween deck, in metres, as shown in Fig. 1.4.2. At weather decks, H_2 and H_3 are to be taken equivalent to the weather head h_1 as defined in Pt 3, Ch 3,5 M_o = bending moment, in kN m (tonne-f m), on the cantilever beam due to the load supported by a single cantilever. This bending moment is to be calculated about an axis at a distance u from the end. For hatch side cantilevers with uniformly distributed loading this will equal $\frac{4,9S_c u}{C} (H_2 B_h + H_3 u)$ $\left(\frac{0,5S_c u}{C} (H_2 B_h + H_3 u) \right)$ S_c = spacing of cantilevers, in metres, see Fig. 1.4.4

4.5.4 Openings in the strength deck outside the line of hatch openings are to be kept to the minimum number consistent with operational requirements. Openings are to be arranged clear of hatch corners and, so far as possible, clear of one another. Where, within 0,4L amidships, deck openings have a total breadth or shadow area breadth, in one transverse section that exceeds the limitation given in Pt 3, Ch 3,3.4.4 and 3.4.5, compensation will be required to restore the excess. This is generally to be arranged by increasing the deck plate thickness, but other proposals will be considered. Plate panels in which openings are cut are to be adequately stiffened, where necessary, against compression and shear buckling. The corners of all openings are to be well rounded and the edges smooth.

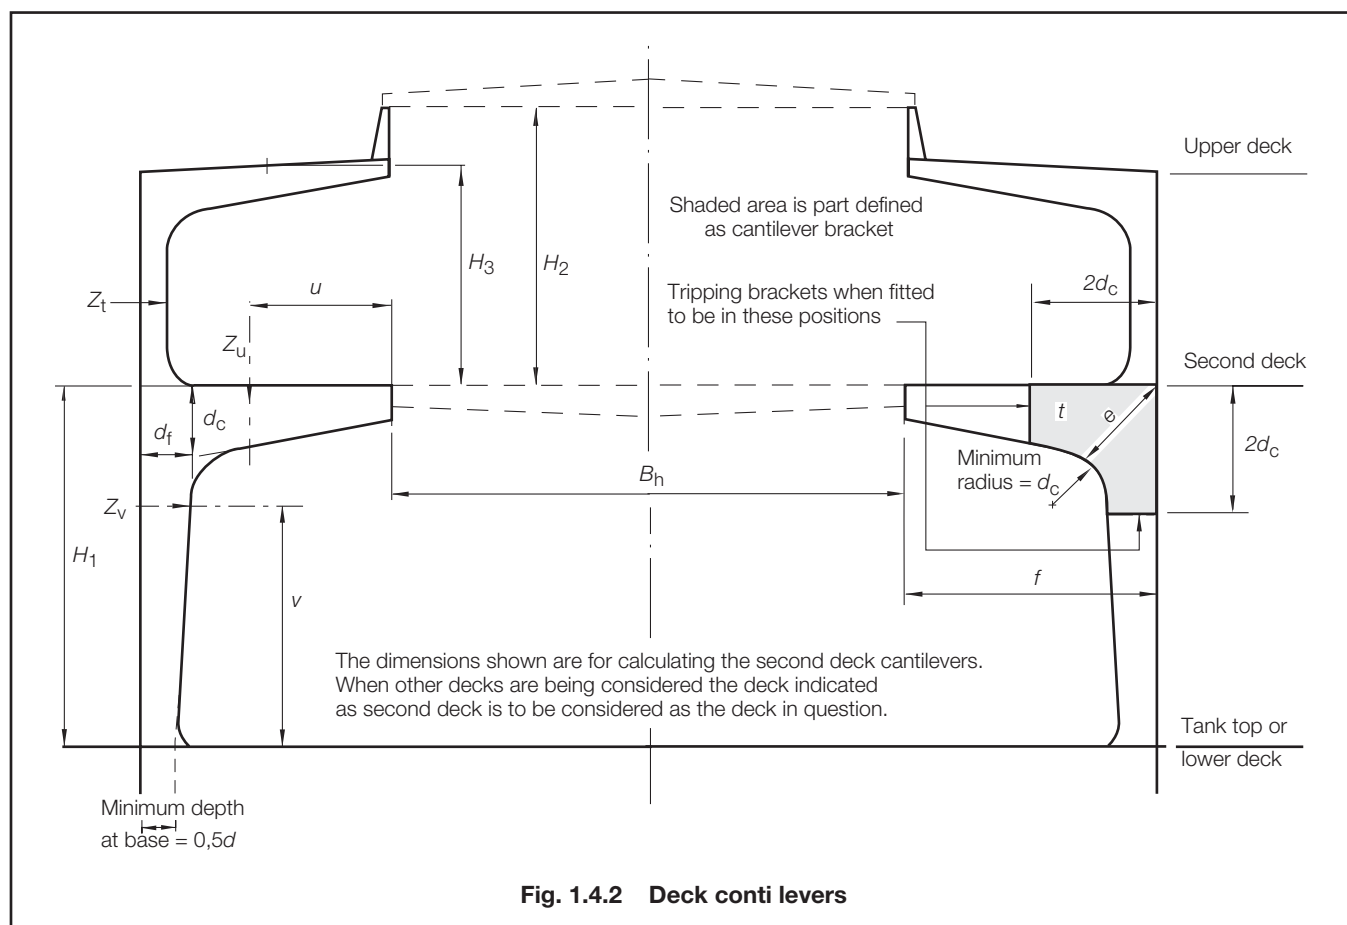

4.5.5 Openings in the strength deck outside the line of hatch openings having a stress concentration factor in excess of 2,4 will require edge reinforcements in the form of a spigot of adequate dimensions, but alternative arrangements will be considered. The area of any edge reinforcement which may be required is not to be taken into account in determining the required sectional area of compensation for the opening. Alternatively, the shape of the opening is to be such that a stress concentration factor of 2,4 is not exceeded. In this respect, reinforcement will not in general, be required in way of:

- elliptical openings having their major axis fore and aft and a ratio of length to breadth not less than 2 to 1, or
- openings of other shapes provided that it has been shown by suitable tests that the stress concentration factor does not exceed 2,4.

General Cargo Ships

Part 4, Chapter 1

Section 4

- (c) reinforcement will not generally be required for circular openings, provided that the plate panels in which they are situated are otherwise adequately stiffened against compression and shear buckling.

4.5.7 All openings are to be adequately framed; attention is to be paid to structural continuity, and abrupt changes of shape, section or plate thickness are to be avoided. Arrangements in way of corners and openings are to be such as to minimise the creation of stress concentrations. Where a deck longitudinal is cut, compensation is to be arranged to ensure full continuity of strength.

4.5.6 Lower deck openings should be kept clear of main hatch corners and the areas of high stress, so far as possible. Compensation will not, in general, be required unless the total width of openings in any frame space, or between any two transverses, exceeds 15k per cent of the original effective plating width. The requirements of 4.5.4 also apply to lower deck openings except that:

- the thickness of inserts, if required, for the second deck hatch corners is to be 2,5 mm greater than the deck thickness,
- inserts will not generally be required for hatch corners on third decks, platform decks and below, and

General Cargo Ships

Part 4, Chapter 1

Section 5

Section 5 Shell envelope plating

5.1 General

5.1.1 Requirements are given in this Section for longitudinal or transversely framed shell plating, and attention is drawn to the requirements of 6.1.1. In ships with a transversely framed bottom construction, the bottom shell plating is, in general, to be reinforced with additional continuous, or intercostal, longitudinal stiffeners, *see also* 7.1.2. Alternative arrangements will be considered.

5.1.2 For ships intended to load or unload while aground, *see* Pt 3, Ch 9,9.

5.2 Keel

5.2.1 The cross-sectional area and thickness of bar keels, and the width and thickness of plate keels, are to comply with the requirements of Table 1.5.1. Forged or rolled bar keels are also to comply with the material requirements of Chapter 3 of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

Table 1.5.1 Bar and plate keels

Item and parameter	Requirement
(1) Bar keels: Cross-sectional area Thickness	$A = (1,8L - 16) \text{ cm}^2$ $t = (0,6L + 8) \text{ mm}$
(2) Plate keels: Breadth Thickness	$b = 70B \text{ mm}$ but need not exceed 1800 mm and is not to be less than 750 mm $t = (t_1 + 2) \text{ mm}$ where t_1 is as in location (1) in Table 1.5.2, using the spacing in way of the keel plate t is to be taken not less than the adjacent bottom shell thickness
Symbols	
L, B as defined in 1.5.1 b = breadth of keel, in mm t = thickness of keel, in mm A = cross-sectional area, in cm^2	

5.3 Bottom shell and bilge

5.3.1 In the midship region the thickness of bottom shell plating to the upper turn of bilge is to be that necessary to give the hull section modulus required by Pt 3, Ch 4,5, and is to be not less than the minimum values given by Table 1.5.2.

5.4 Side shell

5.4.1 In the midship region, the thickness of side shell and sheerstrake plating including the sides of bridge superstructures is to be not less than the values given by Table 1.5.3, but may be required to be increased locally on account of high shear forces in accordance with Pt 3, Ch 4,6.

5.4.2 Sea inlets, or other openings, are to have well rounded corners and so far as possible, are to be kept clear of the bilge radius. Openings on, or near to, the bilge radius are to be elliptical. The thickness of sea inlet box plating is to be the same as the adjacent shell, but not less than 12,5 mm and need not exceed 25 mm.

5.4.3 Where a rounded sheerstrake is adopted the radius should, in general, be not less than 15 times the thickness.

5.4.4 The sheerstrake thickness is to be increased by 20 per cent at the ends of a bridge superstructure extending out to the ship's side. In the case of a bridge superstructure exceeding $0,15L$, the side plating at the ends of the superstructure is also to be increased by 25 per cent and tapered gradually into the upper deck sheerstrake.

5.4.5 In general, compensation will not be required for holes in the sheerstrake which are clear of the gunwale or any deck openings situated outside the line of the main hatchways and whose depth does not exceed 20 per cent of the depth of the sheerstrake or 380 mm, whichever is the lesser. Openings are not to be cut in a rounded gunwale. Cargo door openings are to have well rounded corners, and the proposed compensation for the door openings will be individually considered.

General Cargo Ships

Part 4, Chapter 1

Section 5

Table 1.5.2 Bottom shell and bilge plating

Location	Minimum thickness, in mm, <i>see also</i> 5.3.1	
	Longitudinal framing	Transverse framing
(1) Bottom plating, see Notes 1 and 2	The greater of the following: (a) $t = 0,001s_1 (0,043L_1 + 10) \sqrt{\frac{F_B}{k_L}}$ (see Note 4) (b) $t = 0,0052s_1 \sqrt{\frac{h_{T2}k}{1,8 - F_B}}$	The greater of the following: (a) $t = 0,001s_1 f_1 (0,056L_1 + 16,7) \sqrt{\frac{F_B}{k_L}}$ (see Note 4) (b) $t = 0,0063s_1 \sqrt{\frac{h_{T2}k}{1,8 - F_B}}$
(2) Bilge plating – where framed, see Notes 1 and 2	t as for (1)	t as for (1)
(3) Bilge plating – where unframed, see Note 3	Provided that transverses or adequate bilge brackets are spaced not more than $\frac{8t^2}{DR_B} \sqrt{\frac{t}{R_B}} \times 10^6 \text{ mm apart}$ $t = \frac{R_B F_B}{165k_L}$ but is to be not less than the adjacent bottom plating	
Symbols		
L, D, T, s, S, k_L, k as defined in 1.5.1 C_w is as defined in 1.5.1. Where $L > 227$ m, C_w is not to be taken less than 6,446 m		
$s_1 = s$, but is not to be taken less than the smaller of $470 + \frac{L}{0,6}$ mm or 700 mm		
$f_1 = \frac{1}{1 + \left(\frac{s}{1000S}\right)^2}$ $F_B =$ as defined in Pt 3, Ch 4,5.7 $L_1 = L$ but need not be taken greater than 190 m $R_B =$ bilge radius, in mm, see Note 3		
$h_{T2} = (T + 0,5 C_w)$, in metres but need not be taken greater than 1,2T m		
NOTES		
1. The thickness derived in accordance with (1) is also to satisfy the buckling requirements of Pt 3, Ch 4,7.		
2. The thickness of bottom shell or bilge plating is to be not less than the basic shell end thickness for taper as given in Pt 3, Ch 5,3 and Ch 6,3.		
3. Where longitudinally framed and the lowest side longitudinal lies a distance a mm above the uppermost turn of bilge and/or the outermost bottom longitudinal lies a distance b inboard of the lower turn of bilge, the bilge radius is to be taken as $R_B + \frac{(a + b)}{2}$ mm. In no case is a or b to be greater than s .		
4. Where separate maximum sagging and hogging still water bending moments are assigned, F_B may be based on the hogging moment.

Symbols		NOTES
L, D, T, S, s, k_L, k , as defined in 1.5.1 C_W is as defined in 1.5.1. Where $L > 227$ m, C_W is not to be taken less than 6,446 m $f_1 = \frac{1}{1 + \left(\frac{s}{1000S}\right)^2}$ $h_{T1} = T + C_W \text{ m but need not be taken greater than } 1,36T$ $h_{T2} = T + 0,5C_W \text{ m but need not be taken greater than } 1,2T$ $s_1 = s, \text{ but is not to be taken less than the smaller of } 470 + \frac{L}{0,6} \text{ mm or } 700 \text{ mm}$ $F_D, F_B = \text{as defined in Pt 3, Ch 4,5.7}$ $F_M = \text{the greater of } F_D \text{ or } F_B$ $L_1 = L, \text{ but need not be taken greater than } 190 \text{ m}$		1. The thickness is also to satisfy the buckling requirements of Pt 3, Ch 4,5.6. 2. The thickness of side shell or sheerstrake is to be not less than the basic shell end thickness for taper, as given in Pt 3, Ch 5,3 and Ch 6,3. The width of the sheerstrake (where of different thickness from the side shell) is to be not less than that required by Table 2.2.1 in Pt 3, Ch 2. 3. The thickness of side shell need not exceed that determined from Table 1.5.2 for bottom shell, but using the spacing of side frames or longitudinals. 4. Outside the Rule minimum region of higher tensile steel as defined in Pt 3, Ch 3,2.6.1 the value of k_L may be taken as 1,0. 5. For the expressions contained in (i), where separate maximum sagging and hogging still water bending moments are assigned, F_D may be based on the sagging moment and F_B on the hogging moment.

■ Section 6

Shell envelope framing

6.1 General

6.1.1 Longitudinal framing is, in general, to be adopted at the bottom, but special consideration will be given to proposals for transverse framing in this region. Transverse or longitudinal framing can be adopted for the side shell. Requirements are given in this Section for longitudinal and transverse framing systems.

6.1.2 End connections of longitudinals to bulkheads are to provide adequate fixity and, so far as practicable, direct continuity of longitudinal strength. Where L exceeds 215 m, the bottom longitudinals are to be continuous in way of both watertight and non-watertight floors, but alternative arrangements will be considered. Higher tensile steel longitudinals within 10 per cent of the ship's depth at the bottom and deck are to be continuous irrespective of the ship length, see also Pt 3, Ch 10,5.2.

6.1.3 Stiffeners and brackets on side transverses, where fitted on one side and connected to higher tensile steel longitudinals between the base line and $0,8D_2$ above the base line, are to have their heels well radiused to reduce stress concentrations. Where a symmetrical arrangement is fitted, i.e. bracket or stiffening on both sides, and it is connected to higher tensile steel longitudinals, the toes of the stiffeners or brackets are to be well radiused. Alternative arrangements will be considered if supported by appropriate direct calculations, see also Pt 3, Ch 10,5.2.

6.1.4 Where higher tensile steel side longitudinals pass through transverse bulkheads in the cargo area, well radiused brackets of the same material are to be fitted on both the fore and aft side of the connection between the upper turn of bilge and $0,8D_2$ above the base line. Particular attention should be given to ensuring the alignment of these brackets. Alternative arrangements will be considered if supported by appropriate direct calculations, see also 6.2.3.

6.1.5 For ships intended to load or unload while aground, see Pt 3, Ch 9,9.

6.2 Longitudinal stiffening

6.2.1 For non-CSR tankers and bulk carriers (see Pt 1, Ch 2,2.3) the scantlings of bottom and side longitudinals in the midship region are to comply with the requirements given in Table 1.6.1(b). In general other ships are to comply with Table 1.6.1(a).

6.2.2 The lateral and torsional stability of longitudinals together with web and flange buckling criteria are to be verified in accordance with Pt 3, Ch 4,7.

6.2.3 Where higher tensile steel asymmetrical sections are adopted in double bottom tanks which are interconnected with double skin side tanks or combined hopper and topside tanks the requirements of 6.1.3 and 6.1.4 are to be complied with regarding arrangements to reduce stress concentrations. Alternatively, it is recommended that bulb plate or symmetrical sections are adopted.

6.3 Transverse stiffening

6.3.1 The scantlings of main and 'tween deck frames, and bottom frames in way of bracket floors, in the midship region are to comply with the requirements given in Table 1.6.2.

6.3.2 The scantlings of main frames are normally to be based on Rule standard brackets at top and bottom, whilst the scantlings of 'tween deck frames are normally to be based on a Rule standard bracket at the top only.

6.3.3 End connections of transverse main and 'tween deck frames are to be in accordance with Pt 3, Ch 10,3.

6.4 Primary supporting structure

6.4.1 Side transverses supporting longitudinal stiffening, and webs and stringers supporting transverse side stiffening, are to comply with the requirements of Table 1.6.3.

6.4.2 Side transverses are to be spaced not more than 3,8 m apart when the length, L , is less than 100 m and $(0,006L + 3,2)$ m apart where L is greater than 100 m.

Section 7

Single bottom structure

7.1 General

7.1.1 Requirements are given in this Section for single bottom construction in association with transverse framing, and are generally applicable to the following ships:

- (a) Cargo ships of less than 500 tons gross tonnage.
- (b) Ships not propelled by mechanical means.
- (c) Trawlers and fishing vessels.

Cases where a single bottom structure is adopted in association with longitudinal framing will be considered.

7.1.2 Ships with single bottoms are to have a centre girder fitted. In addition, one side girder is to be fitted on each side of the centreline where B does not exceed 10 m, and two side girders on each side where B is greater than 10 m and does not exceed 17 m. In addition, continuous or intercostal longitudinal stiffeners are to be fitted where the panel size exceeds the ratio 4 to 1. Centre and side girders are to extend as far forward and aft as practicable, and where they are cut at bulkheads the longitudinal strength is to be maintained.

7.1.3 Plate floors are to be fitted at every frame, and the tops of floors, in general, may be level from side to side, but in ships having considerable rise of floor, and towards the ends, the depth of the floor plates is to be increased. Floor plates forming part of a watertight or deep tank bulkhead are to be not less than 900 mm in depth measured at the centreline, and the thickness is to be not less than that required for the bottom strake of a bulkhead.

7.1.4 For ships intended to load or unload while aground, see Pt 3, Ch 9,9.

General Cargo Ships

Part 4, Chapter 1

Sections 7 & 8

Table 1.7.1 Single bottom girders and floors

Item	Depth, in mm	Thickness, in mm	Face plate area, in cm ²
(1) Centre girder	As for floors	$t = \sqrt{Lk} + 2$ but not less than 6,0	$A_f = 0,67Lk$ but not less than 12,5 See Notes 2 and 3
(2) Side girders	As for floors	$t = \sqrt{Lk}$ but not less than 6,0	$A_f = (0,25L + 5)k$ but not less than 10,0 See Note 3
(3) Floors	Where $B \leq 10$ m $d_f = 40 (B + T)$ Where $B > 10$ m $d_f = 40 (1,5B + T) - 200$ (see Note 1)	$t = \frac{s\sqrt{k}}{s_1} \left(\frac{d_f}{100} + 3 \right)$ but not less than 6,0	$A_f = \frac{5Tsk}{s_1} \left(1 - \frac{2,5}{B} \right)$ See Notes 2 and 3
Symbols			
L, B, T, s, k as defined in 1.5.1 $b_f =$ breadth of face plate, in mm $d_f =$ overall depth of floor at the centreline, in mm		$s_1 =$ a standard frame spacing, in mm, and is to be taken as $2(L + 240)$ $A_f =$ cross-sectional area of face plate, in cm ²	
NOTES			
1. If the side frames are attached to the floors by brackets, the Rule depth of floor may be reduced by 15 per cent and the floor thickness determined using the reduced depth. The brackets are to be flanged and have the same thickness as the floors, and their arm lengths clear of the frame and are to be the same as the reduced floor depth given above.		2. The face plate thickness of floors and centre girder is to be not less than the floor plate thickness. 3. The thickness of face plates is to be: not less than $\frac{b_f}{16\sqrt{k}}$ nor more than $\frac{b_f}{8}$	

7.1.5 Provision is made for the free passage of water from all parts of the bottom to the suctions, taking into account the pumping rates required.

7.2 Girders and floors

7.2.1 The scantlings of girders and floors are to comply with the requirements of Table 1.7.1.

Section 8 Double bottom structure

8.1 Symbols and definitions

8.1.1 The symbols used in this Section are defined as follows:

L, B, T as defined in 1.5.1

- d_{DB} = Rule depth of centre girder, in mm
- d_{DBA} = actual depth of centre girder, in mm
- h_{DB} = head from top of inner bottom to top of over-flow pipe, in metres
- s = spacing of stiffeners, in mm
- H_{DB} = height from tank top, at position under consideration, to deck at side amidships, in metres
- Z_{BF} = section modulus of bottom frame at bracket floor, in cm³.

8.2 General

8.2.1 Except as specified in 8.2.4, cargo ships other than tankers are to be fitted with a double bottom extending from the collision bulkhead to the after peak bulkhead, as far as this is practicable and compatible with the design and proper working of the ship.

8.2.2 Where a double bottom is required to be fitted, its depth at the centreline, d_{DB} , is to be in accordance with 8.3.1 and the inner bottom is to be continued out to the ship's side in such a manner as to protect the bottom to the turn of the bilge.

8.2.3 Small wells constructed in the double bottom, in connection with the drainage arrangements of holds, are not to extend in depth more than necessary. A well extending to the outer bottom, may however, be permitted at the after end of the shaft tunnel of the ship. Other well arrangements (e.g. for lubricating oil under main engines) may be considered provided they give protection equivalent to that afforded by the double bottom.

8.2.4 A double bottom need not be fitted in way of watertight compartments used exclusively for the carriage of liquids, provided the safety of the ship in the event of bottom damage is not thereby impaired. In addition, a double bottom need not be fitted on the following ships:

- (a) Cargo ships of less than 500 tons gross tonnage.
- (b) Ships not propelled by mechanical means.
- (c) Trawlers and fishing vessels.

General Cargo Ships

Part 4, Chapter 1

Section 8

8.2.5 This Section provides for longitudinal or transverse framing in the double bottom, but for ships exceeding 120 m in length and for ships strengthened for heavy cargoes, longitudinal framing is, in general, to be adopted. For the additional requirements for ships specially strengthened for heavy cargoes, see Ch 7, 1.3.

8.2.6 For ships intended to load or unload while aground, see Pt 3, Ch 9,9.

8.2.7 Girders and the side walls of duct keels are to be continuous, and the structure in way is to be sufficient to withstand the forces imposed by dry-docking the ship.

8.2.8 Adequate access is to be provided to all parts of the double bottom. The edges of all holes are to be smooth. The size of opening should not, in general, exceed 50 per cent of the double bottom depth, unless edge reinforcement is provided. In way of ends of floors and fore and aft girders at transverse bulkheads, the number and size of holes are to be kept to a minimum, and the openings are to be circular or elliptical. Edge stiffening may be required in these positions.

8.2.9 Provision is to be made for the free passage of air and water from all parts of the tank to the air pipes and suctions, account being taken of the pumping rates required. To ensure this, sufficient air holes and drain holes are to be provided in all longitudinal and transverse non-watertight primary and secondary members. The drain holes are to be located as close to the bottom as is practicable, and air holes are to be located as close to the inner bottom as is practicable, see *also* Pt 3, Ch 10,5.3 and Pt 4, Ch 9,5.8.

8.3 Girders

8.3.1 The centre girder is to have a depth of not less than that given by:

$$d_{DB} = 28B + 205 \sqrt{T} \text{ mm}$$

nor less than 650 mm. The centre girder thickness is to be not less than:

$$t = (0,008d_{DB} + 4) \sqrt{k} \text{ mm}$$

nor less than 6,0 mm. The thickness may be determined using the value for d_{DB} without applying the minimum depth of 650 mm.

8.3.2 **In transversely framed ships** where the breadth, B , does not exceed 10 m, no side girders are required, and one vertical stiffener is to be fitted to the floors on each side, about midway between the centreline and the margin plate. One side girder is to be fitted where the breadth, B , exceeds 10 m but does not exceed 20 m, and for greater breadths two girders are to be fitted on each side of the centreline. The non-watertight side girders are to extend as far forward and aft as practicable and are to have a thickness not less than:

$$t = (0,008d_{DB} + 1) \sqrt{k} \text{ mm}$$

nor less than 6,0 mm.

8.3.3 Vertical stiffeners are to be fitted at every bracket floor (see 8.5.7), and are to have a depth not less than the depth of the tank top frame or 150 mm, whichever is the greater. For ships with a length, L , less than 90 m, stiffeners are to have a depth of not less than $1,65L$ mm with a minimum of 50 mm. The thickness is to be as required for the girder. Watertight side girders are to have a thickness 1 mm greater than required by 8.3.2 for non-watertight side girders. Where the double bottom tanks are interconnected with side tanks or cofferdams, the thickness is to be as for deep tanks (see 9.2.1) with h , in metres, measured to the highest point at the side tank or cofferdam.

8.3.4 **In longitudinally framed ships** one side girder is to be fitted where the breadth, B , exceeds 14 m, and two girders are to be fitted on each side of the centreline where B exceeds 21 m. The girders are to extend as far forward and aft as practicable and are to have a thickness not less than:

$$t = (0,0075d_{DB} + 1) \sqrt{k} \text{ mm}$$

nor less than 6,0 mm.

In general, a vertical stiffener, having a depth not less than 100 mm and a thickness equal to the girder thickness, is to be arranged midway between floors.

8.3.5 **Watertight side girders** are to have a plating thickness corresponding to the greater of the following:

- $t = (0,0075d_{DB} + 2) \sqrt{k} \text{ mm}$, or
- thickness t as for deep tanks (see 9.2.1) with h , in metres, measured to the highest point of the side tank, or cofferdam if the double bottom is interconnected with these tanks.

8.3.6 Watertight side girder stiffeners are to be in accordance with the requirements for watertight floors, see 8.5.4 and 8.5.5.

8.3.7 **Duct keels**, where arranged, are to have a thickness of side plates corresponding to the greater of the following:

- $t = (0,008d_{DB} + 2) \sqrt{k} \text{ mm}$, or
- thickness t , as for deep tanks (see 9.2.1) with h , in metres, measured to the highest point of the side tank, or cofferdam if the double bottom tank is interconnected with these tanks.

8.3.8 The sides of duct keels are, in general, to be spaced not more than 2,0 m apart. Where the sides of the duct keels are arranged on either side of a centreline or side girder, each side is, in general, to be spaced not more than 2,0 m from the centreline or side girder. The inner bottom and bottom shell within the duct keel are to be suitably stiffened. The primary stiffening in the transverse direction is to be suitably aligned with the floors in the adjacent double bottom tanks. Where the duct keels are adjacent to double bottom tanks which are interconnected with side tanks or cofferdams, the stiffening is to be in accordance with the requirements for deep tanks, see 9.2.1. Access to the duct keel is to be by watertight manholes or trunks.

8.3.9 The buckling requirements of Pt 3, Ch 4,7 are also to be satisfied.

General Cargo Ships

Part 4, Chapter 1

Section 8

8.4 Inner bottom plating and stiffening

8.4.1 The thickness of the inner bottom plating in the holds is to be not less than:

$$t = 0,00136 (s + 660) \sqrt[4]{k^2 LT} \text{ mm}$$

nor less than 6,5 mm in holds and 7,5 mm under hatchways if no ceiling is fitted.

8.4.2 The thickness of the inner bottom plating as determined in 8.4.1 is to be increased by 2 mm under the hatchways if no ceiling is fitted. If cargo is to be regularly discharged by grabs, see 2.2.2.

8.4.3 A margin plate, if fitted, is to have a thickness throughout 20 per cent greater than that required for inner bottom plating.

8.4.4 Where the double bottom tanks are common with side tanks or cofferdams, the thickness of the inner bottom plating is to be not less than that required for deep tanks (see 9.2.1), with h , in metres, taken to the highest point of the side tank or cofferdam, and K_1 is to be taken as 'elsewhere'.

8.4.5 Inner bottom longitudinals, or tank top frames at bracket floors within the range of cargo holds, are to have a section modulus not less than 85 per cent of the Rule value for bottom longitudinals (see 6.2.1) or bottom frames in way of bracket floors (see 6.3.1), whichever is applicable. The unsupported span of tank top frames is generally not to exceed 2,5 m. Where the double bottom tanks are inter-connected with side tanks, hopper and topside tanks or cofferdams, the scantlings are to be not less than those required for deep tanks, see 9.2.1. For higher tensile steel inner bottom longitudinals the requirements of 6.2.2 are to be complied with where applicable.

8.4.6 The buckling requirements of Pt 3, Ch 4,7 are also to be satisfied.

8.5 Floors

8.5.1 In longitudinally framed ships, plate floors are to be fitted under bulkheads and elsewhere at a spacing not exceeding 3,8 m. The thickness of non-watertight plate floors is to be not less than:

$$t = (0,009d_{DB} + 1) \sqrt{k} \text{ mm}$$

nor less than 6,0 mm. The thickness need not be greater than 15 mm, but the ratio between the depth of the double bottom and the thickness of the floor is not to exceed $130\sqrt{k}$. This ratio may, however, be exceeded if suitable additional stiffening is fitted. Vertical stiffeners are to be fitted at each longitudinal, having a depth not less than 150 mm and a thickness equal to the thickness of the floors. For ships of length, L , less than 90 m, the depth is to be not less than $1,65L$ mm, with a minimum of 50 mm.

8.5.2 The thickness of watertight floors for longitudinally framed ships is to be not less than:

$$(a) \quad t = (0,008d_{DB} + 3) \sqrt{k} \text{ mm, or}$$

$$(b) \quad t = (0,009d_{DB} + 1) \sqrt{k} \text{ mm}$$

whichever is the greater,

but need not exceed 15 mm on floors of normal depth. The thickness is also to satisfy the requirements for deep tanks (see 9.2.1) with h , in metres, taken to the highest point of the side tank, or cofferdam if the double bottom tank is interconnected with these tanks. The scantlings of stiffeners are to be in accordance with the requirements of 9.2.1 for deep tanks, or as required by 8.5.4 whichever is the greater. The stiffeners are to be connected to the inner bottom and shell longitudinals.

8.5.3 Between plate floors, transverse brackets having a thickness not less than $0,009d_{DB}$ mm are to be fitted, extending from the centre girder and margin plate to the adjacent longitudinal. The brackets, which are to be suitably stiffened at the edge, are to be fitted at every frame at the margin plate, and those at the centre girder are to be spaced not more than 1,25 m.

8.5.4 In transversely framed ships, plate floors are to be fitted under bulkheads, in way of change in depth of double bottom and elsewhere at a spacing not exceeding 3,0 m. The shell inner bottom plating between these floors is to be supported by bracket floors. The thickness of non-watertight plate floors is to be not less than:

$$t = (0,008d_{DB} + 1) \sqrt{k} \text{ mm}$$

but need not exceed 15 mm and is to be not less than 6 mm. Watertight or strengthened floors are to be fitted below, or in the vicinity of, watertight bulkheads, and their thickness is to be 2 mm greater than that derived above for non-watertight floors, but need not exceed 15 mm on floors of normal depth. If the depth of such floors exceeds 915 mm but does not exceed 2000 mm, the floors are to be fitted with vertical stiffeners spaced not more than 915 mm apart and having a section modulus not less than:

$$Z = 5,41d_{DB}^2 h_{DB} s k \times 10^{-9} \text{ cm}^3$$

The ends of the stiffeners are to be sniped.

8.5.5 Where the double bottom tanks are interconnected with side tanks or cofferdams, or where the depth of floor exceeds 2000 mm, the scantlings of watertight floors are to be not less than those required for deep tanks (see 9.2.1), and the ends of the stiffeners are to be bracketed top and bottom.

8.5.6 Where floors form the boundary of a sea inlet box, the thickness of the plating is to be the same as the adjacent shell, but not less than 12,5 mm and need not exceed 25 mm. The scantlings of stiffeners, where required are, in general, to comply with 9.2.1 for deep tanks. Sniped ends for stiffeners on the boundaries of these spaces are to be avoided wherever practicable. The stiffeners should be bracketed or the free end suitably supported to provide alignment with backing structure.

General Cargo Ships

Part 4, Chapter 1

Sections 8 & 9

8.5.7 **Where bracket floors** are fitted, the bottom frames are to be derived from 6.3.1. The unsupported span of the frames is not to exceed 2,5 m. The breadth of the brackets attaching the frames and the reverse frames to the centre girder and margin plate is to be three-quarters of the depth of the centre girder. The brackets are to be flanged on the unsupported edge and are to have the same thickness as the plate floors.

8.5.8 **Where struts** are fitted to reduce the unsupported span of the frames, reverse frames and longitudinals, they are to have a cross-sectional area of not less than:

$$(a) A = 0,32Z_{BF} \text{ cm}^2 \quad \text{for } Z_{BF} \leq 83,5, \text{ or}$$

$$(b) A = 23,2 + \frac{Z_{BF}}{25} \text{ cm}^2 \quad \text{for } Z_{BF} > 83,5$$

where Z_{BF} is the modulus, in cm^3 , of the frame or longitudinal based on the effective length between floors as defined in Pt 3, Ch 3,3.

Section 9 Bulkheads

9.1 General

9.1.1 The requirements of this Section cover watertight and deep tank transverse and longitudinal bulkheads. Requirements are also given for shaft tunnel boundaries and non-watertight bulkheads. For transverse bulkheads in way of ballast holds, stools may be required, see Ch 7,10.2.

9.1.2 The requirements of this Section apply to a vertical system of stiffening on bulkheads. They may also be applied to a horizontal system of stiffening provided that equivalent end support and alignment are provided.

9.1.3 For number and disposition of transverse watertight bulkheads, see Pt 3, Ch 3,4.

9.1.4 The buckling requirements of Pt 3, Ch 4,7 are also to be satisfied.

9.2 Watertight and deep tank bulkheads

9.2.1 The scantlings of watertight and deep tank bulkheads are to comply with the requirements of Tables 1.9.1 to 1.9.3. Where bulkhead stiffeners support deck girders, transverses or pillars over, the requirements of 4.4.11 are also to be satisfied.

9.2.2 In way of partially filled holds or tanks, the scantlings and structural arrangements of the boundary bulkheads are to be capable of withstanding the loads imposed by the movement of the liquid in those spaces. The magnitude of the predicted loadings, together with the scantling calculations may require to be submitted, see Pt 3, Ch 3,5.4.

9.2.3 In deep tanks, oil fuel or oil carried as cargo is to have a flash point of 60°C or above (closed cup test). Where tanks are intended for other liquid cargoes of a special nature the scantlings and arrangements will be considered in relation to the nature of the cargo.

9.2.4 Where watertight bulkhead stiffeners are cut in way of watertight doors in the lower part of a bulkhead, the opening is to be suitably framed and reinforced. Where stiffeners are not cut but the spacing between the stiffeners is increased on account of watertight doors, the stiffeners at the sides of the doorways are to be increased in depth and strength so that the efficiency is at least equal to that of the unpierced bulkhead, without taking the stiffness of the door frame into consideration. Watertight recesses in bulkheads are generally to be so framed and stiffened as to provide strength and stiffness equivalent to the requirements for watertight bulkheads.

9.2.5 A centreline bulkhead is, generally, to be fitted in deep tanks which extend from side to side of the ship and are intended for the carriage of oil fuel for the ship's use. The bulkhead may be intact or perforated as desired. If intact, the scantlings are to be as required for boundary bulkheads. If perforated, the modulus of the stiffeners may be 50 per cent of that required for boundary bulkheads, using h_4 measured to the crown of the tank. The stiffeners are to be bracketed at top and bottom. The area of perforation is to be not less than five per cent nor more than 10 per cent of the total area of the bulkhead. Where brackets from horizontal girders on the boundary bulkheads terminate at the centreline bulkhead, adequate support and continuity are to be maintained.

9.3 Shaft tunnels

9.3.1 Where shaft tunnels are required as specified in Pt 3, Ch 3,4 the thickness of the tunnel plating is to comply with Table 1.9.1 for holds or deep tanks as appropriate. If the top plating is well curved, the thickness may be reduced by 10 per cent in dry cargo holds. If the top plating is flat, it is to be not less than 1,1 times the thickness required for watertight bulkheads in dry cargo holds. Under hatchways the top plating is to be increased by 2 mm, unless covered with wood not less than the thickness specified in 2.2.2, which is to be secured by fastenings which do not penetrate the plating. Where it is intended to use plywood or other forms of ceiling of an approved type instead of planking, the thickness will be considered in each case. The tunnel stiffeners are to comply with Table 1.9.1 for holds or deep tanks, as appropriate. When the section modulus of curved stiffeners is determined, the values of ω_1 and ω_2 are to be taken as 1,0. The span of the stiffener, l_e , is to be taken as the overall height of the tunnel, measured vertically at the centreline of the tunnel. If the tunnel top is flat, scantlings of the stiffeners are also to comply with 4.3. The lower end connection to the tank top is to be welded. Additional strengthening is to be fitted under the heels of pillars or masts stepped on the tunnel.

9.4 Non-watertight bulkheads

9.4.1 The scantlings are to be in accordance with Table 1.4.8.

General Cargo Ships

Part 4, Chapter 1

Section 9

Table 1.9.1 Watertight and deep tank bulkhead scantlings

Item and requirement	Watertight bulkheads	Deep tank bulkheads
(1) Plating thickness for plane, symmetrically corrugated and double plate bulkheads	$t = 0,004sf \sqrt{h_4 k} \text{ mm}$ but not less than 5,5 mm	$t = 0,004sf \sqrt{\frac{\rho h_4 k}{1,025}} + K_1 \text{ mm}$ but not less than 6,5 mm, where $L < 90 \text{ m}$ nor less than 7,5 mm, where $L \geq 90 \text{ m}$
	In the case of symmetrical corrugations, s is to be taken as b or c in Fig. 3.3.1 in Pt 3, Ch 3, whichever is the greater	
(2) Modulus of rolled and built stiffeners, swedges, double plate bulkheads and symmetrical corrugations	$Z = \frac{skh_4 l_e^2}{71\gamma(\omega_1 + \omega_2 + 2)} \text{ cm}^3$	$Z = \frac{\rho skh_4 l_e^2}{22\gamma(\omega_1 + \omega_2 + 2)} \text{ cm}^3$
	In the case of symmetrical corrugations, s is to be taken as p , see also Note 2	
(3) Inertia of rolled and built stiffeners and swedges	—	$I = \frac{2,3}{k} l_e Z \text{ cm}^4$
(4) Symmetrical corrugations and double plate bulkheads	Additional requirements to be complied with as detailed in Table 1.9.2	
(5) Stringers or webs supporting vertical or horizontal stiffening		
(a) Modulus	$Z = 5,5kh_4 S l_e^2 \text{ cm}^3$	$Z = 11,7\rho kh_4 S l_e^2 \text{ cm}^3$
(b) Inertia	—	$I = \frac{2,5}{k} l_e Z \text{ cm}^4$
Symbols		
<p>s, S, I, k, ρ as defined in 1.5.1</p> <p>d_w = web depth of stiffening member, in mm</p> <p>$f = 1,1 - \frac{s}{2500S}$ but not to be taken greater than 1,0</p> <p>h_4 = load head, in metres measured as follows:</p> <p>(a) For watertight bulkhead plating, the distance vertically from a point one-third of the height of the plate above its lower edge to a point 0,91 m above the bulkhead deck at side or perpendicular to the deepest equilibrium waterline in damaged condition obtained from applicable damage stability calculations, whichever is the greater, see also Fig. 3.5.2 in Pt 3, Ch 3</p> <p>(b) For deep tank bulkhead plating, the distance from a point one-third of the height of the plate above its lower edge to the top of the tank, or half the distance to the top of the overflow, whichever is the greater, see also Fig. 3.5.2 in Pt 3, Ch 3</p> <p>(c) For watertight bulkhead stiffeners or girders, the distance vertically from the middle of the effective length to a point 0,91 m above the bulkhead deck at</p> <p>side, or perpendicular to the deepest equilibrium waterline in damaged condition obtained from applicable damage stability calculations, whichever is the greater, see also Fig. 3.5.2 in Pt 3, Ch 3</p> <p>(d) For deep tank bulkhead stiffeners or girders, the distance from the middle of the effective length to the top of the tank, or half the distance to the top of the overflow, whichever is the greater, see also Fig. 3.5.2 in Pt 3, Ch 3</p> <p>K_1 = 3,5 mm within 3 m below top of bulkhead = 2,5 mm elsewhere</p> <p>l_e = effective length of stiffening member, in metres, and for bulkhead stiffeners, to be taken as $l - e_1 - e_2$, see also Fig. 1.9.1</p> <p>p = spacing of corrugations as shown in Fig. 3.3.1 of Pt 3, Ch 3</p> <p>γ = 1,4 for rolled or built sections and double plate bulkheads = 1,6 for flat bars = 1,1 for symmetrical corrugations of deep tank bulkheads = 1,0 for symmetrical corrugations of watertight bulkheads</p> <p>ω, e = as defined in Table 1.9.3, see also Fig. 1.9.1</p>		
NOTES		
<p>1. In no case are the scantlings of deep tank bulkheads to be less than the requirements for watertight bulkheads where watertight bulkheads are required by Pt 3, Ch 3,5.</p> <p>2. In calculating the actual modulus of symmetrical corrugations, the panel width b is not to be taken greater than that given by Pt 3, Ch 3,3.2.</p> <p>3. For rolled or built stiffeners with flanges or face plates, the web thickness is to be not less than $\frac{d_w}{60\sqrt{k}}$ whilst for flat bar stiffeners the web thickness is to be not less than $\frac{d_w}{18\sqrt{k}}$</p>

Table 1.9.2 Symmetrical corrugations and double plate bulkheads (additional requirements)

Symbols	Type of bulkhead	Parameter	Watertight bulkheads	Deep tank bulkheads
s, k as defined in 1.5.1 b = panel width as shown in Fig. 3.3.1 in Pt 3, Ch 3 d = depth, in mm, of symmetrical corrugation or double plate bulkhead l_e as defined in Table 1.9.1 A_w = shear area, in cm ² , of webs of double plate bulkhead θ = angle of web corrugation to plane of bulkhead	Symmetrically corrugated, <i>see also</i> Notes 1 and 2	$\frac{b}{t}$	Not to exceed: 85 \sqrt{k} at top, and 70 \sqrt{k} at bottom	Not to exceed: 70 \sqrt{k} at top, and at bottom
		d	—	To be not less than: 39 l_e mm
		θ	To be not less than 40°	
NOTES 1. The plating thickness at the middle of span l_e of corrugated or double plate bulkheads is to extend not less than 0,2 l_e m above mid-span. 2. Where the span of corrugations exceeds 15 m, a diaphragm plate is to be arranged at about mid-span. 3. <i>See also</i> Pt 3, Ch 10,5.2.1.	Double plate, <i>see also</i> Notes 1 and 3	$\frac{s}{t}$	Not to exceed:	75 \sqrt{k} at top, and 65 \sqrt{k} at bottom
		$\frac{d}{t_w}$	Not to exceed:	85 \sqrt{k} at top, and 75 \sqrt{k} at bottom
		d	—	To be not less than: 39 l_e mm
		A_w	To be not less than: $\frac{0,12Z}{l_e}$ cm ² at top, and $\frac{0,18Z}{l_e}$ cm ² at bottom	To be not less than: $\frac{0,07Z}{l_e}$ cm ² at top, and $\frac{0,10Z}{l_e}$ cm ² at bottom

■ Section 1 General

1.1 Application

1.1.1 This Chapter applies to sea-going roll on-roll off cargo ships, passenger ships and sailing passenger ships defined as follows:

- (a) A passenger ferry is defined as a ship specially designed and constructed for the carriage of passengers on a regular scheduled service between specified ports operating in reasonable weather conditions.
- (b) A passenger/vehicle ferry is defined as a ship specially designed and constructed for the carriage of passengers and vehicles on a regular scheduled service between specified ports operating in reasonable weather conditions.
- (c) A roll on-roll off cargo ship is defined as a ship specially designed and constructed for the carriage of vehicles, and cargo in pallet form or in containers, and loaded/unloaded by wheeled vehicles.
- (d) A passenger ship is defined as a ship specially designed and constructed for the carriage of more than 12 passengers.
- (e) A sailing passenger ship is defined as a ship specially designed and constructed for the carriage of more than 12 passengers and incorporating sail devices which are intended to be the primary means of propulsion.

1.1.2 Ships intended only to operate in certain areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2, will receive individual consideration on the basis of the rules with respect to the environmental conditions agreed for the design basis and approval.

1.1.3 The scantlings and arrangements are to be as required by Chapter 1 except as otherwise specified in this Chapter.

1.1.4 The scantlings of structural items may be determined by direct calculation. For passenger ships where it is considered that the superstructure will be subjected to a significant load from flexure of the hull girder; or, where it is required to utilise the load carrying capability of the superstructure for longitudinal strength, the scantlings of the primary supporting structure are to be assessed by direct calculations and the ShipRight notations **SDA** and **CM** are mandatory, see 1.3 and Section 11.

1.2 Structural configuration

1.2.1 The requirements provide for a basic structural configuration of a multi-deck hull which includes a double bottom, and in some cases wing tanks up to the lowest deck.

1.2.2 For passenger ships, the structural arrangements detailed in Chapter II-1, Part B, of the *International Convention for the Safety of Life at Sea, 1974*, and applicable amendments as they apply to passenger ships are to be complied with in their entirety.

1.2.3 Where bulkheads are omitted in accordance with Pt 3, Ch 3,4, a system of partial bulkheads, web frames and deck transverses should be fitted to provide equivalent transverse strength.

1.2.4 Longitudinal framing is, in general, to be adopted at the strength deck and at the bottom, but special consideration will be given to proposals for transverse framing in these regions.

1.2.5 Reference should be made to the Regulations of the *International Convention for the Safety of Life at Sea, 1974* and applicable amendments and to the relevant Statutory Requirements of the National Authority of the country in which the ship is to be registered.

1.2.6 Attention is also drawn to the requirements for passenger ships given in:

- Bulkhead requirements, see Pt 3, Ch 3,4
- Closing arrangements for shell, deck and bulkheads, see Pt 3, Ch 11,6, Ch 11,8 and Ch 11,9
- Electrical Installations, see Pt 6, Ch 2
- Fire protection, detection and extinction, see SOLAS Reg. II-2/B and C.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Section 1

1.2.7 Attention is drawn to National Authority requirements relating to the stowage and securing of vehicles and cargo units on board roll on–roll off ships. Steel used for the construction of fixed securing fittings attached to the ship's structure is to comply with the requirements of *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials), or with an equivalent acceptable specification. Due account is to be taken of the grade and tensile strength of the hull material in way of the attachment and the chemical composition of the steel is to be such as to ensure acceptable qualities of weldability.

1.2.8 Sailing passenger ships are to be fitted with auxiliary propulsive power to ensure adequate speed and manoeuvrability of the vessel in conditions when the sail systems are not available for use. The auxiliary propulsion and other essential machinery is to comply with the requirements of Part 5 of the Rules, as applicable.

1.2.9 Sail systems may be made up in the form of soft sails, semi-rigid and rigid sail configurations including wind turbines or systems incorporating rotating cylinders.

1.2.10 For sailing vessels, a continuous visual read out of the apparent wind speed and direction is to be available to the ship's master when the vessel is under way. Sail control and service systems are to provide adequate speed of response to neutralise the sail system in the event of high wind conditions. Sufficient information and evidence is to be submitted to substantiate that the foregoing arrangements are in place.

1.2.11 For sailing passenger ships, the Rules for classification will, in principle, apply to the mast arrangements and standing gear, but will exclude running gear, yards, booms and sail arrangements.

1.2.12 For sailing passenger ships, the equipment requirements will be in accordance with the letter and numeral two grades higher than that corresponding to the calculated Equipment Numeral.

1.3 Class notations

1.3.1 In general, ships complying with the requirements of this Chapter will be eligible to be classed:

- '100A1 passenger ferry', or
- '100A1 passenger/vehicle ferry', or
- '100A1 roll on–roll off cargo ship', or
- '100A1 vehicle carrier', or
- '100A1 passenger ship', or
- '100A1 sailing passenger ship'.

1.3.2 For passenger ships that comply with the requirements of the European Council Directive 98/18/EC of 17 March 1998 on safety rules and standards for passengers ships, and subsequent revisions, the following class notations may be appended to the main class notation:

- (a) **EU(A)**. This class notation will be assigned to a passenger ship engaged on domestic voyages other than voyages covered by Classes B, C and D.

- (b) **EU(B)**. This class notation will be assigned to a passenger ship engaged on domestic voyages in the course of which it is at no time more than 20 miles from the line of coast, where shipwrecked persons can land, corresponding to the medium tide height.
- (c) **EU(C)**. This class notation will be assigned to a passenger ship engaged on domestic voyages in sea areas where the probability of exceeding 2,5 m significant wave height is smaller than 10 per cent over a one-year period for all-year-round operation, or over a specific restricted period of the year for operation exclusively in such period (e.g. summer period operation), in the course of which it is at no time more than 15 miles from a place of refuge, nor more than 5 miles from the line of coast, where shipwrecked persons can land, corresponding to the medium tide height.
- (d) **EU(D)**. This class notation will be assigned to a passenger ship engaged on domestic voyages in sea areas where the probability of exceeding 1,5 m significant wave height is smaller than 10 per cent over a one-year period for all-year-round operation, or over a specific restricted period of the year for operation exclusively in such period (e.g. summer period operation), in the course of which it is at no time more than 6 miles from a place of refuge, nor more than 3 miles from the line of coast, where shipwrecked persons can land, corresponding to the medium tide height.

1.3.3 A ship assigned a class notation incorporating the word 'passenger' which is also designed to fulfil other functions not associated with passenger carrying, is to comply with the requirements of this Chapter for passenger ships together with the requirements of the relevant Chapter of this Part for the particular ship type.

1.3.4 Where ferries are specially reinforced for the carriage of trains on fixed rails, the class notation will also include the word 'train'.

1.3.5 The Regulations for the classification and assignment of class notations are given in Pt 1, Ch 2, to which reference should be made.

1.3.6 The 'ShipRight Procedures' for hull construction of ships are detailed in Pt 3, Ch 16 and the classification notations and descriptive notes associated with these procedures are given in Pt 1, Ch 2,2.

1.3.7 The 'Structural Design Assessment' (SDA) and 'Construction Monitoring' (CM) procedures detailed in the *ShipRight Procedures Manual*, published by Lloyd's Register (hereinafter referred to as 'LR'), are mandatory for passenger ships where it is considered that the superstructure will be subjected to a significant load from flexure of the hull girder; or, where it is required to utilise the load carrying capability of the superstructure for longitudinal strength, and for other passenger ships of abnormal hull form, or of unusual structural configuration or complexity.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Sections 1 & 2

1.4 Information required

1.4.1 In addition to the information and plans required by Pt 3, Ch 1,5, the following details are to be submitted:

- The intended service areas required for ships designed to operate within specified geographical limits.
- Stern or bow ramps.
- Bow, stern and side doors.
- Movable decks, if fitted, including stowing arrangements for portable components.
- Sail plans and associated operational and design conditions, including apparent wind speeds (sailing ships).
- Masts and all structural components of the standing rigging (sailing ships).
- The standing rigging and all standing rigging attachments (sailing ships).
- The design deck loadings including details of wheeled vehicles, see Pt 3, Ch 9,3, and trains, where applicable.
- Locations of fixed securing points for wheeled vehicles, with indication of the magnitude and direction of the imposed lashing force.

1.5 Symbols

1.5.1 For the definition of symbols not defined in this Chapter, see Ch 1,1.5.

1.5.2 The following definitions apply to ships employing sails:

- | | |
|---------------------|---|
| Standing rigging | – Rigging of fixed length used to support masts/bowsprit. |
| Running rigging | – Rigging used to control yards, booms and sails and which may pass over revolving sheaves. |
| Apparent wind speed | – The vector resultant of the combination of real wind speed and ship velocity. |

Section 2 Longitudinal strength

2.1 General

2.1.1 Longitudinal strength calculations are to be made in accordance with the requirements given in Pt 3, Ch 4 and the additional notes contained in this Section.

2.1.2 The design vertical wave bending moments and design wave shear forces to be used in Pt 3, Ch 4 are to be determined in accordance with 2.3 and 2.4 below. For ships of unusual hullform or where their design parameters are outwith the applicability of the Rules, see Pt 3, Ch 4, special consideration will be given to the values and distributions of the wave induced global loads.

2.1.3 The still water bending moment and shear force envelopes are to take into account the requirements of 2.3.

2.1.4 For ships where the side shell or side casings contain large openings or where the effectiveness of the superstructures in resisting hull girder bending loads is expected to be reduced by the presence of large numbers of windows or openings, the combined hull and superstructure response may require to be verified using direct calculation techniques.

2.2 Calculation of hull section modulus

2.2.1 The calculation of section modulus is to be in accordance with Pt 3, Ch 3, 3.4 and the additional notes in this Section. In general, the effective sectional area of continuous longitudinal strength members, after deduction of openings, is to be used for the calculation of midship section modulus. For ships where the effectiveness of the superstructure is only partial due to the presence of large or numerous shell openings or discontinuities in the shell envelope, then an equivalent section modulus for the purposes of this section may be derived using direct calculations.

2.2.2 Structural members which contribute to the overall hull girder strength are to be carefully aligned so as to avoid discontinuities resulting in abrupt variations of stresses and are to be kept clear of any form of openings which may affect their structural performances.

2.2.3 In general, short superstructures, see *also* Pt 3, Ch 3,3.4.2, or deckhouses will not be accepted as contributing to the global longitudinal or transverse strength of the ship. However, where it is proposed to include substantial, continuous stiffening members, special consideration will be given to their inclusion on submission of the designer's/builder's calculations, see *also* 2.6.

2.2.4 Adequate transition arrangements are to be fitted at the ends of effective continuous longitudinal strength members in the deck and bottom structures.

2.2.5 Scantlings of all continuous longitudinal members of the hull girder based on the minimum section stiffness requirements determined from Ch 4,5 are to be maintained within $0,4L$ amidships. However, in special cases, based on consideration of type of ship, hull form and loading conditions, the scantlings may be gradually reduced towards the ends of the $0,4L$ part, bearing in mind the desire not to inhibit the ship's loading and operational flexibility.

2.2.6 Structural material which is longitudinally continuous but which is not considered to be fully effective for longitudinal strength purposes may be specially considered. The global longitudinal strength assessment must take into account the presence of such material when it can be considered effective. The consequences of failure of such structural material and subsequent redistribution of stresses into or additional loads imposed on the remaining structure is to be considered.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Section 2

2.2.7 In particular, all longitudinally continuous material will be fully effective in tension whereas this may not be so in compression due to a low buckling capability. In this case, it may be necessary to derive and apply different hull girder section moduli to the hogging and sagging bending moment cases.

2.3 Still water bending moments and shear forces

2.3.1 The design still water hogging and sagging bending moment distribution envelope, M_S , is to be taken as the maximum sagging (negative) and maximum hogging (positive) still water bending moments, calculated at each position along the ship. The maximum moments from all loading conditions are to be used to define the still water bending moment distribution envelope.

2.3.2 It is normal for ships which have a low deadweight requirement or a uniform loading rate in association with a low block coefficient to have a hogging still water bending moment in all conditions of loading. For these ships, the maximum design sagging still water bending moment may be taken as the minimum actual hogging bending moment.

2.3.3 The design still water shear force distribution envelope, Q_S , is to be taken as the maximum positive and negative shear force values, calculated at each position along the ship. The maximum shear forces from all loading conditions are to be used to define the still water shear force distribution envelope.

2.4 Design vertical wave bending moments

2.4.1 The minimum value of vertical wave bending moment, M_w at any position along the ship may be taken as follows:

$$M_w = f_1 f_2 C_2 M_{wo} \quad \text{kNm (tonne-f m)}$$

where

$$M_{wo} = 0,1 C_1 L^2 B_{WL} (C_b + 0,7) \quad \text{kNm}$$

$$(M_{wo} = 0,0102 C_1 L^2 B_{WL} (C_b + 0,7) \quad \text{tonne-f m})$$

B_{WL} = maximum waterline breadth, in metres

C_1 , C_2 , L and C_b are given in Pt 3, Ch 4,5

and

f_1 is given in Pt 3, Ch 4,5

f_2 is the hogging, f_{IH} , or sagging, f_{IS} , correction factor based on the amount of bow flare, stern flare, length and effective buoyancy of the aft end of the ship above the waterline

f_{IS} is the sagging (negative) moment correction factor and is to be taken as

$$f_{IS} = -1,10 R_A^{0,3} \quad \text{for values of } R_A > 1,0$$

$$f_{IS} = -1,10 \quad \text{for values of } R_A \leq 1,0$$

f_{IH} is the hogging (positive) moment correction factor and is to be taken as

$$f_{IH} = \frac{1,9 C_b}{(C_b + 0,7)}$$

R_A is an area ratio factor, see 2.4.2.

2.4.2 The area ratio factor, R_A , for the combined stern and bow shape is to be derived as follows:

$$R_A = \frac{30 (A_{BF} + 0,5 A_{SF})}{L B_{WL}}$$

where

A_{BF} is the bow flare area, in m^2

A_{SF} is the stern flare area, in m^2

2.4.3 The bow flare area, A_{BF} , is illustrated in Fig. 2.2.1 and may be derived as follows:

$$A_{BF} = A_{UB} - A_{LB} \quad m^2$$

where

A_{UB} is half the water plane area at a waterline of $T_{C,U}$ of the bow region of the hull forward of $0,8L$ from the AP

A_{LB} is half the water plane area at the design draught of the bow region of the hull forward of $0,8L$ from the AP

NOTE

The AP is to be taken at the aft end of L

The design draught is to be taken as T , see Pt 3, Ch 1,6.1.

Alternatively the following formula may be used

$$A_{BF} = 0,05L (b_0 + 2b_1 + b_2) + b_0 a/2 \quad m^2$$

where

b_0 = projection of $T_{C,U}$ waterline outboard of the design draught waterline at the FP, in metres, see Fig. 2.2.1

b_1 = projection of $T_{C,U}$ waterline outboard of the design draught waterline at $0,9L$ from the AP, in metres

b_2 = projection of $T_{C,U}$ waterline outboard of the design draught waterline at $0,8L$ from the AP, in metres

a = projection of $T_{C,U}$ waterline forward of the FP, in metres

$T_{C,U}$ is a waterline taken $C_1/2$ m above the design draught

$$T_{C,U} = T + \frac{C_1}{2} \quad m$$

C_1 is given in Pt 3, Ch 4, Table 4.5.1

For ships with large bow flare angles above the $T_{C,U}$ waterline the bow flare area may need to be specially considered.

2.4.4 The stern flare area, A_{SF} , is illustrated in Fig. 2.2.1 and is to be derived as follows:

$$A_{SF} = A_{US} - A_{LS} \quad m^2$$

where

A_{US} is half the water plane area at a waterline of $T_{C,U}$ of the stern region of the hull aft of $0,2L$ from the AP

A_{LS} is half the water plane area at a waterline of $T_{C,L}$ of the stern region of the hull aft of $0,2L$ from the AP

$T_{C,L}$ is a waterline taken $C_1/2$ m below the design draught

$$T_{C,L} = T - \frac{C_1}{2} \quad m$$

For ships with tumblehome in the stern region, the maximum breadth at any waterline less than $T_{C,U}$ is to be used in the calculation of A_{US} . The effects of appendages including bossings are to be ignored in the calculation of A_{LS} .

2.4.5 Direct calculation methods may be used to derive the vertical wave bending moments, see Pt 3, Ch 4,2.5.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Section 2

Fig. 2.2.1
Derivation of bow and stern flare areas

2.4.6 The sagging correction factor, f_{IS} , in the vertical wave bending moment formulation in 2.3.1 may be derived by direct calculation methods. Appropriate direct calculation methods include a combination of long term ship motion analysis, non linear ship motion analysis and static balance on a wave crest or trough.

2.5 Design wave shear force

2.5.1 The design vertical wave shear force, Q_w , at any position along the ship is given by:

$$Q_w = 3f_1 K_f M_{wo}/L \text{ kN (tonne-f)}$$

where

K_f is to be taken as follows, see also Fig. 2.2.2:

(a) Positive shear force:

$K_f = 0$ at aft end of L

= +0,836 f_{fH} between 0,2 L and 0,3 L from aft

= +0,65 f_{fH} between 0,4 L and 0,5 L from aft, but not to be less than 0,70

= -0,65 f_{IS} between 0,5 L and 0,6 L from aft

= -0,91 f_{IS} between 0,7 L and 0,85 L from aft

= 0 at forward end of L

(b) Negative shear force:

$K_f = 0$ at aft end of L

= +0,836 f_{IS} between 0,15 L and 0,3 L from aft

= +0,65 f_{IS} between 0,4 L and 0,5 L from aft

= -0,65 f_{fH} between 0,5 L and 0,6 L from aft, but not to be greater than -0,70

= -0,91 f_{fH} between 0,7 L and 0,85 L from aft

= 0 at forward end of L

Intermediate values to be determined by linear interpolation.

f_1 , M_{wo} , f_{IS} and f_{fH} are defined in 2.4.1.

2.6 Buckling strength

2.6.1 The buckling requirements in Pt 3, Ch 4,7 are to be applied to plate panels and longitudinals subject to hull girder compression and shear stresses. The design stresses are to be based on the design values of still water and wave bending moments and shear forces and are given in 2.4.1 and 2.5.1.

2.6.2 The standard deduction for corrosion, d_t , to be applied to plating and longitudinals is to be taken in accordance with Table 4.7.1 in Pt 3, Ch 4.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Sections 2 & 3

2.6.3 The buckling factors of safety, λ , to be applied to the corrected critical buckling stress, σ_{CRB} , of plate panels and longitudinals subjected to hull girder compression are given in Table 2.2.1, where the corrected critical buckling stress is to be determined in accordance with Pt 3, Ch 4,7.3

Table 2.2.1 Buckling factors of safety, λ

Structural item	Buckling factor of safety, λ
Longitudinally effective plating	1,0
Longitudinal stiffeners when the buckling failure mode of the attached plating is elasto-plastic, see Note	1,1
Longitudinal stiffeners when the buckling failure mode of the attached plating is elastic, see Note	1,25
NOTE The buckling mode of failure of the attached plating is defined as follows: elastic $\sigma_E \leq 0,5 \sigma_0$ elasto-plastic $\sigma_E > 0,5 \sigma_0$ where σ_E = the elastic critical buckling stress, see Pt 3, Ch 4,7.3 σ_0 = specified minimum yield stress, in N/mm ² (kgf/mm ²)	

2.6.4 The shear buckling requirements of Pt 3, Ch 4,7.3 are to be applied.

Section 3 Deck structure

3.1 Loading

3.1.1 In general, loadings for decks should comply with the requirements of Chapter 1 except where specified in this Section.

3.1.2 Vehicle decks for the carriage of cars, trucks, etc., are to have a loading for wheeled vehicles as specified in Pt 3, Ch 9,3. Where vehicle decks are also used for the carriage of cargo, the loadings derived from Pt 3, Ch 9,3 are to be not less than would be required by Chapter 1.

3.1.3 For ferries and passenger ships classed **100A1**, the minimum design loadings for decks are not to be taken as less than those in Table 2.3.1.

Table 2.3.1 Design deck loadings (ferries and passenger ships only)

Deck	Design pressures P_s , in kN/m ² (tonne-f/m ²)	
	Secondary structures	Primary structures
Decks in way of accommodation and public spaces, see Note	6,38 (0,65)	3,12 (0,32)
Deck supporting baggage spaces	$3,53H_t$ ($0,36H_t$)	$3,53H_t$ ($0,36H_t$)
Decks in way of stores and refrigerated spaces	14,13 (1,44)	14,13 (1,44)
Decks in way of workshop and machinery spaces (excludes A/C machinery spaces)	18,34 (1,87)	18,34 (1,87)
Magradomes	2,45 (0,25)	2,45 (0,25)
Balconies	3,92 (0,40)	1,96 (0,20)
Weather exposed superstructure decks	2,26 (0,23)	2,26 (0,23)
Weather exposed lifeboat deck	8,44 (0,86)	8,44 (0,86)
Symbols		
H_t = tween deck height, in metres		
NOTE The design pressure, P_s , may be reduced by 12 per cent for ferries and passenger ships with a specified operating area service notation.		

3.1.4 For ferries and passenger ships classed **100A1** with a specified operating area service notation, the loadings for decks in way of baggage and accommodation spaces are to be in accordance with Table 2.3.1.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Section 3

3.1.5 Mooring decks, afterward and forward, other than when part of the strength deck, are to comply with the requirements for forecastles, see Pt 3, Ch 8. Canopy decks or aprons protecting mooring decks are to be designed using the weather head for forecastle decks reduced by 0,3 m.

3.1.6 For movable decks, see Pt 3, Ch 9,4.

3.1.7 For train decks, the minimum design loading will be specially considered.

3.2 Deck plating

3.2.1 For ferries and passenger ships classed **100A1** the minimum thicknesses of decks are to be in accordance with Table 2.3.2.

Table 2.3.2 Thickness of deck plating

Deck location	Plating thickness (mm)
Accommodation and public spaces	$t = 0,008s\sqrt{k}$
Baggage handling and storage	$t = 0,009s\sqrt{k}$
Storerooms	$t = 0,01s\sqrt{k}$
Workshops and machinery spaces	$t = 0,01s\sqrt{k}$
Weather exposed lifeboat deck	$t = 0,00083s_1\sqrt{Lk} + 2,5$
The thickness of deck plating is in no case to be less than 5,0 mm.	

3.2.2 For roll on-roll off cargo ships, the thickness of deck plating (other than for vehicle decks) will generally be in accordance with Chapter 1.

3.2.3 Where decks are required to resist hull girder bending, the thickness is to satisfy the requirements of Pt 3, Ch 4,7.

3.2.4 Where deck plating is required to form the effective flange of deck primary members, the thickness may need to be increased locally taking account of the compressive forces acting, see also Pt 3, Ch 10, Table 10.4.1.

3.2.5 Vehicle deck plating is to satisfy the requirements for plating loaded by wheeled vehicles as specified in Pt 3, Ch 9,3. Where vehicle decks are also to be used for the carriage of cargo, the thickness of plating derived from Pt 3, Ch 9,3 is to be not less than would be required by Ch 1,4.2.

3.2.6 The thickness of all other decks will generally be in accordance with Chapter 1.

3.3 Deck stiffening

3.3.1 For ferries, roll on-roll off cargo ships and passenger ships, the deck stiffening (other than for vehicle decks) will generally be in accordance with Chapter 1. However, in view of the complexity of some multi-deck arrangements in association with large freeboards, deck stiffening may require special consideration.

3.3.2 Vehicle deck beams and longitudinals are to have scantlings in accordance with the requirements for wheeled vehicles as specified in Pt 3, Ch 9,3. Where vehicle decks are also to be used for the carriage of cargo, the scantlings derived from Pt 3, Ch 9,3 are to be not less than would be required by Ch 1,4.3.

3.3.3 In multi-decked ships with high freeboards, the section modulus of deck beams and longitudinals is to be not less than the value given by Table 2.3.3.

Table 2.3.3 Modulus of deck beams and longitudinals for multi-decked ships with high freeboards

Position of beam/longitudinal	Modulus, in cm ³
Decks, excluding those for the stowage of cargo or vehicles	$Z = 0,00083f_R P_s I_e^2 s k$ ($Z = 0,0081f_R P_s I_e^2 s k$) but not less than: $Z = 0,025s$
Symbols	
I_e, s, Z , and k as defined in Ch 1,1.5 P_s = deck loading in kN/m ² (tonne-f/m ²), see Table 2.3.1 f_R = 1, for ships with unrestricted service f_R = 0,81 for ships with a specified operating area service notation	

3.4 Deck supporting primary structure

3.4.1 The section modulus of primary members supporting four or more point loads or a uniformly distributed load is not to be taken as less than:

$$Z = 0,673 S P_s k I_e^2 \quad (\text{cm}^3)$$

$$(Z = 6,60 S P_s k I_e^2) \quad (\text{cm}^3)$$

where

I_e, S, Z and k are as defined in Ch 1,1.5

P_s = deck design loading, in kN/m² (tonnes/m²), see Table 2.3.1.

3.4.2 The moment of inertia of primary members supporting more than four point loads is not to be taken as less than:

$$I = \frac{1,85}{k} I_e Z \quad (\text{cm}^4)$$

Z and I_e as defined in 3.4.1.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Sections 3 & 4

3.4.3 Scantlings of primary structure are to be verified for the following cases using direct calculation methods.

- (a) The structural support arrangement is complex either due to arrangement or loading pattern.
- (b) Large openings are incorporated in the webs of primary members.
- (c) The structure is of novel or unusual design.

The stress criteria in Table 1.4.6 in Chapter 1 are to be complied with.

3.4.4 For passenger ships direct calculations should be carried out generally in accordance with the SDA procedure.

3.4.5 For roll on-roll off cargo ships and passenger ships and passenger/vehicle ferries with large vehicle stowage spaces, see 5.1.5.

3.4.6 Vehicle deck structure is to be of adequate strength for the upward forces imposed at fixed securing points. Local reinforcement is to be fitted as necessary.

Section 4 Shell envelope plating

4.1 Bottom and side shell

4.1.1 For ferries and passenger ships classed **100A1** with a specified operating area service notation the keel thickness for $0,4L$ amidships is to be as required by Ch 1.5. At ends, the keel thickness may be reduced by 25 per cent from the above value, but is to be not less than that of the adjacent shell plating.

4.1.2 The thickness of side shell plating above $1,6T$ including superstructures may require special consideration depending on the particular structural arrangement, hull vertical bending and shear stresses and position of the shell above the waterline. In no case are the shell scantlings above $1,6T$ be less than the following:

$$(a) \quad t_{zm} = t_{shell} - (Z_m - 1,6T) (0,24 + 0,0012L) \sqrt{\frac{k s_1}{s_b}}$$

$$(b) \quad t_{zm} = (4 + 0,02L) \sqrt{\frac{k s_1}{s_b}}$$

(c) as required by Pt 3, Ch 8

where

t_{shell} = minimum required shell thickness above $D/2$ for the specific location, as calculated in Ch 1.5

t_{zm} = minimum shell thickness at Z_m

Z_m = vertical height in metres above base

L and T as defined in Pt 3, Ch 1.1.5.

s_1 , s_b as defined in Table 5.3.1 in Pt 3, Ch 5 for fore end or Table 6.3.1 in Chapter 6 for aft end.

4.1.3 Openings in the side shell and superstructure plating for windows and doors are to be suitably stiffened and the thickness and grade of plating in way will be specially considered.

4.1.4 For ships with broad flat counter stern sections which are liable to be subjected to large wave impact loading, the effect of wave impact loading on the plating and framing of the local shell structure is to be additionally considered, see 4.3 and 5.2.

4.1.5 The plating and framing of the forward shell structure for ships with significant bow flare is to be additionally considered with regard to wave impact loading, see 4.3 and 5.2.

4.1.6 The minimum thickness of the shell plating at ends and for taper is to be not less than the values given in Table 2.4.1, and is in no case to be less than 6 mm.

Table 2.4.1 End shell thickness

Scantling length	Thickness, in mm
70 m and below	$(6,5 + 0,033L) \sqrt{\frac{k s_1}{s_b}} - 1,0$
Between 70 m and 110 m	$(6,5 + 0,033L) \sqrt{\frac{k s_1}{s_b}} - 0,5$
Over 110 m	Pt 3, Ch 5 and Ch 6
Symbols	
L as defined in Pt 3, Ch 1.1.5	
s_1 , s_b as defined in Table 5.3.1 in Pt 3, Ch 5 for fore end or Table 6.3.1 in Chapter 6 for aft end.	

4.1.7 For ferries and passenger ships classed **100A1** with a specified operating area service notation, the bottom and side shell minimum thickness at ends may be taken 20 per cent less than that required by Table 2.4.1 and Pt 3, Ch 5 and Ch 6, but is in no case to be less than 6 mm.

4.2 Bow flare and wave impact pressures

4.2.1 The bow flare wave impact pressure and wave impact pressure on other parts of the side shell plating close to and above the design waterline, P_{bf} , in kN/m^2 due to relative motion is to be taken as:

$$P_{bf} = 0,5 (K_{bf} V_{bf}^2 + K_{rv} H_{rv} V_{rv}^2) \text{ kN/m}^2$$

where

K_{bf} = hull form shape coefficient for wave impacts

$$= \frac{\pi}{\tan \beta_p} \quad \text{for } \beta_p \geq 10$$

$$= 28 (1 - \tan (2\beta_p)) \quad \text{for } \beta_p < 10$$

V_{bf} = wave impact velocity, in m/s, and is given by

$$= \sqrt{V_{thbf}^2 + 2m_1 \ln (N_{bf})} \quad \text{for } N_{bf} \geq 1$$

$$= 0 \quad \text{for } N_{bf} < 1$$

V_{thbf} = threshold velocity for wave impact, in m/s, to be taken as:

$$= \frac{\sqrt{10}}{\cos \alpha_p}$$

$\ln ()$ is the natural logarithm

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Section 4

N_{bf} = No. of wave impacts in a three hour period and is given by

$$= 1720 PR_{bf} \sqrt{\frac{m_1}{m_0}}$$

PR_{bf} = probability of a wave impact and is given by $= e^{-u}$

$$u = \left(\frac{Z_{wl}^2}{2m_0} + \frac{V_{thbf}^2}{2m_1} \right)$$

Z_{wl} = distance of the centroid of the area of plating or stiffener above the local design waterline

m_1 = variance of the relative vertical velocity
 $= 0,25(\omega_e f_{sl} H_{rm})^2$

m_0 = variance of the relative vertical motion
 $= 0,25(f_{sl} H_{rm})^2$

ω_e = effective encounter wave frequency

$$= \omega \left(1 + \frac{0,4\omega V_{sl}}{g} \right)$$

ω = effective wave frequency based on 80 per cent ship length

$$= \sqrt{\frac{2\pi g}{0,8L_{WL}}}$$

f_{sl} = probability level correction factor for relative vertical motion

$$= 1,2$$

V_{sl} = 0,515V, in m/s

K_{rv} = hull form shape coefficient for impact due to forward speed

$$= \frac{\pi}{\tan(90 - \alpha_p)} \quad \text{for } \alpha_p \leq 80$$

$$= 28(1 - \tan(2(90 - \alpha_p))) \quad \text{for } \alpha_p > 80$$

H_{rv} = relative wave heading coefficient

$$= 1 \quad \text{for } \gamma_p > 45$$

$$= \cos(45 - \gamma_p) \quad \text{for } \gamma_p \leq 45$$

V_{rv} = relative forward speed, in m/s

$$= 0,515V \sin \gamma_p$$

α_p = buttock angle measured in the longitudinal plane, in degrees, see Fig. 2.4.1

β_p = flare angle measured in the transverse plane, in degrees, see Fig. 2.4.1. For bow flare regions where the bow is non prismatic, i.e. changing rapidly, then β may be taken as the maximum of α or β

γ_p = waterline angle measured in the horizontal plane, in degrees, see Fig. 2.4.1.

NOTE

Where only two angles are known and are measured in orthogonal planes, then the third angle may be obtained by the following expression:

$$\alpha_p = \tan^{-1}(\tan \beta_p \tan \gamma_p)$$

The relative vertical motion, H_{rm} , is to be taken as

$$H_{rm} = C_{w,min} \left(1 + \frac{4,5}{(C_b + 0,2)} \left(\frac{x_{WL}}{L_{WL}} - x_m \right)^2 \right)$$

where

$$C_{w,min} = \frac{C_w}{\sqrt{2} k_m}$$

C_w = a wave head in metres

$$= 0,0771 L_{WL} (C_b + 0,2)^{0,3} e^{(-0,0044 L_{WL})}$$

$$k_m = 1 + \frac{4,5(0,5 - x_m)^2}{(C_b + 0,2)}$$

x_m = 0,45 – 0,6 F_n but is not to be less than 0,2

$$F_n = \frac{0,515V}{\sqrt{g L_{WL}}}$$

L_{WL} = waterline length at summer load draught

x_{WL} = longitudinal distance, in metres, measured forwards from the aft end of the L_{WL} to the location being considered

V = speed, in knots, as defined in 1.5.1 for bow locations

V = 0 for stern locations

C_b = Rule block coefficient

If the area of plating under consideration has a waterline angle which is re-entrant or decreasing, e.g. in the stern region, then the relative wave heading coefficient, H_{rv} , and the speed V used in the derivation of H_{rm} , are to be taken as zero.

Fig. 2.4.1 Bow flare and bottom slamming angles

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Sections 4 & 5

4.2.2 Alternatively, P_{bf} may be derived by the direct calculations carried out in accordance with a procedure agreed by LR.

4.3 Strengthening for wave impact loads

4.3.1 The shell envelope in the forward and after portions of the hull are to be strengthened against bow flare or wave impact pressure. Typically, strengthening is to be considered over the following areas:

- over the after body in way of a flat counter stern which is close to the waterline;
- over the fore end side and bow structure above the waterline and up to the deck at side;
- other areas where the hull exhibits significant flare.

4.3.2 The thickness of the side shell plating is to be not less than:

$$t = 3,2s_c \sqrt{k h_s} C_R \times 10^{-2} \text{ mm}$$

where

s_c = is the length of the shorter edge of a plating panel framed by primary and secondary members, see Fig. 2.4.2

h_s = equivalent wave impact head, in metres

$h_s = 0,1P_{bf} \text{ m}$

P_{bf} = is defined in 4.2.1

C_R = panel ratio factor

$C_R = \left(\frac{l}{s_c}\right)^{0,41}$ but is not to be taken less than 0,06 or greater than 0,1

l = overall panel length, in metres, measured along a chord between the primary members.

Fig. 2.4.2
Chord spacing and mean chord spacing for secondary members

4.3.3 The structural scantlings required in areas strengthened against bow flare slamming are to be tapered to meet the normal shell envelope requirements.

4.3.4 The side structure scantlings required by this Section must in no case be taken less than those required by the remaining Sections of Chapter 2.

Section 5 Shell envelope framing

5.1 Side structure

5.1.1 The scantlings of frames, or side longitudinals, web frames or transverses, and stringers below $1,6T$ above base are to satisfy the requirement of Chapter 1 and this Section, but may be required to be confirmed by direct calculation. The scantlings of these members above $1,6T$ from base may require special consideration on the basis of the particular structural arrangements, design deck loading, hull vertical bending stresses, and position of the member above the waterline.

5.1.2 The scantlings of side transverses supporting shell longitudinals above $1,6T$ are to satisfy the requirements of:

- Ch 1,6, Pt 3, Ch 5,4 and Pt 3, Ch 6,4.
- The minimum geometric properties required in order to provide rotational constraint to the end of the deck transverse in way:

$$Z_s = \frac{0,677S k P_s L_d^3}{\left(\left(\frac{I_d}{I_s}\right) L_s + L_d\right)} \text{ cm}^3$$

but is not to be less than $0,339S k P_s L_d^2 \text{ cm}^3$

I_s is not to be less than $I_d \left(\frac{L_s}{L_d}\right) \left(\frac{Z_{dR}}{Z_d}\right) \text{ cm}^4$

where

P_s = deck design loading, in kN/m², see Table 2.3.1

L_d = span of adjacent deck transverse, in metres

Z_d = actual modulus of adjacent deck transverse, in cm³

Z_{dR} = Rule modulus of adjacent deck transverse, in cm³

I_d = moment of inertia of adjacent deck transverse, in cm⁴

L_s = span of side shell transverse, in metres

I_s = moment of inertia of side shell transverse, in cm⁴

S, k = as defined in 1.5.1

Due account should be taken of the shell window dimensions when determining the effective width of attached plating.

5.1.3 The required modulus of transverse main and 'tween deck frames, which may have reasonably constant convex curvature over their entire length, may be corrected for curvature as follows:

$$Z_{\min} = Z_{\text{rule}} \left(\frac{1}{\cosh \left(\frac{2\pi Y_c}{l_e} \right)} \right)^3 \text{ cm}^3$$

where

Z_{rule} = modulus requirement, in cm³, from Chapter 1 using l_e

l_e = distance between span support points, in metres, as shown in Fig. 2.5.1

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Section 5

Y_c = curvature measured from a line intersecting the end support points to the frame at mid-span, in metres, as shown in Fig. 2.5.1

Z_{min} = is not to be less than $0,5Z_{rule}$.

Fig. 2.5.1
Distance between span support points and curvature

5.1.4 Where ramp openings are fitted adjacent to the ship's side, adequate support for the side framing is to be provided.

5.1.5 Where bulkheads are omitted as indicated by 1.2.3, the strength of the structure is to be verified by direct calculation. The direct calculation procedure is to be agreed with LR.

5.2 Strengthening for wave impact loads

5.2.1 The side structure in the forward and after portions of the hull is to be strengthened against bow flare or wave impact pressure. Typically, strengthening is to be considered over the following areas:

- over the after body in way of a flat counter stern which is close to the waterline.
- over the fore end side and bow structure above the waterline and up to the deck at side.
- other areas where the hull exhibits significant flare.

5.2.2 The scantlings of secondary stiffeners are not to be less than:

(a) Effective plastic section modulus of stiffeners:

$$Z_p = 3,75 h_s s_{cm} k l_e^2 \times 10^{-3} \text{ cm}^3$$

where

h_s = wave impact head, in metres, as defined in 4.3.2

s_{cm} = mean spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in Fig. 2.4.2

Other symbols are as defined in 1.5.2.

(b) Web area of secondary stiffeners

$$A = 3,7 s_{cm} k h_s \left(l_e - \frac{s_{cm}}{2000} \right) \times 10^{-4} \text{ cm}^2$$

where

s_{cm} = mean spacing of secondary stiffeners, in mm, measured along a chord between parallel adjacent members or equivalent supports, as shown in Fig. 2.4.2

h_s = wave impact head, in metres, as defined in 4.3.2
Other symbols are as defined in 1.5.2.

5.2.3 The effective section properties of secondary stiffeners are to be taken as:

(a) Plastic section modulus of secondary stiffeners, Z_p , is to be taken as:

$$Z_p = 2,8 \times 10^{-4} s_{cm} t_p^2 - 10^{-3} b_f b_{fc} t_f \sin \theta_e + 5 \times 10^{-4} (h_w^2 t_w + 2 b_f t_f h_w) \cos \theta_e \text{ cm}^3$$

where

$$\theta_e = C_0 (90 - \varphi)$$

$$C_0 = 1,1$$

φ = the angle between the stiffener and the side shell, in degrees

$$b_{fc} = 0,5 (b_f - t_w) \text{ for L profiles}$$

$$= 0 \text{ for flat bar and T profiles}$$

$$= \text{see Fig. 4.7.1 in Pt 3, Ch 4, for bulb profiles}$$

$$h_w = \text{height of stiffener web, in mm}$$

$$t_w = \text{web thickness, in mm}$$

$$b_f = \text{breadth of flange, in mm}$$

$$t_f = \text{flange thickness, in mm}$$

$$t_p = \text{thickness of attached plating, in mm}$$

(b) Web area of secondary stiffeners, A_s , is to be taken as:

$$A_s = 0,01 (h_w + t_p) t_w \sin \varphi \text{ cm}^2$$

5.2.4 Where the stiffener web is not perpendicular to the plating, tripping brackets have to be fitted in order to obtain adequate lateral stability.

5.2.5 The scantlings of primary members are not to be less than:

(a) Section modulus of primary members

$$Z = 2 \gamma_z k h_s q v l_e^2 \text{ cm}^3$$

(b) Web area of primary members

$$A = 0,2 \gamma_A k h_s q v l_e \text{ cm}^2$$

where

h_s = wave impact head, in metres, as defined in 4.3.2

and

γ_A and γ_z are strength factors dependent on the load position

for $q < 1$ $\gamma_A = q^3 - 2q^2 + 2$ and $\gamma_z = 3q^3 - 8q^2 + 6q$

for $q = 1$ $\gamma_A = 1$ and $\gamma_z = 1$

$$q = \frac{u}{l_e} \text{ but } \leq 1$$

for web frames:

u is the minimum of g_{bfv} or l_e

v is the minimum of g_{bfh} or s_{cm}

for primary stringers:

u is the minimum of g_{bfh} or l_e

v is the minimum of g_{bfv} or s_{cm}

where

l_e is the effective length of the primary member, in metres

s_{cm} is the mean spacing between primary members along the plating, in metres, see Fig. 2.5.2

g_{bfv} and g_{bfh} are defined in 5.2.6

Other symbols are as defined in 1.5.2.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Sections 5 & 6

- (c) The web of the primary member is to be adequately stiffened

5.2.6 The extents of the wave impact pressure are to be derived as follows:

- (a) the vertical extent, g_{bfv} , is to be taken as:

$$g_{bfv} = \frac{4}{\sin \beta_p \sqrt{8K_{bf}}} \text{ m}$$

- (b) the horizontal extent, g_{bfh} , is to be taken as:

$$g_{bfh} = 4 \text{ m}$$

where

K_{bf} and β_p are given in 4.2.1.

5.2.7 For primary members with cut-outs for the passage of secondary stiffeners, and which may have web stiffeners connected to the secondary stiffener, buckling checks are to be carried out to ensure that the primary member web plating and web stiffener will not buckle under the design load. The buckling procedure to be followed is given in Table 5.1.3 in Pt 3, Ch 5. Where the web stiffener is fitted with a bracket, the buckling capability of the web stiffener in way of the cut-out is to take account of the bracket. Where no web stiffener is fitted, the buckling capability of the primary member web plating is to be checked for the total load transmitted to the connection.

5.2.8 Where the angle between the primary structure web and the plating is less than 70° , the effective section modulus and shear area are to take account of the non-perpendicularity.

5.2.9 The structural scantlings required in areas strengthened against bow flare slamming are to be tapered to meet the normal shell envelope requirements.

5.2.10 The side structure scantlings required by this Section must in no case be taken less than those required by the remaining Sections of Chapter 2.

Section 6 Double bottom

6.1 General

6.1.1 In passenger ships (see 1.1) a double bottom is to be fitted extending from the forepeak bulkhead to the afterpeak bulkhead as far as this is practicable and compatible with the design and proper working of the ship, however:

- In ships of 50 m and upwards but less than 61 m in length a double bottom is to be fitted at least from the machinery space to the forepeak bulkhead, or as near thereto as practicable.
- In ships of 61 m and upwards but less than 76 m in length a double bottom is to be fitted at least outside the machinery space, and is to extend to the fore and after peak bulkheads, or as near thereto as practicable.
- In ships of 76 m in length and upwards, a double bottom is to be fitted amidships, and is to extend to the fore and after peak bulkheads, or as near thereto as practicable.
- A double bottom need not be fitted in way of watertight compartments of moderate size used exclusively for the carriage of liquids, provided the safety of the ship, in the event of bottom or side damage, is not impaired.
- Subject to the provisions stipulated in the relevant Regulations of the *International Convention for the Safety of Life at Sea, 1974* including the 1981 amendments, any deviations from the above requirements will be specially considered.

6.1.2 Where a double bottom as required by 6.1.1 is fitted, its depth is to be compatible with the requirements of Ch 1.8 and the inner bottom is to be continued out to the ship's sides in such a manner as to protect the bottom to the turn of bilge. Such protection will be deemed satisfactory if the line of intersection of the outer edge of the margin plate with the bilge plating is not lower at any part than a horizontal plane passing through the point of intersection with the frame line amidships of a transverse diagonal line inclined at 25° to the base line and cutting it at a point one-half the ship's moulded breadth from the middle line, see Fig. 2.6.1.

6.1.3 Small wells constructed in the double bottom in conjunction with drainage arrangements of holds, etc., are not to extend downwards more than necessary. The depth of the wells is to be at least 460 mm less than the depth of the double bottom at the centreline, and the well is not to extend below the horizontal plane referred to in 6.1.2. A well extending to the outer bottom is, however, permitted at the after end of the shaft tunnel. Other well arrangements (e.g. for lubricating oil under main engines) will be considered provided they give protection equivalent to that afforded by the double bottom.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Sections 6 & 7

Fig. 2.6.1 Inner bottom and well position

6.1.4 Where podded drive systems are to be employed, adequate floors and girders are to be arranged in order to efficiently integrate the unit into the aft structure. The adequacy of the hull structure supporting the unit is to be verified using the maximum external forces and moments stated by the manufacturer. Due account is to be taken of additional forces induced by ship motion accelerations.

6.2 Transmission of pillar loads

6.2.1 In ships where the deck centreline supports are widely spaced, transmission of the pillar loads to the double bottom structure will be specially considered, and additional reinforcement may be required if high shear and bending stresses are induced by the concentrated loads. The reinforcement should take the form of additional floors, and fore and aft girders. The final reinforcement is to be confirmed by direct calculation.

6.2.2 Where, in multi-decked passenger ships, the rule deck loadings from Table 2.3.1 have been used to determine the primary deck supporting structure, the cumulative pillar load P_p may be taken as:

$$P_p = \Sigma (b_p S_p) P_s \quad \text{kN}$$

where

- b_p = breadth of deck supported by pillar
- S_p = mean spacing between pillars
- P_s see Table 2.3.1.

6.2.3 Pillars are to be provided with suitable pads at their heels. Long pillars, and those terminating at the inner bottom are to be bracketed. At pillar heads, the free edges of deck primary structure face plates are to be at least 20 mm clear of the pillar head attachment weld. Where necessary, gusset plates are to be fitted at primary member intersections in way of pillars. These gussets may be applied as doublers onto the primary member face plates and should be at least equal in thickness to the pillar or the face plate, whichever is greater. Where pillars act in tension, the gussets are to be integral with the primary member face plates. The axial stress in tensile pillars is not to exceed $110/k \text{ N/mm}^2$ and full penetration welds are to be arranged in way of the end connections.

6.3 Ferries and passenger ships with a specified operating area service

6.3.1 The thickness of double bottom centre girders may be reduced by 10 per cent, and the thickness of double bottom side girders and floors may be reduced by five per cent, from the values required by Ch 1,8, but is in no case to be less than 6 mm.

Section 7 Peak, watertight and deep tank bulkheads

7.1 General

7.1.1 The scantlings of watertight and deep tank bulkheads are to comply with the requirements of Chapter 1.

7.1.2 The load head, h_4 to be used in watertight bulkhead scantlings for passenger ships is, in addition, to comply with the following:

- For watertight bulkhead plating, the distance from a point one-third of the height of the plate above its lower edge to a point 0,91 m above the bulkhead deck at side, or to the deepest intermediate/equilibrium waterline in damaged condition obtained from applicable damage stability calculations, whichever is the greater.
- For watertight bulkhead stiffeners or girders, the distance from the middle of the effective length to a point 0,91 m above the bulkhead deck at side, or to the deepest intermediate/equilibrium waterline in damaged condition obtained from applicable damage stability calculations, whichever is the greater.

7.1.3 Partial watertight bulkheads and webs fitted above the bulkhead deck which are to be included in damage stability calculations, are to be assessed as watertight, see 7.1.2.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Sections 7 & 8

7.2 Ferries and passenger ships with a specified operating area service

7.2.1 The thickness of bulkhead plating for peak tanks and deep tanks, other than the collision bulkhead, may be reduced by 0,5 mm, and the modulus of bulkhead stiffeners, swedges, corrugations and girders may, in general, be reduced by 20 per cent from the values required by Ch 1,9.

Section 8

Bow doors and inner doors

8.1 Symbols

8.1.1 The symbols used in this Section are defined as follows:

- a = vertical distance, in metres, from the bow door pivot to the centroid of the vertical projected area of bow door, see Fig. 2.8.1
- b = horizontal distance, in metres, from the bow door pivot to the centroid of the horizontal projected area of the bow door, see Fig. 2.8.1
- c = horizontal distance, in metres, from bow door pivot to centre of gravity of bow door, see Fig. 2.8.1
- d = vertical distance, in metres, from bow door pivot to the centre of gravity of the bow door, see Fig. 2.8.1
- h = height of the door, in metres, between the levels of the bottom of the door and the upper deck or between the bottom of the door and the top of the door, whichever is the lesser, see Fig. 2.8.2
- k = material factor (see Pt 3, Ch 2,1.2), but is not to be taken less than 0,72 unless demonstrated otherwise by a direct strength analysis with regard to relevant modes of failure
- l = projected length, in metres, of the door at a height of $\frac{h}{2}$ above the bottom of the door, see Fig. 2.8.2

- w = width of bow door at half height, in metres
- A_z = area, in m^2 , of the horizontal projection of the bow door, between the bottom of the door and the top of the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, see Fig. 2.8.1. Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is the lesser.

A_s = area of stiffener web, in cm^2

A_x = area, in m^2 , of the transverse vertical projection of the bow door, between the bottom of the door and the top of the door or between the bottom of the door and the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, see Fig. 2.8.1. Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is lesser. In determining the height

from the bottom of the door to the upper deck or to the top of the door, the bulwark is to be excluded.

A_y = area, in m^2 , of the longitudinal vertical projection of the bow door, between the bottom of the door and the top of the upper deck bulwark, or between the bottom of the door and the top of the door, including the bulwark, where it is part of the door, whichever is the lesser, see Fig. 2.8.1. Where the flare angle of the bulwark is at least 15 degrees less than the flare angle of the adjacent shell plating, the height from the bottom of the door may be measured to the upper deck or to the top of the door, whichever is the lesser.

W = weight of bow visor, in tonnes

q = distance, in metres, from the centroid of the hydrostatic head profile, to the top of the cargo space

C_H = 0,0125 L where $L < 80$ m

= 1,0 where $L \geq 80$ m

L = length of ship, but need not be taken greater than 200 m

V as defined in 1.5.1

λ = coefficient depending on the area where the ship is intended to be operated

= 1,0 for seagoing ships

= 0,8 for ships operated in coastal waters

= 0,5 for ships operated in sheltered waters

σ = bending stress, in N/mm^2 (kgf/mm 2)

σ_e = equivalent stress, in N/mm^2 (kgf/mm 2)

= $\sqrt{\sigma^2 + 3\tau^2}$

σ_y = yield stress of the bearing material, in N/mm^2 (kgf/mm 2)

τ = shear stress, in N/mm^2 (kgf/mm 2).

Fig. 2.8.1 Bow door (upward hinging)

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Section 8

Fig. 2.8.2 Definition of α and β

8.2 General

8.2.1 Bow doors are defined by the following types:

- Visor doors opened by rotating upwards and outwards about a horizontal axis through two or more hinges located near the top of the door and connected to the primary structure of the door by longitudinally arranged lifting arms.
- Side-opening doors opened either by rotating outwards about a vertical axis through two or more hinges located near the outboard edges or by horizontal translation by means of linking arms arranged with pivoted attachments to the door and the ship. It is expected that side-opening bow doors will be arranged in pairs.

Other bow door types will be specially considered.

8.2.2 Bow doors are to be situated above the freeboard deck. A watertight recess in the freeboard deck located forward of the collision bulkhead and above the deepest waterline, fitted for arrangement of ramps or other related mechanical devices, may be regarded as a part of the freeboard deck for the purpose of this requirement.

8.2.3 Where bow doors lead to a complete or long forward enclosed superstructure, or to a long non-enclosed superstructure which is fitted to attain minimum bow height equivalence, an inner door is to be fitted. The inner door is to be part of the collision bulkhead. Where a sloping vehicle ramp forming the collision bulkhead above the freeboard deck is arranged, the inner door may be omitted if the ramp is weathertight over its complete length and fulfils the requirements of Pt 3, Ch 3 concerning the position of the collision bulkhead.

8.2.4 Bow doors are to be fitted with arrangement for ensuring weathertight sealing, such as gaskets, and to give effective protection to inner doors.

8.2.5 Inner doors forming part of the collision bulkhead are to be watertight over the full height of the cargo space and arranged with fixed sealing supports on the aft side of the doors.

8.2.6 Bow doors and inner doors are to be arranged so as to preclude the possibility of the bow door causing structural damage to the inner door or to the collision bulkhead in the case of damage to or detachment of the bow door. If this is not possible, a second separate inner weather-tight door, complying with 8.2.5, is to be installed.

8.2.7 The requirements for inner doors are based on the assumption that vehicles and cargo are effectively lashed and secured against movement from the stowed position.

8.2.8 For ships complying with the requirements of this Section, the securing, supporting and locking devices are defined as follows:

- A securing device is used to keep the door closed by preventing it from rotating about its hinges.
- A supporting device is used to transmit external and internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed device, that transmits loads from the door to the ship's structure.
- A locking device locks a securing device in the closed position.

8.2.9 The scantlings and arrangements of side shell and stern doors are to be in accordance with the requirements of Pt 3, Ch 11,8.

8.3 Scantlings

8.3.1 The strength of the bow door is to be equivalent to the surrounding structure, as given in Pt 3, Ch 5,6.

8.3.2 For bow doors, including bulwark, of unusual form or proportions, the areas and angles used for the determination of design values of external forces are to be specially considered.

8.3.3 Bow doors of the visor or hinged opening type are to be adequately stiffened, and means are to be provided to prevent lateral or vertical movement of the doors when closed. Care is to be taken to ensure that adequate strength is provided in the connections of the hinge or linking arms to the door structure and to the ship structure.

8.3.4 The thickness of the bow door plating is not to be less than the side shell plating calculated with the door stiffener spacing, and in no case to be less than the minimum shell plate end thickness or forecastle side thickness as appropriate.

8.3.5 The section modulus of horizontal or vertical stiffeners is not to be less than required for end framing. Consideration is to be given, where necessary, to differences in fixity between ship frames and bow door stiffeners.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Section 8

8.3.6 The stiffener webs are to have a net sectional area not less than:

$$A_s = \frac{10Q}{\tau} \text{ cm}^2$$

τ is to be taken as $\frac{100}{k} \text{ N/mm}^2 \left(\frac{10,2}{k} \text{ kgf/mm}^2 \right)$

where

Q = shear force, in kN (tonne-f) calculated using the uniformly distributed external sea pressure, p_e , defined in 8.5.15.

8.3.7 Bow door secondary stiffeners are to be supported by primary members constituting the main stiffening elements of the door.

8.3.8 The scantlings of such primary members are to be based on direct strength calculations. Normally, formulae for simple beam theory may be applied to determine the bending stress. Members are to be considered to have simply supported end connections. The design load, P_e , is the uniformly distributed external sea pressure. The formulae for P_e given in 8.6.1, may be used with α and β defined as:

α = flare angle, in degrees, generally to be measured normal to the shell between the vertical axis and the vertical tangent to the outer shell of the door measured at the point on the bow door, one half of the projected length ($l/2$) aft of the stern line on the plane at the half height of the door ($h/2$) (see Fig. 2.8.2)

β = entry angle, in degrees, generally to be measured on the outer shell of the door between the longitudinal axis and the waterplane tangent measured at the point on the bow door, one half of the projected length ($l/2$) aft of the stem line on the plane at the half height of the door ($h/2$) (see Fig. 2.8.2)

The permissible stresses are as follows:

$$\tau = \frac{80}{k} \text{ N/mm}^2 \left(\frac{8,2}{k} \text{ kgf/mm}^2 \right)$$

$$\sigma = \frac{120}{k} \text{ N/mm}^2 \left(\frac{12,2}{k} \text{ kgf/mm}^2 \right)$$

$$\sigma_e = \frac{150}{k} \text{ N/mm}^2 \left(\frac{15,3}{k} \text{ kgf/mm}^2 \right)$$

8.3.9 The webs of primary members are to be adequately stiffened, preferably in a direction perpendicular to the shell plating.

8.3.10 The primary members of the bow doors and hull structure in way are to have sufficient stiffness to ensure the integrity of the boundary support of the doors.

8.3.11 All load transmitting elements in the design load path, from door through securing arrangements and supporting devices into the ship structure, including welded connections, are to be to the same strength standard. These elements include pins, supporting brackets and back-up brackets. Where cut-outs are made in the supporting structure, the strength and stiffness will be specially considered.

8.3.12 For bow doors and inner doors, the distribution of forces acting on the securing devices and the supporting devices is to be supported by direct calculations taking into account the flexibility of the structure and the actual position and stiffness of the supports.

8.3.13 The buckling strength of primary members is to be specially considered.

8.4 Vehicle ramps

8.4.1 Where doors also serve as vehicle ramps, the scantlings are to be not less than would be required by 3.2.2 and 3.3.2 and where they form part of the collision bulkhead the arrangement is to be in accordance with Pt 3, Ch 3,4.5.

8.5 Arrangements for the closing, securing and supporting of doors

8.5.1 Bow doors are to be fitted with adequate means of closing, securing and supporting so as to be commensurate with the strength and stiffness of the surrounding structure. The hull supporting structure in way of the bow doors is to be suitable for the same design loads and design stresses as the securing and supporting devices. Where packing is required, the packing material is to be of a comparatively soft type, and the supporting forces are to be carried by the steel structure only. Maximum design clearance between securing and supporting devices is not to exceed 3 mm.

8.5.2 Securing devices are to be simple to operate and easily accessible. They are to be of a design approved by LR for the intended purpose.

8.5.3 Securing devices are to be equipped with positive locking arrangements. Arrangements are to be such that the devices are retained in the closed position within design limits of inclination, vibration and other motion-induced loads and in the event of loss of any actuating power supply.

8.5.4 Systems for door opening/closing and securing/locking are to be interlocked in such a way that they can only operate in a proper sequence. Hydraulic systems are to comply with Pt 5, Ch 14,9.

8.5.5 Means are to be provided to enable the bow doors to be mechanically fixed in the open position taking into account the self weight of the door and a minimum wind pressure of 1,5 kN/m² (0,153 tonne-f/m²) acting on the maximum projected area in the open position.

8.5.6 The spacing for side and top cleats should not exceed 2,5 m and there should be cleats positioned as close to the corners as practicable. Alternative arrangements for ensuring weathertight sealing will be specially considered.

8.5.7 Control and monitoring arrangements are to comply with Pt 6, Ch 2,18.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Section 8

8.6 Design of securing and supporting devices

8.6.1 The external design forces for securing devices, supporting devices and surrounding structure are to be taken not less than P , taking the direction of the pressure into account:

$$\begin{aligned} P_x &= A_x p_e \\ P_y &= A_y p_e \\ P_z &= A_z p_e \end{aligned}$$

where

p_e = external sea pressure, not to be taken less than:

(a) For bow doors:

$$\begin{aligned} p_e &= 0,8 (0,15V + 0,6 \sqrt{L})^2 \text{ kN/m}^2 \\ &\quad (0,082 (0,15V + 0,6 \sqrt{L})^2 \text{ tonne-f/m}^2) \\ \text{or} \\ p_e &= 2,75\lambda C_H (0,22 + 0,15 \tan \alpha) (0,4V \sin \beta + \\ &\quad 0,6 \sqrt{L})^2 \text{ kN/m}^2 \\ \text{or} \\ &\quad (0,28\lambda C_H (0,22 + 0,15 \tan \alpha) (0,4V \sin \beta + \\ &\quad 0,6 \sqrt{L})^2 \text{ tonne-f/m}^2) \end{aligned}$$

whichever is the greater.

(b) For inner doors:

$$p_e = 0,45L \text{ kN/m}^2 \\ (0,046L \text{ tonne-f/m}^2)$$

or

$$p_e = 10q \text{ kN/m}^2 \\ (1,02q \text{ tonne-f/m}^2) \\ \text{whichever is the greater}$$

The symbols are as defined in 8.1.1

8.6.2 The inner door internal design pressure, considered for the scantlings of securing devices, is not to be less than 25 kN/m² (2,5 tonne-f/m²).

8.6.3 For visor doors, the pivot arrangement is to be such that the visor is self closing under external loads. The closing moment, M_c , is to be taken as:

$$\begin{aligned} M_c &= P_x a + 10Wc - P_z b \text{ kN m} \\ &\quad (P_x a + 1,02Wc - P_z b \text{ tonne-f m}) \end{aligned}$$

but is not to be less than:

$$\begin{aligned} M_c &= 10Wc + 0,1 \sqrt{(a^2 + b^2) (P_x^2 + P_z^2)} \text{ kN m} \\ &\quad (1,02Wc + 0,1 \sqrt{(a^2 + b^2) (P_x^2 + P_z^2)} \text{ tonne-f m}) \end{aligned}$$

8.6.4 For visor doors, two securing devices are to be provided at the lower part of the door, each capable of providing the full reaction force required to prevent opening of the door within the permissible stresses given in 8.6.7. The opening moment M_o , to be balanced by this reaction force, is to be taken as not less than:

$$\begin{aligned} M_o &= 10Wd + 5A_x a \text{ kN m} \\ &\quad (1,02Wd + 0,51A_x a \text{ tonne-f m}) \end{aligned}$$

8.6.5 For visor type doors, the securing and supporting devices, excluding hinges, are to be capable of resisting the vertical design force ($P_z - 10W$) kN ($(P_z - 1,02W)$ tonne-f), within the permissible stresses given in 8.6.7.

8.6.6 For side-opening doors, securing devices are to be provided such that in the event of a failure of any single securing device the remainder are capable of providing the full reaction force required to prevent the opening of the door. The permissible stresses given in 8.6.7 are not to be exceeded. The opening moment about the hinges to be balanced by this reaction force is not to be less than that calculated when the following loads are applied:

- An internal pressure of 5 kN/m² (0,51 tonne-f/m²).
- A force of 10W kN (1,02W tonne-f) acting forward at the centroid of mass.

8.6.7 Securing devices and supporting devices are to be designed to withstand the forces given above using the following permissible stresses:

$$\tau = \frac{80}{k} \text{ N/mm}^2 \left(\frac{8,2}{k} \text{ kgf/mm}^2 \right)$$

$$\sigma = \frac{120}{k} \text{ N/mm}^2 \left(\frac{12,2}{k} \text{ kgf/mm}^2 \right)$$

$$\sigma_e = \frac{150}{k} \text{ N/mm}^2 \left(\frac{15,3}{k} \text{ kgf/mm}^2 \right)$$

8.6.8 The arrangement of securing and supporting devices is to be such that threaded bolts are not to carry support forces. The maximum tensile stress in way of threads of bolts, not carrying support forces, is not to exceed:

$$\frac{125}{k} \text{ N/mm}^2 \left(\frac{12,7}{k} \text{ kgf/mm}^2 \right).$$

8.6.9 For steel to steel bearings in securing and supporting devices, the nominal bearing pressure is not to exceed 0,8 σ_y . For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification. The nominal bearing pressure is to be calculated by dividing the design force by the projected bearing area.

8.6.10 The reaction forces to be applied to the effective securing and supporting devices, are to be determined from the combination of external loads defined in Table 2.8.1.

Table 2.8.1 Combination of external loads

Bow door type	Combination of external loads	
	Case 1 (Head seas)	Case 2 (Quartering seas)
Visor doors, see Notes 1 and 2	P_x and P_z , see Note 3	0,7 P_y acting on each side separately, together with 0,7 P_x and 0,7 P_z
Side opening, see Notes 1 and 2	P_x , P_y and P_z acting on both doors, see Note 3	0,7 P_x and 0,7 P_z acting on both doors and 0,7 P_y acting on each door separately

NOTES

- P_x , P_y and P_z are defined in 8.5.15. These forces are to be applied at the centroid of the projected areas.
- The self weight of the door is to be included in the combination of external loads.
- The Case 1 forces are generally to give rise to a zero moment about the transverse axis through the centroid of area A_y , see Fig. 2.8.1.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Section 8

8.6.11 The distribution of the reaction forces acting on the securing and supporting devices is to be supported by direct calculations taking into account the flexibility of the hull structure and the actual position and stiffness of the supports. Small and/or flexible devices, such as cleats, intended to provide load compression of the packing material are not to be included in these calculations.

8.6.12 The hinge or linking arms of a bow door and its supports are to be designed for the static and dynamic opening forces. A minimum wind pressure of 1,5 kN/m² (0,153 tonne-f/m²), acting on the transverse projected area of the door is to be taken into account.

8.6.13 For side-opening doors, supporting devices are to be provided in way of girder ends at the closing of the two doors to prevent one side shifting towards the other under the effect of asymmetrical pressure. A typical arrangement is shown in Fig. 2.8.3.

Fig. 2.8.3
Typical supporting device between doors

8.6.14 Inner doors are to be gasketed and weathertight.

8.6.15 Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be included and considered to calculate the reaction forces acting on the devices.

8.6.16 The number of securing and supporting devices is to be the minimum practicable whilst complying with 8.6.4 and 8.6.17 and taking account of the available space for adequate support in the hull structure.

8.6.17 The arrangement of securing devices and supporting devices in way of these securing devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable of withstanding the reaction forces, resulting from the external loads defined in Table 2.8.1, without exceeding, by more than 20 per cent, the permissible stresses as defined in 8.6.7.

8.7 Operating and Maintenance Manual

8.7.1 An Operating and Maintenance Manual for the bow doors and inner doors is to be provided on board and is to contain the following information:

- (a) main particulars and design drawings,
 - special safety precautions;
 - details of vessel, class and statutory certificates;
 - equipment and design loading for ramps;
 - key plan of equipment for doors and ramps;
 - manufacturers' recommended testing for equipment; and
 - a description of the following equipment:
 - bow doors;
 - inner bow doors;
 - bow ramp/doors;
 - side doors;
 - stern doors;
 - central power pack;
 - bridge panel;
 - ramps leading down from the main deck
 - engine control room panel.
- (b) service conditions:
 - limiting heel and trim of the ship for loading/unloading;
 - limiting heel and trim for door operations;
 - operating instructions for doors and ramps; and
 - emergency operating instructions for doors and ramps.
- (c) maintenance:
 - schedule and extent of maintenance;
 - trouble shooting and acceptable clearances; and
 - manufacturers' maintenance procedures.
- (d) register of inspections, including inspection of locking, securing and supporting devices, repairs and renewals.

This Manual is to be submitted for approval, and is to contain a note recommending that recorded inspections of the door supporting and securing devices be carried out by the ship's staff at monthly intervals or following incidents that could result in damage, including heavy weather or contact in the region of the doors. Any damages recorded during such inspections are to be reported to LR.

8.7.2 Documented operating procedures for closing and securing the bow doors and inner doors are to be kept on board and posted at an appropriate place.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Section 9

Section 9 Subdivision structure on vehicle deck

9.1 General

9.1.1 The requirements of this Section cover subdivision structure fitted on the vehicle deck(s) of roll on–roll off passenger ships. Subdivision structure includes partition doors, bulk-heads and longitudinal casings.

9.1.2 Where a ship is provided with subdivision structure that complies with the requirements of this Section, the ship will be eligible to be assigned the descriptive note **SSDS** which will be entered in column 6 of the *Register Book*.

9.1.3 The fitting of subdivision structure on the vehicle deck(s) forms one option to mitigate the stability-reducing effects of water on the vehicle deck(s) after damage. Such measures may be required by the National Administration with whom the ship is registered and/or by the National Administration within whose territorial jurisdiction the ship is intended to operate, for example see The Stockholm Agreement.

9.2 Design loads

9.2.1 For calculation of the design loads, an equivalent depth of water on the first vehicle deck above the design waterline, d , in metres, is to be derived in accordance with the requirements of the National Administration, see 9.1.3.

9.2.2 It is assumed that vehicles and cargo are effectively lashed and secured to prevent movement from the stowed position.

9.2.3 The design heads (see Fig. 2.9.1) are not to be taken less than the greater of 0,5 m and:

(a) For transverse structure more than 1,5 m away from the longitudinal boundaries of the compartment:

$$h_T = 1,4 \sqrt{L_C d K} \quad \text{in metres, for } z < 1$$

$$= 1,4 \sqrt{L_C d K} \left(1 - \frac{(z-1)}{1,4 \sqrt{L_C d K} - 1} \right) \quad \text{in metres, for } z \geq 1$$

Symbols are as defined in 9.2.4.

(b) For longitudinal structure more than $L_C/6$ away from the transverse boundaries of the compartment:

$$h_L = \sqrt{B_C d} \quad \text{in metres, for } z < 1$$

$$= \sqrt{B_C d} \left(1 - \frac{(z-1)}{(1,4 \sqrt{B_C d} - 1)} \right) \quad \text{in metres, for } z \geq 1$$

Symbols are as defined in 9.2.4.

(c) For structure elsewhere:

$$h_c = \frac{L_C K}{2} + \sqrt{R} \quad \text{in metres, for } z < 1$$

$$\left(\frac{L_C K}{2} + \sqrt{R} \right) \left(1 - \frac{(z-1)}{1,4 \left(\frac{L_C K}{2} + R \right) - 1} \right)$$

in metres, for $z \geq 1$

Symbols are as defined in 9.2.4.

Fig. 2.9.1
Design heads for different locations in compartment

9.2.4 Symbols, as used in 9.2.3, are defined as follows:

d = equivalent depth of water on the vehicle deck, in metres, in the upright condition taking into account the volume of flooded and accumulated water on the vehicle deck calculated in accordance with the requirements of the National Administration, see 9.1.3 and 9.2.1

z = vertical distance, between the point under consideration and the flooded vehicle deck, in metres. For plate panels the point under consideration is to be taken as one third of the panel height above its lower edge. For stiffeners the point under consideration is to be taken as the midspan of the effective length

B_C = breadth of compartment, in metres, see Fig. 2.9.1

K = $0,21e^{(-0,0033L_{pp})}$ and need not exceed 0,14

L_C = length of compartment, in metres, see Fig. 2.9.1

R = $B_C d - \frac{L_C^2 K^2}{12}$ and is not to be taken less than 0

e = base of natural logarithms, 2,7183

L_{pp} = as defined in Pt 3, Ch 1,6.

9.2.5 The design heads calculated in 9.2.3 are based on the ship being in the upright condition. Where the actual damaged floating position is specified, the design heads will be specially considered taking this into account.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Section 9

9.2.6 The subdivision structure, and access doors within the subdivision structure, are to be capable of withstanding the design loading applied from the side of the compartment under consideration.

9.2.7 Consideration will be given to the use of design heads agreed by the National Administration.

9.3 Height of subdivision structure

9.3.1 The height of the subdivision structure, H_D , is not to be less than:

- 4 m, or
- $8d$, but not less than 2,2 m, or
- the height between the vehicle deck under consideration and the underside of the next watertight deck above, whichever is the lesser

where

d = as defined in 9.2.4.

9.3.2 For special arrangements, such as hanging car decks or wide side casings, other subdivision structure heights may be accepted on the basis of detailed model tests in the flooded conditions under investigation by the National Administration.

9.4 Material

9.4.1 Where materials other than steel are used, the scantlings are to be specially considered.

9.5 Scantlings of subdivision structure other than doors

9.5.1 The minimum scantlings of subdivision bulkheads and casings are to be derived in accordance with Table 1.9.1 in Chapter 1 for watertight bulkheads, where h_4 is to be substituted by either of h_T , h_L or h_C , depending on the location under consideration.

9.5.2 Where a cut-out is made in the subdivision structure for the fitting of an access door, the strength and integrity of the subdivision structure are to be maintained.

9.6 Scantlings of subdivision doors

9.6.1 The plate thickness of subdivision doors of single plate construction is not to be less than the greater of:

$$t = 0,004s f (h k)^{0,5} \text{ mm, or}$$

$$t = 5,0 \text{ mm}$$

where

s, k = as defined in 1.5.1

f = as defined in Table 1.9.1 in Chapter 1

h = h_T , h_L or h_C as defined in 9.2.3, as appropriate.

9.6.2 For subdivision doors of a double plate construction the plate thickness is to be specially considered.

9.6.3 The scantlings of primary and secondary stiffeners of subdivision doors are to be based on direct strength calculations.

9.6.4 The direct strength calculations are also to provide an assessment of the door, under the design load, to enable the leakage and hence the drainage requirements of 9.9 to be assessed.

9.6.5 For the purpose of the direct strength calculations, the stresses induced in the subdivision door, determined using the design loads from 9.2, are not to exceed the permissible values given in Table 2.9.1. Checks are also to be carried out to ensure that the door will not buckle under the design loads.

Table 2.9.1 Permissible stress values

Stress type	Permissible stress
Direct stress	σ_o
Shear stress	$\frac{\sigma_o}{3}$
Combined stress	σ_o
Symbols	
σ_o = specified minimum yield stress, in N/mm ² (kgf/mm ²)	

9.6.6 Where a cut-out is made within the subdivision door for the fitting of an access door, the strength of the subdivision door is to be maintained.

9.7 Closing, securing and supporting of subdivision doors

9.7.1 The closing and securing devices of doors are to comply with the following requirements:

- Securing devices are to be simple to operate and easily accessible. They are to be of a design approved by LR for the intended purpose.
- Securing devices and supporting devices are to be designed to withstand the design loads calculated in 9.2.1 in association with the permissible stresses shown in Table 2.9.2.
- The arrangement of securing and supporting devices is to be such that threaded bolts do not carry support forces. The maximum tensile stress in way of threads of bolts not carrying support forces is not to exceed $0,5\sigma_o$.
- For steel to steel bearings in securing and supporting devices, the bearing pressure is not to exceed $0,8\sigma_o$. For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification. The bearing pressure is to be calculated by dividing the design force by the projected bearing area.
- Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be included when calculating the reaction forces acting on the devices.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Sections 9 & 10

- (f) Securing devices are to be equipped with positive locking arrangements. Arrangements are to be such that the securing devices are retained in the closed position within design limits of inclination, vibration and other motion-induced loads and in the event of loss of any actuating power supply.
- (g) Hydraulic systems are to comply with Pt 5, Ch 14,9.
- (h) Control and monitoring arrangements are to comply with Pt 6, Ch 2,18.

Table 2.9.2 Permissible stress values

Stress type	Permissible stress
Direct stress	$0,8\sigma_0$
Shear stress	$0,5\sigma_0$
Combined stress	$0,8\sigma_0$
Symbols	
σ_0 = specified minimum yield stress, in N/mm ² (kgf/mm ²)	

9.7.2 The reaction forces to be applied to the effective securing and supporting devices are to be determined using the applicable design loads calculated using the heads in 9.2 together with the weight of the door.

9.8 Access doors

9.8.1 Access doors are permitted to be fitted in subdivision doors or bulkheads in order to provide access between compartments.

9.8.2 Access doors may be manually operated.

9.8.3 The strength of access doors is to be not less than that of the surrounding structure.

9.8.4 Means are to be provided to ensure that access doors are closed and secured when not in use after the ship has left the berth.

9.8.5 A notice is to be displayed on the access doors stating that the door is to be closed and secured at all times when not in use, when the ship is under way.

9.8.6 Means are to be provided on the navigation bridge to indicate whether the access doors are open or closed.

9.9 Watertightness and drainage

9.9.1 Subdivision doors and access doors are to be fitted with gaskets in order to minimise leakage. For access doors where down flooding could result, particular attention is to be paid to drainage requirements.

9.9.2 The gasket arrangement shall provide sufficient flexibility to absorb possible racking deformation.

9.9.3 Attention is drawn to the drainage requirements of Pt 5, Ch 13,3.1 with respect to the compartments created by subdivision structures.

9.9.4 The drainage arrangement for each compartment is to have sufficient capacity to handle leakage from any adjacent flooded compartment.

9.10 Ventilation of vehicle deck spaces

9.10.1 Attention is drawn to the ventilation requirement of Pt 6, Ch 2,13.12.4, since subdivision structure could disrupt air flow.

9.11 Operating and Maintenance Manual

9.11.1 An Operating and Maintenance Manual for the subdivision doors is to be provided on board and is to contain the following:

- main particulars and design drawings,
- service conditions (e.g. service area restrictions),
- maintenance and function testing,
- register of inspections, repairs and renewals.

9.11.2 The Manual is to be submitted for approval. It is to contain a note recommending that recorded inspections of supporting and securing devices are to be carried out by the ship's staff at monthly intervals, or following incidents that could result in damage, including heavy weather or contact in the region of the subdivision doors. Any damages recorded during such inspections are to be reported to LR.

9.11.3 Documented operating procedures for closing and securing the subdivision doors are to be kept on board and posted in an appropriate place.

Section 10 Masts and standing rigging

10.1 General

10.1.1 Masts are generally to be of tubular construction and may be either stayed or unstayed. Special consideration will be given to other forms of construction.

10.1.2 Masts are to be of sufficient strength to withstand the worst combination of loads from both the operational case with full sail, reduced sail configurations where applicable and survival conditions.

10.1.3 Masts are to be adequately supported using stays if necessary.

10.1.4 Drainage is to be provided to prevent the build up of seawater or condensation within the mast structure. Steel masts should, where possible, be coated internally with a suitable anti-corrosive preparation.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Section 10

10.1.5 Openings in the masts for entry and exit of running-rigging or cables should be adequately compensated with suitable insert plates or doublers.

10.1.6 Masts are to be efficiently integrated into the hull and in principle, carried through to the keel. Alternative arrangements of supporting masts will require to be specially considered.

10.1.7 Where ship response data are not available the values for roll, pitch and heave given in Table 2.10.1 should be used.

Table 2.10.1 Ship motions

Motion	Maximum single amplitude	Period, in seconds
Roll	$\phi = \sin^{-1} \theta$ degrees but need not exceed 30° and is not to be taken less than 22°	$T_r = \frac{0,7B}{\sqrt{GM}}$
Pitch	$\psi = 12e^{-0,0033L_{pp}}$ degrees, but need not exceed 8°	$T_p = 0,5\sqrt{L_{pp}}$
Heave	$\frac{L_{pp}}{80}$ m	$T_h = 0,5\sqrt{L_{pp}}$
where L_{pp} , B as defined in Pt 3, Ch 1,6 GM = transverse metacentric height of loaded ship, in metres $\theta = \left(0,45 + 0,1 \frac{L}{B}\right) \left(0,54 - \frac{L}{1270}\right)$		

10.2 Design loadings and allowable stresses

10.2.1 The mast and standing rigging design is to be considered with respect to the loads from the following conditions:

- R1 – Operational case with full press of sails for the maximum operational apparent wind speed as specified by the designer.
- R2 – Storm conditions with reduced sail.
- R3 – Survival case with sails reefed/stowed/weather-vaning with the environmental loads resulting from the combination of a maximum wind speed of 63 m/sec and the accelerations produced by ship motions.

10.2.2 The mast section is to be designed to have a margin against failure due to column buckling using the greatest combined design axial and bending stress in both the transverse and fore and aft directions.

10.2.3 For loadcases R1 and R2 described in 10.2.1, the following condition is to be satisfied:

$$\frac{\sigma_b}{\sigma_y} + \frac{\sigma_a}{\sigma_c} \leq 0,67$$

For loadcase R3 the following condition is to be satisfied:

$$\frac{\sigma_b}{\sigma_y} + \frac{\sigma_a}{\sigma_c} \leq 0,85$$

where

σ_b is the bending stress in the mast section under consideration

σ_y is the tensile yield stress for the material

σ_a is the axial stress in the mast section under consideration

σ_c is the critical buckling stress for the mast section.

10.2.4 For thin walled masts, constructed from either flat or curved shells, calculations are to be submitted demonstrating adequate margin against local elastic instability.

10.3 Materials of mast construction

10.3.1 In general masts are to be constructed from either steel or aluminium alloy tubular members, extrusions and/or welded constructions, and are, generally, to comply with LR's *Rules for the Manufacture, Testing and Certification of Materials*, where appropriate.

10.3.2 Other materials will be specially considered.

10.4 Standing rigging

10.4.1 Standing rigging is to be so arranged such that it does not foul running rigging or interfere with the operation of the sails. Protection is to be provided against routine quay contacts.

10.4.2 Standing rigging is to be effectively attached to the masts, deck and hull structure and is to be so designed that it cannot become disconnected during operation.

10.4.3 Standing rigging is to be properly erected using tensioning devices to ensure that the correct pre-tension is applied as specified by the designer.

10.4.4 The initial pre-tension applied to standing rigging is to be measured and recorded.

10.5 Design loadings

10.5.1 The forces in the standing rigging are to be obtained by direct calculation methods for the load conditions given in 10.2.1.

10.5.2 The minimum factors of safety on the breaking strength of shrouds and stays are as follows:

Sail cases R1 and R2	3,5
Survival case R3	2,0

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Sections 10 & 11

10.6 Shroud and stay attachment points

10.6.1 Standing rigging is to be effectively attached to the masts, ship's deck or bulwark structure. Chain plates, mast eyeplates and the structure in way is to be reinforced to withstand a load of 1,2 x breaking strength of the appropriate shroud or stay.

Generally the hull structure in way of shroud/stay attachment should be capable of withstanding the wire breaking load without permanent deformation of the structure.

10.6.2 Increased mast wall thickness, or, internal or external mast stiffening rings or diaphragms are to be arranged in way of the toes of shroud and stay eyeplates to resist mast wall punching shear loads. Where additional mast stiffening rings or diaphragms are not fitted, the mast wall is not to be less than:

$$t_{wall} = \frac{2 (h_{eye} B_s k_{mast})}{(t_{eye} l_{eye})} \text{ (mm)}$$

where

- h_{eye} = eyeplate pin axis from mast wall, mm, see Fig. 2.10.1
- B_s = breaking strength, in kN, of attached rigging component
- k_{mast} = mast material factor, k
- t_{eye} = eyeplate thickness, mm, see Fig. 2.10.1
- l_{eye} = eyeplate length, mm, see Fig. 2.10.1.

10.6.3 The attachments of the stays and shrouds are to be efficiently integrated into the hull structure and due regard given to any attachments to the sheerstrake.

10.6.4 Where it is intended to use mechanical attachments (bolting) of running rigging or other gear to the mast walls, the number of holes are to be kept to a minimum and are to be staggered in order to maintain the structural integrity of the mast. All details are to be submitted.

10.7 Materials for rigging

10.7.1 In general, standing rigging is to be made from galvanised steel wire rope (GSWR) with galvanised steel rigging screws, shackles and terminations, and is to comply with the requirements of LR. Special consideration will however be given to other rigging materials.

10.7.2 Alternatively, stainless steel wire rope or solid rod rigging may be used in place of GSWR.

10.7.3 The steel wire rope, solid rods and loose fittings used for standing rigging are to be manufactured to a recognised National or International Standard and at an LR approved works.

10.7.4 Rigging components from other sources will be specially considered.

10.7.5 Where stainless steel rigging is employed, particular attention is to be given to the selection of the grade of material used as some stainless steels are prone to stress corrosion cracking and consequent fatigue failure, the onset of which is not readily observed.

10.7.6 Attention is drawn to the requirements of the Flag Administration for the vessel who may have requirements regarding the application of certain materials, systems or criteria.

10.8 Testing and certification

10.8.1 All equipment items used for standing rigging, including loose items of gear such as shackles, bottle screws, sheaves, etc., are to be tested and surveyed in accordance with LR requirements. For systems employing specialised devices or materials, individual consideration will be given to the testing and survey requirements.

10.8.2 For sailing passenger ships, the equipment requirement will be in accordance with the letter and numeral two grades higher than that corresponding to the calculated Equipment Numeral.

Section 11 Miscellaneous openings

11.1 General

11.1.1 The requirements of Pt 3, Ch 11,6 are to be complied with.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Section 11

11.2 Openings in main vehicle deck

11.2.1 Where the main vehicle deck is enclosed, all companionways and openings in the deck which lead to spaces below are generally to be protected by steel doors or hatch covers. Approved fire doors may be accepted in lieu of steel doors. The sills or coamings are to be not less than 230 mm above the main vehicle deck, with the exception of those leading to machinery spaces which are to have sills or coamings not less than 380 mm. Exceptionally, when such openings are to be kept closed at sea, sills or coamings may be reduced in height, provided that the sealing arrangements are adequate. In such cases, the doors or hatch covers are to be secured weathertight by gaskets and a sufficient number of clamping devices. Such items as portable plates in the main vehicle deck arranged for the removal of machinery parts, etc., may be arranged flush with the deck, provided they are secured by gaskets and closely spaced bolts at a pitch not exceeding five diameters.

11.2.2 Scuppers from vehicle or cargo spaces fitted with an approved fixed pressure water spray fire-extinguishing system are to be led inboard to tanks. Alternatively they may be led overboard providing they comply with Pt 3, Ch 12,4.1.3 (a) and (b).

11.2.3 Inboard draining scuppers do not require valves but are to be led to suitable drain tanks (not engine room or hold bilges) and the capacity of the tanks should be sufficient to hold approximately 10 minutes of drenching water. The arrangements for emptying these tanks are to be approved and suitable high level alarms provided.

11.2.4 A drainage system is to be arranged in the area between bow door and ramp, or where no ramp is fitted, between the bow door and inner door. The system is to be equipped with an audible and visual alarm function to the navigation bridge being set off when the water levels in these areas exceed 0,5 m or the high water level alarm, whichever is the lesser.

11.2.5 The drainage arrangement for each area is to have sufficient capacity to prevent accumulation of water in case of leakage. Scuppers are to be provided on both sides of the ship with a diameter not less than 50 mm and in accordance with Pt 3, Ch 12,4. Alternatively, a bilge suction should be provided.

11.2.6 If the main vehicle deck is not totally enclosed, scuppers or freeing ports are to be provided consistent with the requirements of Pt 3, Ch 8,5.3.

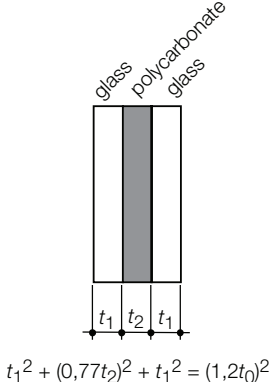

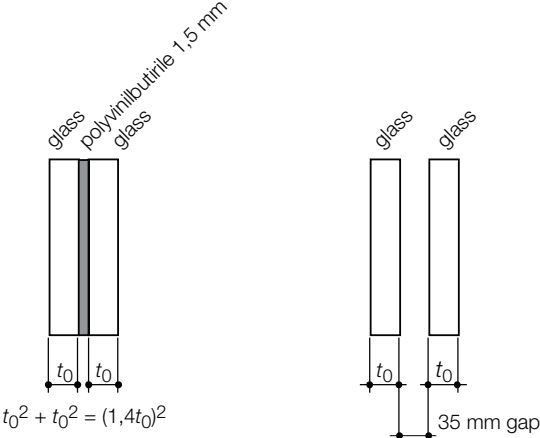

11.2.7 Air pipes from cofferdams or void spaces may terminate in the enclosed 'tween deck space on the main vehicle deck provided the space is adequately ventilated and the air pipes are provided with weathertight closing appliances.

11.2.8 Between the bow door and the inner door a television surveillance system is to be fitted with a monitor on the navigation bridge and in the engine control room. The system must monitor the position of doors and a sufficient number of their securing devices. Special consideration is to be given for lighting and contrasting colour of objects under surveillance, see also 8.5.7.

11.3 Strength assessment of windows in large passenger ships

11.3.1 On windows in the second tier and higher above the freeboard deck, a glazing equivalent may be fitted in lieu of deadlights/storm covers. The thicknesses and arrangements are to be acceptable to the National Authority with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the ship is intended to operate. For arrangements of glazing acceptable to LR, see Table 2.11.1. Alternative arrangement of glazing in lieu of deadlights/storm covers may be accepted provided details are submitted for consideration.

Table 2.11.1 Acceptable arrangements of glazing in lieu of portable storm covers/deadlights

In lieu of portable storm covers	In lieu of deadlights and storm covers
 $t_1^2 + (0,77t_2)^2 + t_1^2 = (1,2t_0)^2$	 $t_0^2 + t_0^2 = (1,4t_0)^2$
Symbols	
t_0 = minimum thickness of toughened glass as calculated in Table 2.11.3.	

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Section 11

11.3.2 For passenger ships the design pressure, H_d , on windows is to be taken as given in Table 2.11.2, or an equivalent National or Internationally Recognised Standard.

Table 2.11.2 Design pressure, H_d , on windows

Window location	Design pressure head H_d in metres
Between the design waterline and a point $Z_{1,5}$ m above the waterline	Per BS MA 25: 1973
Between a point $Z_{1,5}$ m above the waterline and the deck immediately above (at $Z_{d1,5}$)	1,5
Over the next 2 'tween deck heights	$1,5 - f_w \left(\frac{Z_w - Z_{d1,5}}{H_{t1} + H_{t2}} \right)$
For subsequent decks to the top of the navigation bridge	0,25 sides and aft ends 0,75 house fronts
From the top of the navigation bridge to the uppermost deck, for house fronts	0,75 at top of navigation bridge 0 at uppermost continuous deck, with linear variation between, but not less than 0,25
From the top of the navigation bridge to the uppermost deck, at sides and aft ends	0,25
Symbols	
f_w = 1,25 in way of sides and ends of superstructures = 0,75 in way of house fronts $Z_{1,5}$ = the vertical location in metres above the waterline at which the BS MA:25 pressure as given in Annex E of BS MA:25 (1973) is 1,5 t/m ² $Z_{d1,5}$ = the vertical location in metres of the deck at which the pressure is 1,5 t/m ² from the table above Z_w = the vertical location in metres above the waterline to the point under consideration $H_{t1} + H_{t2}$ = sum of the appropriate 'tween deck heights in metres	

11.3.3 The thickness, t_o , of toughened safety glass is to be taken as given in Table 2.11.3.

11.4 Frame design and testing

11.4.1 **Application.** The testing requirements contained in this Section are for all exterior window designs on all tiers for passenger ships regardless of length. The testing is to be carried out for characteristic window sizes (largest, smallest) and forms (circular, semi-circular and rectangular) for each passenger ship. Window designs, which are not covered by Type Approval Certification, will require prototype testing in order to confirm structural integrity and weather or water tightness as required. Tests are to be carried out to the satisfaction of the Surveyor.

Table 2.11.3 Thickness of toughened glass

Window type	Thickness, t_o , in mm
Rectangular	$b \sqrt{\frac{H_d \beta}{4000}}$
Circular	$0,0175 r \sqrt{H_d}$
Semi-circular	$0,011r \sqrt{H_d}$
Symbols	
b = length of shorter side of window, in mm H_d = design pressure head, in metres, as calculated in Table 2.11.2 β = $0,54A_R - 0,078A_R^2 - 0,17$ for $A_R \leq 3$ = 0,75 for $A_R > 3$ A_R = aspect ratio of window, in mm = a/b a = length of longer side of window, in mm r = the radius of the window, in mm	

11.4.2 **Water tightness.** A hydrostatic test is to be carried out in order to examine water tightness. This is carried out by applying the design pressure head H_d , as calculated in Section 11.3, and maintained at this level for at least 15 minutes.

11.4.3 **Structural testing.** A hydrostatic test is to be carried out in order to examine the capability of the frame, mullions and glass retaining arrangements. This is carried out by applying a test pressure of $4H_d$ (H_d as calculated in Section 11.3). Alternatively this test may be carried out using a steel plate in place of the glass. Ideally, the steel plate thickness should be of a suitable reduced thickness in order to simulate the flexural performance of the glass.

11.4.4 Equivalent proposals for testing will be considered. Where alternative testing procedures are proposed, these are to be agreed with LR before commencement.

11.4.5 Chemically toughened glass.

- Chemically toughened glass may be used in lieu of thermally toughened glass provided it can be demonstrated the strength of the arrangement is at least equivalent in strength to that of thermally toughened glass.
- The glazing system is to be of laminated construction.
- Method of testing will be specially considered.

11.4.6 The overlap between glazing and the retaining frame is not to be less than 12 mm.

Ferries, Roll on–Roll off Ships and Passenger Ships

Part 4, Chapter 2

Sections 12 & 13

Section 12 Glass structures

12.1 General

12.1.1 The requirements of 12.3 and 12.4 apply solely to external balcony balustrades.

12.2 Strength of mullions

12.2.1 The section modulus of mullions is not to be less than:

$$Z = 10,78H_d l A_m k 10^{-9} \text{ cm}^3$$

where

a = see Table 2.12.1

b = see Table 2.12.1

r = see Table 2.12.1

l = a for rectangular windows

= $2r$ for semi-circular windows

H_d = design pressure head, in metres, as calculated in 11.3.2

A_m = ab for rectangular windows

= $1,22r^2$ for semi-circular windows

k = as defined in 1.5.1

12.3 Top rail of balcony balustrades

12.3.1 The minimum section modulus of the steel top rail of glass wall balconies is given by:

$$Z = L_b^2 \text{ cm}^3$$

where

L_b = span of top rail, in metres.

12.4 Glass balustrades

12.4.1 The minimum thickness of glass balustrades is to be not less than as given by Table 2.11.3 using a design pressure of $H_d = 0,25 \text{ t/m}^2$.

12.4.2 The glazing is to be of laminated construction.

Section 13 Direct calculation

13.1 Application

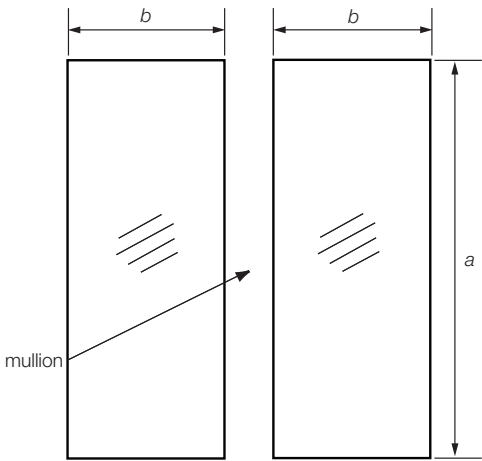

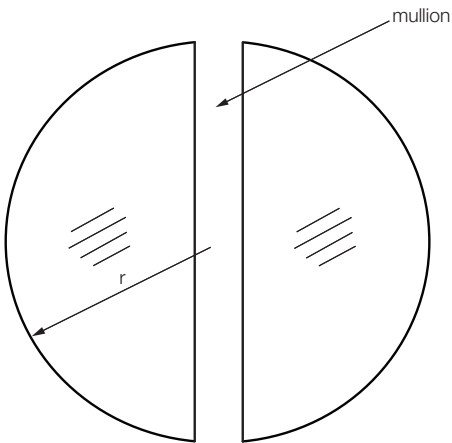

13.1.1 Direct calculations are to be employed in derivation of scantlings where required by preceding Sections of this Chapter or by related provisions included in Part 3.

13.1.2 Direct calculation methods are also generally to be used where additional calculations are required by the Rules in respect of unusual structural arrangements.

13.2 Procedures

13.2.1 For details of LR's direct calculation procedures, see Pt 3, Ch 1,2. For requirements concerning use of other calculation procedures, see Pt 3, Ch 1,3.

Table 2.12.1 Mullion arrangements

Rectangular windows	Semi-circular windows
	
Symbols

Tugs

Part 4, Chapter 3

Sections 1 & 2

Section

- 1 **General**
- 2 **Longitudinal strength**
- 3 **Floors in single bottoms**
- 4 **Panting and strengthening of bottom forward**
- 5 **Machinery casings**
- 6 **Freeing arrangements**
- 7 **Towing arrangements**
- 8 **Fenders**
- 9 **Escort operation, performance numeral and trials**

■ Section 1 General

1.1 Application

1.1.1 Sections 1 to 8 of this Chapter apply to tugs.

1.1.2 Section 9 of this Chapter applies to tugs and offshore supply ships intended to provide escort operation.

1.1.3 The scantlings and arrangements are to be as required by Chapter 1 except as otherwise specified. The draught, T , used for the determination of scantlings is to be not less than $0,85D$.

1.2 Class notations

1.2.1 Ships complying with relevant requirements will be assigned one or more of the class notations given in Table 3.1.1.

Table 3.1.1 Class notations

Class Notation	Applicable Sections
100A1 tug	Sections 1 to 8
100A1 escort tug	Sections 1 to 9, except 9.3
100A1 escort tug EPN (F,B,V,C)	Sections 1 to 9
NOTE Tugs which comply with the anchor handler requirements in Ch 4, Sections 1 to 4 and 10 will be eligible for the additional notation anchor handler .	

1.2.2 Tugs intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2,2.3.6 to 2.3.10, will receive individual consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval. In particular, tugs complying with the requirements of this Chapter and Pt 3, Ch 13,7 for the relevant reduced equipment requirements, will be eligible to be classed:

- **A1 tug protected waters service;** or
- **A1 escort tug protected waters service;** or
- **A1 escort tug EPN (F,B,V,C) protected waters service,** see Pt 1, Ch 2,2.3.6; or
- **100A1 tug with service restriction notation;** or
- **100A1 escort tug with service restriction notation;** or
- **100A1 escort tug EPN (F,B,V,C) with service restriction notation;**

whichever is applicable.

1.2.3 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 to which reference should be made.

1.3 Information required

1.3.1 In addition to the information and plans required by Pt 3, Ch 1,5, plans covering the following items are to be submitted for approval where applicable:

- Support structure and foundations of towing equipment.
- Skegs, propeller guards and other structures which support the weight of the vessel during dry-docking.

1.3.2 The following supporting documents are to be submitted for information:

- Towing arrangements, including lines of action, magnitudes and corresponding points of application of towline pulls on towing equipment.
- Details of the breaking strength of the components of the towline system, together with maximum pull and brake holding load, or equivalent, of towing winches where applicable.

■ Section 2 Longitudinal strength

2.1 General

2.1.1 The longitudinal strength standard is to comply with the relevant requirements of Pt 3, Ch 4.

2.1.2 The requirements of Pt 3, Ch 4,8.3 regarding loading instruments are not applicable to tugs.

Tugs

Part 4, Chapter 3

Sections 3 to 7

■ Section 3 Floors in single bottoms

3.1 Floors

3.1.1 Single bottom floors are to be in accordance with the requirements of Ch 1,7, except that floors clear of the machinery space may be flanged in lieu of a face plate being fitted.

■ Section 4 Panting and strengthening of bottom forward

4.1 Panting region reinforcement

4.1.1 The arrangements to resist panting required by Pt 3, Ch 5 do not apply to tugs less than 46 m in length. In tugs 46 m or more in length, additional stiffening is also to be fitted in the 'tween decks throughout the panting region.

4.2 Strengthening of bottom forward

4.2.1 The requirements for strengthening of bottom forward detailed in Pt 3, Ch 5 do not apply to tugs.

■ Section 5 Machinery casings

5.1 Escape hatches

5.1.1 Any emergency exit from the machinery room to the deck is to be capable of being used at extreme angles of heel, and should be positioned as high as possible above the waterline and on or near the ship's centreline. Covers to escape hatches are to have hinges arranged athwartships. Coaming heights are to be at least 600 mm above the upper surface of the deck.

■ Section 6 Freeing arrangements

6.1 General

6.1.1 If the only means of access to the wheelhouse is external, then stormboards, or an equivalent, are to be fitted between the deckhouse and the ship's sides forward of any deckhouse doors up to the height of the bulwark rail. A gap is to be left between the deck and the bottom board for freeing purposes.

■ Section 7 Towing arrangements

7.1 Towing equipment

7.1.1 For tugs which normally tow over the stern with the main towline connection to the hull ahead of the propellers, the position of towline connection is normally to be five to 10 per cent of the ship's length abaft amidships, but in no circumstances is it to be sited forward of a position, five per cent of the ship's Rule length abaft the longitudinal centre of gravity of the tug in any anticipated condition of loading.

7.1.2 The attachment of the towline to the tug is to be located as low as practicable in order to minimise heeling moments arising from working conditions. Reliable slip arrangements which facilitate towline release regardless of the angle of the towline are to be provided.

7.1.3 It is recommended that the slip arrangements should also be operable from the bridge. The arrangements should be tested to the Surveyor's satisfaction. The breaking strength of the hook, or its equivalent, should generally be 50 per cent in excess of that of the towline, see Pt 3, Ch 13,7.

7.2 Towing equipment foundations

7.2.1 Direct support for towing equipment by means of pillars and/or pillar bulkheads is to be arranged as far as this is practicable.

7.2.2 The design load for the support structure in way of towing equipment is to be not less than the breaking strength of the towline system. The design load is also to be taken as not less than the breaking strength of the tow hook or the brake holding load, or equivalent, of the winch, whichever is appropriate.

7.2.3 Scantlings of pillars and pillar bulkheads are to be in accordance with Ch 1,4.4.

7.2.4 Scantlings of deck girders and transverses forming the support structure of towing equipment are to be determined by direct calculations using the following stresses:

$$\tau = \left(\frac{87}{k} \text{ N/mm}^2 \right) \left(\frac{8,9}{k} \text{ kgf/mm}^2 \right)$$

$$\sigma = \left(\frac{150}{k} \text{ N/mm}^2 \right) \left(\frac{15,3}{k} \text{ kgf/mm}^2 \right)$$

$$\sigma_e = \left(\frac{213}{k} \text{ N/mm}^2 \right) \left(\frac{21,7}{k} \text{ kgf/mm}^2 \right)$$

where

τ = shear stress, in N/mm²

σ = bending stress, in N/mm²

k = material factor, see Pt 3, Ch 2,1.2

σ_e = equivalent stress, in N/mm²
 $\sqrt{\sigma^2 + 3\tau^2}$

Tugs

Part 4, Chapter 3

Sections 7, 8 & 9

7.2.5 Generally, the foundations of towing fairleads are to be carried through the deck and integrated into suitable underdeck structure.

7.2.6 On tugs which utilise an indirect method of towing, attention is drawn to the increased out-of-plane forces that occur in towing fairleads.

Section 8 Fenders

8.1 Ship's side fenders

8.1.1 An efficient fender is to be fitted to the ship's side at deck level extending all fore and aft.

Section 9 Escort operation, performance numeral and trials

9.1 General

9.1.1 An escort tug is a tug intended for escort operation. Escort operation is an operation in which the tug closely follows the assisted ship providing control by steering and braking, as necessary.

9.1.2 Escort tugs are to be capable of utilising methods of towing through which steering and braking forces are generated by a combination of propulsive and hydrodynamic forces developed by the tug, acting on the towline to the attended ship, see example in Fig. 3.9.1.

9.1.3 The intact stability of the tug during escort operation is to comply with a Standard recognised by the National Administration with whom the ship is registered and/or by the National Administration within whose territorial jurisdiction the tug is intended to operate, as applicable. Attention is drawn to the inherent problems relating to the quick release of the towline and the sudden loss of propulsion power during the escort operation in addition to the maximum steering and braking forces.

9.2 Towing arrangements

9.2.1 The specified breaking strength of the towline is to be at least 2,5 x maximum design towline force.

9.2.2 The towing winch is to include a system of continuous load monitoring, with a bridge readout display and an overload prevention system, which is to be operational during escort duties. The overload prevention system is to be designed with the capability to pay out the towline in a controlled manner when the load reaches the maximum design towline force, and is to be capable of alerting the Master and crew.

9.3 Performance trials

9.3.1 Escort tugs which carry out full scale performance trials in accordance with the requirements of this Section will be eligible to have the escort performance numeral **EPN (F,B,V,C)** appended to the **escort tug** notations, see 1.2.1 and 1.2.2 and Ch 4,1.2.2, where

- F** is the maximum steering force (F_s), in tonnes, see Fig. 3.9.1 and 9.3.6.
- B** is the maximum braking force (F_b), in tonnes, see Fig. 3.9.1 and 9.3.6.
- V** is the speed, in knots, at which **F** and **B** are determined.
- C** is the time, in seconds (s), required for the escort tug in manoeuvring from maintained oblique position of tug giving maximum steering force F_s on one side of assisted vessel to mirror position on the other side, see 9.3.6. The towline angle, α , need not be taken less than 30°, see Fig. 3.9.1.

9.3.2 The performance numeral may be determined with speed **V** equal to either 8 knots or 10 knots. If both sets of numerals are determined at the trials then the class notation will include them all.

9.3.3 A trials plan, which includes the estimated forces, is to be submitted and approved prior to trials being undertaken.

9.3.4 The trials of the escort tug are to be performed using a ship capable of maintaining almost constant heading and speed when subjected to the steering and braking forces from the escort tug.

9.3.5 The following trials are to be carried out in calm weather conditions and in the presence of a Lloyd's Register Surveyor:

- Steering and braking force capability test, see 9.3.6.
- Bollard pull test, see 9.3.8.

A record of the results is to be kept on board the escort tug.

9.3.6 Prior to commencing a trial, the following data are to be recorded:

- Wind speed and direction.
- Sea state.
- Current speed and direction.
- Water depth.
- The main particulars and the loading condition of the assisted ship.
- Loading condition of the escort tug.

9.3.7 **Steering and braking force capability test** is a test by which the steering force, F_s , and braking force, F_b , are determined when utilising the method, shown in Fig. 3.9.1, of towing at a range of towline angles, α , from 0 to 90 degrees and for a range of operating speeds up to and including the maximum escort speed. The following parameters are to be continuously recorded during the test:

- Position, speed and heading of the assisted ship and the escort tug.
- Towline force, F_t .
- Angle of towline, α .
- Heel angle of the escort tug.
- Direction of thrust and power absorbed by all propellers and thrusters of the tug.
- Rudder angles of the tug.

9.3.8 The length of the towline is to represent a typical operating condition and is to be recorded prior to and at the completion of the test. The steering and braking forces for a given speed and angle can be calculated by using the average values of the recorded towline force.

9.3.9 **Bollard pull test** is to be carried out in accordance with LR's *Bollard Pull Certification Procedures Guidance Information*.

Offshore Supply Ships

Part 4, Chapter 4

Section 1

Section

1	General
2	Longitudinal strength
3	Hull envelope plating
4	Hull envelope framing
5	Superstructures and deckhouses
6	Miscellaneous openings
7	Engine exhaust outlets
8	Transport and handling of limited amounts of hazardous and noxious liquid substances in bulk
9	Standby ship
10	Anchor handler

■ Section 1 General

1.1 Application

1.1.1 This Chapter applies to sea-going ships specially designed and constructed for the carriage of specialised stores and cargoes to mobile offshore units and other offshore installations, and also to offshore tug/supply ships which in addition to the above perform the duties of a tug.

1.1.2 The scantlings and arrangements are to be as required by Chapter 1, except as otherwise specified in this Chapter.

1.1.3 Attention is drawn to the need for Masters to be able to assess the stability of their ships quickly and accurately in all service conditions, see Pt 1, Ch 2,3.

1.1.4 Where towing equipment is fitted, the requirements of Ch 3,7 are to be applied.

1.2 Class notations

1.2.1 In general, ships complying with the requirements of this Chapter and relevant additional requirements will be eligible for one or a combination of the notations indicated in Table 4.1.1.

1.2.2 The following additional notations and annotations can be provided to give a further detailed description of features:

- **WDL(+)** (Weather deck load):
If the weather deck scantlings have been approved for a loading greater than a design head of 3,5 m, the notation **WDL(+)** may be added. If requested, the maximum permissible weather deck load and extent can be identified in the notation, e.g. **WDL(5,0 t/m² from Aft to Fr. 26)**.
- **RD** (Relative density):
Where a ship has tanks appraised for a maximum permissible relative density greater than 1,025, the notation **RD(specified tank names, density)** may be added, see Chapter 1.
- **LFPL** (Low flashpoint liquids):
Ships intended for the carriage of liquids with flash point below 60°C (closed cup test) in bulk are to be built and equipped in accordance with the relevant requirements of Section 8 and will be given the class notation **LFPL**. If requested, the concerned cargo, flash point (closed cup test) and tank can be identified in the notation, e.g. **LFPL(methanol, 12°C, No. 7 centre tank)**.

1.2.3 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2, to which reference should be made.

1.3 Information required

1.3.1 In addition to the information and plans required by Pt 3, Ch 1,5, plans covering the following items are to be submitted where applicable:

- Independent cargo tanks.
- Cargo tank foundations and securing arrangements.
- Towing arrangements, including supports and foundations of towing winches.
- Arrangements for the stowage of deck cargoes (cargo containment) and details of any associated racks or other similar structures and their supports/foundations together with information to indicate design loads.
- Movable decks, including the stowing arrangements for portable components.
- Freeing arrangements.

1.4 Symbols

1.4.1 The symbols are as defined in Ch 1,1.5.

Table 4.1.1 Class notations applicable to offshore supply ships

Class notation	Requirements
100A1	Pt 1, Ch 2
Offshore supply ship	Pt 4, Ch 4, Sections 1 to 7
Supply ship	Pt 4, Ch 1
Standby ship	Pt 4, Ch 4, Sections 1 to 7 and 9
Anchor handler	Pt 4, Ch 4, Sections 1 to 7 and 10 Sections 5 to 7 need not be applied if notation for Offshore supply ship is not applied
Tug Escort tug Escort tug EPN (F,B,V,C)	Pt 4, Ch 3, Sections 1 to 8 Pt 4, Ch 3, except 9.3 Pt 4, Ch 3
AHTS	Pt 4, Ch 3, Sections 1 to 8; and Pt 4, Ch 4, Sections 1 to 7 and 10
Oil Recovery	Pt 7, Ch 5
NOTES 1. A ship designed to fulfil more than one function can be assigned a combination of the notations listed above, e.g.: <ul style="list-style-type: none"> • 100A1 Offshore supply ship/Standby ship • 100A1 Offshore supply ship/Anchor handler • 100A1 Offshore supply ship/Standby ship/Oil Recovery • Any combination of the requirements listed in this table. 2. The notation Offshore Supply Ship will be assigned to ships that are designed to be operated on unrestricted worldwide service. 3. The notation Supply Ship will be assigned to ships that are designed for operation in specified restricted locations where the environmental conditions are less severe than for unrestricted worldwide service.	

Section 2 Longitudinal strength

2.1 General

2.1.1 The longitudinal strength standard is to comply with the relevant requirements of Pt 3, Ch 4.

2.1.2 The requirements of Pt 3, Ch 4,8.3 regarding loading instruments are generally not applicable to offshore supply ships.

Section 3 Hull envelope plating

3.1 Side shell

3.1.1 The thickness of side shell is to be that required by Ch 1,5.4 but is not to be less than given by Table 4.3.1.

3.1.2 As an alternative, where over the length of a vessel, portions of the sheer strake that are not protected by an efficient fender, the sheer strake is to be increased by a minimum of 5 mm thickness. The increased thickness shall extend from the deck level to not less than 600 mm below the deck level.

Table 4.3.1 Minimum side shell thickness

Ship type	Minimum thickness, mm
Offshore supply ships	9
Standby ships	8
Anchor handler	9

3.2 Weather decks

3.2.1 Where cargo is to be carried on weather decks, the scantlings are to be suitable for the specified loadings. The thickness, t , of deck plating is to be not less than the greater of:

$$(a) \quad t = 0,025L + 4,5 + t_a \quad \text{mm}$$

$$(b) \quad t = 0,1f_m s \sqrt{\frac{PF_D}{f_y \sigma}} + t_a \quad \text{mm}$$

where

P = specified design load for weather deck, in tonnef/m²

$$= \frac{h}{1,39}$$

h = equivalent design head, in metres, not to be taken less than 3,5 m

s = spacing of secondary stiffeners, in mm

σ = yield stress of plating, in N/mm²

F_D = as defined in Pt 3, Ch 4,5.7

f_m = 0,75

f_y = 0,67

Offshore Supply Ships

Part 4, Chapter 4

Sections 3, 4, 5 & 6

t_a = 2,5 mm, in general
 = 1,0 mm, for ships with dedicated class notation
Standby ship.

3.2.2 Scantlings are to be increased locally where specialised cargoes are likely to induce concentrated loads that exceed the specified design load. Acceptable stress levels are given in Ch 3,7.2.4.

3.3 Cargo containment

3.3.1 Means are to be provided to enable deck cargoes to be adequately secured and protected. In general, suitable inner bulwarks, rails, bins or storage racks of substantial construction are to be provided and properly secured to adequately strengthened parts of the hull structure. Properly designed locking equipment or efficient means of lashing containers are to be fitted where appropriate. Small hatches (including escape hatches), valve controls, ventilators, air pipes, etc., are to be situated clear of the cargo containment areas.

Section 4 Hull envelope framing

4.1 General

4.1.1 The section moduli of side longitudinals, the main and 'tween deck frames are to be not less than kZ , cm^3 where

k = 1,25 in general
 = 1,10 for ships with dedicated class notation
Standby ship
 Z = as required by Ch 1,6, Pt 3, Ch 5,4 and Pt 3, Ch 6,4 for the appropriate location.

4.1.2 Frames are not to be scalloped.

4.1.3 The scantlings of deck secondary stiffeners are to be in accordance with the requirements of Table 1.4.4(1) or Table 1.4.5(2) in Chapter 1, where h_2 is to be taken as the specified design loading and not less than a design head of 3,5 m.

Section 5 Superstructures and deckhouses

5.1 Scantlings

5.1.1 The scantlings of deckhouses situated on the fore-castle deck and above are to comply with the requirements of Table 4.5.1.

5.1.2 The scantlings of fore-castle end bulkheads are to be not less than those required by Table 4.5.1 for aft ends of deckhouses or less than those required by Pt 3, Ch 8,2 for an exposed machinery casing.

Table 4.5.1 Superstructures and deckhouses on fore-castle deck

Position	Thickness of plating, in mm	Modulus of stiffeners, in cm^3	Depth of stiffeners, in mm
Fronts	The greater of $t = 0,012s$ or 8,0	$Z = 0,034sl_e^2$	Not less than 100
Sides	The greater of $t = 0,01s$ or 6,5	$Z = 0,027sl_e^2$	Not less than 75
Aft ends	The greater of $t = 0,008s$ or 6,5	$Z = 0,027sl_e^2$	Not less than 65
NOTE The ends of stiffeners are to be connected on all tiers.			

Section 6 Miscellaneous openings

6.1 General

6.1.1 For offshore supply ships the requirements of Pt 3, Ch 11,6 are to be complied with.

6.2 Access from freeboard deck

6.2.1 There is to be no direct access from the freeboard deck to machinery or other spaces below the freeboard deck. Indirect access may be arranged via a space or passageway fitted with an outer door having a sill not less than 600 mm high and an inner door having a sill not less than 380 mm high. The inner door is to be self-closing and gastight. The space or passageway between the two doors is to be adequately drained. It is desirable, however, that access to spaces below the freeboard deck is arranged from a position above the superstructure deck. Where it is necessary to provide an emergency escape trunk which cannot terminate within a superstructure space, the arrangements for maintaining the integrity of the hatch or outlet are to be approved by Lloyd's Register (hereinafter referred to as 'LR').

6.3 Windows and side scuttles

6.3.1 The requirements of this Section are to be applied in conjunction with Pt 3, Ch 11,6.5.

6.3.2 Windows may only be fitted in the following locations:

- (a) Second tier and higher above the freeboard deck:
 - (i) in the after end bulkhead of deckhouses and superstructures,
 - (ii) in the sides of deckhouses and superstructures which are not part of the shell plating.
- (b) Third tier and higher above the freeboard deck:
 - (i) in the forward facing bulkheads of deckhouse and superstructures, except that in the first tier of the front bulkhead above the weather deck, only side scuttles will be accepted.

6.3.3 In locations not specified in 6.3.2, only side scuttles will be accepted.

6.3.4 Permanently attached deadlights are to be provided as follows:

- (a) Side scuttles:
 - (i) in the side shell plating,
 - (ii) in the forward facing bulkheads of superstructures and deckhouses,
 - (iii) in the sides of deckhouses and superstructures up to and including the third tier above the freeboard deck,
 - (iv) in the after end bulkheads of superstructures, deckhouses, casings and companionways in the first and second tiers above the freeboard deck.
- (b) Windows in locations permitted in 6.3.2:
 - (i) in the sides of deckhouses and superstructures in the second and third tiers above the freeboard deck.
 - (ii) in the after end bulkheads of superstructures, deckhouses, casings and companionways in the second tier above the freeboard deck.

6.3.5 On windows in the second tier and higher above the freeboard deck, hinged storm covers may be fitted in lieu of deadlights, provided there is safe access for closing.

6.3.6 Windows in the wheelhouse front are to have deadlights or storm covers. For storm covers, an arrangement for easy and safe access is to be provided, (e.g. gangway with railing). However, for practical purposes, the deadlights or storm covers may be portable if stowed adjacent to the window for quick fitting. At least two of the deadlights or storm covers are to have the means of providing a clear view.

6.3.7 Deadlights for side scuttles, and for windows not mentioned in 6.3.5 and 6.3.6, are to be internally hinged.

6.3.8 Side scuttles are to comply with ISO Standard 1751, as follows:

- (a) Type A side scuttles in the shell plating, in the sides of superstructures and in the forward facing bulkheads of superstructures and deckhouses on the weather deck;
- (b) Type B side scuttles in the after ends of superstructures and in the sides and ends of deckhouses; or
- (c) an equivalent National Standard.

6.3.9 For the location of windows and side scuttles, see Fig. 4.6.1.

6.3.10 The thickness of the toughened safety glass for windows is to be not less than the greater of:

- (a) $t = 10 \text{ mm}$
- (b) $t = b \sqrt{\frac{H_d \beta}{4000}} \text{ mm}$

where

H_d = design pressure head, in metres, as obtained from Table 4.6.1

b = length of shorter side of window, in mm

$\beta = 0,54A_R - 0,078A_R^2 - 0,17$ for $A_R \leq 3$
 $= 0,75$ for $A_R > 3$

A_R = aspect ratio of window

$= a/b$

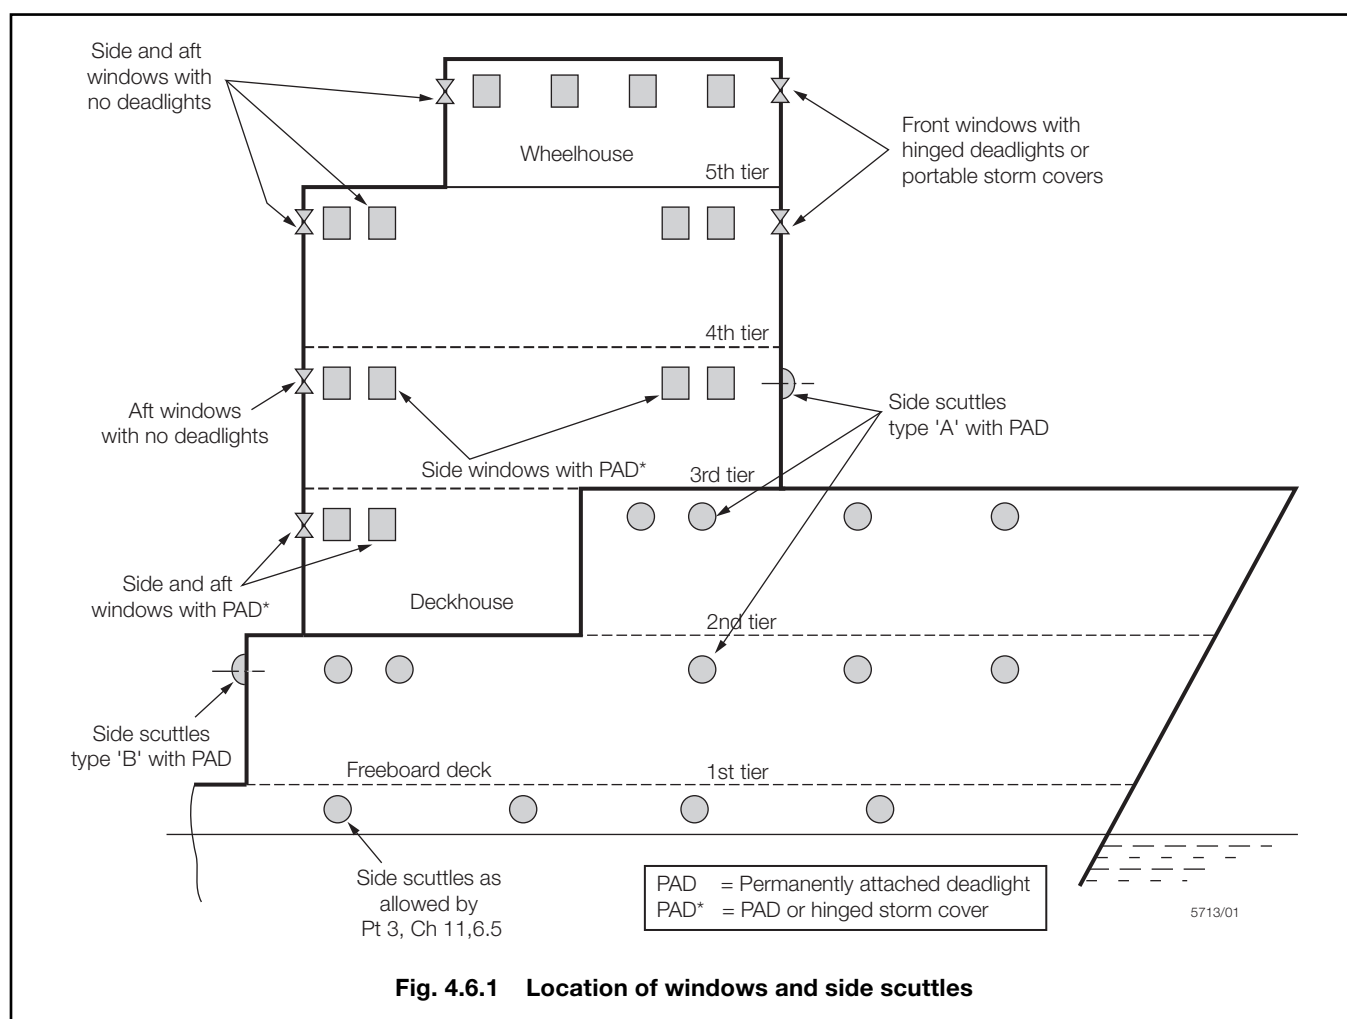

a = length of longer side of window, in mm.

Table 4.6.1 Design pressure head, H_d , on windows

	Design pressure head, in metres	
	Windows in front and side bulkheads	Windows in after end bulkheads
6th tier and above	3,0	2,5
5th tier	5,0	2,5
4th tier	8,0	2,5
3rd tier	12,5	6,25
2nd tier	14,0	8,0

6.3.11 Proposals for alternative materials will be specially considered.

6.3.12 On standby ships, windows larger than 1000 x 710 or an area greater than 0,71 m² are not acceptable, except in the after ends of deckhouses which are to be submitted for consideration in each case.

Section 7

Engine exhaust outlets

7.1 Location

7.1.1 Engine exhaust outlets are to be located as high as is practicable above the deck and are to be fitted with spark arresters.

Section 8

Transport and handling of limited amounts of hazardous and noxious liquid substances in bulk

8.1 General

8.1.1 The requirements of this section are, in general, to be complied with unless they are waived or substituted by requirements mandated by the Administration.

8.1.2 This section applies to the arrangement and scantling of seagoing ships as defined in 1.1 and intended for the carriage of:

- the aggregate quantity of bulk liquids identified in 8.1.3 that is carried is any amount not exceeding a maximum which is the lesser of 800 m³ or a volume in cubic metres equal to 40 per cent of the vessel's deadweight calculated at a cargo density of 1,0.

8.1.3 Products which may be carried are:

- hazardous and noxious liquids listed in Table 4.8.1 and those other products which may be assigned to Table 4.8.1 based on the following criteria:
 - products which for safety reasons may be assigned for carriage on a type 3 ship as defined by the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk* (hereinafter referred to as *Rules for Ships for Liquid Chemicals*) and which are not required to meet the requirements for toxic products in 15.12 of the *Rules for Ships for Liquid Chemicals*;
 - noxious liquid substances which would be permitted for carriage on a type 3 ship;
- flammable liquids (liquids having a flashpoint not exceeding 60°C (closed cup test)).

Offshore Supply Ships

Noxious liquid, (11) n.o.s. (trade name ..., contains ...) Cat. Z	No	P
Non-noxious liquid, (12) n.o.s. (trade name ..., contains ...) Cat. OS	No	P

8.1.4 Carriage of products not listed in Table 4.8.1 should only be undertaken in accordance with suitable preliminary carriage conditions and the limitation referred to in 8.1.3.

8.1.5 Additives which are considered to fall outside the scope of products in 8.1.3 may be carried in limited amounts. The aggregate amount of such additives which may be transported should not exceed 10 per cent of the vessel's maximum authorised quantity of products subject to this Section. An individual tank should contain not more than 10 m³ of these additives. The discharge of these additives into the sea from offshore support vessels is prohibited.

8.1.6 Ships complying with the requirements of this section will be eligible for the special feature notation **HNLS**.

8.2 Definitions

8.2.1 Cargo area is that part of the offshore supply ship where cargo and cargo vapours are likely to be present and includes cargo tanks, cargo pump-rooms, hold spaces in which independent tanks are located, cofferdams surrounding integral tanks and the following deck areas:

- within 3 m of a cargo tank installed on deck;
- within 3 m of a cargo tank outlet in case of independent tanks installed below deck;
- within 3 m of a cargo tank outlet in case of integral tanks installed below deck and separated from the weather deck by a cofferdam;
- the deck area above an integral tank without an overlaying cofferdam plus the deck area extending transversely and longitudinally for a distance of 3 m beyond each side of the tank;
- within 3 m of any cargo liquid or vapour pipe, flange, cargo valve, gas or vapour outlet, or entrance or ventilation opening to a cargo pump-room.

8.2.2 Deadweight means the difference in metric tons between the displacement of an offshore support vessel in water of a density of 1,025 at the load waterline corresponding to the assigned summer freeboard and the lightweight of the ship.

8.2.3 Lightweight means the displacement of an offshore support vessel in metric tons without cargo, fuel, lubricating oil, ballast water, fresh water and feed water in tanks, consumable stores, and passengers and crew and their effects.

8.2.4 Hazardous substance is any substance either listed in chapter 17 of the Rules for Ships for Liquid Chemicals or having a hazard more severe than one of the minimum hazard criteria given in criteria for hazard evaluation of bulk chemicals as approved by the Organisation.

8.2.5 Pollution hazard only substance means a substance having an entry only of 'P' in column d in chapter 17 of the Rules for Ships for Liquid Chemicals.

8.2.6 Safety hazard substance means a substance having an entry of 'S' or 'S/P' in column d in chapter 17 of the Rules for Ships for Liquid Chemicals.

8.2.7 Flammable liquid is any liquid having a flashpoint not exceeding 60°C (closed cup test).

8.3 Cargo tank location

8.3.1 Cargo tanks should be located at least 760 mm measured inboard from the side of the vessel perpendicular to the centreline at the level of the summer load waterline.

8.4 Cargo segregation

8.4.1 Tanks containing cargo or residues of cargo should be segregated from machinery spaces, propeller shaft tunnels, if fitted, dry cargo spaces, accommodation and service spaces and from drinking water and stores for human consumption, by means of a cofferdam, void space, cargo pump-room, empty tank, oil fuel tank, or other similar space. On-deck stowage of independent tanks or installing independent tanks in otherwise empty hold spaces should be considered as satisfying this requirement.

8.4.2 Cargoes which react in a hazardous manner with other cargoes or oil fuels should:

- be segregated from such other cargoes or oil fuels by means of a cofferdam, void space, cargo pump-room, empty tank, or tank containing a mutually compatible cargo;
- have separate pumping and piping systems which should not pass through other cargo tanks containing such cargoes, unless encased in a tunnel; and
- have separate tank venting systems.

8.4.3 Cargo piping should not pass through any accommodation, service or machinery space other than cargo pump-rooms or pump-rooms.

8.4.4 Pumps, ballast lines, vent lines and other similar equipment serving permanent ballast tanks should be independent of similar equipment serving cargo tanks.

8.4.5 Bilge pumping arrangements for cargo pump-rooms or for hold spaces in which independent cargo tanks are installed should be situated entirely within the cargo area.

8.5 Segregation requirements for integral tanks

8.5.1 Where not bounded by bottom shell plating, fuel oil tanks, a cargo pump-room or a pump-room, the cargo tanks should be surrounded by cofferdams. Tanks for other purposes (except fresh water and lubricating oils) may be accepted as cofferdams for these tanks.

8.5.2 For access to all spaces, the minimum spacing between cargo tank boundaries and adjacent ship's structures should be 600 mm.

8.5.3 Cargo tanks may extend to the deck plating, provided dry cargo is not handled in that area. Where dry cargo is handled on the deck area above a cargo tank, the cargo tank may not extend to the deck plating unless a continuous, permanent deck sheathing of wood or other suitable material of appropriate thickness and construction is fitted.

8.5.4 Cargoes subject to the scope of products in 8.1.2 and 8.1.3 should not be carried in either the fore or aft peak tanks.

8.5.5 For pollution hazard only substances having a flashpoint exceeding 60°C (closed cup test) the arrangements referred to in 8.4.1 and 8.4.3 need not be applied provided that the segregation requirements for accommodation spaces, drinking water and stores for human consumption are satisfied. Additionally, 8.5.1 and 8.5.2 need not be applied.

8.6 Accommodation, service and machinery spaces and control stations

8.6.1 Accommodation or service spaces, or control stations should not be located within the cargo area.

8.6.2 Unless they are spaced at least 7 m away from the cargo area containing flammable products, entrances, air inlets and openings to accommodation, service and machinery spaces and control stations should not face the cargo area. Doors to spaces not having access to accommodation, service and machinery spaces and control stations, such as cargo control stations and store-rooms, may be permitted within the 7 m zone specified above, provided the boundaries of the spaces are insulated to A-60 Standard and each case will be specially considered. When arranged within the 7 m zone specified above, windows and sidescuttles facing the cargo area should be of a fixed type. Such sidescuttles in the first tier on the maindeck should be fitted with inside covers of steel or equivalent material.

8.6.3 In order to guard against the danger of hazardous vapours, due consideration should be given to the location of air intakes and openings into accommodation, service and machinery spaces and control stations in relation to cargo piping and cargo vent systems.

8.6.4 For pollution hazard only substances having a flashpoint exceeding 60°C, the arrangements referred to in 8.6.1 to 8.6.3 may be waived.

8.7 Access to spaces in the cargo areas

8.7.1 Access to spaces within the cargo area should meet the requirements of 3.4 of the Rules for Ships for Liquid Chemicals.

8.8 Cargo tank construction

8.8.1 Cargo tanks are to be as required by the Rules for Ships for Liquefied Gases or Rules for Ships for Liquid Chemicals as applicable and for the intended cargo.

8.8.2 Instead of the use of permanently attached deck-tanks, portable tanks meeting the requirements of the International Dangerous Goods (IMDG) Code or other portable tanks specially approved may be used for cargoes indicated in 8.1.3, provided that the tanks are properly located and secured to the vessel.

8.8.3 Except for the tank connections to cargo pump-rooms, all tank openings and connections to the tank should terminate above the weather deck and should be located in the tops of the tanks. Where cofferdams are provided over integral tanks, small trunks may be used to penetrate the cofferdam.

8.8.4 The greater of the following design pressures (gauge) should be used for determining scantlings of independent pressure tanks:

- 0,07 MPa;
- the vapour pressure of the cargo at 45°C;
- the vapour pressure of the cargo at 15°C above the temperature at which it is normally carried; or
- the pressure which occurs in the tank during the loading or unloading.

The design of the tanks should comply with acceptable standards taking into account the carriage temperature and relative density of cargo. Due consideration should also be given to dynamic forces and any vacuum pressure to which the tanks may be subjected.

8.8.5 Integral and independent gravity tanks should be constructed and tested according to acceptable standards taking into account the carriage temperature and relative density of cargo.

8.8.6 For pollution hazard only substances having a flashpoint exceeding 60°C, the requirements of 8.8.3 need not be applied.

8.9 Materials of construction

8.9.1 Materials of construction for tanks, piping, fittings and pumps should be in accordance with chapter 6 of the Rules for Ships for Liquid Chemicals, or the Rules for Ships for Liquefied Gases, as applicable.

8.10 Cargo tank vent systems

8.10.1 Independent pressure tanks should be fitted with pressure relief devices that are so designed as to direct the discharge away from personnel and that have a set pressure and capacity which is in accordance with acceptable standards taking into account the design pressure referred to in 8.8.4.

8.10.2 Cargo tank vent systems of integral or independent gravity tanks should meet the requirements of the Rules for Ships for Liquid Chemicals, except that the height specified in 8.3.4 of those Rules may be reduced to 2 m.

Offshore Supply Ships

Part 4, Chapter 4

Section 8

8.10.3 The location of cargo tank vent outlets for independent pressure tanks and for cargo tanks used to carry pollution hazard only substances with a flashpoint exceeding 60°C (closed cup test) should be to the satisfaction of LR.

8.10.4 Cargo tank vent systems of portable tanks allowed under 8.8.2 should be to the satisfaction of LR, taking into account the requirements of 8.10.

8.11 Cargo transfer

8.11.1 The cargo transfer system should comply with the requirements of chapter 5 of the Rules for Ships for Liquid Chemical, or the Rules for Ships for Liquefied Gases, when considered applicable and practical, taking into account existing industry standards and practices.

8.11.2 The remote shutdown devices for all cargo pumps and similar equipment, required by 5.6.1.3 of the Rules for Ships for Liquid Chemicals, should be capable of being activated from a dedicated cargo control location which is manned at the time of cargo transfer and from at least one other location outside the cargo area and at a safe distance from it.

8.12 Electrical installations

8.12.1 Electrical installations should meet the requirements of chapter 10 of the Rules for Ships for Liquid Chemicals.

8.13 Acid spill protection

8.13.1 Floors or decks under acid storage tanks and pumps and piping for acid should have a lining or coating of corrosion-resistant material extending up to a minimum height of 500 mm on the bounding bulkheads or coamings. Hatches or other openings in such floors or decks should be raised to a minimum height of 500 mm; however, where this height is not practicable a lesser height may be required.

8.13.2 Flanges or other detachable pipe connections should be covered by spray shields.

8.13.3 Portable shield covers for connecting the flanges of the loading manifold should be provided. Drip trays of corrosion-resistant material should be provided under loading manifolds for acids.

8.13.4 Spaces for acid storage tanks and acid pumping and piping should be provided with drainage arrangements of corrosion-resistant materials.

8.13.5 Deck spills should be kept away from accommodation and service areas by means of a permanent coaming of suitable height and extension.

8.14 Ventilation of spaces in the cargo area

8.14.1 The requirements of chapter 12 of the Rules for Ships for Liquid Chemicals are to be applied. Consideration will be given to requests for relaxation of requirements concerning the distance required in 12.1.5 of the Rules for Ships for Liquid Chemicals.

8.15 Vapour detection

8.15.1 Vapour detection for the cargoes carried should be provided in accordance with the requirements contained in the Rules for Ships for Liquid Chemicals.

8.15.2 Enclosed and semi-enclosed spaces containing installations for acid should be fitted with fixed vapour detection and alarm systems which provide visual and audible indication. The vapour detection systems should be capable of detecting hydrogen except that, in the case where only hydrochloric acid is carried, a hydrogen chloride vapour detection system should be provided.

8.15.3 At least two portable instruments for detecting flammable vapour concentrations should be provided when cargoes subject to the requirements of this section (see 8.1.3) with a flashpoint not exceeding 60°C (closed-cup test) are carried.

8.15.4 At least two portable instruments suitable for measuring the concentration of oxygen in atmospheric air should be provided.

8.16 Special requirements

8.16.1 The special requirements for the cargo as referred to in chapter 17 of the Rules for Ships for Liquid Chemicals or chapter 19 of the Rules for Ships for Liquefied Gases are applicable; however, the requirement in 15.19.6 of the Rules for Ships for Liquid Chemicals for a visual and audible high-level alarm may be waived taking into account the cargo carriage arrangements and cargo loading procedures and each case will be specially considered.

8.17 Special requirements for the carriage of liquefied gases

8.17.1 Each enclosed space used for handling or storage of a liquefied gas should be fitted with a sensor continuously monitoring the oxygen content of the space and an alarm indicating low oxygen concentration. For semi-enclosed spaces portable equipment may also be acceptable.

8.17.2 Drip trays resistant to cryogenic temperatures should be provided at manifolds transferring liquefied gases or at other flanged connections in the liquefied gas system.

8.17.3 For the carriage of liquid nitrogen the requirements of 17.19 of Rules for Ships for Liquefied Gases are to be applied.

8.17.4 The construction of cargo tanks and cargo piping systems for liquefied nitrogen and liquid carbon dioxide should be to the satisfaction of LR.

8.17.5 Emergency shutoff valves should be provided in liquid outlet lines from each liquefied gas tank. The controls for the emergency shutoff valves should meet the requirements given in 8.10.2 for remote shutdown devices.

8.18 Gauging and level detection

8.18.1 Each cargo tank should have a level gauging system in accordance with the Rules for Ships for Liquefied Gases or Rules for Ships for Liquid Chemicals as applicable.

8.19 Emergency remote shutdown

8.19.1 In the case of transfer operations involving pressures in excess of 5 MPa, arrangements for emergency depressurising and disconnection of the transfer hose should be provided. The controls for activating emergency depressurisation and disconnection of the transfer hose should meet the requirements given in 8.11.2 for remote shutdown devices.

8.20 Pollution requirements

8.20.1 Each ship certified to carry noxious liquid substances should be provided with a Cargo Record Book, a Procedure and Arrangements Manual and a Shipboard Marine Emergency Plan developed for the ship in accordance with Annex II to MARPOL 73/78 and approved.

8.20.2 Discharge into the sea of residues of noxious liquid substances permitted for the carriage in Ship Type 3, or products listed in 8.1.2 or ballast water, tank washings, or other residues or mixtures containing such substances, is prohibited. Any discharges of residues and mixtures containing noxious liquid substances should be to reception facilities in port. As a consequence of this prohibition, the requirements for efficient stripping and underwater discharge arrangements in MARPOL 73/78, Annex II may be waived.

8.20.3 In the case of cargoes regulated by MARPOL 73/78, Annex I, the requirements of that Annex should apply as appropriate.

8.21 Decontamination showers and eyewashes

8.21.1 Except in the case of pollution hazard only substances, a suitably marked decontamination shower and eyewash should be available on deck in a convenient location. The shower and eyewash should be operable in all ambient conditions.

8.22 Protective and safety equipment

8.22.1 Protective and safety equipment should be kept on board in suitable locations as required by chapter 14 of the Rules for Ships for Liquefied Gases or Rules for Ships for Liquid Chemicals for products to be carried.

■ **Section 9** **Standby ship**

9.1 Application and definitions

9.1.1 The requirements in this Section apply to standby ships. A standby ship is a seagoing ship designed, constructed, organised and maintained in such a way that she can give assistance in the event of an emergency on or near an offshore installation.

9.1.2 The National Authority with whom the ship is registered and/or the Administration within whose territorial jurisdiction the ship is intended to operate may have requirements for the same items as required by these Rules. In those instances the more onerous requirements are to be applied.

9.2 Configuration of standby ship

9.2.1 The main features of standby ships which dictate the structural configuration are:

- (a) Designated and illuminated winching area for helicopter operations.
- (b) Clearly marked and lighted rescue zone at the side of the ship.
- (c) Survivors area.
- (d) Fast rescue boat.

9.3 Information required

9.3.1 In addition to the information and plans required by Ch 4, 1.3, details of local strengthening of the following items are to be submitted where applicable:

- (a) The arrangement and integration into the hull of equipment, supports, foundations for rescue equipment, etc. in conjunction with their weight, working load and holding capability information.
- (b) Support for towing arrangement as applicable.
- (c) The arrangement for the fast rescue craft

9.4 Equipment foundations

9.4.1 When considering the loads, all expected directions of operation are to be taken into account.

9.4.2 The foundation for towing equipment, if applicable, is to be in accordance with Ch 3, 7.2.

9.5 Ship arrangement

9.5.1 For standby ships the rescue arrangement, accommodation and facilities for survivors and safety equipment is required to comply with a National Standard. The applicable Certificate or Statement of Compliance with a National Standard is to be issued by a National Administration, or by LR, or by an IACS member when so authorised. Where no national requirements exist for a particular vessel, LR will issue statement of compliance with UKOOA.

■ Section 10

Anchor handler

10.1 Application and definitions

10.1.1 The requirements of this Section apply to ships specially designed, constructed and equipped for handling anchors of a floating offshore installation.

10.2 Structural configuration

10.2.1 The main features of an anchor handler which dictate the structural configurations are:

- (a) The ship has a completely clear after deck in order to handle the anchors effectively.
- (b) One or more winches designed for the purpose of deploying and recovering the anchors.
- (c) Large horizontal stern roller, if fitted. During the anchor-handling process the ship is often required to take the anchors on board by hauling them over her stern, along with their associated chain and other fittings. For this purpose a large horizontal roller is installed in the stern, usually at deck level.
- (d) A rounded form in way of the area for ship-ping/unshipping anchors at stern.
- (e) Chain lockers under the main winch, if fitted. Anchor handlers are sometimes required to store rig or mooring chain and, for this purpose, most are fitted with chain lockers under the main winch which double as ballast or brine tanks when not in use.
- (f) Equipment for temporary securing of the anchor, e.g. shark's jaw.
- (g) Towing pins in way of the stern roller.
- (h) High duty bollards.

10.3 Information required

10.3.1 In addition to the information and plans required by Ch 4,1.3, details of local strengthening of the following items are to be submitted where applicable:

- (a) The arrangement and integration into the hull of equipment, tanks, supports, foundations, etc. in conjunction with their weight, working load and holding capability information.
- (b) For unusual structural arrangement and equipment, calculations are to be submitted showing acceptable structural strength.
- (c) Supports and foundations for anchor handling and laying arrangements for anchors carried as cargo.

10.4 Hull envelope plating

10.4.1 Anchor handing activities often give rise to areas of high local loads and/or frequent impacts, such as in way of stern rollers and immediately adjacent to high duty bollards. The shell in way of high loads and/or frequent impacts is to be suitably reinforced by increasing shell plate thickness, additional stiffening support or other appropriate means.

10.5 Working deck

10.5.1 Deck areas, where there are arrangements for the collection and handling of anchors and associated equipment, are to be protected by wooden sheathing. Alternatively, this can be omitted if the plate thickness is increased by 2,5 mm.

10.6 Equipment foundations

10.6.1 When considering the loads, all expected directions of operation are to be taken into account. The foundation for deck equipment (winch, stern roller etc.) is to be in accordance with Ch 3,7.2 as applicable.

Barges and Pontoons

Part 4, Chapter 5

Section 1

Section

- 1 **General**
- 2 **Longitudinal strength**
- 3 **Hull envelope plating**
- 4 **Hull envelope framing**
- 5 **Strengthening of bottom forward**
- 6 **Bottom strengthening for loading and unloading aground**
- 7 **Watertight bulkheads**

Section 1 General

1.1 Application

1.1.1 This Chapter applies, in general, to manned or unmanned non-self-propelled ships defined as follows:

- (a) Barges for the carriage of general dry cargoes in cargo holds.
- (b) Barges for the carriage of liquid cargoes in bulk.
- (c) Pontoons designed specifically for the carriage of non-perishable cargo on deck.
- (d) Shipborne barges for the carriage of general dry cargo in cargo holds and intended to operate afloat only within specified geographical limits, and suitable for regular carriage on board a larger ship.

1.1.2 Manned or unmanned barges for the carriage of liquid chemicals in bulk and barges for the carriage of liquefied gases will receive individual consideration on the basis of the Rules, see Table 5.1.1.

Table 5.1.1 Applicable Rules

Type of barge	Applicable Rules
Barge for the carriage of general dry cargo in cargo hold	Chapter 1
Barge for the carriage of liquid cargo in bulk	Chapter 10
Pontoon designed specifically for the carriage of non-perishable cargo on deck	Chapter 1
Shipborne barges for the carriage of general dry cargo in cargo holds	Chapter 1 and this Chapter for 'extended protected water service' barges
Barge for the carriage of liquid chemicals in bulk	<i>Rules for Ships for Liquid Chemicals in Bulk</i>
Barge for the carriage of liquefied gases	<i>Rules for Ships for Liquefied Gases</i>

1.1.3 The scantlings and arrangements, except where otherwise specified in this Chapter, are to comply with the Rules as indicated in Table 5.1.1.

1.1.4 The Rules assume that the structural arrangements of barges carrying cargo in holds will generally approximate to normal ship shape and construction. Barges of this type not doing so will receive individual consideration on the basis of the Rules.

1.1.5 The Rules also assume that barges and pontoons are homogeneously loaded. Barges or pontoons with other types of loading, e.g. crane pontoon, will receive individual consideration.

1.1.6 All barges and pontoons are to be fitted with adequate arrangements for towing. In general, such arrangements are to consist of, or be equivalent to, not less than two sets of bollards, each of which shall be suitable for accepting a towline of suitable breaking strength.

1.2 Class notations

1.2.1 In general, ships complying with the requirements of this Chapter will be eligible for one of the following classes:

- (a) **100A1 barge**. This class will be assigned to non-self-propelled sea-going ships as defined in 1.1.1(a).
- (b) **100A1 oil barge**. This class will be assigned to non-self-propelled sea-going ships as defined in 1.1.1(b).
- (c) **100A1 pontoon**. This class will be assigned to non-self-propelled sea-going ships as defined in 1.1.1(c).

1.2.2 Barges and pontoons intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2, 2.3.6 to 2.3.10, will receive individual consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval. In particular, shipborne barges as defined in 1.1.1(d) complying with the requirements of this Chapter will be eligible to be classed **100A1 shipborne barge extended protected water service**.

1.2.3 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2, to which reference should be made.

1.3 Information required

1.3.1 In addition to the information and plans required by Pt 3, Ch 1, 5, the following are to be submitted:

- Details of structure and fittings to which deck cargo securing lashings, etc., are attached.
- Details of the bollards and their supporting structure.
- Where pusher tugs or integral tug/barge systems are proposed, full details and data of the attachment and support arrangements.
- Details of the intended service areas required for barges or pontoons designed to operate within specified geographical limits.
- Longitudinal strength and lifting arrangements for shipborne barges.

Barges and Pontoons

Part 4, Chapter 5

Sections 1, 2 & 3

1.4 Symbols and definitions

1.4.1 The Rule length, L , for vessels with swim ends is to be measured as shown in Fig. 5.1.1. Where a swim end is arranged aft but no rudder is fitted, L need not exceed 97 per cent of the extreme length on the summer load waterline. For tugs and barge units having rigid connections, the length, L , is to be taken as the combined length of the tug and barge.

Section 2

Longitudinal strength

2.1 General

2.1.1 Longitudinal strength calculations are to be made in accordance with the requirements given in Pt 3, Ch 4, and the ship service factor, f_1 , is given in Table 5.2.1.

Table 5.2.1 Ship service factor f_1

Type of ship	f_1	
	'100A1'	'100A1 extended protected water service'
Barge for the carriage of general cargo in holds and for the carriage of liquid cargoes in bulk	1,0	0,80
Pontoons for the carriage of non-perishable cargoes on deck		
Shipborne barges for the carriage of general cargo in holds and unmanned	—	0,70

2.1.2 The requirements of Pt 3, Ch 4,8.3 regarding loading instruments are not applicable to barges and pontoons.

2.1.3 For shipborne barges, where it is the intention to lift the barge on board ship by crane, a condition 'fully loaded barge suspended by crane' is to be submitted. For this condition the following stresses are permissible:

$$\text{Bending stress } \sigma_b = 147,2 \text{ N/mm}^2 (15,0 \text{ kgf/mm}^2)$$

$$\text{Shear stress } \tau = 98,1 \text{ N/mm}^2 (10,0 \text{ kgf/mm}^2)$$

Section 3

Hull envelope plating

3.1 Shell and deck plating

3.1.1 The thickness of shell and deck plating is to be as necessary to give the hull section modulus required by 2.1 and to satisfy the requirements listed in Table 5.3.1.

Table 5.3.1 Shell and deck plating

Item of plating	Thickness for ships classed 100A1	Thickness for ships having extended protected water service notation
(a) Keel	The separate requirements of Chapter 1 or Chapter 10, whichever is applicable, for keel width and thickness need not be applied, except where $L > 100$ m and the bottom has a rise of floor	
(b) Bottom shell and bilge	In accordance with the requirements of Chapter 1 or Chapter 10, whichever is applicable	In accordance with the requirements of Chapter 1 or Chapter 10, whichever is applicable, reduced by 12,5 per cent, but is to be not less than required by (c) below
	For chines, see 3.1.2	
(c) Side shell from upper turn of bilge or chine to deck	The greater of the values obtained from Chapter 1 or Chapter 10, whichever is applicable, for the appropriate framing arrangement	
(d) Deck	In accordance with the requirements of Chapter 1 or Chapter 10, whichever is applicable	In accordance with the requirements of Chapter 1 or Chapter 10, whichever is applicable, reduced by 2 mm, but is to be not less than the deck basic end thickness as required by Pt 3, Ch 5 and Ch 6
	In pontoon barges with deck cargoes the deck thickness derived from (d) may be required to be increased	
(e) Swim ends	The bottom shell plating thickness is to be maintained up to the summer load waterline for the rake plating. Above this point the thickness may be tapered to that of the side shell requirements from a point not less than 1 m above the load waterline	

Barges and Pontoons

Part 4, Chapter 5

Sections 3 & 4

3.1.2 On ships with two chines each side, the bilge plating should generally be calculated from the bottom plating formulae. On hard chine ships, flanged chines will not, in general, be approved, but where a chine is formed by knuckling the shell plating, the radius of curvature, measured on the inside of the plate, is to be not less than 10 times the plate thickness. Where a solid round chine bar is fitted, the bar diameter is to be not less than three times the thickness of the thickest abutting plate. Where welded chines are used, the welding is to be built up as necessary to ensure that the shell plating thickness is maintained across the weld.

Section 4 Hull envelope framing

4.1 Symbols

4.1.1 The symbols used in this Section are defined as follows:

- h = head or load height, in metres, and is to be taken as:
for bottom longitudinals, frames, girders and transverses: the depth D
for side longitudinals: the distance of the longitudinal below the deck at side, but not less than $0,01L + 0,7$
for side transverses: the distance from the mid-point of span to the deck at side, but not less than $0,01L + 0,7$
for deck longitudinals and transverses: the head equivalent to cargo carried at a stowage rate of $1,39 \text{ m}^3/\text{tonne}$, but is not to be taken less than $0,01L + 0,7$
for side frames: the distance from the midpoint of span to the deck at the side
for deck beams and girders: the head equivalent to cargo carried at a stowage rate of $1,39 \text{ m}^3/\text{tonne}$, but is not to be taken less than required by Table 3.5.1 in Pt 3, Ch 3
- l_e = effective length of stiffening member, in metres, see Pt 3, Ch 3,3
- s = spacing of frames, beams or longitudinals, in mm
- S = spacing or mean spacing of girders, transverses or floors, in metres
- Z = section modulus of stiffening member, in cm^3 , see Pt 3, Ch 3,3.

4.2 General

4.2.1 Bottom, side and deck transverses are to be connected in such a manner as to ensure continuity of the transverse ring system, and longitudinals are to be attached to transverses. In way of deck and bottom transverses, a deep web frame is to be fitted.

4.2.2 End connections of longitudinals at bulkheads are to provide adequate fixity and direct continuity of longitudinal strength.

4.2.3 Brackets at the top and bottom of side frames are to extend to the adjacent deck or bottom longitudinal to which they are to be attached.

4.2.4 In pontoons where truss arrangements, comprising top and bottom girders in association with pillars and diagonal bracing, are used in the support of the deck loads, the diagonal members are generally to have angles of inclination with the horizontal of about 45° and cross-sectional area of approximately 50 per cent of the adjacent pillar in accordance with Ch 1,4.4, with a head in accordance with 4.1.1.

4.2.5 Adequate support must be provided on the centre-line for the loads imposed on the structure when the ship is in dry-dock.

4.3 Longitudinal framing

4.3.1 The scantlings of bottom, side and deck longitudinals are to comply with the requirements of Table 5.4.1.

Table 5.4.1 Longitudinal framing

Position of longitudinals	Modulus, in cm^3
Bottom	$* Z = 11,0 l_e^2 s h \times 10^{-3}$
Side shell	$* Z = 8,0 l_e^2 s h \times 10^{-3}$
Deck	$* Z = 5,5 l_e^2 s h \times 10^{-3}$
NOTE The scantlings derived from above need not exceed the scantling requirements of Chapter 1 or Chapter 10, whichever is applicable.	

4.4 Transverse framing

4.4.1 The scantlings of bottom and side frames and deck beams are to comply with the requirements of Table 5.4.2.

Table 5.4.2 Transverse framing

Position of member	Modulus, in cm^3
Bottom and side frames	$* Z = 9,5 l_e^2 s h \times 10^{-3}$
Deck beams	$* Z = 4,5 l_e^2 s h \times 10^{-3}$
NOTE The scantlings derived from above need not exceed the scantling requirements of Chapter 1 or Chapter 10, whichever is applicable.	

Barges and Pontoons

Part 4, Chapter 5

Sections 4, 5, 6 & 7

4.5 Primary supporting structure

4.5.1 Primary supporting members are to comply with the requirements of Table 5.4.3.

Table 5.4.3 Primary supporting structure

Position of member	Modulus, in cm ³
Bottom transverse	* $Z = 11,0l_e^2Sh$
Side transverse	* $Z = 8,0l_e^2Sh$ (may be reduced by 5 per cent for vessels classed '100A1 extended protected water service')
Deck transverse	* $Z = 5,5l_e^2Sh$
Bottom girder	* $Z = 9,5l_e^2Sh$
Deck longitudinal girder	* $Z = 5,0l_e^2Sh$
	* For the requirements for barges carrying liquid cargoes in bulk see Chapter 10
NOTE The scantlings derived from above need not exceed the scantling requirements of Chapter 1 or Chapter 10, whichever is applicable.	

Section 7 Watertight bulkheads

7.1 Collision bulkheads

7.1.1 Barges and pontoons are to have a collision bulkhead extending intact to the strength/weather deck and, in general, this is to be positioned as detailed in Table 5.7.1.

Table 5.7.1 Collision bulkhead position

Length L , in metres	Distance of collision bulkhead aft of fore end of L , in metres, see Fig. 5.1.1	
	Minimum	Maximum
≤ 150	$0,05L$	$0,05L + 4,5$
> 150	The lesser of: $0,05L$ or 10	$0,08L$

Section 5 Strengthening of bottom forward

5.1 Application

5.1.1 The requirements for strengthening of bottom forward detailed in Pt 3, Ch 5 do not apply to barges or pontoons less than 50 m in length.

Section 6 Bottom strengthening for loading and unloading aground

6.1 Application

6.1.1 For barges or pontoons intended to load or unload while aground, see Pt 3 Ch 9,9.

Trawlers and Fishing Vessels

■ Section 1 General

1.1 Application

1.1.1 This Chapter applies to sea-going steel trawlers, stern trawlers and fishing vessels.

1.1.2 For the purpose of this Chapter, a fishing vessel is a ship used for fishing operations, but not equipped for trawling.

1.1.3 The scantlings and arrangements are to be as required by Chapter 1 except as otherwise specified in this Chapter. Consideration will be given to proposals for modified scantlings on vessels where L is less than 24 m.

1.2 Assignment of load lines

1.2.1 The *International Convention on Load Lines, 1966* does not apply to trawlers and fishing vessels, but certain National Authorities may request the assignment of load lines for ships registered in their countries.

1.2.2 The Rules affecting the protection of openings and protection of crew, and particularly those contained in Pt 3, Ch 11 and Ch 12, may be modified to take account of National Regulations or practicabilities related to fishing operations.

1.3 Class notations

1.3.1 In general, ships complying with the requirements of this Chapter will be eligible for one of the following classes:

- (a) **100A1 trawler**. This class will be assigned to side fishing trawlers.
- (b) **100A1 stern trawler**. This class will be assigned to stern fishing trawlers.
- (c) **100A1 fishing vessel**. This class will be assigned to fishing vessels, see 1.1.2.

1.3.2 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 to which reference should be made.

1.4 Information required

1.4.1 In addition to the information required by Pt 3, Ch 1,5, the position and arrangement of trawl gear and deck machinery and location of insulated compartments are to be indicated.

1.5 Symbols and definitions

1.5.1 The Rule length, L , is the distance, in metres, on the classification waterline from the fore side of the stem to the after side of the rudder post, or to the centre of the rudder stock if there is no rudder post. L is to be not less than 96 per cent, and need not be greater than 97 per cent, of the extreme length on the classification waterline.

1.5.2 Breadth B , is the greatest moulded breadth, in metres.

1.5.3 Depth D , is measured, in metres, at the middle of the length, L from the base line to top of the deck beam at side on the uppermost continuous deck.

1.5.4 The classification waterline in single deck ships is the waterline taken perpendicular to the plane of the transverse bulkheads located at $0,85D$ from the base line amidships, or at the maximum operational draught amidships, whichever is the greater. In two-deck ships, it is the waterline located at the maximum operational draught, but if this is unknown, it may be taken at 50 mm below the lower deck. If a load line is required by a National Authority, the classification waterline is the summer load waterline.

1.5.5 Keel line is the line parallel to the slope of the keel intersecting the top of the keel at amidships, or the line of intersection of the inside of shell plating with the keel where a bar keel is fitted.

1.5.6 Base line is a line parallel to the classification waterline and intersecting the keel line at amidships.

1.5.7 Draught T , is the distance in metres, between the classification waterline and the base line amidships.

1.5.8 The block coefficient C_b is to be taken at the classification waterline.

Trawlers and Fishing Vessels

Part 4, Chapter 6

Sections 1 to 5

1.5.9 The following symbols are also applicable to this Chapter:

- k = material factor, see Ch 1,1.5
- l_e = effective length of stiffening member, in metres, see Pt 3, Ch 3,3
- s = spacing of stiffeners, in mm
- $s_b = 470 + \frac{L}{0,6}$ with minimum limitation at ends as defined in Table 5.3.1 in Pt 3, Ch 5, for fore end structure and Table 6.3.1 in Pt 3, Ch 6, for aft end structure
- s_1 = s , but not less than s_b
- t = thickness of plating, in mm
- Z = section modulus of stiffening member, in cm^3 , see Pt 3, Ch 3,3.

Section 2 Protection

2.1 Protection of steelwork

2.1.1 Where wood sheathing is fitted, the material is to be of good quality, well seasoned and free from sapwood, and the thickness is to be not less than 65 mm. The plank widths should not normally exceed 150 mm. Thwartship planks are to be laid at the ends of deckhouses and at break of deck. Fastenings are to be sunk below the surface of the planking and covered with turned dowels, and the whole to be thoroughly bedded in a suitable composition. All weather decks are to be caulked and payed.

2.1.2 Where gutter waterways are fitted, the bar forming the inner edge of the waterway is to be not less than 7,5 mm thick.

2.1.3 Welded studs are to be not less than 9,5 mm diameter, and are to be coated with suitable composition before the planking is laid. Bolts used instead of studs may be 12,5 mm diameter galvanised. If the steel deck is penetrated for bolts, the deck is to be hose tested in accordance with Pt 3, Ch 1,8.

2.2 Protection of cargo

2.2.1 When an oil fuel bunker or double bottom carrying oil fuel, or a lubricating oil tank, is adjacent to a fish hold, the relevant requirements of Pt 6, Ch 3,4 are to be complied with.

2.2.2 Compartments used for the processing of fish, or for temporary storage during or while awaiting processing, need not comply with the requirements of 2.2.1, but the construction of the bulkheads, decks and insulation, if any, should be such as to minimise the risk of oil leakage.

Section 3 Longitudinal strength

3.1 General

3.1.1 The longitudinal strength standard is to comply with the relevant requirements of Pt 3, Ch 4.

3.1.2 The requirements of Pt 3, Ch 4,8.3 regarding loading instruments are not applicable to trawlers and fishing vessels.

Section 4 Deck structure

4.1 Deck plating

4.1.1 The thickness of deck plating is to be not less than that required by Ch 1,4. Under the trawl winch, windlass, mast, centre and side bollards and gallows, the plating thickness is to be not less than:

$$t = (0,04L + 7,5) \text{ mm}$$

where L is to be taken not less than 30 m.

4.1.2 When a raised deck is fitted, adequate scarfing is to be arranged at the step.

4.2 Factory deck beams

4.2.1 The section modulus of the beams of factory decks under fish handling spaces is to be not less than that required by Table 1.4.5(2) in Chapter 1, with h_2 equal to 2 m, but extra strengthening may be required in way of heavy items of machinery or equipment.

Section 5 Shell envelope plating

5.1 Shell plating

5.1.1 The thickness of shell plating is to be not less than that required by Ch 1,5 but in no case is it to be less than the following:

$$\begin{aligned} \text{For } L \leq 70 \text{ m} \quad t &= (5,5 + 0,033L) \sqrt{\frac{ks_1}{s_b}} \text{ mm} \\ \text{For } L > 70 \text{ m} \quad t &= (6,5 + 0,033L) \sqrt{\frac{ks_1}{s_b}} \text{ mm} \end{aligned}$$

5.1.2 For single deck side trawlers the thickness derived from the formulae in 5.1.1 is to be increased by 10 per cent.

Trawlers and Fishing Vessels

Part 4, Chapter 6

Sections 5 to 9

5.1.3 When nets or control wires are in contact with the ship's side, such as below the gallows in a side trawler, the side shell plating is to be increased by 40 per cent.

5.1.4 Where a bar keel is fitted, the breadth of the garboard strake is to be not less than 760 mm, and the thickness is to be 10 per cent greater than the bottom shell.

5.1.5 The thickness of the bottom shell plating is to be increased by 10 per cent where intercostal girders are not fitted.

5.1.6 For increase to sheerstrake at the break of a raised deck, see Ch 1,5.

5.1.7 Cope irons are to be fitted under gallows or any other area where excessive wear could occur.

Section 6 Shell envelope framing

6.1 Transverse side framing

6.1.1 The section modulus of the side frames of single deck trawlers and fishing vessels need not be greater than 80 per cent of the modulus required by Ch 1,6, but in no case is the depth of the frame to be less than 60 mm. Where not specified the draught is to be taken as not less than $0,85D$.

6.1.2 For two deck trawlers and two deck fishing vessels and all vessels requiring a load line, the requirements of Ch 1,6 are to be complied with.

6.1.3 The section modulus of frames in the fore peak is to be the greater of the following:

- (a) 10 per cent greater than that required by Pt 3, Ch 5,4.
- (b) $Z = (45D - 212) \text{ cm}^3$.

6.1.4 The section modulus of frames in the aft end region is to be not less than that required by Pt 3, Ch 6,3.

6.1.5 Where frames are stopped at watertight flats they are to be bracketed.

Section 7 Watertight bulkheads

7.1 Collision bulkheads

7.1.1 Consideration will be given to proposals for the collision bulkhead to be positioned further aft than $0,08L$ from the fore end of the classification waterline, provided that bow damage will not result in excessive trim forward.

Section 8 Stern ramp, and cruiser and transom sterns

8.1 Stern ramp

8.1.1 The thickness of plating of the stern ramp is to be not less than:

$$t = 0,025s \text{ mm or } 10 \text{ mm, whichever is the greater.}$$

8.1.2 The section modulus of stiffeners is to be not less than:

$$Z = 0,019s l_e^2 \text{ cm}^3.$$

8.2 Cruiser and transom sterns

8.2.1 Cruiser and transom sterns are to have frames of the size required for peaks, and are to be additionally stiffened by web frames when required. The depth of plate floors is to be not less than that given in Ch 1,7, and the floors are to be associated with a suitable system of girders.

Section 9 Strengthening of bottom forward

9.1 General

9.1.1 The requirements of Pt 3, Ch 5,1 are to be applied except when the forward draught contemplated for any sea-going condition is equal to or greater than $0,03L$ in which case the bottom shell plating in the region to be strengthened may be taken as:

$$t = 0,00818s f L^{1/4} k^{1/2}$$

where the symbols are as defined in Table 5,1.1 in Pt 3, Ch 5. This thickness derivation may be adopted for both longitudinal and transverse framing.

Section 1 General

1.1 General

1.1.1 This Chapter applies to sea-going self propelled ships, constructed generally with single deck double bottom, hopper side tanks and topside tanks and with single or double side skin construction in the cargo length area, and intended primarily for the carriage of bulk dry cargoes.

1.1.2 A 'bulk carrier of single side skin construction' is defined as a bulk carrier where one or more cargo holds are bound by the side shell only, or by two watertight boundaries, one of which is the side shell, which are less than 1000 mm apart.

1.1.3 The term 'bulk carrier of double side skin construction' is defined as a bulk carrier where all cargo holds are bound by two watertight boundaries, one of which is the side shell, which are greater than or equal to 1000 mm apart at any location within the hold length.

1.1.4 The ShipRight Procedures for the hull construction of ships are detailed in Pt 3, Ch 16 and the classification notations and descriptive notes associated with these procedures are given in Pt 1, Ch 2,3.

1.1.5 The attention of Owners, Masters and Cargo Shippers is drawn to the IMO Code of Safe Practice for Solid Bulk Cargoes when shipping these cargoes. Attention is also drawn to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered, and any special requirements of the Port Authorities at the ports of loading and discharge.

1.1.6 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 to which reference should be made.

1.2 Application

1.2.1 Single skin and double skin bulk carriers with length, L , greater than or equal to 90 m with structural configuration as shown in Fig. 7.1.1 are defined as 'CSR Bulk Carriers' and are to comply with 1.4.

Fig. 7.1.1 CSR-BC applicability

1.2.2 Single skin and double skin bulk carriers other than those described in 1.2.1 are defined as 'Non-CSR Bulk Carriers' and are to comply with 1.5.

1.3 General class notations

1.3.1 Class notations applicable to CSR bulk carriers are defined as follows:

- **CSR**
Identifies the bulk carrier as being compliant with the IACS Common Structural Rules for Bulk Carriers;
- **ESP**
Identifies the bulk carrier as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3,3 and Ch 3,6, see also Pt 1, Ch 2,2.3.12.

Bulk Carriers

Part 4, Chapter 7

Section 1

1.3.2 Class notations applicable to non-CSR bulk carriers are defined as follows:

- **Strengthened for heavy cargoes**
For bulk carriers with scantlings complying with 8.2;
- **ESP**
Identifies the bulk carrier as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3,3 and Ch 3,6, see also Pt 1, Ch 2,2.3.12;
- **ESN**
Identifies the bulk carrier as having been assessed for enhanced survivability with respect to flooding. Scantlings and arrangements are to comply with 3.1.2, 8.8 and 10.4.

1.4 Class notation for CSR bulk carriers

1.4.1 In general, CSR bulk carriers less than 150 m in length are to comply with the requirements of 1.6, Pt 3, Ch 2 and the *IACS Common Structural Rules for Bulk Carriers* (CSR) and will be eligible for one of the following mandatory class notations:

- (a) **100A1 bulk carrier, CSR, {any holds may be empty}, ESP.** This class notation is normally assigned to a ship designed to carry dry bulk cargoes of cargo density 1,0 tonne/m³ and above, with an approved arrangement of loaded holds such that any hold may be empty at the full loaded draught.
- (b) **100A1 bulk carrier, CSR, {holds a, b, ... may be empty}, ESP.** This class notation is normally assigned to a ship designed to carry dry bulk cargoes of cargo density 1,0 tonne/m³ and above with specified holds empty at maximum draught.
- (c) **100A1 bulk carrier, CSR, ESP.** This class notation will be assigned to a ship designed to carry dry bulk cargoes of cargo density less than 1,0 tonne/m³.

1.4.2 In general, CSR bulk carriers equal to or greater than 150 m in length are to comply with the requirements of 1.6, Pt 3 Ch 2 and the *IACS Common Structural Rules for Bulk Carriers* (CSR) and will be eligible for one of the following mandatory class notations:

- (a) **100A1 bulk carrier, CSR, BC-A, {holds a, b, ... may be empty}, GRAB [X] ESP.** This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density 1,0 tonne/m³ and above with specified holds empty at maximum draught.
- (b) **100A1 bulk carrier, CSR, BC-B, GRAB [X], ESP.** This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density 1,0 tonne/m³ and above with all cargo holds loaded.
- (c) **100A1 bulk carrier, CSR, BC-C, ESP.** This class will be assigned for bulk carriers designed to carry dry bulk cargoes of cargo density less than 1,0 tonne/m³ with all cargo holds loaded.

1.4.3 The following additional notations and annotations are to be provided giving further detailed description of limitations to be observed during operation as a consequence of the design loading condition applied during the design.

- **Notations:**
(maximum cargo density (in tonnes/m³)) For notations **BC-A** and **BC-B** if the maximum cargo density is less than 3,0 tonnes/m³;

(no MP) For all notations when the vessel has not been designed for loading and unloading in multiple ports in accordance with the conditions specified in *IACS Common Structural Rules for Bulk Carriers* (CSR) Ch 4,7.3.3;

GRAB [X] where the net thickness of inner bottom, lower strake of hopper tank sloping plate and transverse lower stool plating comply with *IACS Common Structural Rules for Bulk Carriers* (CSR) Ch 12,1 for **BC-A** and **BC-B**, see also CSR Ch 1,1;

- **Annotations:**
(allowed combination of specified empty holds). For notation **BC-A**.

1.4.4 The 'Construction Monitoring' (CM) procedures detailed in the *ShipRight Procedures Manual*, published by LR, are mandatory for bulk carriers greater than 190 m in length.

1.4.5 Optional notations indicating compliance with specific requirements of Sections 3 to 14 on a voluntary basis may also be assigned.

1.5 Class notation for non-CSR bulk carriers

1.5.1 In general, non-CSR Bulk Carriers are to comply with the requirements of 1.5.2 to 1.5.7 and will be eligible for one of the following mandatory class notations:

- (a) **100A1 bulk carrier, ESP.**
- (b) **100A1 bulk carrier, strengthened for heavy cargoes, ESP.** This class notation will be assigned to a ship when the double bottom structure has been specially strengthened in accordance with the requirements of Table 7.8.1.
- (c) **100A1 bulk carrier, strengthened for heavy cargoes, {holds a, b, ... may be empty}, ESP.** This class notation is normally assigned to a ship which has been specially strengthened for heavy cargoes (see (b)), so as to enable the ship to be fully loaded with an approved arrangement of empty holds, see also 1.3.5 and 1.4.3.
- (d) **100A1 bulk carrier, strengthened for heavy cargoes, {any holds may be empty}, ESP.** This class notation is normally assigned to a ship which has been specially strengthened for heavy and ore cargoes, with an approved arrangement of loaded holds such that any hold may be empty at the full loaded draught.

1.5.2 Plans and information are to be submitted in accordance with 1.7.

1.5.3 Requirements are also given for special strengthening for heavy cargoes, see 8.2.

1.5.4 The scantlings and arrangements of the cargo region are to be as specified in this Chapter in Sections 2 to 14. The requirements are intended to cover the midship region, but also apply, with suitable modification, to the taper regions forward and aft in way of cargo spaces.

Bulk Carriers

Part 4, Chapter 7

Section 1

1.5.5 The 'Structural Design Assessment' (SDA), 'Fatigue Design Assessment' (FDA) and 'Construction Monitoring' (CM) procedures detailed in the *ShipRight Procedures Manual*, published by LR, are mandatory for non-CSR bulk carriers greater than 190 m in length and for other non-CSR bulk carriers of abnormal hull form, or of unusual structural configuration or complexity see 1.1.5 and Section 11.

1.5.6 Where the class notation referred to in 1.5.1(d) is assigned such that any hold may be empty at the full draught the following items are to be considered and the corresponding requirements complied with:

- Longitudinal strength calculations are to be carried out for all the operational fully loaded, non-homogeneous, part loaded, heavy cargo conditions, and these conditions included in the approved Loading Manual, see Section 3. Envelopes of the still water bending moments and the shear forces covering these conditions are also to be submitted.
- The double bottom structure in each hold is to satisfy the requirements of 8.4.
- The arrangement and scantlings of cross-deck structure between the upper deck cargo hatchways, see 4.1.2.
- Transverse bulkheads in holds, see 10.1.4.
- For main cargo hatchway openings the requirements of 4.3.1 are to be complied with.

1.5.7 Where appropriate, other cargoes or particular loading arrangements will be included in the class notation. When the class notation referred to in 1.5.1(c) is to be assigned for other combinations of empty and loaded holds, for example where it is the intention to load fully any two adjoining holds with adjacent holds empty in sea-going or short voyage conditions, the longitudinal and local strength aspects will be specially considered, see also 4.1.2. In addition, permissible weights of cargo in each hold or pair of adjacent holds, plotted against ship's draught likely to be incurred, is to be included in the ship's approved Loading Manual.

1.5.8 The scantlings of structural items may be determined by direct calculation.

1.5.9 The additional requirements for bulk carriers for the alternate carriage of oil cargo and dry bulk cargo are given in Ch 9,11. When complying with the requirements of this Chapter, such ships may be excluded from all requirements and notations pertaining to vessels with length, L , greater than or equal to 150 m. The requirements of 1.5.5 are however to be complied with.

1.6 Information required for CSR bulk carriers

1.6.1 In addition to the plans and documents required by the CSR the following are to be submitted:

- Ice strengthening.
- Freeboard plan or equivalent showing freeboards and items relative to the conditions of assignment.
- In addition the supporting calculations given in Pt 3, Ch 1,5.2.3 are to be submitted.

1.7 Information required for non-CSR bulk carriers

1.7.1 In addition to the information and plans required by Pt 3, Ch 1,5, the following are to be submitted:

- Cargo loadings on decks, hatchways and inner bottom if these are to be in excess of Rule, see Pt 3, Ch 3,5.
- The maximum pressure head in service on tanks, also details of any double bottom tanks interconnected with hopper, and topside tanks.
- Details of the proposed depths of any partial fillings where water ballast or liquid cargo is intended to be carried in the holds.
- Details of loading arrangements where combinations of empty and loaded holds are envisaged, and where it is the intention to load fully any two adjoining holds with adjacent holds empty in sea-going or short voyage conditions.

1.7.2 Additional information required for bulk carriers of length, L , 150 m or above:

- The bulk cargo density to be used in the design homogeneous loading condition at scantling draught with all holds, including hatchways, being 100 per cent full.
- The maximum bulk cargo density the ship is designed to carry.
- The maximum bulk cargo weight to be carried in each hold.
- Tables or curves indicating the change of cargo hold volume as a function of height above moulded baseline.

1.8 Symbols and definitions

1.8.1 The following symbols and definitions are applicable to this Chapter unless otherwise stated: L , B , D , T as defined in Pt 3, Ch 1,6

- k_L, k = higher tensile steel factor, see Pt 3, Ch 2,1
- l = overall length of stiffening member, in metres, see Pt 3, Ch 3,3
- l_e = effective length of stiffening member, in metres, see Pt 3, Ch 3,3
- s = spacing of secondary stiffeners, in mm
- t = thickness of plating, in mm
- C = stowage rate, in m^3/tonne , as defined in Pt 3, Ch 3,5
- I = inertia of stiffening member, in cm^4 , see Pt 3, Ch 3,3
- M_H = the actual cargo mass in a cargo hold corresponding to a homogeneously loaded condition at maximum draught
- M_{Full} = the cargo mass in a cargo hold corresponding to cargo with virtual density (homogeneous mass/hold cubic capacity, minimum $1,0 \text{ tonne}/\text{m}^3$) filled to the top of the hatch coaming. M_{Full} is in no case to be less than M_H
- M_{HD} = the maximum cargo mass allowed to be carried in a cargo hold according to design Loading conditions with specified holds empty at maximum draught
- R = $\sin \theta$
- S = spacing, or mean spacing, of primary members, in metres

Bulk Carriers

Part 4, Chapter 7

Sections 1, 2 & 3

- Z = section modulus of stiffening member, in cm^3 , see Pt 3, Ch 3,3
- ρ = relative density (specific gravity) of liquid carried in a tank, and is not to be taken less than 1,025.
- θ = roll angle, in degrees
- $$\sin \theta = \left(0,45 + 0,1 \frac{L}{B} \right) \left(0,54 - \frac{L}{1270} \right)$$

Section 2 Materials and protection

2.1 Materials and grades of steel

2.1.1 Materials and grades of steel are to comply with the requirements of Pt 3, Ch 2.

2.2 Protection of steelwork

2.2.1 For the protection of steelwork, in addition to the requirements specified in Ch 1,2 and Pt 3, Ch 2,3 the requirements of 2.2.2 are to be complied with.

2.2.2 All internal and external surfaces of hatch coamings and hatch covers, and all internal surfaces of the cargo holds, except where excluded below, are to have an efficient protective coating (epoxy coating or equivalent) applied in accordance with the manufacturer's recommendations. In the selection of coating, due consideration is to be given to the intended cargo conditions in service. Areas which may remain uncoated are:

- The inner bottom plating.
- The hopper tank sloping plating between the intersection with the inner bottom plating and a line approximately 300 mm below the toe of the side shell frame end brackets.

2.2.3 For the notation 'strengthened for regular discharge by heavy grabs', see Pt 3, Ch 9,9.

Section 3 Longitudinal strength

3.1 General

3.1.1 Longitudinal strength calculations are to be made in accordance with the requirements given in Pt 3, Ch 4 and 1.5.6 and 1.5.7 where appropriate.

3.1.2 Longitudinal strength calculations for the flooded conditions defined in 3.2 to 3.4 are to be applied for bulk carriers which satisfy all of the following criteria:

- Single skin construction.
- Length, L , of 150 m or above.
- Intended for the carriage of cargoes having bulk densities of 1,0 tonne/ m^3 or above.

3.2 Hull vertical bending stresses for flooded conditions

3.2.1 The maximum hull vertical bending stresses in the flooded condition at deck, σ_{Df} , and keel, σ_{Bf} , for use in Pt 3, Ch 4 are given by the following, using the appropriate combination of bending moments to give sagging and hogging stresses:

$$\sigma_{Df} = \frac{|M_{sf} + 0,8M_w| \times 10^{-3}}{Z_D} \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$$

$$\sigma_{Bf} = \frac{|M_{sf} + 0,8M_w| \times 10^{-3}}{Z_B} \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$$

where

M_{sf} = maximum still water bending moment in the flooded condition, in kN m (tonne-f m), at the section under consideration, see 3.4

M_w = design hull vertical wave bending moment, in kN m (tonne-f m), as defined in Pt 3, Ch 4,5 at the section under consideration

Z_D, Z_B = actual hull section moduli, in m^3 , at strength deck and keel respectively, at the section under consideration.

3.2.2 The maximum values of σ_{Df} and σ_{Bf} are to be used in Pt 3, Ch 4.

3.3 Shear stresses for flooded conditions

3.3.1 The shear stress, τ_{Af} , in the flooded condition to be used in Pt 3, Ch 4,6, is to be taken as:

$$\tau_{Af} = 100Az \frac{|Q_{sf}| + |0,8Q_w|}{I \delta_i} \text{ N/mm}^2$$

$$\left(\tau_{Af} = 10,2Az \frac{|Q_{sf}| + |0,8Q_w|}{I \delta_i} \text{ kgf/mm}^2 \right)$$

where

Az = the first moment, in cm^3 , about the neutral axis, of the area of the effective longitudinal members between the vertical level under consideration and the vertical extremity of the effective longitudinal members, taken at the section under consideration

Q_{sf} = maximum hull still water shear force, in kN (tonne-f), in the flooded condition at the section under consideration

Q_w = design hull wave shear force, in kN (tonne-f), as defined in Pt 3, Ch 4,6.3 at the section under consideration

I = moment of inertia of the hull about the horizontal neutral axis, in cm^4 , at the longitudinal section under consideration

δ_i = as defined in Pt 3, Ch 4,6.5.

3.4 Flooded conditions

3.4.1 For the relevant loading conditions specified in Pt 3, Ch 4,5.3 and 5.4, each cargo hold is to be considered individually flooded up to the equilibrium waterline, except that cargo holds of double skin construction of not less than 1000 mm breadth at any location within the hold length, measured perpendicular to the side shell need not be

Bulk Carriers

Part 4, Chapter 7

Sections 3 & 4

considered flooded. The shear forces and still water bending moments are to be calculated for the most severe flooded conditions which will significantly load the ship's structure. Harbour conditions, docking conditions afloat, loading and unloading transitory conditions in port and loading conditions encountered during ballast water exchange need not be considered.

3.4.2 In calculating the weight of ingressed water into the cargo hold under consideration, the permeabilities and bulk densities given in Table 7.3.1 are to be used.

Table 7.3.1 Permeability and bulk density factors

Hold condition	Permeability (see Note 1)	Bulk density (tonne/m ³)
Empty cargo space	0,95	—
Volume left in loaded cargo spaces above any cargo	0,95	—
Iron ore cargo	0,3 (see Note 2)	3,0
Cement	0,3 (see Note 2)	1,3
NOTES 1. Bulk cargo permeability is defined as the ratio of the voids within the cargo mass to the volume occupied by the cargo. 2. More specific information relating to the bulk cargo may be used where available, but permeabilities are not to be less than those given above. 3. For packed cargo, the actual density of the cargo is to be used with a permeability of zero.		

3.4.3 In calculating the strength of the ship's structure in the flooded condition it is to be assumed that the ship's structure will remain fully effective in resisting the applied loads.

Section 4 Deck structure

4.1 General

4.1.1 Longitudinal framing is, in general, to be adopted outside line of openings. The arrangement of structure between hatches is to be such as to ensure continuity of the main deck structure to resist athwartship forces, and transverse stiffening is to be arranged. For and aft knuckles in cross deck strip plating between hatches should be arranged close to longitudinal girders or supported by brackets.

4.1.2 In the case of large bulk carriers with narrow deck strips between hatchways, or where it is the intention to fully load any two adjoining holds with adjacent holds empty for a sea-going condition or for bulk carriers to be classed 'any hold may be empty', the cross deck scantlings will be specially considered.

4.1.3 The requirements of Ch 1,4 are to be applied, together with the requirements of this Section.

4.1.4 The *ShipRight FDA Procedure, Structural Detail Design Guide* (SDDG), indicates recommended structural design configurations in critical areas, for the deck structure outside the line of openings and between hatches.

4.2 Deck plating

4.2.1 Where the difference between the thickness of plating inside and outside the line of main hatches exceeds 12 mm, a transitional plate of thickness equivalent to the mean of the adjacent plate thicknesses is to be fitted. The plate thickness outside the line of hatches is to be continued inboard between hatches beyond the end of the hatch corner curvature, to ensure that the chamfered plating is clear of the corner tangent point.

4.3 Main cargo hatchway openings

4.3.1 The following requirements apply to bulk carriers with vertically corrugated transverse bulkheads in cargo holds having one or more of the following characteristics:

- (a) $B \geq 40 \text{ m}$
- (b) $\frac{b}{w} \geq 2,2$
 b = breadth of deck opening
 w = width of cross deck strip
 B = moulded breadth of ship
- (c) A structural arrangement where the hatch side coaming and deck opening are arranged inboard of the topside tank.
- (d) All bulk carriers to be classed 100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP.

4.3.2 The corners of main cargo hatchways in the strength deck are to be rounded with a radius not less than $\frac{1}{20}$ of the breadth of the opening, with a maximum radius of 1000 mm.

4.3.3 Insert plates are to be fitted at the corners having a thickness not less than 25 per cent greater than the adjacent deck thickness outside the line of openings, with a minimum increase of 5 mm, *see also* 4.3.4.

The corner inserts are to be extended transversely into the cross deck plating for a minimum distance equal to $0,075b$, where b , is the breadth of deck opening.

4.3.4 For the extreme corners of the end hatchways of the cargo region furthest from amidships the thickness of the corner insert plates is to be not less than 60 per cent greater than the adjacent deck thickness outside the line of openings.

4.4 Deck supporting structure

4.4.1 For the scantlings of deck longitudinals and transverses in way of topside tanks, *see* 7.4 and 7.5, respectively.

Bulk Carriers

Part 4, Chapter 7

Sections 5 & 6

Section 5 Shell envelope plating

5.1 General

5.1.1 Longitudinal framing is, in general, to be adopted at the bottom, but special consideration will be given to proposals for transverse framing in this region. The side shell may be longitudinally or transversely framed.

5.1.2 The requirements of Ch 1,5 are to be applied together with the requirements of this Section.

5.2 Bottom shell

5.2.1 The thickness of the bottom shell plating below loaded holds may be required to be increased for local strength considerations.

5.3 Side shell

5.3.1 The thickness of the side shell plating may be required to be increased for shear forces to satisfy the requirements of 3.2.1.

5.3.2 The thickness of the side shell plating located between the hopper and topside tanks of single skin bulk carriers is to be not less than:

$$t = \sqrt{L} \text{ mm}$$

Section 6 Shell envelope framing

6.1 Longitudinal stiffening

6.1.1 Side frames of all single skin bulk carriers with a hopper are to comply with 6.2 and 6.3.

6.1.2 Side frames and end brackets of all double skin bulk carriers are to comply with Ch 1,6.

6.1.3 Side frames and end brackets of other structural configurations will be specially considered.

6.1.4 The end connections for the longitudinal stiffening are to satisfy the requirements of Pt 3, Ch 10,3, see also 7.6.1 and 9.7.1.

6.1.5 The arrangements at the intersections of continuous secondary and primary members are to satisfy the requirements of Pt 3, Ch 10,5.2 and Ch 1,6.2.

6.2 Transverse stiffening

6.2.1 The modulus and inertia of main and topside tank frames in the midship region are to comply with the requirements given in Table 7.6.1. Arrangements of main frames in holds in association with web frames are not recommended in view of the vulnerability to cargo handling damage. Where such web frames are proposed the arrangements and scantlings will be specially considered.

Table 7.6.1 Shell framing

Location	Modulus, in cm ³	Inertia, in cm ⁴
(1) Main frames in dry cargo holds	$Z = 3,50skh_{T1}H^2 \times 10^{-3}$	$I = \frac{3,2}{k} HZ$
(2) Main frames in cargo holds used for water ballast	The greater of the following: (a) $Z = 1,15 \times \text{modulus given in (1)}$ (b) $Z = 6,7skh_4H^2 \times 10^{-3}$	$I = \frac{3,2}{k} HZ$
(3) Transverse frames in topside wing tanks	The greater of the following: (a) $1,15 \times Z$ as given in location (1) of Table 1.6.2 in Chapter 1 (b) As required by 7.3.1 for the sloped bulkhead stiffeners	$I = \frac{3,2}{k} HZ$
Symbols		
<p>D, T, s, k as defined in 1.7.1 h_{T1} = head, in metres, at middle of H $= C_w \left(1 - \frac{h_6}{D-T} \right) F_\lambda$, in metres, for frames where the mid-length of frame is above the summer load waterline, $\left(1 - \frac{h_6}{D-T} \right)$ is not to be taken less than 0,7 $= \left(h_6 + C_w \left(1 - \frac{h_6}{2T} \right) \right) F_\lambda$, in metres, where the mid-length of frame is below the summer load waterline</p>		
<p>h_4 = head, in metres, measured from the middle of H to the deck at side, or half the distance from the middle of H to the top of the overflow, whichever is greater. h_6 = vertical distance in metres, from the summer load waterline at draught T to the mid-length of H C_w = a wave head, in metres $= 7,71 \times 10^{-2} Le^{-0,0044L}$ where e = base of natural logarithms 2,7183 $F_\lambda = 1,0$ for $L \leq 200$ m $= (1,0 + 0,0023(L - 200))$ for $L > 200$ m H = length overall of frame, in metres, but is to be taken not less than 2,5 m</p>		

Bulk Carriers

Part 4, Chapter 7

Section 6

6.2.2 Main frames in the cargo and ballast holds are to have a web thickness not less than:

- In general:

$$t_{\min} = 7 + 0,03L \text{ mm,}$$
or 13 mm whichever is the lesser
- In the foremost hold:

$$t_{\min} = 1,15 (7 + 0,03L) \text{ mm,}$$
or 15 mm whichever is the lesser

where L is the Rule length, in metres.

6.2.3 The web depth to thickness ratio of the frames is not to be greater than:

$$60 \sqrt{k}, \text{ for symmetric sections}$$

$$50 \sqrt{k}, \text{ for asymmetric sections}$$

The breadth to thickness ratio of the flange outstand is not to be greater than:

$$10 \sqrt{k}$$

6.2.4 The upper and lower end brackets of the main frames in the cargo and ballast holds are to satisfy the requirements of 6.2.5 to 6.2.14 inclusive, based on the mild steel section modulus Z in cm^3 , derived from Table 7.6.1, or the equivalent mild steel section modulus for higher tensile steel frames.

6.2.5 The lengths of the arms of the brackets, measured as shown in Fig. 7.6.1, are not to be less than:

(a) Frame connection to hopper tank.

Athwartship arm:

$$\text{Dry cargo hold} \quad l_a = 32,43 \sqrt{Z} \text{ mm}$$

$$\text{Ballast hold} \quad l_a = 32,43 (\sqrt{Z} - 7,5) \text{ mm}$$

Vertical arm:

$$\text{Dry cargo hold} \quad l_v = 27,6 \sqrt{Z} \text{ mm}$$

$$\text{Ballast hold} \quad l_v = 27,6 (\sqrt{Z} - 9,0) \text{ mm}$$

(b) Frame connection to topside tank

Athwartship arm:

$$\text{Dry cargo hold} \quad l_a = 30,0 \sqrt{Z} \text{ mm}$$

$$\text{Ballast hold} \quad l_a = 30,0 (\sqrt{Z} - 9,0) \text{ mm}$$

Vertical arm:

$$\text{Dry cargo hold} \quad l_v = 26,85 \sqrt{Z} \text{ mm}$$

$$\text{Ballast hold} \quad l_v = 26,85 (\sqrt{Z} - 11,0) \text{ mm}$$

In no case are the bracket arm lengths to be taken less than $0,125H$, where H is as defined in Table 7.6.1.

6.2.6 The section modulus of the frame and bracket or integral bracket, and associated shell plating at the location marked Z_a in Fig. 7.6.1 is to be not less than $2,0Z$.

In addition, the minimum depth of the frame and bracket or integral bracket at the location indicated in Fig. 7.6.1 is to be not less than $1,5d$.

6.2.7 The upper and lower integral or separate brackets are to have a web thickness not less than the as built web thickness of the side frame. In addition, the lower bracket thickness is to be not less than:

$$t = t_{\min} + 2 \text{ mm, where } t_{\min} \text{ is derived from 6.2.2}$$

The toes of the brackets are to be designed to avoid notch effects by making the upper and lower toes concave or otherwise tapering them off, see also Pt 3, Ch 10.5.1.7.

6.2.8 Except as indicated in 6.2.9, frames are to be fabricated symmetrical sections with integral upper and lower brackets. The side frame face plate is to be curved (not knuckled) at the connection with the end brackets. The radius of curvature, r , is to be not less than:

$$r = \frac{0,4b_f^2}{t_f} \text{ mm}$$

where

b_f = breadth of the bracket face plate, in mm

t_f = thickness of the bracket face plate, in mm

The brackets are to be arranged with soft toes and the frame section face bar tapered symmetrically to the toes with a taper rate not exceeding 1 in 3. Where the free edge of the bracket is hollowed out, it is to be stiffened or increased in size to ensure that the section modulus of the bracket through the throat is not less than that of the required straight edged bracket.

6.2.9 In ships of length, L , less than 190 m, mild steel fabricated frames may be asymmetric and fitted with separate brackets. Brackets are to be arranged with soft toes. The free edges of the brackets are to be stiffened as follows:

(a) Where a flange is fitted, its breadth, b_f , is to be not less than:

$$b_f = 40 \left(1 + \frac{Z}{1000} \right) \text{ mm}$$

or 50 mm, whichever is the greater.

The flange is to be tapered at the ends with a taper rate not exceeding 1 in 3.

(b) Where the edge is stiffened by a welded face flat, the cross-sectional area of the face flat is to be not less than:

(i) $0,009b_f t \text{ cm}^2$ for offset edge stiffening

(ii) $0,014b_f t \text{ cm}^2$ for symmetrically placed stiffening

where

t = web thickness of bracket, in mm

The face plate is to be tapered at the ends with a taper rate not exceeding 1 in 3.

6.2.10 For mild steel construction with separate brackets where the frames are lapped on to the bracket, the length of the overlap is to be adequate to provide for the required area of welding to achieve equivalent strength.

6.2.11 Double continuous welding is to be adopted for the connections of frames and brackets to side shell, hopper and topside tank plating and web to face plates. For this purpose, the following weld factors are to be adopted:

- 0,44 in Zone 'a' and
- 0,40 in Zone 'b', see Fig. 7.6.1.

Where the hull form is such that an effective fillet weld cannot be made, edge preparation of the web of the frame and bracket may be required, in order to ensure the required efficiency of the weld connection.

Fig. 7.6.1 Diagrammatic arrangement of end brackets

Bulk Carriers

Part 4, Chapter 7

Section 6

6.2.12 Continuity of the frames is to be maintained by supporting brackets, see Fig. 7.6.2, in the topside and hopper tanks. The design of end connections and their supporting structure is to be such as to provide adequate resistance to rotation and displacement of the joint. For this purpose, in the hopper and topside tanks, the thickness of the supporting brackets (which must align with the hold main frame brackets) is to be not less than the following:

(a) Lower brackets (In hopper tank):

$$t = t_{\min} + 0,5 \text{ mm, where } t_{\min} \text{ is derived from 6.2.2, or}$$

$$t = 9,0 \text{ mm}$$

whichever is the greater.

(b) Upper brackets (in topside tank):

$$t = t_{\min}, \text{ where } t_{\min} \text{ is derived from 6.2.2, or}$$

$$t = 9,0 \text{ mm}$$

whichever is the greater.

The size and arrangement of stiffening of the supporting brackets will be specially considered. Where the toe of the hold frame bracket is situated on or in close proximity to the first longitudinal from the shell of the hopper or topside tank sloped bulkheads, the supporting brackets are to be extended to the next longitudinal. This extension is to be achieved by enlarging the supporting bracket or by fitting an intercostal flat bar stiffener the same depth as the longitudinal and connected to the webs of the longitudinals.

Fig. 7.6.2

Supporting brackets in topside and hopper tanks

6.2.13 The requirements are to be maintained throughout the cargo hold region. However, in the forward and aft cargo holds where the shape becomes finer because of the ship form, increased requirements may be necessary and each case will be specially considered.

6.2.14 In way of the foremost hold, side frames of asymmetric section are to be effectively supported by intercostal brackets, see Fig. 7.6.3.

Fig. 7.6.3

Typical arrangement of intercostal brackets supporting asymmetric side shell frames in No. 1 hold

6.2.15 The hold side shell frame adjacent to the collision bulkhead is to be suitably strengthened. As an alternative, at least two supporting structures are to be fitted which align with the forepeak stringers or flats, see Fig. 7.6.4. The supporting structures are to have adequate cross sectional shear resisting area at their connections to the hold frame.

6.2.16 Detail design guidelines for connection of side shell frames to hopper and topside tank plating are shown in the *ShipRight FDA Procedure, Structural Detail Design Guide (SDDG)*.

6.3 Primary supporting structure

6.3.1 For the requirements for primary supporting structure, see 7.5 and 9.6.

Fig. 7.6.4

Hold frame supporting structures at fore end of No. 1 cargo hold

Section 7 Topside tank structure

7.1 General

7.1.1 Requirements are given in this Section for longitudinal or transverse framing in the topside tank, but, in general, the deck is to be longitudinally framed. The sloped bulkhead is to be of plane construction with the associated stiffening arranged inside or outside the tank.

7.1.2 The buckling requirements of Pt 3, Ch 4,7 are to be satisfied.

7.1.3 Recommended examples of structural design configurations around the transverse ring web of the topside tank can be seen in the *ShipRight FDA Procedure, Structural Detail Design Guide (SDDG)*.

7.2 Bulkhead plating

7.2.1 The thickness of the sloped bulkhead, tank end bulkhead, and diaphragm, if fitted, is to be the greater of the following:

- (a) For watertight bulkheads, the thickness, t , as derived from Table 1.9.1 in Chapter 1 for a deep tank bulkhead using a head, h_4 , in metres determined as follows:
 $h_4 = h_o \cos\theta + Rb_1$ or
 = the greater of the distance from a point one-third of the height of the plate above its lower edge to the top of the tank, or half the distance to the top of the overflow
 whichever is the greater, or

- (b) $t = 7,5 \text{ mm}$

In no case, however, is the thickness of the sloped bulkhead and diaphragm to be taken less than:

$$t = 0,012s \text{ mm, or}$$

$$t = 0,012s \sqrt{\frac{F_D}{k_D}} \text{ mm}$$

whichever is the greater

where

k_D = the higher tensile steel factor equal to k_L value for deck material

F_D = as defined in Pt 3, Ch 4,5.7

R = as defined in 1.8.1

h_o = the vertical distance, in metres, from a point one third of the height of the plate from its lower edge to the highest point of the tank excluding hatchway

b_1 = the larger horizontal distance, in metres, from the tank corner at top of tank either side to point of plate under consideration.

7.2.2 The thickness of the top strake of the sloped bulkhead, including the vertical plate attached to deck, may be required to be increased to form an effective girder below the deck. In general, this plate is to be not less in thickness than 60 per cent of the thickness of the deck plate outside the line of openings nor less than:

- (a) $t = 0,018s \text{ mm, or}$

$$(b) t = 0,018s \sqrt{\frac{F_D}{k_D}} \text{ mm}$$

whichever is the greater.

7.2.3 The thickness of the transverse wash bulkhead, where fitted, is to be not less than:

$$t = 0,012s \text{ mm or } 7,5 \text{ mm}$$

whichever is the greater.

7.3 Bulkhead stiffeners

7.3.1 The section modulus of longitudinal or transverse stiffeners on the sloped bulkhead or watertight diaphragms, if fitted, is to be not less than:

$$Z = 0,01skh_4 l_e^2 \text{ cm}^3$$

where

$$h_4 = h_o \cos\theta + Rb_1$$

= the greater of the distance, in metres, from the middle of the effective length to the top of the tank, or half the distance to the top of the overflow, or
 = 1,5 m
 whichever is the greatest

R = as defined in 1.7.1

h_o = the vertical distance, in metres, from the mid-point of span of the stiffener to the highest point of the tank excluding hatchway

b_1 = the larger horizontal distance, in metres, from the tank corner at top of tank, either side to midpoint of span.

7.3.2 Where the bulkhead stiffening is fitted on the hold side of the sloped bulkhead, suitable arrangements are to be made to prevent tripping.

Bulk Carriers

Part 4, Chapter 7

Sections 7 & 8

7.3.3 The scantlings of stiffeners on tank end bulkheads are to be not less than those given in Table 1.9.1 in Chapter 1 for deep tanks, using h as defined in 7.3.1.

7.3.4 The section modulus of stiffeners of non-watertight fore and aft diaphragms, or transverse wash bulkheads is to be not less than 50 per cent of that required by 7.3.3. The stiffeners are to be bracketed at both ends.

7.3.5 Tank end bulkheads are generally to be in line with the main hold bulkheads.

7.4 Shell and deck structure

7.4.1 The scantlings of shell and deck longitudinals are to comply with 7.3.1. The scantlings must also satisfy the requirements of Chapter 1, see also 7.6.1.

7.4.2 The scantlings of side shell frames are to comply with 6.2.

7.5 Primary supporting structure

7.5.1 The section modulus and inertia of deck, shell and bulkhead transverses or stringers are to be not less than:

$$Z = 7,5 k S h l_e^2 \text{ cm}^3$$

$$I = \frac{2,5}{k} l_e Z \text{ cm}^4$$

using h as defined in 7.3.1. The scantlings of shell and deck members must also satisfy the requirements of Chapter 1 for dry cargo holds.

7.5.2 Primary transverse members are, in general, to be spaced not more than 3,8 m apart where the length, L , is 100 m or less, and $(0,006L + 3,2)$ m apart for lengths greater than 100 m.

7.5.3 Transverses are to be arranged in line with the primary structure at ends of hatchways, or equivalent scarfing arranged. Where the sloped bulkhead or side shell is transversely framed, arrangements are to be made to ensure effective continuity at the ends of the deck transverse.

7.5.4 Where non-watertight transverse diaphragms are arranged instead of open transverses, the thickness of plating is to be in accordance with 7.2.3. The diaphragms are to be efficiently stiffened.

7.6 Structural details

7.6.1 Bracket/diaphragm connections at the bottom of the topside tank are to be of sufficient size and thickness to provide effective rigidity, and care is to be taken to ensure alignment with brackets at the heads of the side frames in the holds, see also 6.2.12. The shell and sloped bulkhead longitudinals supporting the diaphragms are to be derived using the span taken between transverses.

7.6.2 For ships where $L \geq 300$ m a fore and aft diaphragm extending vertically from the deck to the sloping plating of the topside tank is to be arranged at about the half-width of the tank.

7.6.3 Where longitudinal framing is fitted to the side shell, a bracket may be required in way of a rounded gunwale, approximately halfway between transverses and extending to the adjacent shell and deck longitudinal.

Section 8 Double bottom structure

8.1 General

8.1.1 The double bottom is, in general, to be longitudinally framed, but special consideration will be given to proposals for a transverse framing system.

8.1.2 The requirements of Ch 1,8 are to be applied, together with the requirements of this Section, see also 2.2.3.

8.1.3 Where the double bottom tanks are interconnected with double skin side tanks or combined hopper and top side tanks, the double bottom scantlings are also to satisfy the requirements of Table 7.8.1(3)(c), (3)(d), (4)(c) and (4)(d) for ballast holds, and (3)(c) and (4)(c) in way of dry cargo holds, see also Ch 1,6.2.

8.1.4 The requirements given in 8.8 are to be applied to bulk carriers which satisfy the following criteria:

- Single skin construction.
- Length, L , of 150 m or above.
- Intended for the carriage of cargoes having bulk densities of 1,0 tonne/m³ or above.

8.1.5 For all bulk carriers where bulk cargoes are discharged by grabs the maximum recommended unladen weight of the grab corresponding to the approved inner bottom plating thickness is to be calculated using the following formulae:

$$P = \left(\frac{s}{k} \right)^2 \frac{10^d}{1,775} \text{ tonnes}$$

where

$$d = \frac{40,875 (t - 1,5) \sqrt{k + 344,5}}{s} - 5,7633$$

P = unladen grab weight, in tonnes

s = spacing of inner bottom longitudinal, in mm

k = higher tensile steel factor as defined in 1.7.1

t = thickness of inner bottom plating, in mm

The maximum recommended unladen weight of the grab rounded up to the next tonne above, is to be recorded in the Loading Manual (see also Pt 3, Ch 4,8.2.4(e)) and does not preclude the use of heavier grabs. It is intended as an indication to the Builders, Owners and operators of the increased risk of local damage and the possibility of accelerated diminution of the plating thickness if grabs heavier than this are used regularly to discharge cargo.

Bulk Carriers

Part 4, Chapter 7

Section 8

Table 7.8.1 Strengthening for heavy cargo requirements

Symbols	Item	Requirement
L, I_e, D, T, s, S, k, Z , and t as defined in 1.8.1 $C_1 =$ a factor varying from 1,0 at $\frac{D}{2}$ to $\frac{75}{225 - 150F_B}$ at base line of ship $C =$ stowage rate, in m ³ /tonne, and is defined as the volume of the hold excluding the volume contained within the depth of the cargo hatchway divided by the weight of cargo stowed in the hold. The value is not to be taken greater than 0,865 F_B as defined in Pt 3, Ch 4,5.7 R and θ as defined in 1.8.1 $H =$ height from tank top, at position under consideration, to deck at side amidships, in metres $Y_1 =$ distance from $\frac{D}{2}$ to tank top, in metres $h_o =$ for plating and stiffeners the vertical distance, in metres, from the inner bottom to the highest point of the tank excluding hatchway $b_1 =$ the larger horizontal distance, in metres, from the tank corner at top of tank either side to the point of plate or stiffener under consideration	(1) Double bottom floors (2) Double bottom side girders (3) Inner bottom plating, see Note 3 (4) Inner bottom longitudinals, see Notes 1 and 2	The spacing of floors, generally, is not to exceed 2,5 m. Scantlings are to comply with the requirements of Ch 1,8.5 The spacing of side girders, generally is not to exceed 3,7 m. Scantlings are to comply with requirements of Ch 1,8.3 The thickness of the inner bottom plating in the holds is to be not less than required by the greatest of the following: (a) $t = 0,00136 (s + 660) \sqrt[4]{k^2 L T} + 5$ mm, or (b) $t = 0,00455 s \sqrt{\frac{Hk}{C}}$ mm, or (c) Where the double bottom tanks are interconnected with double skin side tanks or combined hopper and topside tanks the scantlings are also to satisfy the requirements for deep tanks in Table 1.9.1(b) in Chapter 1, with the load head $h_4 = h_o \cos \theta + Rb_1$ m (d) In way of ballast holds the scantlings are also to satisfy the requirements for deep tanks in Table 1.9.1 in Chapter 1, with the load head h_4 , in metres, measured to the deck at centre. but see also Pt 3, Ch 9,9 if protection against heavy grabs is desired The section modulus of inner bottom longitudinals is to be not less than the greatest of the following: (a) $Z = 85$ per cent of the Rule value for bottom longitudinals as given in Table 1.6.1(b) in Chapter 1, or (b) $Z = \frac{0,0083s I_e^2 H C_1 k}{\left(1 - 0,233 \frac{Y_1}{D}\right) C}$ cm ³ , or (c) Where the double bottom tanks are interconnected with double skin side tanks or combined hopper and topside tanks $Z = 0,0073sk h_4 I_e^2$ cm ³ where $h_4 = h_o \cos \theta + Rb_1$ m Z is not to be less than the requirements for deep tanks in Table 1.9.1 in Chapter 1, with the load head h_4 , in metres, measured to the highest point of the topside tank, or side tank, or (d) In way of ballast holds the section modulus of the longitudinals is to be not less than required for deep tanks in Table 1.9.1 in Chapter 1, with the load head h_4 , in metres measured to the deck at centre
NOTES 1. If plate girders are fitted alternately with built or rolled sections, the section modulus as given in (4)(b) may be reduced by 10 per cent. 2. Consideration will be given to the fitting of struts in way of double bottom tanks in ships with homogeneous loading. The arrangement and scantlings are, in general, to be confirmed by direct calculation. 3. See also 8.1.5 for the maximum recommended unladen weight of the grab corresponding to the approved inner bottom plating thickness.		

8.1.6 Detail design guidelines for stiffeners connecting inner bottom and bottom longitudinals are shown in the *ShipRight FDA Procedure, Structural Detail Design Guide* (SDDG).

8.2 Carriage of heavy cargoes

8.2.1 When the notation 'strengthened for heavy cargoes' is to be assigned, the requirements of Table 7.8.1 are to be complied with.

8.3 Carriage of heavy cargoes with specified or alternate holds empty

8.3.1 For ships strengthened for heavy cargoes and having a class notation permitting specified or alternate holds to be empty, the requirements of 8.2.1 are to be complied with. In addition the scantlings and arrangements of the primary structure are to be confirmed by additional calculations, see 11.1.

Bulk Carriers

Part 4, Chapter 7

Section 8

8.4 Ships to be classed '100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP'

8.4.1 For ships to be classed '100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP', the requirements of 8.2.1 and 8.3.1 are to be complied with. In addition the value for C, the stowage rate in m³/tonne, as defined in Table 7.8.1, is not to be taken greater than 0,60 for each hold.

8.5 Ballast ducts

8.5.1 Where ballast ducts are arranged in lieu of suction and/or filling pipes, the scantlings will be approved as suitable for a specified equivalent static head of water. This head must not be exceeded in service, and details of methods to ensure this are to be submitted. The continuity of the floors is to be maintained in way of the ducts.

8.6 Structural details in way of double bottom tank and hopper tank knuckle

8.6.1 In all dry holds where the double bottom tank and hopper tank knuckle is of radiused construction and the floor spacing is 2,5 m or greater brackets as shown in Fig. 7.8.1 are to be arranged mid-length between floors in way of the intersection. The brackets are to be attached to the adjacent inner bottom and hopper longitudinal. The thickness of the brackets is to be in accordance with Ch 1,8.5.3 but need not exceed 15 mm. This requirement does not apply where the double bottom tank and hopper tank knuckle is of welded construction.

8.6.2 In way of floodable holds, two intermediate bracket arrangements, as shown in Fig. 7.8.1, are to be provided in all cases where the hopper to double bottom knuckle is radiused and are, in general, to be located at each frame space. Where the double bottom tank and hopper tank knuckle is of welded construction, a single intermediate bracket arrangement, as shown in Fig. 7.8.1, is to be provided only when the floor spacing is greater than 2,5 m.

8.6.3 The connections at the intersection are to be as follows:

- Where of welded construction the corner scallops in floors and transverses are to be omitted, or closed by welded collars where arranged for purposes of construction. In such cases to ensure satisfactory welding of the collars the radius of the scallops should not be less than 150 mm, see Fig. 7.8.2(a). Alternatively the scallop may be retained on the hopper tank side provided gusset plates are arranged in line with the inner bottom plating, see Fig. 7.8.2(b).
- Where of radiused construction the corner scallops are to be omitted, and full penetration welding arranged locally for the connection to the inner bottom plating. The centre of the flange is not to be greater than 70 mm from the side girder, see Fig. 7.8.2(c).

8.6.4 Detail design guidelines for the connection of hopper tank sloping plating to inner bottom plating are shown in the *ShipRight FDA Procedure, Structural Detail Design Guide* (SDDG).

8.7 Combined double bottom/hopper tank and topside tank

8.7.1 Where a double bottom/hopper tank is interconnected with a topside tank the dimensions of the connecting trunks or pipes, and the air/overflow pipe(s) and the type of closing appliance are to comply with the requirements of Pt 5, Ch 13,10.10.

8.8 Allowable hold loading in the flooded condition

8.8.1 The requirements of this sub-Section are to be applied as defined in 8.1.4.

8.8.2 The maximum load which may be carried in each cargo hold in combination with flood water is to be determined for the most severe homogeneous, non-homogeneous and packed cargo conditions contained in the Loading Manual. The maximum density of cargo intended to be carried in each condition is to be used.

Fig. 7.8.2 Connection at intersection of double bottom and hopper

Bulk Carriers

Part 4, Chapter 7

Section 8

8.8.3 The ship is to be assumed immersed to the draught, T_F , in metres, in way of the flooded cargo hold under consideration. The flooding head, h_f , see Fig. 7.8.3, is to be taken as the distance, in metres, measured vertically with the ship in the upright position, from the inner bottom to position, d_f , in metres, from the base line given by:

- (a) In general:
- (i) $d_f = D$ for the foremost hold
 - (ii) $d_f = 0,9D$ for other holds
- (b) For ships less than 50 000 tonnes deadweight with Type B freeboard:
- (i) $d_f = 0,95D$ for the foremost hold
 - (ii) $d_f = 0,85D$ for other holds

where

D = distance, in metres, from the base line to the freeboard deck at side amidships.

Fig. 7.8.3 Loading

8.8.4 For this application, the double bottom is defined as the structure bounded by the transverse bulkhead lower stools (or bulkhead plating if no lower stools are fitted) and the hopper sides. The floors and girders immediately in way of these structures are excluded.

8.8.5 The determination of shear strength required for the permissible load assessment in 8.8.9, is to be performed using the net plate thickness, t_{net} , for the floors and girders:

$$t_{net} = t - t_c$$

where

t = as built thickness, in mm

t_c = thickness deduction for corrosion, in mm, generally to be taken as 2,5 mm.

8.8.6 Shear capacity of the double bottom is defined as the sum of the shear strengths for:

- (a) all the floors adjacent to both hoppers, less one half the strength of the floors adjacent to each lower stool (or transverse bulkhead if no lower stool is fitted), see Fig. 7.8.4, and
- (b) all the girders adjacent to the lower stools (or transverse bulkheads if no lower stool is fitted).

Where a girder or floor terminates without direct attachment to the boundary stool or hopper side girder, its shear capacity is to include only that for the effectively connected end.

8.8.7 The shear strengths, S_{f1} , of floors adjacent to hoppers and, S_{f2} , of floors in way of openings in bays nearest to the hoppers, are as follows:

$$S_{f1} = 0,001 A_f \tau_p / \eta_1 \text{ kN (tonne-f)}$$

$$S_{f2} = 0,001 A_{f,h} \tau_p / \eta_2 \text{ kN (tonne-f)}$$

where

A_f = net sectional area, in mm², of floor panel adjacent to hopper

$A_{f,h}$ = net sectional area, in mm², of floor panel in way of opening in the bay closest to hopper

$$\eta_1 = 1,10$$

$$\eta_2 = 1,20 \text{ generally}$$

= 1,10 where appropriate reinforcement is fitted in way of the opening

σ_0 = specified minimum yield stress, in N/mm² (kgf/mm²)

τ_p = permissible shear stress, to be taken equal to the lesser of:

$$\tau_0 = \frac{\sigma_0}{\sqrt{3}} \text{ N/mm}^2 \text{ (kgf/mm}^2\text{) and}$$

$$\tau_c = \frac{162 \sigma_0^{0,6}}{\left(\frac{s_1}{t_{net}}\right)^{0,8}} \text{ N/mm}^2$$

$$\left(\tau_c = \frac{65 \sigma_0^{0,6}}{\left(\frac{s_1}{t_{net}}\right)^{0,8}} \text{ kgf/mm}^2 \right)$$

where

s_1 = spacing of stiffening members, in mm, for the panel under consideration

t_{net} = net thickness, in mm, of the panel under consideration.

For floors adjacent to the stools (or bulkhead plating if no lower stools are fitted), τ_p may be taken as $\frac{\sigma_0}{\sqrt{3}}$ N/mm² (kgf/mm²).

8.8.8 The shear strengths S_{g1} , of girders adjacent to transverse bulkhead lower stools (or transverse bulkheads if no lower stools are fitted) and, S_{g2} , of girders in way of the largest openings in bays nearest to the lower stools (or transverse bulkheads if no lower stools are fitted), are as follows:

$$S_{g1} = 0,001 A_g \tau_p / \eta_1 \text{ kN (tonne-f)}$$

$$S_{g2} = 0,001 A_{g,h} \tau_p / \eta_2 \text{ kN (tonne-f)}$$

where

A_g = net sectional area, in mm², of the girder adjacent to transverse bulkhead lower stool (or transverse bulkhead, if no lower stool is fitted)

$A_{g,h}$ = net sectional area, in mm², of the girder in way of the largest openings in the bays closest to the transverse bulkhead lower stool (or transverse bulkhead if no lower stool is fitted)

$$\eta_1 = 1,10$$

$$\eta_2 = 1,15 \text{ generally}$$

= 1,10 where appropriate reinforcement is fitted in way of the opening.

**Fig. 7.8.4 Double bottom structure**

8.8.9 The permissible cargo hold loading, W_p , is given by:

$$W_p = g \rho_c V / F_c \text{ kN}$$

$$(W_p = \rho_c V / F_c \text{ tonne-f})$$

where

d_f, D = as defined in 8.8.3

g = gravitational constant, 9,81 m/sec²

h_f = flooding head, in metres, as defined in 8.8.3

$$h_1 = \frac{X}{\rho_c g} \text{ where } Y \text{ is in kN/m}^2$$

$$\left(h_1 = \frac{X}{\rho_c} \text{ where } Y \text{ is in tonne-f/m}^2 \right)$$

n = number of floors between transverse bulkhead lower stools or transverse bulkheads, if no lower stools are fitted

s = spacing, in metres, of double bottom longitudinals adjacent to hoppers

$$A_{DB,e} = \sum_{i=1}^n S_i (B_{DB} - s)$$

$$A_{DB,h} = \sum_{i=1}^n S_i B_{DB,i}$$

B_{DB} = breadth of double bottom, in metres, between hoppers, see Fig. 7.8.5

$B_{DB,h}$ = distance, in metres, between openings, see Fig. 7.8.5

Fig. 7.8.5 Double bottom breadth

$B_{DB,i} = (B_{DB} - s)$ for floors where shear strength is given by S_{f1}

$= B_{DB,h}$ for floors where shear strength is given by S_{f2}

C_e = shear capacity of the double bottom, in kN (tonne-f), as defined in 8.8.6, considering for each floor, the shear strength S_{f1} , see 8.8.7, and for each girder, the lesser of the shear strengths S_{g1} and S_{g2} , see 8.8.8

C_h = shear capacity of the double bottom, in kN (tonne-f), as defined in 8.8.6, considering for each floor, the lesser of the shear strengths S_{f1} and S_{f2} , see 8.8.7, and for each girder, the lesser of the shear strengths S_{g1} and S_{g2} , see 8.8.8

$F_c = 1,1$ in general

$= 1,05$ for steel mill products

S_i = spacing of i th floor, in metres

$T_F = d_f - 0,1D$

V = volume, in m^3 , occupied by cargo at a level h_i

X = the lesser of X_1 and X_2 for bulk cargoes and

$X = X_1$ for steel mill products

where

$$X_1 = \frac{Y + \rho g (T_F - h_f)}{1 + \left(\frac{\rho}{\rho_c}\right) (\mu - 1)} \text{ where } Y \text{ is in kN/m}^2$$

$$\left(X_1 = \frac{Y + \rho (T_F - h_f)}{1 + \left(\frac{\rho}{\rho_c}\right) (\mu - 1)} \text{ where } Y \text{ is in tonne-f/m}^2 \right)$$

$X_2 = Y + \rho g (T_F - h_f \mu)$ where Y is in kN/m²

$(X_2 = Y + \rho (T_F - h_f \mu)$ where Y is in tonne-f/m²)

Y = the lesser of Y_1 and Y_2 given by:

$$Y_1 = \frac{C_h}{A_{DB,h}}$$

$$Y_2 = \frac{C_e}{A_{DB,e}}$$

μ = permeability of cargo but need not exceed 0,3

$= 0,0$ for steel mill products

ρ = density of sea water, 1,025 tonne/m³

ρ_c = cargo density, in tonne/m³ (bulk density for bulk cargoes and actual cargo density for steel mill products).

Section 9

Hopper side tank structure

9.1 General

9.1.1 Provision is made in this Section for longitudinal framing of the hopper side tank, but proposals for transverse framing will be specially considered.

9.1.2 Where oil cargoes are carried the scantlings of the sloped bulkhead are to comply with the requirements of 10.2.

9.1.3 For ships to be classed '**100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP**', the requirements of 9.2, 9.3 and 9.6 are to be complied with. In addition the value for C , the stowage rate in m^3 /tonne, as defined in Table 7.8.1 is not to be taken greater than 0,60 for each hold.

9.1.4 The buckling requirements of Pt 3, Ch 4,7 are also to be satisfied.

9.1.5 The *ShipRight FDA Procedure, Structural Detail Design Guide* (SDDG), indicates recommended details of structural design configurations around the transverse ring web of the hopper tank.

9.2 Sloped bulkhead plating

9.2.1 The thickness of the sloped bulkhead plating is to be as required by Ch 1,8.4.1 but based on actual spacing of sloped bulkhead stiffeners.

9.2.2 Where the ship is regularly discharged by grabs and the optional notation for heavy grabs is not desired (see Pt 3, Ch 9.9) the increase in thickness, as required by Ch 1,2.2, is to be tapered from the inner bottom knuckle to nil at the top corner of the tank.

Bulk Carriers

Part 4, Chapter 7

Sections 9 & 10

9.2.3 Where a 'strengthened for heavy cargo notation' is desired, in addition to 9.2.2 the thickness of the sloped bulkhead plating is also to comply with the requirements of Table 7.8.1(3)(b) using the actual spacing of stiffeners and with H , in metres, measured vertically from a point one third of each plate width from its lower edge to the upper deck at side.

9.2.4 Where the hopper tanks are interconnected with the topside tanks, or in way of ballast holds, the plating is also to comply with the requirements of Table 7.8.1(3)(c) and (3)(d), whichever is appropriate.

9.3 Sloped bulkhead stiffeners

9.3.1 The scantlings of sloped bulkhead stiffeners are to be as required for inner bottom longitudinals, see Section 8. In ships strengthened for heavy cargoes, the scantlings of the stiffeners are to be derived from Table 7.8.1 using a head for heavy cargo measured vertically from the mid-point of the effective length to the underside of the topside tank sloped bulkhead. Where the hopper tanks are interconnected with the topside tanks, or in way of ballast holds, the scantlings of the stiffeners are also to comply with the requirements of Table 7.8.1(4)(c) and (4)(d), whichever is appropriate. For higher tensile steel longitudinals the requirements of Ch 1,6.2.3 are to be complied with where applicable, see also 9.7.1.

9.4 Shell and bilge stiffeners

9.4.1 The scantlings of the shell and bilge longitudinals are to comply with the requirements of Ch 1,6.

9.5 Tank end bulkheads

9.5.1 The scantlings of tank end bulkheads are to comply with the requirements for deep tanks in Table 1.9.1 in Chapter 1. Where the hopper tanks are interconnected with the topside tanks, the scantlings are to be derived, using the load head h_4 , in metres, from Table 7.8.1(3)(c) and (4)(c), as appropriate.

9.6 Primary supporting structure

9.6.1 Transverses supporting longitudinal stiffening are to comply with the requirements of Table 7.9.1, and are to be in line with the double bottom floors.

9.7 Structural details

9.7.1 Bracket/diaphragms at the top of the hopper tank are to be of sufficient size and thickness to provide effective rigidity, and care is to be taken to ensure alignment with brackets at the bottom of the side frames in the holds. The shell and sloped bulkhead longitudinals supporting the diaphragms are to be derived using the span taken between transverses, see also 6.2.11.

Table 7.9.1 Hopper tank primary structure

Item	Modulus, in cm^3	Inertia, in cm^4
(1) Bottom and side shell transverses	$Z = 11,71 \rho k S h l_e^2$	$I = \frac{2,5}{k} l_e Z$
(2) Sloped bulkhead transverses	The greater of: (a) $Z = 11,71 \rho k S h_1 l_e^2$ (b) $Z = 6,6 \frac{k S H_H l_e^2}{C}$	$I = \frac{2,5}{k} l_e Z$ $I = \frac{1,85}{k} l_e Z$
Symbols		
S, k, l_e, Z, I, ρ as defined in 1.7.1 h = distance, in metres, from the mid-point of the effective length to the upper deck at side h_1 = the greater of the distance, in metres, from the midpoint of the effective length to the top of the tank or half the distance, in metres, to the top of the overflow, or in way of cargo oil or ballast holds: the distance from the tank top to the deck at centre, or where the hopper tank is interconnected with the topside tank: the load head h_4 , as derived from Table 7.8.1(4)(c), whichever is the greatest C = stowage rate, in m^3/tonne , as defined in Table 7.8.1. For bulk carriers without the notation 'strengthened for heavy cargoes', the value to be used is $1,39 \text{ m}^3/\text{tonne}$. For bulk carriers with the notation 'strengthened for heavy cargoes', the actual stowage rate is to be used, but the value is not to be taken greater than $0,865 \text{ m}^3/\text{tonne}$ H_H = distance, in metres, measured vertically from the mid-point of the effective length to the underside of the topside tank sloped bulkhead		

Section 10 Bulkheads

10.1 General

10.1.1 The requirements of Ch 1,9 are to be applied, together with the requirements of this Section.

10.1.2 Where vertically corrugated transverse watertight bulkheads are fitted, the scantlings and arrangements are also to satisfy the requirements of 10.4 to 10.6. Other transverse watertight bulkhead types will be specially considered.

10.1.3 In way of ballast holds, the scantlings are to satisfy the requirements of Table 1.9.1 in Chapter 1 for deep tanks with the load head, h_4 , in metres, taken to the deck at centre. This includes the scantlings of vertically corrugated and double plate transverse bulkheads supported by stools. In addition, the thickness of corrugations is to be not less than given by 10.5.8 for watertight corrugated bulkheads. Alternatively, the scantlings may be based on direct calculations which are to be submitted.

10.1.4 All bulk carriers to be classed '**100A1 bulk carrier, strengthened for heavy cargoes, any hold may be empty, ESP**' are to be arranged with top and bottom stools. The requirements of 10.2 are to be complied with as appropriate.

Bulk Carriers

Part 4, Chapter 7

Section 10

10.2 Bulkheads supported by stools

10.2.1 The stools are to be reinforced with plate diaphragms or deep webs, and in bottom stools the diaphragms are to be aligned with double bottom side girders. Continuity is also to be maintained between the diaphragms and the bulkhead corrugations for 90° corrugations.

10.2.2 The sloping plate of bottom stools is to be aligned with double bottom floors. Particular attention is to be given to the through-thickness properties of the inner bottom plating and continuity at the connection to the inner bottom, and to the through-thickness properties of the bottom stool shelf plate. See Ch 3,8 of the *Rules for the Manufacture, Testing and Certification of Materials* regarding requirements for plates with specified through thickness properties.

10.2.3 An efficient system of reinforcement is to be arranged in line with the hold transverse bulkheads or bulkhead stools at the intersection with the sloped plating of the hopper and topside tanks. The reinforcement fitted in the tanks is to consist of girders or intercostal bulb plate or equivalent stiffeners fitted between, and connected to, the sloped bulkhead longitudinals.

10.2.4 The shelf plates of the bulkhead stools are to be arranged to align with the longitudinals in the hopper and topside tanks. Where sloping shelf plates are fitted to stools, suitable scarfing is to be arranged in way of the connections of the stools to the adjoining structures.

10.2.5 The *ShipRight FDA Procedure, Structural Detail Design Guide* (SDDG), indicates recommended structural design configurations in the critical areas of the lower stool and of the upper boundaries.

10.3 Structural details in way of holds confined to dry cargoes

10.3.1 In dry cargo holds where transverse bulkheads are arranged without bottom stools, the stiffeners and brackets of plane bulkheads, and rectangular corrugations of corrugated bulkheads, are to be aligned with floors and inner bottom longitudinals. In the case of non-rectangular corrugations, the flanges are to be aligned with floors, but consideration will be given to the fitting of a substantial transverse girder in place of one of the floors.

10.3.2 Where transverse corrugated bulkheads are arranged without top stools, transverse beams are to be arranged under the deck in way.

10.4 Vertically corrugated transverse watertight bulkheads – application and definitions

10.4.1 Where corrugated transverse watertight bulkheads are fitted, the scantlings are to be determined in accordance with the following requirements.

10.4.2 For ships of length, L , 190 m or above, the vertically corrugated transverse bulkheads are to be fitted with a bottom stool and, generally, with a top stool below the deck. The requirements of 10.6 are to be complied with as appropriate.

10.4.3 The loads to be considered as acting on the bulkheads are those given by the combination of cargo loads with those induced by the flooding of one hold adjacent to the bulkhead under consideration. The most severe combinations of cargo induced loads and flooding loads are to be used for the determination of the scantlings of each bulkhead, depending on the specified design loading conditions:

- (a) homogeneous loading conditions,
 - (b) non-homogeneous loading conditions (excluding part loading conditions associated with multi-port loading and unloading),
 - (c) packed cargo conditions (such as steel mill products).
- The individual flooding of loaded and empty holds is to be considered, but the pressure used in the assessment is not to be less than that obtained for flood water alone. Holds containing packed cargo are to be treated as empty holds.

10.4.4 The cargo surface is to be taken as horizontal and at a distance d_1 , in metres, from the base line, see Fig. 7.10.1, where d_1 is calculated taking into account the cargo properties and the hold dimensions. Unless the ship is designed to carry only cargo of bulk density greater than or equal to 1,78 tonne/m³ in non-homogeneous loading conditions, the maximum mass of cargo which may be carried in the hold is to be taken as filling that hold to the upper deck level at centreline. A permeability, μ , of 0,3 and angle of repose, ψ , of 35° is to be assumed for this application.

Fig. 7.10.1 Cargo hold dimensions

10.4.5 An homogeneous load condition is defined as one where the ratio between the highest and the lowest filling levels, d_1 , in adjacent holds does not exceed 1,20. For this purpose, where a loading condition includes cargoes of different densities, equivalent filling levels are to be calculated for all holds on the basis of a single reference value of cargo density, which can be the minimum to be carried.

Bulk Carriers

Part 4, Chapter 7

Section 10

10.4.6 The permeability, μ , may be taken as 0,3 for ore, coal and cement cargoes. The bulk density and angle of repose, ψ , may generally be taken as 3,0 tonne/m³ and 35° respectively for iron ore and 1,3 tonne/m³ and 25° respectively for cement.

10.4.7 The flooding head, h_f , see Fig. 7.10.1, is the distance, in metres, measured vertically with the ship in the upright position, from the location P , under consideration, to a position d_f , in metres, from the base line as given in Table 7.10.1.

10.4.8 In considering a flooded hold, the total load is to be taken as that of the cargo and flood water at the appropriate permeability. Where there is empty volume above the top of the cargo, this is to be taken as flooded to the level of the flooding head.

10.4.9 Corrugations may be constructed of flanged plates or fabricated from separate flange and web plates, which may be of different thicknesses. The corrugation angle is to be not less than 55°, see Fig. 7.10.2.

10.4.10 The term net plate thickness is used to describe the calculated minimum thickness of plating of the web, t_w , or flange, t_f . The plate thickness to be fitted is the net plate thickness plus a corrosion addition of 3,5 mm.

10.5 Vertically corrugated transverse watertight bulkheads – scantling assessment

10.5.1 The bending moment M , in kNm (tonne-f m), for the bulkhead corrugations is given by:

$$M = \frac{F l}{8}$$

where

l = span of the corrugation, in metres, to be measured between the internal ends of the bulkhead upper and lower stools in way of the neutral axis of the corrugations or, where no stools are fitted, from inner bottom to deck, see Fig. 7.10.2 and Fig. 7.10.3. The lower end of the upper stool is not to be taken greater than a distance from the deck at the centre-line equal to:

3 times the depth of the corrugation, in general, or
2 times the depth of the corrugation, for rectangular stools

F = resultant force, in kN (tonne-f), see Table 7.10.3.

10.5.2 The shear force, Q , in kN (tonne-f) at the lower end of the bulkhead corrugation is given by:

$$Q = 0,8F$$

where

F is defined in 10.5.1.

Table 7.10.1 Flooding head

Item	Bulkhead location	Bulk carriers with Type B freeboard and deadweight < 50 000 tonnes	Other bulk carriers
I ⁽¹⁾	Between holds 1 and 2	$d_f = 0,95D$	$d_f = D$
	Elsewhere	$d_f = 0,85D$	$d_f = 0,9D$
II ⁽¹⁾	Between holds 1 and 2	$d_f = 0,9D$	$d_f = 0,95D$
	Elsewhere	$d_f = 0,8D$	$d_f = 0,85D$

NOTES

- Item II is to be used for non-homogeneous loading conditions where the bulk cargo density is less than 1,78 tonne/m³. Otherwise, Item I is to be used.
- D = distance, in metres, from the base line to the freeboard deck at side amidships, see Fig. 7.10.1.

Bulk Carriers

Part 4, Chapter 7

Section 10

Table 7.10.2 Bulkhead pressure and force

Item	Pressure, kN/m ² (tonne-f/m ²)	Force, kN (tonne-f)
(1) In non-flooded bulk cargo holds	$p_c = g \rho_c h_1 \tan^2 \theta$ ($\rho_c = \rho_c h_1 \tan^2 \theta$)	$F_c = 0,5 \rho_c g s_1 (d_1 - h_{DB} - h_{LS})^2 \tan^2 \theta$ ($F_c = 0,5 \rho_c s_1 (d_1 - h_{DB} - h_{LS})^2 \tan^2 \theta$)
(2) In flooded bulk cargo holds, when $d_f \geq d_1$		$F_{cf} = 0,5 s_1 (\rho g (d_f - d_1)^2 + (\rho g (d_f - d_1) + \rho_{le}) (d_1 - h_{DB} - h_{LS}))$ ($F_{cf} = 0,5 s_1 (\rho (d_f - d_1)^2 + (\rho (d_f - d_1) + \rho_{le}) (d_1 - h_{DB} - h_{LS}))$)
(a) For positions between d_1 and d_f from base line	$p_{cf} = g \rho h_f$ ($\rho_{cf} = \rho h_f$)	
(b) For positions at a distance lower than d_1 from base line	$p_{cf} = g (\rho h_f + (\rho_c - \rho (1 - \mu)) h_1 \tan^2 \theta)$ ($\rho_{cf} = (\rho h_f + (\rho_c - \rho (1 - \mu)) h_1 \tan^2 \theta)$)	
(3) In flooded bulk cargo holds, when $d_f < d_1$		$F_{cf} = 0,5 s_1 (\rho_c g (d_1 - d_f)^2 \tan^2 \theta + \rho_c g (d_1 - d_f) \tan^2 \theta + \rho_{le} (d_f - h_{DB} - h_{LS}))$ ($F_{cf} = 0,5 s_1 (\rho_c (d_1 - d_f)^2 \tan^2 \theta + (\rho_c (d_1 - d_f) \tan^2 \theta + \rho_{le} (d_f - h_{DB} - h_{LS}))$)
(a) For positions between d_1 and d_f from base line	$p_{cf} = g \rho_c h_1 \tan^2 \theta$ ($\rho_{cf} = \rho_c h_1 \tan^2 \theta$)	
(b) For positions at a distance lower than d_f from base line	$p_{cf} = g (\rho h_f + (\rho_c h_1 - \rho (1 - \mu) h_f) \tan^2 \theta)$ ($\rho_{cf} = (\rho h_f + (\rho_c h_1 - \rho (1 - \mu) h_f) \tan^2 \theta)$)	
(4) In flooded empty holds	$p_f = g \rho h_f$ ($\rho_f = \rho h_f$)	$F_f = 0,5 s_1 \rho g (d_f - h_{DB} - h_{LS})^2$ ($F_f = 0,5 s_1 \rho (d_f - h_{DB} - h_{LS})^2$)
Symbols		
d_f = see 10.4.7 d_1 = vertical distance, in metres, from the base line to the top of the cargo, see Fig. 7.10.1 g = gravitational constant, 9,81 m/sec ² h_{DB} = height of double bottom, in metres h_f = flooding head, see 10.4.7 h_{LS} = mean height of lower stool, in metres h_1 = vertical distance, in metres, from the calculation point to the top of the cargo, see Fig. 7.10.1 $\rho_c, \rho_{cf}, \rho_f$ = pressure on the bulkhead at the point under consideration, in kN/m ² (tonne-f/m ²) ρ_{le} = pressure at the lower end of the corrugation, in kN/m ² (tonne-f/m ²) s_1 = spacing of the corrugations, in metres, see Fig. 7.10.2 ρ = density of sea water = 1,025 tonne/m ³ ρ_c = bulk cargo density, in tonne/m ³ θ = $45^\circ - (\Psi/2)$ Ψ = angle of repose of the cargo, in degrees μ = permeability of cargo, see 10.4.6		

Table 7.10.3 Resultant pressure and force

Loading condition	Resultant pressure kN/m ² (tonne-f/m ²)	Resultant force kN (tonne-f)
Homogeneous	$p_r = p_{cf} - 0,8 \rho_c$	$F = F_{cf} - 0,8 F_c$
Non-homogeneous	$p_r = p_{cf}$	$F = F_{cf}$
Flood water alone (adjacent holds empty)	$p_r = p_f$	$F = F_f$
NOTE For symbols, see Table 7.10.2.		

10.5.3 The section modulus of the corrugations is to be calculated using net plate thicknesses. At the lower end, the following requirements apply:

- An effective width of compression flange, b_{ef} , not greater than given in 10.5.7, is to be used.
- Where corrugation webs are not supported by local brackets below the shelf plate (or below the inner bottom if no lower stool is fitted), they are to be assumed 30 per cent effective in bending. Otherwise, the full area of web plates may be used, see also (e).

Fig. 7.10.3 Scantling assessment

- Where effective shedder plates are fitted, see Figs. 7.10.4(a) and 7.10.4(b), the net area of the corrugation flange plates, in cm², may be increased by the lesser of:

$$2,5b \sqrt{t_f t_{sh}} \text{ and } 2,5b t_f$$

where

b = width of corrugation flange, in metres, see Fig. 7.10.2

t_f = net flange plate thickness, in mm

t_{sh} = net shedder plate thickness, in mm

A shedder plate is considered effective when it:

- is not knuckled; and
- is welded to the corrugations and the lower stool shelf plate by one-side penetration welds or equivalent; and
- has a minimum slope of 45° and lower edges in line with the stool side plating; and
- has a thickness not less than 0,75 times the thickness of the corrugation flanges; and
- has material properties at least equal to those of the corrugation flanges.

(d) Where effective gusset plates are fitted, see Figs. 7.10.5(a) and (b) the net area of the corrugation flange plates, in cm^2 , may be increased by:

$$7h_g t_f$$

where

h_g = height of the gusset plate, in metres, but is not to be taken greater than $\frac{10}{7} s_{gu}$

t_f = net flange plate thickness, in mm

s_{gu} = width of the gusset plate, in metres

A gusset plate is considered effective when it:

- is fitted in combination with an effective shedder plate as defined in (c); and
- has height not less than half the flange plate width; and
- is fitted in line with the stool side plating; and
- has thickness and material properties at least equal to those of the flanges; and
- is welded to the top of the lower stool by full penetration welds and to the corrugations and shedder plates by one-side penetration welds or equivalent.

(e) Where the corrugation is welded to a sloping stool shelf plate, set at an angle of not less than 45° to the horizontal, the corrugation webs may be taken as fully effective in bending. Where the slope is less than 45° , the effectiveness is to be assessed by linear interpolation between fully effective at 45° and the appropriate value from (b) at 0° . Where effective gusset plates are also fitted, the area of the flange plates may be increased in accordance with (d). No increase is permitted in the case where shedder plates are fitted without gussets.

10.5.4 The section modulus of corrugations at cross-sections other than the lower end is to be calculated with fully effective webs and an effective compression flange width, b_{ef} not greater than given in 10.5.7.

10.5.5 The bending capacity of the bulkhead corrugations is to comply with the following relationship:

$$\frac{1000 M}{0,5Z_{le} \sigma_{p,le} + Z_m \sigma_{p,m}} \leq 0,95$$

where

M = bending moment, in kNm (tonne-f m), see 10.5.1

Z_{le} = section modulus at the lower end of the corrugations, in cm^3

Z_m = section modulus at mid-span of the corrugations, in cm^3

$\sigma_{p,le}$ = permissible bending stress at the lower end of the corrugations, in N/mm^2 (kgf/mm^2)

Fig. 7.10.4(a) Symmetric shedder plates

Part 4, Chapter 7

Section 10

**Table 7.10.4 Permissible shear and buckling stresses**

Bending, N/mm ² (kgf/mm ²)	Shear, N/mm ² (kgf/mm ²)	Shear buckling, N/mm ² (kgf/mm ²)
$\sigma_p = \sigma_0$	$\tau_p = 0,5\sigma_0$	$\tau_{cr} = \tau_E$ when $\tau_E \leq \frac{\tau_0}{2}$ $= \tau_0 \left(1 - \frac{\tau_0}{4\tau_E}\right)$ when $\tau_E \leq \frac{\tau_0}{2}$
Symbols		
b = width of corrugation flange, in metres, see Fig. 7.10.2 c = width of corrugation web, in metres, see Fig. 7.10.2 t_f = net flange plate thickness, in mm t_w = web plate net thickness, in mm E = modulus of elasticity = 206 000 N/mm ² (21000 kgf/mm ²) σ_0 = specified minimum yield stress, in N/mm ² (kgf/mm ²) $\tau_E = 5,706 E (t_w/1000c)^2$ N/mm ² (kgf/mm ²) $\tau_0 = \frac{\sigma_0}{\sqrt{3}}$ N/mm ² (kgf/mm ²)		

Bulk Carriers

Part 4, Chapter 7

Section 10

$\sigma_{p,m}$ = permissible bending stress at mid-span of the corrugations, in N/mm² (kgf/mm²)

In the above expression Z'_{le} , in cm³, is not to be taken greater than Z'_{le} where

$$Z'_{le} = Z_g + \left(\frac{1000 Q h_g - 0,5 h_g^2 s_1 p_g}{\sigma_{p,le}} \right)$$

and Z_m is not to exceed the lesser of $1,15Z_{le}$ and $1,15Z'_{le}$ where

h_g = height of the gusset plate, in metres

p_g = resultant pressure calculated in way of the middle of the shedder or gusset plates as appropriate, in kN/m² (tonne-f/m²)

s_1 = spacing of the corrugations, in metres

Q = shear force, in kN (tonne-f), see 10.5.2

Z_g = section modulus of the corrugations in way of the upper end of shedder or gusset plates as appropriate, in cm³.

10.5.6 The applied shear stress, in N/mm² (kgf/mm²), is determined by dividing the shear force derived from 10.5.2 by the shear area of the corrugation, calculated using the net plate thickness. The shear area is to be reduced to account for non-perpendicularity between the corrugation webs and flanges. In general, the reduced area may be obtained by multiplying the web sectional area by $\sin \phi$, where ϕ is the angle between the web and the flange, see Fig. 7.10.2. The applied shear stress is not to exceed the permissible shear stress or the shear buckling stress given in Table 7.10.4.

10.5.7 The width of the compression flange, in metres, to be used for calculating the effective modulus is:

$$b_{ef} = C_{ef} b$$

where

$$C_{ef} = \frac{2,25}{\beta} - \frac{1,25}{\beta^2} \text{ for } \beta > 1,25$$

$$C_{ef} = 1,0 \text{ for } \beta \leq 1,25$$

$$\beta = 10^3 \left(\frac{b}{t_f} \right) \sqrt{\frac{\sigma_0}{E}}$$

Other symbols are as defined in Table 7.10.4.

10.5.8 The corrugation flange and web local net plate thickness are not to be less than:

$$t = 14,9 s_w \sqrt{1,05 \frac{p_r}{\sigma_0}} \text{ mm}$$

where

s_w = plate width, in metres, to be taken equal to the width of the corrugation flange or web, whichever is the greater

p_r = resultant pressure, in kN/m² (tonne-f/m²), as defined in Table 7.10.3, at the lower edge of each strake of plating. The net thickness of the lowest strake is to be determined using the resultant pressure at the top of the lower stool, (or at the inner bottom, if no lower stool is fitted), or at the top of the shedders, if effective shedder or gusset and shedder plates are fitted

σ_0 = specified minimum yield stress of the material, in N/mm² (kgf/mm²).

10.5.9 For built-up corrugations, where the thickness of the flange and of the web are different, the net thickness of the narrower plating is to be not less than:

$$t_n = 14,9 s_n \sqrt{1,05 \frac{p_r}{\sigma_0}} \text{ mm}$$

where

s_n = width of the narrower plating, in metres.

The net thickness, in mm, of the wider plating is not to be taken less than the greater of:

$$t_{wp} = 14,9 s_w \sqrt{1,05 \frac{p_r}{\sigma_0}} \text{ mm or}$$

$$t_{wp} = \sqrt{\frac{462 s_w^2 p_r}{\sigma_0} - t_{np}^2} \text{ mm}$$

where

$t_{np} \leq$ actual net thickness of the narrower plating but not greater than:

$$14,9 s_w \sqrt{1,05 \frac{p_r}{\sigma_0}} \text{ mm}$$

10.5.10 The required thickness of plating is the net thickness plus the corrosion addition given in 10.4.10.

10.5.11 Scantlings required to meet the bending and shear strength requirements at the lower end of the bulkhead corrugation are to be maintained for a distance of $0,15l$ from the lower end, where l is as defined in 10.5.1. Scantlings required to meet the bending requirements at mid-height are to be maintained to a location no greater than $0,3l$ from the top of the corrugation. The section modulus of the remaining upper part of the corrugation is to be not less than $0,75$ times that required for the middle part, corrected for differences in yield stress.

10.6 Vertically corrugated transverse bulkheads – support structure at ends

10.6.1 The requirements of 10.2 are to be complied with as applicable, together with the following.

10.6.2 Lower stool:

- The height of the lower stool is generally to be not less than three times the depth of the corrugations.
- The thickness and steel grade of the stool shelf plate are to be not less than those required for the bulkhead plating above.
- The thickness and steel grade of the upper portion of vertical or sloping stool side plating, within the depth equal to the corrugation flange width from the stool top, are to be not less than the flange plate thickness and steel grade needed to meet the bulkhead requirements at the lower end of the corrugation.
- The thickness of the stool side plating and the section modulus of the stool side stiffeners are to be not less than those required by Ch 1,9 for a plane transverse bulkhead and stiffeners using the greater of the pressures determined from the head, h_4 , in Table 1.9.1 and the expressions given in Table 7.10.2.
- The ends of stool side vertical stiffeners are to be attached to brackets at the upper and lower ends of the stool.

Fig. 7.10.6 Width of shelf plate

- (f) The width of the shelf plate is to be in accordance with Fig. 7.10.6.
- (g) The stool bottom is to have a width not less than 2,5 times the mean depth of the corrugation.
- (h) Scallop in the brackets and diaphragms in way of connections to the stool shelf plate are to be avoided.
- (j) Where corrugations are terminated on the bottom stool, corrugations are to be connected to the stool top plate by full penetration welds. The stool side plating is to be connected to the stool top plate and the inner bottom plating by either full penetration or partial penetration welds, see Fig. 7.10.7. The supporting floors are to be connected to the inner bottom by either full penetration or partial penetration welds.

10.6.3 Upper stool:

- (a) The upper stool, where fitted, is to have a height generally between two and three times the depth of corrugations.
- (b) Rectangular stools are to have a height generally equal to twice the depth of corrugations, measured from the deck level and at hatch side girder.
- (c) The upper stool is to be properly supported by girders or deep brackets between the adjacent hatch-end beams.
- (d) The width of the shelf plate is generally to be the same as that of the lower stool shelf plate.
- (e) The upper end of a non-rectangular stool is to have a width not less than twice the depth of corrugations.
- (f) The thickness and steel grade of the shelf plate are to be the same as those of the bulkhead plating below.
- (g) The thickness of the lower portion of stool side plating is to be not less than 80 per cent of that required for the upper part of the bulkhead plating where the same materials is used.
- (h) The thickness of the stool side plating and the section modulus of the stool side stiffeners are to be not less than those required by Ch 1,9 for plane transverse bulkheads and stiffeners using the greater of the pressures determined from the head, h_4 , in Table 1.9.1 and the expressions given in Table 7.10.2.
- (j) Where vertical stiffening is fitted, the ends of stool side stiffeners are to be attached to brackets at the upper and lower end of the stool.
- (k) Diaphragms are to be fitted inside the stool, in line with, and effectively attached to, longitudinal deck girders extending to the hatch end coaming girders for effective support of the corrugated bulkhead.
- (l) Scallop in the brackets and diaphragms in way of the connection to the stool shelf plate are to be avoided.

10.6.4 If no upper stool is fitted, two transverse reinforced beams are to be fitted in line with the corrugation flanges.

Fig. 7.10.7 Partial penetration welding

Bulk Carriers

Part 4, Chapter 7

Sections 10, 11 & 12

10.6.5 If no bottom stool is fitted, the corrugation flanges are to be in line with the supporting floors. Corrugations are to be connected to the inner bottom plating by full penetration welds. The thickness and steel grades of the supporting floors are to be at least equal to those provided for the corrugation flanges. The plating of supporting floors is to be connected to the inner bottom by either full penetration or deep penetration welds, see Fig. 7.10.7. The cut-outs for connections of the inner bottom longitudinals to double bottom floors are to be closed by collar plates. The supporting floors are to be connected to each other by suitably designed shear plates. Stool side plating is to align with the corrugation flanges. Stool side vertical stiffeners and their brackets in the lower stool are to align with the inner bottom longitudinals to provide appropriate load transmission between these stiffening members. The lower stool side plating is not to be knuckled.

10.6.6 Stool side plating is to align with the corrugation flanges. Stool side vertical stiffeners and their brackets in the lower stool are to align with the inner bottom longitudinals to provide appropriate load transmission between these stiffening members. The lower stool side plating is not to be knuckled.

10.6.7 The design of local details is to take into account the transfer of the bulkhead forces and moments to the boundary structures and particularly to the double bottom and cross-deck structures.

Section 11 Direct calculation

11.1 Application

11.1.1 Direct calculations are to be employed in derivation of scantlings where required by the preceding Sections of this Chapter or by related provisions included in Part 3.

11.1.2 Direct calculation methods are also generally to be used where additional calculations are required by the Rules in respect of unusual structural arrangements.

11.2 Procedures

11.2.1 For details of LR's direct calculation procedures, see Pt 3, Ch 1,2. For requirements concerning use of other calculation procedures, see Pt 3, Ch 1,3.

Section 12 Steel hatch covers

12.1 General

12.1.1 These requirements apply to hatch covers on exposed decks in Position 1, see Pt 3, Ch 1,6.5.1, and are in addition to the requirements of Pt 3, Ch 11,2.

12.1.2 The net plate thickness, t_{net} , is the calculated minimum thickness of the plating and stiffeners. The required thickness is the net thickness plus a corrosion addition, t_c , given in Table 7.12.1.

Table 7.12.1 Corrosion addition t_c

Hatch cover type	t_c , in mm
(a) Single skin	2,0
(b) Pontoon (double skin)	
(i) for the top and bottom plating	2,0
(ii) for the internal structures	1,5

12.1.3 Material for the hatch covers is to be steel according to the requirements for ship's hull.

12.2 Stiffener arrangement

12.2.1 The secondary stiffeners and primary supporting members of the hatch covers are to be continuous over the breadth and length of the hatch covers, as far as practical. When this is impractical, sniped end connections are not to be used and appropriate arrangements are to be adopted to ensure sufficient load carrying capacity.

12.2.2 The spacing of primary supporting members parallel to the direction of secondary stiffeners is not to exceed 1/3 of the span of primary supporting members.

12.3 Closing arrangements

12.3.1 Panel hatch covers are to be secured by appropriate devices (bolts, wedges or similar) suitably spaced alongside the coamings and between cover elements.

12.3.2 Arrangement and spacing are to be determined with due attention to the effectiveness for weather-tightness, depending upon the type and the size of the hatch cover, as well as on the stiffness of the cover edges between the securing devices.

12.3.3 The net sectional area of each securing device is not to be less than:

$$A = 1,4 a/f \text{ cm}^2$$

where

a = spacing in m of securing devices, not being taken less than 2 m

$$f = (\sigma_Y/235)^e$$

σ_Y = specified minimum upper yield stress in N/mm² of the steel used for fabrication, not to be taken greater than 70 per cent of the ultimate tensile strength

$$e = 0,75 \text{ for } \sigma_Y > 235$$

$$= 1,0 \text{ for } \sigma_Y \leq 235$$

12.3.4 Rods or bolts are to have a net diameter not less than 19 mm for hatchways exceeding 5 m² in area.

Bulk Carriers

Part 4, Chapter 7

Section 12

12.3.5 Between cover and coaming and at cross-joints, a packing line force sufficient to obtain weathertightness is to be maintained by the securing devices. For packing line forces exceeding 5 N/mm, the cross section area is to be increased in direct proportion. The packing line force is to be specified.

12.3.6 The cover edge stiffness is to be sufficient to maintain adequate sealing pressure between securing devices. The moment of inertia, I , of edge elements is not to be less than:

$$I = 6p a^4 \text{ cm}^4$$

where

- p = packing line pressure in N/mm, minimum 5 N/mm
- a = spacing in m of securing devices.

12.3.7 Securing devices are to be of reliable construction and securely attached to the hatchway coamings, decks or covers. Individual securing devices on each cover are to have approximately the same stiffness characteristics.

12.3.8 Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

12.3.9 Where hydraulic cleating is adopted, a positive means is to be provided to ensure that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

12.3.10 Hatch covers are to be effectively secured, by means of stoppers, against transverse and longitudinal forces arising from a pressure of 175 kN/m².

12.3.11 The equivalent stress:

- in stoppers and their supporting structures; and
- calculated in the throat of the stopper welds; is not to exceed the allowable value of $0,8\sigma_Y$.

12.4 Load model

12.4.1 The pressure, p , in kN/m², acting on the hatch covers is given by:

- For ships of length 100 m or greater, for hatchways located on the freeboard deck, p is to be the greater of 34,3 or the following:

$$p = 34,3 + \frac{p_{FP} - 34,3}{0,25} \left(0,25 - \frac{x}{L} \right)$$

Where a hatchway is located in position 1 and at least one superstructure standard height higher than the freeboard deck, the pressure p may be 34,3 kN/m².

- For ships less than 100 m in length, for hatchways located at the freeboard deck, p is to be the greater of $0,195L + 14,9$ or the following:

$$p = 15,8 + \frac{L}{3} \left(1 - \frac{5}{3} \frac{x}{L} \right) - 3,6 \frac{x}{L}$$

Where two or more panels are connected by hinges, each individual panel is to be considered separately.

where

- p_{FP} = pressure at the forward perpendicular
- = $49,1 + (L - 100) a$
- a = 0,0726 for type B freeboard ships
- 0,356 for ships with reduced freeboard

L = Freeboard length, in metres, as defined in Regulation 3 of Annex I to the 1966 Load Line Convention as modified by the Protocol of 1988, to be taken not greater than 340 m

x = distance, in metres, of the mid length of the hatch cover under examination from the forward end of L .

12.5 Allowable stress

12.5.1 The normal and shear stresses calculated for the net section hatch cover structures are not to exceed the values given in Table 7.12.2.

Table 7.12.2 Permissible stresses

Failure mode	Permissible stress, in N/mm ² (kgf/mm ²)
Bending	$\sigma_a = 0,80\sigma_F$
Shear	$\tau_a = 0,46\sigma_F$
Symbols	
σ_F = minimum upper yield stress, in N/mm ² (kgf/mm ²)	

12.5.2 The normal stress in compression of the attached flange of primary supporting members is not to exceed 0,8 times the critical buckling stress of the structure according to the buckling check as given in 12.10, 12.11 and 12.12.

12.5.3 The stresses in hatch covers that are designed as a grillage of longitudinal and transverse primary supporting members are to be determined by a grillage or a FE analysis. When such an analysis is used the secondary stiffeners are not to be included in the attached flange area of the primary members.

12.5.4 When calculating the stresses σ and τ as defined in Table 7.12.2, the net scantlings are to be used.

12.6 Effective cross-sectional area of panel flanges for primary supporting members

12.6.1 The effective flange area, A_f , in cm², of the attached plating, to be considered for the yielding and buckling checks of primary supporting members, when calculated by means of a beam or grillage model, is obtained as the sum of the effective flange areas of each side of the girder web as appropriate:

$$A_f = \sum_{nf} (10b_{ef}t)$$

where

- nf = 2 if attached plate flange extends on both sides of girder web
- = 1 if attached plate flange extends on one side of girder web only
- t = net thickness of considered attached plate, in mm
- b_{ef} = effective breadth of attached plate flange on each side of girder web, in metres
- = b_p , but not to be taken greater than 0,165/

Bulk Carriers

Part 4, Chapter 7

Section 12

- b_p = half distance between the considered primary supporting member and the adjacent one, in metres
 l = span of primary supporting members, in metres.

12.7 Local net plate thickness

12.7.1 The local net plate thickness of the hatch cover plating is to be not less than:

$$t = F_p 15,8s \sqrt{\frac{p}{0,95\sigma_F}}$$

or 1 per cent of the spacing of the stiffeners or 6 mm, whichever is greater

where

- F_p = factor for combined membrane and bending response
 = 1,50 in general
 = $1,90\sigma/\sigma_a$, where $\sigma/\sigma_a \geq 0,8$, for the attached plate flange of primary supporting members
 s = stiffener spacing, in metres
 p = pressure, in kN/m², as defined in 12.4
 σ = as defined in 12.9
 σ_a = as defined in 12.5.

12.8 Net scantlings of secondary stiffeners

12.8.1 The required minimum section modulus, Z , in cm³, of secondary stiffeners of the hatch cover top plate, based on stiffener net member thickness, is given by:

$$Z = \frac{1000l^2 s p}{12\sigma_a}$$

where

- l = secondary stiffener span, in metres, to be taken as the spacing, in metres, of primary supporting members or the distance between a primary supporting member and the edge support, as applicable. When brackets are fitted at both ends of all secondary stiffener spans, the secondary stiffener span may be reduced by an amount equal to 2/3 of the minimum bracket arm length, but not greater than 10 per cent of the gross span, for each bracket
 s = secondary stiffener spacing, in metres
 p = pressure, in kN/m², as defined in 12.4
 σ_a = as defined in 12.5.

12.8.2 The net section modulus of the secondary stiffeners is to be determined based on an attached plate width assumed equal to the stiffener spacing.

12.9 Net scantlings of primary supporting members

12.9.1 The section modulus and web thickness of primary supporting members, based on member net thickness, are to be such that the normal stress σ in both flanges and the shear stress τ , in the web, do not exceed the allowable values σ_a and τ_a , respectively, defined in 12.5.

12.9.2 The breadth of the primary supporting member flange is to be not less than 40 per cent of their depth for laterally unsupported spans greater than 3,0 m. Tripping brackets attached to the flange may be considered as a lateral support for primary supporting members.

12.9.3 The flange outstand is not to exceed 15 times the flange thickness.

12.10 Hatch cover plating

12.10.1 The compressive stress, σ , in N/mm², in the hatch cover plate panels, induced by the bending of primary supporting members parallel to the direction of secondary stiffeners, is not to exceed 0,8 times the critical buckling stress σ_{C1} , to be evaluated as defined below:

$$\begin{aligned} \sigma_{C1} &= \sigma_{E1} && \text{when } \sigma_{E1} \leq \sigma_F/2 \\ &= \sigma_F [1 - \sigma_F/(4\sigma_{E1})] && \text{when } \sigma_{E1} > \sigma_F/2 \end{aligned}$$

where

- σ_F = minimum upper yield stress, in N/mm², of the material
 $\sigma_{E1} = 3,6E \left(\frac{t}{1000s} \right)^2$
 E = modulus of elasticity, in N/mm²
 = $2,06 \times 10^5$ for steel
 t = net thickness, in mm, of plate panel
 s = spacing of secondary stiffeners, in metres

12.10.2 The mean compressive stress σ in each of the hatch cover plate panels, induced by the bending of primary supporting members perpendicular to the direction of secondary stiffeners, is not to exceed 0,8 times the critical buckling stress σ_{C2} , to be evaluated as defined below:

$$\begin{aligned} \sigma_{C2} &= \sigma_{E2} && \text{when } \sigma_{E2} \leq \sigma_F/2 \\ &= \sigma_F [1 - \sigma_F/(4\sigma_{E2})] && \text{when } \sigma_{E2} > \sigma_F/2 \end{aligned}$$

where

- σ_F = minimum upper yield stress, in N/mm², of the material
 $\sigma_{E2} = 0,9m E \left(\frac{t}{1000s_s} \right)^2$
 $m = c \left[1 + \left(\frac{s_s}{l_s} \right)^2 \right]^2 \frac{2,1}{\psi + 1,1}$
 E = modulus of elasticity, in N/mm²
 = $2,06 \times 10^5$ for steel
 t = net thickness of plate panel, in mm
 s_s = length of the shorter side of the plate panel, in metres
 l_s = length of the longer side of the plate panel, in metres
 Ψ = ratio between smallest and largest compressive stress
 c = 1,3 when plating is stiffened by primary supporting members
 = 1,21 when plating is stiffened by secondary stiffeners of angle or T type
 = 1,1 when plating is stiffened by secondary stiffeners of bulb type
 = 1,05 when plating is stiffened by flat bar.

Bulk Carriers

Part 4, Chapter 7

Section 12

12.10.3 The biaxial compressive stress in the hatch cover panels, when calculated by means of FEM shell element model will be specially considered.

12.11 Hatch cover secondary stiffeners

12.11.1 The compressive stress σ , in N/mm², in the top flange of secondary stiffeners, induced by the bending of primary supporting members parallel to the direction of secondary stiffeners, is not to exceed 0,8 times the critical buckling stress σ_{CS} , to be evaluated as defined below:

$$\begin{aligned}\sigma_{CS} &= \sigma_{ES} & \text{when } \sigma_{ES} \leq \sigma_F/2 \\ &= \sigma_F [1 - \sigma_F/(4\sigma_{ES})] & \text{when } \sigma_{ES} > \sigma_F/2\end{aligned}$$

where

- σ_F = minimum upper yield stress, in N/mm², of the material
 σ_{ES} = ideal elastic buckling stress, in N/mm², of the secondary stiffener
 = minimum between σ_{E3} and σ_{E4}
 σ_{E3} = $0,001E I_a/(A l^2)$
 E = modulus of elasticity, in N/mm²
 = $2,06 \times 10^5$ for steel
 I_a = moment of inertia of the secondary stiffener, including a top flange equal to the spacing of secondary stiffeners, in cm⁴
 A = cross-sectional area of the secondary stiffener, including a top flange equal to the spacing of secondary stiffeners, in cm²
 l = span of the secondary stiffener, in metres

$$\sigma_{E4} = \frac{\pi^2 E I_w}{10^4 I_p l^2} \left(m^2 + \frac{K}{m^2} \right) + 0,385E \frac{I_t}{I_p}$$

$$K = \frac{C l^4}{\pi^4 E I_w} 10^6 \text{ m}$$

- m = number of half waves, given in Table 7.12.3
 I_w = sectorial moment of inertia (warping constant) of the secondary stiffener about its connection with the plating, in cm⁶

$$= \frac{h_w^3 t_w^3}{36} 10^{-6} \text{ for flat bar secondary stiffeners}$$

$$= \frac{t_f b_f^3 h_w^2}{12} 10^{-6} \text{ for 'Tee' secondary stiffeners}$$

$$= \frac{b_f^3 h_w^2}{12(b_f + h_w)^2} [t_f(b_f^2 + 2b_f h_w + 4h_w^2) + 3t_w b_f h_w] 10^{-6}$$

for angles and bulb secondary stiffeners

- I_p = polar moment of inertia of the secondary stiffener about its connection with the plating, in cm⁴

$$= \frac{h_w^3 t_w}{3} 10^{-4} \text{ for flat bar secondary stiffeners}$$

$$= \left(\frac{h_w^3 t_w}{3} + h_w^2 b_f t_f \right) 10^{-4}$$

for flanged secondary stiffeners

- I_t = St.Venant's moment of inertia of the secondary stiffener without top flange, in cm⁴

$$= \frac{h_w^3 t_w}{3} 10^{-4} \text{ for flat bar secondary stiffeners}$$

$$= \frac{1}{3} \left[h_w t_w^3 + b_f t_f^3 \left(1 - 0,63 \frac{t_f}{b_f} \right) \right] 10^{-4}$$

for flanged secondary stiffeners

h_w, t_w = height and net thickness of the secondary stiffener, respectively, in mm

b_f, t_f = width and net thickness of the secondary stiffener bottom flange, respectively, in mm

s = spacing of secondary stiffeners, in metres

C = spring stiffness exerted by the hatch cover top plating

$$= \frac{k_p E t_p^3}{3s \left[1 + \frac{1,33k_p h_w t_p^3}{1000s t_w^3} \right]} 10^{-3}$$

k_p = $1 - \eta_p$ to be taken not less than zero; for flanged secondary stiffeners, k_p need not be taken less than 0,1

$$\eta_p = \frac{\sigma}{\sigma_{E1}}$$

σ = as defined in 12.9

σ_{E1} = as defined in 12.10

t_p = net thickness of the hatch cover plate panel, in mm.

Table 7.12.3 Number of half waves

K	m
$0 < K < 4$	1
$4 < K < 36$	2
$36 < K < 144$	3
$(m-1)^2 m^2 < K \leq m^2 (m+1)^2$	m

12.11.2 For flat bar secondary stiffeners and buckling stiffeners, the ratio h/t_w is to be not greater than $15k^{0,5}$

where

h, t_w = height and net thickness of the stiffener, respectively

$$k = 235/\sigma_F$$

σ_F = minimum upper yield stress, in N/mm², of the material.

12.12 Web panels of hatch cover primary supporting members

12.12.1 This check is to be carried out for the web panels of primary supporting members formed by web stiffeners or by the crossing with other primary supporting members, the face plate (or the bottom cover plate) or the attached top cover plate.

Bulk Carriers

Part 4, Chapter 7

Sections 12 & 13

12.12.2 The shear stress τ in the hatch cover primary supporting members web panels is not to exceed 0,8 times the critical buckling stress τ_C , to be evaluated as defined below:

$$\begin{aligned}\tau_C &= \tau_E & \text{when } \tau_E \leq \tau_F/2 \\ &= \tau_F [1 - \tau_F/(4\tau_E)] & \text{when } \tau_E > \tau_F/2\end{aligned}$$

where

σ_F = minimum upper yield stress of the material, in N/mm²

$$\tau_F = \frac{\sigma_F}{3}$$

$$\tau_E = 0,9k_t E \left(\frac{t_{pr,n}}{1000d} \right)^2$$

E = modulus of elasticity, in N/mm²
= 2,06 x 10⁵ for steel

$t_{pr,n}$ = net thickness of primary supporting member, in mm

k_t = 5,35 + 4,0/(a/d)²

a = greater dimension of web panel of primary supporting member, in metres

d = smaller dimension of web panel of primary supporting member, in metres.

12.12.3 For primary supporting members parallel to the direction of secondary stiffeners, the actual dimensions of the panels are to be considered.

12.12.4 For primary supporting members perpendicular to the direction of secondary stiffeners or for hatch covers built without secondary stiffeners, a presumed square panel of dimension d is to be taken for the determination of the stress τ_C . In such a case, the average shear stress τ between the values calculated at the ends of this panel is to be considered.

12.13 Deflection limit and connections between hatch cover panels

12.13.1 Load bearing connections between the hatch cover panels are to be fitted with the purpose of restricting the relative vertical displacements.

12.13.2 The vertical deflection of primary supporting members is to be not more than 0,0056*l*, where *l* is the greatest span of primary supporting members.

Section 13 Hatch coamings

13.1 General

13.1.1 The height and construction of forward and side hatch coamings are to comply with the following requirements. All hatch coamings are to comply with the requirements of Pt 3, Ch 11,5.

13.1.2 For the structure of hatch coamings and coaming stays, the corrosion addition t_s is to be 1,5 mm.

13.1.3 Material for the hatch coamings is to be steel according to the requirements for the ship's hull.

13.1.4 The secondary stiffeners of the hatch coamings are to be continuous over the breadth and length of the hatch coamings.

13.2 Load model

13.2.1 The pressure p_{coam} , on hatch coamings is to be taken as 220 kN/m².

13.3 Local net plate thickness

13.3.1 The local net plate thickness, t , in mm, of the hatch coaming plating is to be the greater of 9,5 mm or the following:

$$t = 14,9s \sqrt{\frac{p_{coam}}{\sigma_{a,coam}}} S_{coam}$$

where

s = secondary stiffener spacing, in metres

p_{coam} = pressure, in kN/m², as defined in 13.2.1

S_{coam} = safety factor to be taken equal to 1,15

$\sigma_{a,coam}$ = 0,95 σ_F .

σ_F = minimum upper yield stress, in N/mm², of the material.

13.4 Net scantlings of longitudinal and transverse secondary stiffeners

13.4.1 The required section modulus, Z , in cm³, of the longitudinal or transverse secondary stiffeners of the hatch coamings, based on net member thickness, is given by:

$$Z = \frac{1000S_{coam} l^2 s p_{coam}}{m c_p \sigma_{a,coam}}$$

where

m = 16 in general

= 12 for the end spans of stiffeners sniped at the coaming corners

S_{coam} = safety factor to be taken equal to 1,15

l = span of secondary stiffeners, in metres

s = spacing of secondary stiffeners, in metres

p_{coam} = pressure in kN/m² as defined in 13.2.1

c_p = ratio of the plastic section modulus to the elastic section modulus of the secondary stiffeners with an attached plate breadth equal to 40*t*, where *t* is the plate net thickness, in mm

= 1,16 in the absence of more precise evaluation

$\sigma_{a,coam}$ = 0,95 σ_F

σ_F = minimum upper yield stress, in N/mm², of the material.

13.5 Net scantlings of coaming stays

13.5.1 The required minimum section modulus, Z , in cm^3 , and web thickness, t_w , in mm of coaming stays designed as beams with flange connected to the deck or sniped and fitted with a bracket (see Fig. 7.13.1, Type A and B) at their connection with the deck, based on member net thickness, are given by:

$$Z = \frac{1000 H_c^2 s p_{\text{coam}}}{2 \sigma_{a,\text{coam}}}$$

$$t_w = \frac{1000 H_c s p_{\text{coam}}}{h \tau_{a,\text{coam}}}$$

where

H_c = stay height, in metres

s = stay spacing, in metres

h = stay depth at the connection with the deck, in mm

p_{coam} = pressure, in kN/m^2 , as defined in 13.2.1

$\sigma_{a,\text{coam}} = 0,95\sigma_F$

$\tau_{a,\text{coam}} = 0,5\sigma_F$

σ_F = minimum upper yield stress, in N/mm^2 , of the material.

13.5.2 For calculating the section modulus of coaming stays, their face plate area is to be taken into account only when it is welded with full penetration welds to the deck plating and adequate underdeck structure is fitted to support the stresses transmitted by it.

Fig. 7.13.1 Typical coaming stays

Bulk Carriers

Part 4, Chapter 7

Sections 13 & 14

13.5.3 For other designs of coaming stays, such as those shown in Fig. 7.13.1 Type C and D, the stress levels in 12.5 apply and are to be checked at the highest stressed locations.

13.6 Local details

13.6.1 The design of local details is to comply with Pt 3, Ch 11,5 for the purpose of transferring the pressures on the hatch covers to the hatch coamings and, through them, to the deck structures below. Hatch coamings and supporting structures are to be adequately stiffened to accommodate the loading from hatch covers, in longitudinal, transverse and vertical directions.

13.6.2 Underdeck structures are to be checked against the load transmitted by the stays, adopting the same allowable stresses specified in 13.5.1.

13.6.3 Double continuous welding is to be adopted for the connections of stay webs with deck plating and the weld throat is to be not less than $0,44t_W$, where t_W is the gross thickness of the stay web.

13.6.4 Toes of stay webs are to be connected to the deck plating with deep penetration double bevel welds extending over a distance not less than 15 per cent of the stay width.

Section 14 Forecastles

14.1 Arrangement

14.1.1 An enclosed forecastle is to be fitted on the free-board deck.

14.1.2 The aft bulkhead of the forecastle is to be fitted in way or aft of the forward bulkhead in the foremost cargo hold. See Fig. 7.14.1. However, if this requirement hinders hatch cover operation, the aft bulkhead of the forecastle may be fitted forward of the forward bulkhead of the foremost cargo hold provided the forecastle length is not less than 7 per cent of ship length abaft the forward perpendicular where the ship length and forward perpendicular are defined in the *International Convention on Load Line 1966* and its Protocol 1988.

14.1.3 The forecastle height H_F , in metres, above the main deck is to be not less than the greater of:

- the standard height of a superstructure as specified in the *International Convention on Load Lines 1966* and its Protocol of 1988; or
- $H_C + 0,5$ m

where

H_C = the height, in metres, of the forward transverse hatch coaming of cargo hold No.1.

Fig. 7.14.1 Forecastle arrangement

14.1.4 All points of the aft edge of the forecastle deck are to be located at a distance:

$$l_f < 5 \sqrt{(H_F - H_C)}$$

from the hatch coaming, see Fig. 7.14.1.

14.1.5 A breakwater is not to be fitted on the forecastle deck with the purpose of protecting the hatch coaming or hatch covers. If fitted for other purposes, it is to be located such that its upper edge at centre line is not less than:

$$H_B / \tan 20^\circ$$

forward of the aft edge of the forecastle deck.

where

H_B = the height, in metres, of the breakwater above the forecastle, see Fig. 7.14.1.

14.2 Construction

14.2.1 The construction of the forecastle is to comply with the requirements of Pt 3, Ch 8,4.

Container Ships

Part 4, Chapter 8

Section 1

Section

1	General
2	Materials
3	Longitudinal strength
4	Deck structure
5	Shell envelope plating
6	Shell envelope framing
7	Double bottom structure
8	Longitudinal bulkheads
9	Transverse bulkheads

11	Hatch covers
12	Strengthening for wave impact loads
13	Container stowage systems
14	Direct calculation
15	Requirements for ships with large deck openings

Section 1 General

1.1 Application and definitions

1.1.1 A **container ship** is defined as a ship designed exclusively for the carriage of containers in holds and on deck. Containers in holds are normally stowed within cellular guide systems.

1.1.2 The term 'Panamax' container ship is as defined in Lloyd's Register's (hereinafter referred to as 'LR') ShipRight SDA Procedures Manual *Primary Structure of Container Ships*.

1.1.3 The term 'narrow side structures' applies where the breadth of hatch opening exceeds 90 per cent of the breadth of the ship.

1.1.4 Other terms used to describe the various structural components of container ships are generally indicated in LR's ShipRight FDA Procedure, *Structural Detail Design Guide*.

1.1.5 For container ships with a beam of Panamax size or greater, or where the structural arrangements are considered such as to necessitate it, the ShipRight notations **SDA** and **CM** are mandatory, see 1.3 and Section 14.

1.1.6 Scantlings of the primary structure of double bottom, side and transverse bulkheads are to be verified by direct calculation as required by 14.2.

1.1.7 Scantlings and arrangements are to be as required by Chapter 1, except as otherwise indicated in this Chapter.

1.2 Structural configuration

1.2.1 This Chapter describes a basic structural configuration as shown in Fig. 8.1.1 which includes:

- An efficient torsion box girder or equivalent structure at the topsides comprising strength deck, side shell, inner skin and a second deck. The space within the torsion box is often utilised as an underdeck access passageway.
- Single or double skin side construction with or without bilge box.
- Double bottom.
- Continuous or discontinuous hatch coamings.
- Optional continuous deck girders to support hatch covers.

1.3 Class notations

1.3.1 In general, ships complying with the requirements of this Chapter will be eligible to be classed **100A1 Container Ship**.

1.3.2 The 'ShipRight Procedures' for the hull construction of ships are detailed in Pt 3, Ch 16 and the classification notations and descriptive notes associated with these procedures are given in Pt 1, Ch 2,2.

Container Ships

Part 4, Chapter 8

Sections 1, 2, 3 & 4

1.3.3 The notations **SDA** and **CM** are mandatory for container ships with any of the following features:

- (a) beam of a Panamax size or greater;
- (b) narrow side structures;
- (c) abnormal hull form; or
- (d) unusual structural configuration or complexity.

1.3.4 When required, other cargoes or particular loading arrangements will be included in the class or cargo notations.

1.3.5 Reference is made to Pt 1, Ch 2 with respect to the Regulations for classification and assignment of class notations.

1.4 Information required

1.4.1 In addition to the information and plans required by Pt 3, Ch 1,5, the following are to be submitted:

- (a) Details of overlap arrangement of steps in decks and longitudinal bulkheads.
- (b) Details of outline stowage arrangement of containers.
- (c) Details of design container stack weights.
- (d) Details of cell guides and supporting structure indicating the position of guides relative to hatch corners, and attachment to structural members.
- (e) Details of reinforcement to structure in way of container corners/supports.
- (f) Details of reinforcement to structure in way of lashing bridges where fitted.
- (g) Details showing the location of all openings in decks within the cargo holds.
- (h) Details of longitudinal girders supporting hatch coamings where fitted.

1.5 Symbols and definitions

1.5.1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

- $L, L_{pp}, B, D, T, V, C_b$ as defined in Pt 3, Ch 1,6
- e = base of natural logarithms, 2,7183
- k_L, k = higher tensile steel factor, see Pt 3, Ch 2,1
- s = spacing of secondary stiffeners, in mm
- s_1 = spacing of secondary stiffeners, but is not to be taken less than $470 + 1,67L$ mm
- t = thickness of plating, in mm
- L_1 = L but need not be taken greater than 190 m

Section 2 Materials

2.1 Materials

2.1.1 Materials are to comply with Pt 3, Ch 2.

2.1.2 Attention is drawn to the specific requirements for container ship hatch corners in Pt 3, Ch 2, Note 1 of Table 2.2.1.

2.2 Protection of steelwork

2.2.1 In addition to the requirements of Pt 3, Ch 2,3 the requirements of Ch 1,2.2.3 may also be applied.

Section 3 Longitudinal strength

3.1 General

3.1.1 Longitudinal strength calculations are to be carried out in accordance with 3.2 and 3.3.

3.1.2 Alternatively the values and distributions of wave induced loads may be derived by direct calculation, see Pt 3, Ch 4,2.5.

3.1.3 For ships of abnormal hull form, or for ships of unusual structural configuration or complexity, the values and distributions of wave induced loads are to be agreed with LR.

3.2 Longitudinal strength

3.2.1 Longitudinal strength calculations are to be made in accordance with the requirements of Pt 3, Ch 4 and the additional notes contained in this Section.

3.2.2 The design vertical wave bending moments and design wave shear forces to be used in Pt 3, Ch 4 are to be determined in accordance with Ch 2,2.4 and 2.5.

3.3 Combined longitudinal and torsional strength

3.3.1 The strength of the ship to resist a combination of longitudinal and torsional loads is to be determined in accordance with 14.1.

Section 4 Deck structure

4.1 General

4.1.1 The requirements of Ch 1,4 are to be complied with as modified by this Section.

4.1.2 The strength deck is to be longitudinally framed throughout the region of container holds for ships where $L \geq 100$ m.

4.1.3 Lower decks/side stringers are to be efficiently scarfed into the machinery space, and the fore end and aft end structure.

Container Ships

Part 4, Chapter 8

Section 4

4.1.4 The ShipRight FDA Procedure, *Structural Detail Design Guide (SDDG)*, indicates recommended examples of structural design configurations in critical areas of deck structures.

4.2 Primary supporting structure

4.2.1 Where decks form part of the primary support structures described in 6.2 and 9.2 the scantlings of the decks are to be verified by direct calculation procedures in accordance with 14.2.

4.3 Deck plating and stiffeners

4.3.1 Strength/weather deck scantlings outside the line of hatch openings are to satisfy the requirements of Section 3 and 4.2, and are to be not less than required by Ch 1,4.2 and Ch 1,4.3.

4.3.2 Within the cargo holds, strength/weather/second deck scantlings inside the line of hatch openings are to satisfy the requirements of Sections 3, 4.2 and 4.4.

4.3.3 Other deck scantlings are to satisfy the requirements of Sections 3, 4.2 and Ch 1,4 as appropriate.

4.4 Cross decks

4.4.1 The width and scantlings of cross-deck strips are to satisfy the requirements of 4.2. The thickness, t , of cross deck strips is to comply with the requirements of Table 8.4.1.

Table 8.4.1 Cross deck plating

Location	Minimum thickness, in mm
At strength deck	The greater of the following: (a) $t = 0,012s_1$ (b) $t = 10 + 0,01L_1$
At second deck	The greater of the following: (a) $t = 0,012s_1$ but need not exceed 12 (b) $t = 8,0$
Symbols	
s_1 and L_1 as defined in 1.5.1.	

4.4.2 The thickness may require to be increased locally in way of access openings.

4.4.3 Where the difference between the thickness of plating inside and outside the line of main hatchway openings exceeds 25 mm, a single transition plate is to be fitted at the end of the cross deck strip. The thickness of the transition plate is to be equal to the mean of the adjacent plate thicknesses.

4.4.4 The scantlings of cross-deck stiffeners are to comply with Ch 1,4.

4.4.5 For initial design purposes the width of the cross deck strips, w , forming a transverse bulkhead top box (or equivalent) can be estimated according to the following formula:

$w = 32,5B + 400$, or 1000 mm, whichever is the greater where B is given in 1.5.1.

4.5 Deck openings

4.5.1 The corners of main hatchway openings are generally to be rounded. However, corners with negative radii, or parabolic or elliptic profiles will be specially considered.

4.5.2 The design of hold corners including deck thickness and corner profile is to comply with either 4.5.3 or 4.5.4.

4.5.3 The design of hatch corners is to be verified by direct calculations, see 14.1.1.

4.5.4 Alternatively, where the design of hatch corners has not been verified by direct calculations:

- The outboard radius of main hatchway openings at strength deck level is, in general, to be not less than 35 per cent of the width of the cross deck strip indicated in 4.4.5 with a minimum of 300 mm.
- The radius of the hatch corners of the main hatchway openings adjacent to the engine room is to be made as large as practicable, with a radius of approximately $40B$ mm.
- Insert plates at main hatch corners, are to have an increased thickness above the adjacent plating outside the line of hatchways of 15 per cent in way of the container holds, and 25 per cent in container holds at engine room bulkheads. The minimum increase is to be not less than 4,0 mm, nor need exceed 7,0 mm, and the minimum fore and aft extent is to be 1,0 m from the edge of the openings.

4.6 Local reinforcement

4.6.1 Attention is to be paid to structural continuity, and abrupt changes of shape, section or plate thickness are to be avoided, particularly in highly stressed areas. Arrangements in way of openings are to be such as to minimise the creation of stress concentrations.

4.6.2 In general, large access openings are not to be arranged in the strength deck outside the line of main hatchways in the region of container holds.

4.6.3 Small openings, such as those for ventilation pipes or scuppers, are to be kept clear of hold corners, ends of longitudinal hatch coamings, ends of cross deck strips and other critical locations.

4.7 Support for container corner seats

4.7.1 In general, local stiffening is to be fitted under seats for container supports.

4.7.2 The design of attachments to the strength deck is to minimise the effects of stress concentration, and consideration is to be given to the strength and grade of welding consumable used, see Ch 13,2.2.2 of the Rules for Materials.

4.7.3 The strength of support arrangements is to be verified in accordance with Pt 3, Ch 14,4.

4.7.4 Doubler plates are not to be utilised in connections subject to tensile loads.

Section 5 Shell envelope plating

5.1 General

5.1.1 The requirements of Ch 1,5 are to be applied, together with the requirements of this Section.

5.1.2 The bottom shell is, in general, to be longitudinally framed for ships where $L \geq 100$ m.

5.1.3 The side shell may be longitudinally or transversely framed, except in way of the topside torsion box which is, in general, to be longitudinally framed.

5.2 Bottom shell and bilge

5.2.1 The thickness of the bottom shell plating is to satisfy the requirements of Section 3 and 7.2 and is to be not less than required by Ch 1,5.3.

5.2.2 In regions where transverse framing is adopted, particularly towards the end of the ship, the buckling stability of the plating will be specially considered.

5.3 Side shell and sheerstrake

5.3.1 The thickness of the side shell and sheerstrake plating is to satisfy the requirements of Section 3 and 6.2 and is to be not less than required by Ch 1,5.4.

5.3.2 At positions where high shear forces are present, local increases in thickness may be required.

5.3.3 The difference in thickness between the sheerstrake and shell plating below is not to exceed 25 mm.

Section 6 Shell envelope framing

6.1 General

6.1.1 The requirements of Ch 1,6 are to be applied, together with the requirements of this Section.

6.1.2 The ShipRight FDA Procedure, *Structural Detail Design Guide (SDDG)* indicates recommended examples of configurations for end connections of shell envelope longitudinals.

6.2 Side shell primary supporting structure

6.2.1 A primary supporting structure for side shell envelope framing is to be provided of either single or double skin construction. This normally consists of a combination of vertical transverse webs and horizontal side stringers/decks.

6.2.2 Transverse webs supporting side shell envelope framing are to be arranged in line with the floors in the double bottom to ensure continuity of transverse strength.

6.2.3 The scantlings of double skin primary structure, including thickness of side shell envelope plating, are to be verified by direct calculations in accordance with 14.2.

6.2.4 The scantlings of single skin primary structure are to comply with Ch 1,6.4. Alternatively the scantlings are to be verified by direct calculations in accordance with 14.2.

6.3 Side stringers in double skin construction

6.3.1 The scantlings of side stringers are to satisfy the requirements of Sections 3, 6.2 and 6.5.

6.3.2 In addition, the scantlings of watertight side stringers are to satisfy the requirements of Ch 1,9.

6.4 Transverse webs in double skin construction

6.4.1 The scantlings of transverse webs are to satisfy the requirements of 6.2 and 6.5.

6.4.2 Transverse webs are to be efficiently stiffened, and the thickness increased locally where necessary on account of high shear stress.

6.4.3 Where, towards the end of the ship, the width of transverse webs reduces from that assumed in the direct calculations, the thickness may require to be increased locally.

6.5 Minimum thickness of transverse webs/side stringers in double skin construction

6.5.1 Transverse webs and side stringers are to have a thickness, t , not less than:

$$t = 7,5 + 0,015L \text{ or } 9 \text{ mm whichever is the lesser.}$$

■ Section 7 Double bottom structure

7.1 General

7.1.1 The double bottom is, in general, to be longitudinally framed for ships where $L \geq 100$ m.

7.1.2 Longitudinally framed double bottoms are to comply with Ch 1,8.2 and the contents of this Section.

7.1.3 Transversely framed double bottoms are to comply with Ch 1,8.

7.1.4 The ShipRight FDA Procedure, *Structural Detail Design Guide (SDDG)*, indicates recommended examples of structural design configurations in critical areas of the double bottom.

7.2 Double bottom primary supporting structure

7.2.1 The primary supporting structure formed by the double bottom comprises inner bottom plating, floors, longitudinal girders and bottom shell plating.

7.2.2 The scantlings of this primary structure are to be verified by direct calculations in accordance with 14.2.

7.2.3 Where, towards the end of the ship, the depth of double bottom structure webs is reduced from that assumed in the direct calculations, the thickness may require to be increased locally.

7.2.4 Where mid-hold or quarter-length-of-hold supports for the double bottom structure are arranged, these are to take the form of an efficiently stiffened transverse box or open section structure, see 9.4.

7.3 Inner bottom plating and stiffening

7.3.1 The scantlings of the inner bottom are to satisfy the requirements of Section 3 and 7.2 and are to be not less than required by Ch 1,8.4 as modified by this sub-Section.

7.3.2 The requirements of Ch 1,8.4.2 need not be applied to container ships.

7.3.3 In applying Ch 1,8.4.5, the Rule value of bottom longitudinals may be calculated assuming $F_{sb} = 1,05$.

7.4 Girders

7.4.1 Girders are, in general, to be arranged under container corner seatings.

7.4.2 The scantlings of watertight centreline/side girders are to satisfy the requirements of Section 3 and 7.2 and are to be not less than required by Ch 1,8.3.

7.4.3 The scantlings of non-watertight centreline/side girders are to satisfy the requirements of Section 3 and 7.2.

7.4.4 For double bottoms having a depth greater than 1,6 m, additional longitudinal stiffening may have to be introduced in order to ensure the buckling stability of the girders.

7.5 Floors

7.5.1 Plate floors are to be fitted under watertight bulkheads, non-watertight bulkheads/mid-hold supports, under container corners at hold quarter length locations and at other locations to ensure that the maximum spacing does not, in general, exceed 3,8 m. Proposals for floor spacings greater than 3,8 m are to be supported by direct calculations agreed with LR.

7.5.2 The scantlings of watertight floors are to satisfy the requirements of 7.2 and are to be not less than required by Ch 1,8.5.

7.5.3 The thickness, t , of non-watertight floors is to satisfy the requirements of 7.2 and is to be not less than:

$$t = 6 + 0,03L \text{ or } 12 \text{ mm, whichever is the lesser.}$$

7.5.4 Non-watertight floor stiffeners are to be fitted at approximately the same spacing as the bottom longitudinals. The scantlings are to satisfy the requirements of Pt 3, Ch 10.

7.5.5 Docking brackets, or equivalent, are to be fitted in accordance with Ch 1,8.5.3.

7.6 Support for containers

7.6.1 In general, local stiffening is to be fitted to double bottom floors or girders under container corner seatings in order to ensure the effective transmission of load.

7.6.2 Such stiffening normally takes the form of additional brackets with suitable extensions to adjacent stiffening members. The scantlings of the adjacent stiffening members may require to be increased depending on the arrangements proposed.

7.6.3 Attention is drawn to the benefit of direct support in order to minimise the effect of eccentric loading on the support brackets.

7.6.4 The scantlings of these arrangements may be determined utilising simple beam models to verify the shear and bending strength. Based on static container loads, the stresses induced in the structure are not to exceed the permissible values stated in Table 8.7.1. Alternative more complex assessment methods are to be agreed with LR.

7.6.5 In general, doubling members or equivalent structures are to be attached to the inner bottom to distribute the load from container corners into the supporting structure. Doubler plates are to have well-rounded corners.

Container Ships

Part 4, Chapter 8

Sections 7, 8 & 9

Table 8.7.1 Permissible stress values

	Permissible stress, N/mm ² (kgf/mm ²)
Normal stress (bending, tension, compression)	$0,67\sigma_0$
Shear stress	$0,4\sigma_0$
Combined stress	$0,86\sigma_0$
Symbols	
σ_0 = specified minimum yield stress, in N/mm ² (kgf/mm ²)	

Section 8 Longitudinal bulkheads

8.1 General

8.1.1 The requirements of Ch 1,9 are to be applied, together with the requirements of this Section.

8.1.2 Longitudinal bulkheads may be transversely or longitudinally framed, except in way of the topside torsion box which is, in general, to be longitudinally framed.

8.1.3 Longitudinal bulkheads are to be maintained continuous in way of the machinery space where this is situated between container holds and as far forward and aft as practicable.

8.1.4 The scarfing arrangements in way of the steps are to be sufficient to ensure an efficient overlap of the inner skin bulkheads.

8.1.5 The ShipRight FDA Procedure, *Structural Detail Design Guide (SDDG)*, indicates recommended examples of structural design configurations in critical areas of the double side skin structures.

8.2 Side shell primary supporting structure

8.2.1 Where the longitudinal bulkhead forms the inner skin of the side shell primary supporting structure the thickness of longitudinal bulkhead plating is to be verified by direct calculations as described in 14.2.

8.3 Plating and stiffeners

8.3.1 The scantlings of longitudinal bulkheads are to satisfy the requirements of Section 3 and 8.2 and are to be not less than required by Ch 1,9.

8.3.2 Openings in the upper parts of longitudinal bulkheads are to have shapes which minimise stress concentrations and are to be framed to ensure adequate buckling stability.

8.3.3 The difference in thickness between the top strake and the bulkhead plating below is not to exceed 25 mm.

8.4 Support for container corner seats

8.4.1 Where direct support for 20 ft containers by the longitudinal bulkhead is required at the mid length of a cell arranged for 40 ft containers, adequate stiffening is to be fitted in order to ensure the effective transmission of load.

8.4.2 The strength of these arrangements is to be verified in accordance with Pt 3 Ch 14,4.

Section 9 Transverse bulkheads

9.1 General

9.1.1 The requirements of Ch 1,9 are to be applied, together with the requirements of this Section.

9.1.2 Watertight transverse bulkheads may be vertically or horizontally framed.

9.1.3 The ShipRight FDA Procedure, *Structural Detail Design Guide (SDDG)*, indicates recommended examples of structural design configurations in critical areas of transverse bulkhead structures.

9.2 Transverse watertight/non-watertight bulkhead primary supporting structure

9.2.1 The primary supporting structure of transverse bulkheads normally comprises a grillage of vertical webs and horizontal stringers/decks.

9.2.2 Vertical webs are to be fitted in line with double bottom girders.

9.2.3 The scantlings of transverse bulkhead primary structure including bulkhead plating are to be verified by direct calculations as described in 14.2.

9.2.4 The scantlings are to be adequate for the static and dynamic loads imposed on the structure by the container stowage arrangements.

9.3 Transverse watertight bulkheads

9.3.1 The thickness of the transverse bulkhead plating is to satisfy the requirements of 9.2 and is to be not less than required by Ch 1,9.2 for watertight bulkheads.

9.3.2 In general, a transverse box structure or equivalent is to be arranged at upper deck level.

9.3.3 In certain cases, a transverse box structure at the inner bottom may also be required.

Container Ships

Part 4, Chapter 8

Sections 9, 10 & 11

9.4 Transverse non-watertight mid-hold bulkheads

9.4.1 Where non-watertight bulkheads are arranged in conjunction with the double bottom mid-hold support, a transverse box is to be arranged at strength deck level.

9.4.2 Non-watertight bulkhead scantlings are to satisfy the requirements of 9.2 and Ch 1,4.4 for a non-watertight pillar bulkhead.

Section 10 Hatch coamings and support for hatch covers

10.1 Hatch coamings

10.1.1 Scantlings of hatch coamings are to comply with Pt 3, Ch 11,5 in addition to the requirements of this Section. For ships where the base of the hatch coaming is more than one standard superstructure height (as defined in Pt 3, Ch 8,1.3.2) above the freeboard deck a reduction of the minimum thickness by 1 mm will be permitted.

10.1.2 Continuous side coamings are to be effectively scarfed into the deckhouse structure or gradually tapered at ends, as applicable. The scantlings are also to satisfy the requirements of Section 3.

10.1.3 The scantlings of transverse hatch coamings forming part of a transverse bulkhead top box are also to satisfy the requirements of 9.2.

10.1.4 The ShipRight FDA Procedure, *Structural Detail Design Guide* (SDDG), indicates examples of recommended structural design configurations in critical areas of the hatch side coamings.

10.2 Support for inboard edges of hatch covers by girders

10.2.1 Where longitudinal underdeck girders are fitted at deck level to support the hatch covers the requirements of this sub-Section are to be complied with.

10.2.2 The girders may take the form of open or closed box sections and these should align with webs on the transverse bulkheads to form a continuous ring structure.

10.2.3 The girders are, in general, to be continuous throughout the container hold area, including the engine room where this is situated between container holds.

10.2.4 Special attention is to be given to the intersection of the girders with transverse box girders and the integration into the fore end, aft end and machinery space structures.

10.2.5 Where girders are integrated into the cross deck strips, inserts plates with integral gussets are to be incorporated. The inserts are to have a thickness not less than that of the girder top and bottom plates, as appropriate. The radius of main hatchway openings in way of ends of hatch girders at upper deck level is, in general, to be not less than 20 per cent of the width of the cross deck strip indicated in 4.4.5 with a minimum of 250 mm.

10.2.6 Scantlings of girders are to comply with the requirements of Ch 1,4.

10.3 Support for hatch cover fittings

10.3.1 The width of hatch coaming top plates is to be suitable to accommodate the hatch covers and associated fittings.

10.3.2 Local stiffening is to be fitted below hatch cover supporting devices and in some cases the thickness of the coaming in way may need to be increased, (see also Pt 3, Ch 11,4.2.3 and 5.2.12).

Section 11 Hatch covers

11.1 General

11.1.1 The requirements of Pt 3, Ch 11 are to be complied with in addition to the requirements of this Section.

11.1.2 For the purposes of this Section, hatch covers are categorised into two types as indicated in Table 8.11.1.

Table 8.11.1 Definitions of hatch cover types

Type	Description
I	All edges of the hatch cover are supported by external structures
II	One or more edges of the hatch cover are self-supporting

11.1.3 The primary structure of hatch covers normally consists of an arrangement of deep beams and girders including hatch cover top plating.

11.1.4 For hatch covers subjected to point loads from containers, the primary structure scantlings are to be verified by direct calculation in accordance with 11.2.

11.1.5 Local stiffening is to be arranged below container corners.

11.2 Direct calculations

11.2.1 Direct calculations are to be based on 2D or 3D finite element analysis. Simplified boundary constraints may be applied in the modelling, provided this does not compromise the overall structural response.

11.2.2 The load cases, method of loading and acceptance criteria are indicated in Tables 8.11.2 and 8.11.3.

11.3 Omission of hatch cover gaskets

11.3.1 For ships which have hatch covers in the position defined in Pt 3, Ch 11,2.2.5, special consideration will be given to the omission of gaskets and a reduction in number of cleats. The agreement of the National Authority will be required in such cases.

11.3.2 The horizontal gap between panels is not to exceed 50 mm.

Table 8.11.2 Loadcases for direct calculations

Application	Loadcase	Applied loading
Type I, II	Loadcase 1 UDL Weather Load	Uniform distributed weather loading as defined in Pt 3, Ch 11,1.2 and 2.2.5
Type I, II	Loadcase 2 Container Load - Static Upright	Container loads normal to the hatch cover top plating, see Fig. 8.11.1 $F_a, F_b = \frac{W_T}{4}$
Type II	Loadcase 3 Container Load - Static Heeled	Static container loads normal to the hatch cover top plating, see Fig. 8.11.1 $F_a = 0,25\cos\theta W_T + 0,5 \frac{\sin\theta}{b_1} \sum_{i=1}^n (W_i Z_i)$ $F_b = 0,25\cos\theta W_T - 0,5 \frac{\sin\theta}{b_1} \sum_{i=1}^n (W_i Z_i)$
Symbols		
F_a and F_b = corner forces acting on a hatch cover at each end of the container b_1 = distance between the twistlocks n = number of containers in stack, see Note W_i = specified weight of each individual container, see Note W_T = total stack weight Z_i = lever to vertical centre of gravity of each container above base of stack. Vertical centre of gravity is assumed one third of the container depth above the base of the container θ = roll angle of 30°		
NOTE W_i and n are to be specified based on the most onerous stack weight combination.		

Table 8.11.3 Assessment criteria for direct calculations

Loadcase	Permissible bending stress N/mm ² (kgf/mm ²)	Permissible shear stress N/mm ² (kgf/mm ²)	Permissible deflection	Buckling requirement
1	Pt 3, Ch 11, Table 11.2.3 for uniform distributed (weather load)			
2	117,7/ <i>k</i> (12,0/ <i>k</i>)	68,7/ <i>k</i> (7,0/ <i>k</i>)	0,0035 <i>l</i> ₀	Pt 3, Ch 11, Table 11.2.1 See Note 1
3	164,5/ <i>k</i> (16,8/ <i>k</i>)	98,7/ <i>k</i> (10,1/ <i>k</i>)	See Notes 2 and 3	
Symbols				
<i>l</i> ₀ = unsupported span, in metres as shown in Fig. 11.1.2 in Pt 3 Ch 11.				
NOTES				
1. In using Table 11.2.1 in Pt 3, Ch 11, the ratio σ_c/σ_b (or σ_{ac}/σ_b) is not to be less than 1,15 where the primary bending stress acts on either the longer or shorter panel edge.				
2. The weathertightness is to be maintained where appropriate.				
3. When the deflection exceeds 0,0045/ <i>l</i> ₀ , ultimate strength of the hatch cover is to be specially considered.				
4. No allowance is to be given for the effect of cargo securing loads.				

11.4 Omission of hatch covers

11.4.1 Proposals for the omission of hatch covers will be specially considered. Such proposals are to include details, established by model tests or alternative means, of the quantity of water likely to ingress the cargo holds under the worst sea-going and weather conditions, and the means by which it is to be efficiently and safely discharged. The proposals will also require to be agreed by the National Authority in order that an exemption from the Load Line Convention requirements for hatch covers may be obtained.

Section 12 Strengthening for wave impact loads

12.1 General

12.1.1 The scantlings of plating, stiffeners of forward and after portions of the hull are to be increased for protection against bow flare and wave impact pressure in accordance with Ch 2,4.3 and 5.2.

12.1.2 The scantlings of the primary support structure are to be adequate to resist the application of the Rule slamming load, P_{bf} , as defined in Ch 2,4.2.1, over an area A_{s1} , as shown in Fig. 2.5.2 in Chapter 2. The loaded area, A_{s1} , is a rectangle with a horizontal extent, g_{bfh} , and vertical extent, g_{bfv} , taken as follows:

$$g_{bfh} = 4 \text{ m}$$

$$g_{bfv} = \frac{8}{\sin \beta_p \sqrt{8K_{bf}}} \text{ m}$$

where

K_{bf} and β_p are given in Ch 2,4.2.1

12.1.3 To satisfy 12.1.2, the scantlings of web frames supporting side longitudinals or side stringers supporting transverse frames are to comply with the following:

(a) Section modulus not to be less than:

$$Z = 3,75 f_{rpc} \gamma_Z k h_s q v l_e^2 \text{ cm}^3$$

(b) Web area not to be less than:

$$A = 0,20 f_{rpc} \gamma_A k h_s q v l_e \text{ cm}^2$$

where

h_s = wave impact head, in metres, as defined in Ch 2,4.3.2.

and

$$f_{rpc} = \frac{P}{3,05V^3} \left(\frac{P}{2,27V^3} \right)$$

P is the maximum propulsion shaft power in kW(HP) for which the machinery is classed, see Pt 5, Ch 1,3

V is the speed, in knots as defined in Pt 3, Ch 1,6

γ_A and γ_Z are strength factors dependent on the load position:

for $q < 1$: $\gamma_A = q^3 - 2q^2 + 2$ and $\gamma_Z = 3q^3 - 8q^2 + 6q$

for $q = 1$: $\gamma_A = 1$ $\gamma_Z = 1$

$$q = \frac{u}{l_e} \text{ but } \leq 1$$

for web frames

u is the minimum of g_{bfv} or l_e

v is the minimum of g_{bfh} or S_{cm}

for side stringers

u is the minimum of g_{bfh} or l_e

v is the minimum of g_{bfv} or S_{cm}

l_e is the effective length of the primary member, in metres

S_{cm} is the mean spacing between primary members along the plating, in metres, see Fig. 2.5.2 in Chapter 2

g_{bfv} and g_{bfh} are defined in 12.1.2

(c) Web plating is to be adequately stiffened to resist shear buckling as required by Table 8.12.1.

Container Ships

Part 4, Chapter 8

Sections 12 to 15

Table 8.12.1 Critical shear buckling stress for web plating of primary support structure

$\tau_A \leq \tau_{CRB}$ where $\tau_{CRB} = \tau_E \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)} \quad \text{when } \tau_E \leq \frac{\tau_0}{2}$ $\tau_{CRB} = \tau_0 \left(1 - \frac{\tau_0}{4\tau_E}\right) \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)} \quad \text{when } \tau_E > \frac{\tau_0}{2}$ where $\tau_E = 3,6 \left[1,335 + \left(\frac{s}{1000S}\right)^2 \right] E \left(\frac{\tau_p}{s}\right)^2 \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$	
Symbols	
τ_A	= design shear stress for the web panel in N/mm ² (kgf/mm ²) corresponding to the worst combination of application of the slamming load P_{bf} on the patch area A_{sl}
τ_{CRB}	= critical buckling stress in shear, N/mm ² (kgf/mm ²) corrected for yielding effects
τ_0	= $\frac{\sigma_0}{\sqrt{3}}$
σ_0	= specified minimum yield stress, in N/mm ² (kgf/mm ²)
τ_E	= elastic critical buckling stress in shear, in N/mm ² (kgf/mm ²)
s	= length of longer panel edge, in mm (generally the spacing of web stiffeners)
S	= length of smaller panel edge, in metres (generally the web depth)
E	= modulus of elasticity, in N/mm ² (kgf/mm ²) = 206000 N/mm ² (21000 kgf/mm ²) for steel
τ_p	= as built thickness of primary member web plating, in mm

Section 13 Container stowage systems

13.1 Cell guide systems

13.1.1 Where cell guide systems are fitted to support containers in holds or on deck, they are to comply with the requirements of Pt 3, Ch 14,7.

13.2 Stowage on decks/hatch covers

13.2.1 Strength of support structures for pads/pedestals under container corners, lashing equipment and lashing bridges is to comply with Pt 3, Ch 14,4.

Section 14 Direct calculation

14.1 Procedures for calculation of combined longitudinal and torsional strength

14.1.1 For container ships as defined in 1.3.3(b), (c) and (d) or with beam greater than Panamax, longitudinal strength calculations are to be made in accordance with LR's ShipRight SDA Procedures.

14.1.2 For other container ships with large deck openings, longitudinal strength calculations are to be made in accordance with the requirements of Section 15.

14.2 Procedures for verification of primary structure scantlings

14.2.1 For container ships defined in 1.3.3 the strength of the ship's primary structure scantlings of double bottom, side and transverse bulkheads is to be assessed in accordance with LR's ShipRight SDA Procedures.

14.2.2 For other container ships the method for analysis of primary structure of double bottom, side structure and transverse bulkheads is to be agreed with LR. Acceptable methods will include the application of LR's ShipRight SDA procedures or simplified 2D or 3D (grillage) finite element analysis. For simple structural arrangements a structural model based on elastic beam theory may also be accepted.

Section 15 Requirements for ships with large deck openings

15.1 Application

15.1.1 A container ship has large deck openings where any of the following criteria apply:

- $\frac{b}{B_1} \geq 0,7$
- $\frac{I_H}{I_{BH}} \geq 0,89$
- $\frac{b}{B_1} \geq 0,6$ and $\frac{I_H}{I_{BH}} \geq 0,7$

where

b = overall breadth of the cargo hold, in metres. Where there are multiple openings abreast, these are regarded as a single opening, and b is to be the sum of individual breadths of these openings

I_{BH} = distance between centres of the deck strip at each end of the opening, in metres. Where there is no further opening beyond the one under consideration, I_{BH} is to be measured to the end bulkhead position, see also Fig. 8.15.1

Container Ships

Part 4, Chapter 8

Section 15

- l_H = length of the opening, in metres
 B_1 = extreme breadth of ship measured at the mid-length of the opening, in metres.

Fig. 8.15.1 Deck openings

15.2 Definitions and information required

15.2.1 For the purposes of this Section the term 'open length' is defined as the distance between the aft end of the hatch opening adjacent to the engine room and the forward end of the foremost cargo hatch.

15.2.2 Combined stress calculations are to be carried out at a minimum of seven locations along the open length of the holds including the following:

- At the forward end of the engine room.
- At the forward end of the foremost cargo hatch.
- Three locations within 0,4L intermediate between point (a) and point (b).
- At any other sections where there are significant changes in cross-section properties.

15.3 Symbols and definitions

15.3.1 The following symbols and definitions are applicable to this Section unless otherwise stated:

Z_Y = actual hull section modulus about the transverse neutral axis at the position considered, in m³

Z_Z = actual hull section modulus about the vertical neutral axis at the position considered, in metres

ε = the distance of the shear centre below the baseline of the ship, in metres

M_s = design still water bending moment at the section under consideration, in kN m (tonne-f m)

σ_c = combined stress at the position considered.

15.4 Design loadings

15.4.1 The design vertical wave bending moment, M_{WC} , at any position along the ship is defined as:

$$M_{WC} = 0,981 C_3 C_0 L^2 B (C_b + 0,7) \text{ kN m} \\ = (0,1 C_3 C_0 L^2 B (C_b + 0,7) \text{ tonne-f m})$$

$$C_0 = 0,6 + 0,0942 \left(\frac{L}{100} - 1 \right)$$

C_3 = coefficient depending on position along the length, L_{pp} , as defined in Table 8.15.1

L, B, C_b are given in 1.5.1.

Table 8.15.1 Distribution of wave bending moments and cargo torque

Position		Distribution factors		
		C_3		C_4
		$F_n \leq 0,20$	$F_n = 0,30$	
Station	0 (A.P.)	0,00	0,00	0,0
	2	0,14	0,14	0,2
	4	0,30	0,30	0,4
	6	0,58	0,58	0,6
	8	0,87	0,87	0,8
	10 (mid - L_{pp})	1,00	1,00	1,0
	12	0,90	0,95	0,8
	14	0,68	0,80	0,6
	16	0,41	0,62	0,4
	18	0,20	0,33	0,2
	20 (F.P.)	0,00	0,00	0,0
NOTE For intermediate values of F_n , the factor is to be determined by linear interpolation, and for values greater than 0,3 linear extrapolation is to be used $F_n = \frac{0,164V}{\sqrt{L_{pp}}}$				

Container Ships

Part 4, Chapter 8

Section 15

15.4.2 The design horizontal wave bending moment, M_{HC} , at any position along the ship is defined as:

$$M_{HC} = 0,431 C_4 L^2 B \text{ kN m}$$

$$= (0,044 C_4 L^2 B \text{ tonne-f m})$$

C_4 = coefficient depending on position along the length, L_{pp} , as defined in Table 8.15.1

L and B are given in 1.5.1.

15.4.3 The design hydrodynamic torque, M_{WTC} at any position along the ship is defined as:

$$M_{WTC} = 0,000981 C_5 e^{-0,00295L} L B^3 C_T \left(1,75 + 1,5 \frac{\varepsilon}{D} \right) \text{ kNm}$$

$$= \left(0,0001 C_5 e^{-0,00295L} L B^3 C_T \left(1,75 + 1,5 \frac{\varepsilon}{D} \right) \text{ tonne-fm} \right)$$

$$C_T = 13,2 - 43,4 C_w + 78,9 C_w^2$$

C_w = the water plane area coefficient at draught T , but need not exceed $0,165 + 0,95 C_b$

$$C_5 = \frac{1}{2} \left[1 - \cos \left(2\pi \frac{x}{L_{pp}} \right) \right]$$

x = position along the length L_{pp} measured from A.P.
 L , L_{pp} , B , D , T and C_b , are given in 1.5.1
 ε is given in 15.3.1.

15.4.4 The design value of static cargo torque, M_{STC} at any position along the ship is defined as:

$$M_{STC} = 15,7 C_4 B n_s n_t \text{ kN m}$$

$$(M_{STC} = 1,6 C_4 B n_s n_t \text{ tonne-f m})$$

n_s = the number of stacks of containers over the breadth, B
 n_t = the number of tiers of containers in cargo holds amidships, excluding containers on deck or on the hatch covers
 C_4 = as defined in 15.4.2
 B is given in 1.5.1.

15.5 Combined stress

15.5.1 The combined stress, σ_c is to be calculated at a number of sections along the ship as defined in 15.2.2:

$$\sigma_c = \sigma_{HC} + \sigma_{WTC} + \sigma_{STC} + \sigma_{SC} + \sigma_{WC}$$

$$\sigma_{SC} = \frac{M_s}{Z_y} \times 10^{-3} \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$$

$$\sigma_{WC} = 0,6 \frac{M_{WC}}{Z_y} \times 10^{-3} \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$$

$$\sigma_{HC} = C_6 \frac{M_{HC}}{Z_z} \times 10^{-3} \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$$

σ_{WTC} , σ_{STC} are to be evaluated by approved calculation procedures

σ_{STC} = warping stress due to static cargo torque

σ_{WTC} = warping stress due to hydrodynamic torque

C_6 = co-efficient for shear lag depending on vertical location of the point under consideration
 = 0,6 of inboard edge of strength deck
 = 1,0 at base line
 = intermediate positions by interpolation

other symbols are as defined in 15.3 and 15.4.

15.5.2 At each section the stresses are to be calculated at:

- the inboard edge of the strength deck;
- the point on the bilge where the combined stress is greatest; and
- the top of continuous hatch coaming (where fitted).

15.6 Permissible stress

15.6.1 The combined stress σ_c at any position along the open length is to be not more than indicated in Table 8.15.2.

Table 8.15.2 Permissible stress

Position	Permissible combined stress N/mm ² (kgf/mm ²)
Top of continuous hatch coaming where fitted	$\sigma_c = \frac{175}{k_L} \left(\frac{17,84}{k_L} \right)$
Elsewhere	$\sigma_c = \frac{157}{k_L} \left(\frac{16,0}{k_L} \right)$

15.6.2 The assessment of combined stress may conveniently be presented in the form of a combined stress diagram as indicated in Fig. 8.15.2.

NOTES

1. These diagrams are for illustration only and are not to scale.
2. A similar diagram is to be prepared for bottom.

■ Section 1 General

1.1 General

1.1.1 This Chapter applies primarily to the arrangements and scantlings within the cargo tank region of sea-going tankers having integral cargo tanks, for the carriage of oil having a flash point not exceeding 60°C (closed cup test), in association with the class notation indicated in 1.3.1 or 1.4.1. Except as indicated in 1.1.2, 1.1.3 and 1.1.4, the cargo spaces are to be bounded by side and bottom dedicated water ballast tanks or void spaces constituting a double hull for the ship, see Table 9.1.1.

1.1.2 Double side tanks may be dispensed with for tankers of less than 5000 tonnes deadweight where each cargo tank capacity does not exceed 700 m³, see Table 9.1.1.

1.1.3 Double bottom tanks may be dispensed with for tankers of 5000 tonnes deadweight or greater subject to compliance with the requirements of 1.2.18.

1.1.4 Double bottoms and double sides may be dispensed with for vessels less than 600 tonnes deadweight, see Table 9.1.1.

1.1.5 Where only oils having flash points exceeding 60°C are to be carried, the Rule requirements and class notation will be modified accordingly the additional class notation 'F.P. exceeding 60°C' will be entered in the *Register Book*.

1.1.6 Oil cargoes listed in Table 9.1.2 are those which are generally envisaged as being carried in ships classed in accordance with this Chapter.

1.1.7 The scantlings and arrangements of tankers intended for cargoes other than oil will be specially considered in relation to the characteristics of the cargo, and the class notation will be modified accordingly. A full list of such cargoes for a particular ship, with special requirements as applicable, can be provided by Lloyd's Register (hereinafter referred to as 'LR') on application. Chemical cargoes listed in Chapter 18 of the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk* (hereinafter referred to as the Rules for Ships for Liquid Chemicals) may be carried in ships for which the arrangements, scantlings and materials comply with the requirements of that Chapter. Special consideration will also be given to the carriage of cargoes with a relative density greater than 1,025, see also 1.3 and 1.4.

1.1.8 Where higher tensile steel is incorporated in principal structural members, a suitable descriptive note may be entered in the *Register Book*.

1.1.9 The Regulations for classification and assignment of the above notations and other notations, as appropriate to the arrangements, scantlings and service are provided for in Pt 1, Ch 2,2.

1.2 Application and ship arrangement

1.2.1 Double hull tankers with length, *L*, greater than or equal to 150 m with structural configuration as shown in Table 9.1.3 are defined as 'CSR Oil Tankers' and are to comply with 1.3.

1.2.2 The applicable Rules for Double hull tankers with length, *L*, greater than or equal to 150 m of unusual hull form or structural arrangements will be specially considered.

1.2.3 Double hull tankers with length, *L*, less than 150 m are defined as 'Non-CSR Oil Tankers' and are to comply with 1.4.

1.2.4 Any dry tanks, or tanks intended for water ballast and thus empty in the loaded condition, are to be so arranged that they cannot be used for any other purpose.

1.2.5 Cofferdams are to be provided at the forward and after ends of the oil cargo spaces; cofferdams are to be at least 760 mm in length and are to cover the whole area of the end bulkheads of the cargo spaces.

1.2.6 A pump room, oil fuel bunker or water ballast tank will be accepted in lieu of a cofferdam.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 1

Table 9.1.1 Cargo tank boundary requirements

Deadweight (DWT) tonnes	Minimum double side width (d_s) metres	Minimum double bottom depth (d_b) metres
$DWT \geq 5000$	$d_s = 0,5 + \frac{DWT}{20\,000}$ or $d_s = 2,0$ whichever is the lesser, but not less than 1,0	$d_b = \frac{B}{15}$ or $d_b = 2,0$ whichever is the lesser, but not less than 1,0
$600 \leq DWT < 5000$	$d_s = 0,4 + \frac{2,4 DWT}{20\,000}$ or $d_s = 0,76$ whichever is the greater, see Note 2	$d_b = \frac{B}{15}$ or $d_b = 0,76$ whichever is the greater
$DWT < 600$	$d_s = 0$	$d_b = 0$
NOTES 1. The symbols DWT , d_s and d_b are defined in 1.5. 2. Where each cargo tank capacity does not exceed 700 m ³ , the value of d_s is taken as 0 and the inner bottom line is to run parallel to the line of the midship flat of bottom as shown in Fig. 9.1.2. 3. Where the double bottom tank is fitted, the centre girder depth is to be not less than as required by 9.3.3.		

Table 9.1.2 Oil cargoes suitable for carriage in oil tankers, see Note 1

Asphalt solutions (see Note 2) Blending Stocks Roofers Flux Straight Run Residue	Gasoline Blending Stocks Alkylates - fuel Reformats Polymer - fuel
Oils Clarified Crude Oil Mixtures containing crude oil Diesel Oil Fuel Oil No. 4 Fuel Oil No. 5 Fuel Oil No. 6 Residual Fuel Oil Road Oil Transformer Oil Lubricating Oils and Blending Stocks Mineral Oil Motor Oil Penetrating Oil Spindle Oil Turbine Oil	Gasolines Casinghead (natural) Automotive Aviation Straight Run Fuel Oil No. 1 (Kerosene) Fuel Oil No. 1-D Fuel Oil No. 2 Fuel Oil No. 2-D
Distillates Straight Run Flashed Feed Stocks	Jet Fuels JP-1 (Kerosene) JP-3 JP-4 JP-5 (Kerosene, Heavy) Turbo Fuel Kerosene Mineral Spirit
Gas Oil Cracked	Naphtha (see Note 3) Solvent Petroleum Heartcut Distillate Oil
NOTES 1. This list of oils is taken from Appendix 1 to Annex 1 of the MARPOL Convention. Special consideration will be given to the carriage of oil cargoes not included in the above list. 2. Asphalt solutions, see Chapter 18 of the Rules for Ships for Liquid Chemicals. 3. For naphtha coal tar and naphthalene molten, see Chapter 17 of the Rules for Ships for Liquid Chemicals.	

1.2.7 Where the lower portion of the pump room is recessed into the machinery space, the height of the recess is not, in general, to exceed one-third of the moulded depth above the keel, see *also* Pt 5, Ch 15,1.

1.2.8 Where a compartment or tank, such as a fore peak tank, forms a cofferdam, access is to be from the open deck. Alternatively, any space through which it is necessary to pass in order to obtain access is to conform to the requirements of Pt 6, Ch 2,13. Oil engine or electrically driven pumps are not to be sited in the space containing the access to such cofferdams.

1.2.9 A cofferdam is also to be arranged between a cargo oil tank and accommodation spaces, and between cargo oil tanks and spaces containing electrical equipment, other than spaces where the only items of electrical equipment are lighting fittings complying with Pt 6, Ch 2,13. Where a corner-to-corner situation occurs, protection may be formed by a diagonal plate across the corner. The scantlings and testing arrangements are to comply with Rule requirements for cofferdam bulkheads, and arrangements are to be made to enable the space to be filled with water ballast to assist in gas freeing, see *also* Pt 5, Ch 15,3. Suitable corrosion protection, drainage and gas-freeing arrangements are to be provided to such spaces.

1.2.10 Passages or tunnels passing through, or adjacent to, a cargo oil tank and not separated from it by a cofferdam, are to be provided with mechanical ventilation, and any access is to be from the open deck.

1.2.11 Arrangements are to be provided to enable double bottom and vertical wing tanks to be filled with water ballast to assist in gas freeing these tanks, see Pt 5, Ch 15,3.

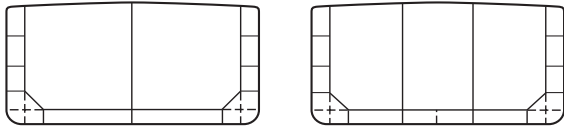

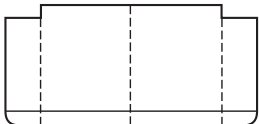

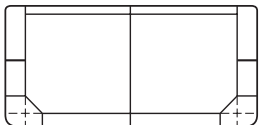

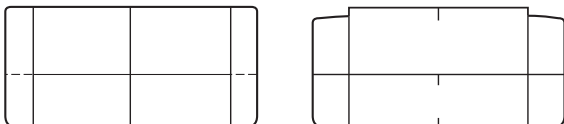

1.2.12 Fittings within cargo tanks and pump rooms are to be securely fastened to the structure.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 1

Table 9.1.3 Structural arrangement

Arrangement	Typical configuration	$L < 150$	$L \geq 150$
No longitudinal bulkhead		Non CSR	CSR (specially considered)
One or two longitudinal bulkhead(s)		Non CSR	CSR
Trunk deck in association with longitudinal bulkhead(s) (see Ch 10,6)		Non CSR	CSR
Double deck in association with a centreline bulkhead		Non CSR	CSR (specially considered)
Mid-deck in association with a centreline bulkhead or centreline girders		Non CSR	CSR (specially considered)

1.2.13 Accommodation, control and service spaces are to be located clear of the cargo tank region such that a single failure of deck or bulkhead will not allow cargo fumes into these spaces. Navigation positions, where fitted above the cargo tank region, are to be separated from the cargo tank deck by means of an open space with a height of at least 2,0 m.

1.2.14 Where spill retainment flats are fitted at the sides of the weather deck, separate arrangements are to be provided for freeing the deck of oil and water respectively, see also Pt 3, Ch 10,5.1.1.

1.2.15 Alternative arrangements which are proposed as being equivalent to the Rules will receive individual consideration, taking into account any relevant National Authority requirements.

1.2.16 Reference should also be made to the relevant Regulations of the *International Convention for the Safety of Life at Sea, 1974* and applicable amendments.

1.2.17 Cargo spaces are to be bounded by double bottom and double side tanks or void spaces such that the distance between the cargo tank boundary and the shell plating is not less than that given in Table 9.1.1 and Fig. 9.1.1, except as otherwise specified in 1.2.18 and 1.2.19. Cargo or oil fuel are not to be carried in double bottom or double side tanks.

1.2.18 Where $DWT \geq 5000$ tonnes, double bottom tanks as required by 1.2.17 may be dispensed with, provided the following requirements are complied with:

- (a) The cargo height, h_c , in contact with the bottom shell plating is to be not greater than:

$$h_c = \frac{1,025T_m - 10,2P_v}{1,1\rho}$$

where the symbols are defined in 1.6.

- (b) Where a mid-deck dividing the cargo oil tanks into upper and lower spaces is arranged, it is to be located at a height of not less than the lesser of $\frac{B}{6}$ or 6 m, but not

more than $0,6D$, above the base line.

- (c) Below a level $1,5d_b$ above the base line, the cargo tank boundary line may be vertical down to the bottom shell plating as shown in Fig. 9.1.3.

1.2.19 Alternative arrangements which are equivalent to 1.2.17 will receive individual consideration, taking into account any relevant National Authority requirements.

1.2.20 The length of each cargo tank is not to exceed 10 m or the appropriate value obtained from Table 9.1.4, whichever is the greater.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 1

Fig. 9.1.1

Cargo tank boundary lines for oil tankers having double bottom and double side tank arrangements
(See Table 9.1.1)

Fig. 9.1.2

Cargo tank boundary lines for oil tankers having double bottom arrangement (See Table 9.1.1)

Fig. 9.1.3

Cargo tank boundary lines for oil tankers having mid-deck arrangement (See 1.2.18)

1.2.21 Where DWT ≥ 5000 tonnes, the cargo pump room shall be provided with a double bottom such that at any cross-section the depth of each double bottom tank or space shall be such that the distance d_c , as defined in 1.5, is not less than the lesser of $\frac{B}{15}$ m and 2 m

d_c is in no case to be less than 1 m.
In the case of cargo pump rooms whose bottom plate is located above the base line by at least the minimum height required, there will be no need for a double bottom construction in way of the cargo pump-room.

1.2.22 Notwithstanding the requirements of 1.2.21, above, where the flooding of the cargo pump-room would not render the ballast or cargo pumping system inoperative, a double bottom need not be fitted.

Table 9.1.4 Permissible length of cargo tanks, see 1.2.20

Number of longitudinal bulkheads inside cargo tanks		One (on centreline)	Two	Three (one on centreline)	Where no longitudinal bulkhead is arranged or where longitudinal bulkheads are perforated across breadth of cargo tanks
Length of wing cargo tank		$\left(0,25 \frac{b_i}{B} + 0,15\right) L_L$	$0,2L_L$	$0,2L_L$	$\left(0,5 \frac{b_i}{B} + 0,1\right) L_L$ or $0,2L_L$ whichever is the lesser
Length of centre tank	$b_i \geq 0,2B$	—	$0,2L_L$	$0,2L_L$ port and starboard	
	$b_i < 0,2B$	—	$\left(0,5 \frac{b_i}{B} + 0,1\right) L_L$	$\left(0,25 \frac{b_i}{B} + 0,15\right) L_L$ port and starboard	
NOTE The symbols L_L , B and b_i are defined in 1.5.					

Double Hull Oil Tankers

Part 4, Chapter 9

Section 1

1.3 Class notation and applicable Rules for CSR Double Hull Oil Tankers

1.3.1 In general, CSR Double Hull Oil Tankers are to comply with 1.3.2 to 1.3.8 and the *IACS Common Structural Rules for Double Hull Oil Tankers (CSR)* for the draught required and will be eligible to be classed **100A1 Double Hull Oil Tanker CSR, ESP**.

1.3.2 Class notations applicable to CSR double hull oil tankers are defined as follows:

- **CSR**
Identifies the double hull oil tanker as being compliant with the *IACS Common Structural Rules for Double Hull Oil Tankers*
- **ESP**
Identifies the double hull oil tanker as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3,3 and Ch 3,6, see also Pt 1, Ch 2,2.3.12.

1.3.3 Materials are to comply with the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials). Corrosion protection is to comply with Pt 3, Ch 2,3.

1.3.4 The rudder and rudder stock are to comply with Pt 3, Ch 13,2.

1.3.5 Ice strengthening is to be in accordance with Pt 3, Ch 9.

1.3.6 The 'Construction Monitoring' (CM) procedures detailed in the *ShipRight Procedures Manual*, published by LR, are mandatory for oil tankers greater than 190 m in length and for other tankers of abnormal hull form, or of unusual structural configuration or complexity.

1.3.7 The 'ShipRight Procedures' for the hull construction of ships are detailed in Pt 3, Ch 16 and the classification notations and descriptive notes associated with these procedures are given in Pt 1, Ch 2,2.

1.3.8 Ships intended to carry heated cargoes are to comply with Section 12.

1.4 Class notation and applicable Rules for non-CSR Double Hull Oil Tankers

1.4.1 In general, non-CSR Double Hull Oil Tankers are to comply with 1.4.2 to 1.4.7 for the draught required and will be eligible to be classed **100A1 Double Hull Oil Tanker, ESP**.

1.4.2 The notation **ESP** serves to identify the ship as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3,3 and Ch 3,6, see also Pt 1, Ch 2,2.3.12.

1.4.3 At the Owner's request, the notation **MARPOL 20.1.3** may be appended to the notation **100A1 Double Hull Oil Tanker** for vessels not meeting the minimum double side width (d_s) requirements of Table 9.1.1 but which comply with MARPOL Annex I, Regulation 20.1.3.

1.4.4 At the Owner's request, the notation **MARPOL 21.1.2** may be appended to the notation **100A1 Double Hull Oil Tanker** for vessels of less than 5000 tonnes deadweight which have a complete double hull in accordance with MARPOL Annex I, Regulation 21.1.2.

1.4.5 Where the length of the ship is greater than 190 m, or where the structural arrangements are considered such as to necessitate it, the scantlings of the primary supporting structure are to be assessed by direct calculation and the ShipRight notations **SDA**, **FDA** and **CM** are mandatory, see 1.4.6 and Section 14.

1.4.6 The 'ShipRight Procedures' for the hull construction of ships are detailed in Pt 3, Ch 16 and the classification notations and descriptive notes associated with these procedures are given in Pt 1, Ch 2,2.

1.4.7 The disposition of transverse bulkheads is to comply with the requirements of Pt 3, Ch 3,4, as applicable to ships with machinery located aft.

1.4.8 Arrangements and scantlings forward and aft of the cargo tank region are to comply with Pt 3, Ch 5, Ch 6 and Ch 7. The remaining requirements of Part 3 are also to be complied with as appropriate to the intended arrangements.

1.4.9 Arrangements pertaining to gangways, bulwarks and rails are to comply with the requirements of Pt 3, Ch 8.

1.4.10 The structural configurations may include one or more of the arrangements shown in Table 9.1.3. these provisions do not preclude the fitting of additional bulkheads or the perforation of longitudinal bulkheads.

1.4.11 The bottom shell, inner bottom and deck are generally to be framed longitudinally in the cargo tank region where the ship length, L , exceeds 75 m. However, consideration will be given to alternative proposals for ships of special design.

1.4.12 The side shell, inner hull bulkheads and longitudinal bulkheads are generally to be longitudinally framed where the ship length, L , exceeds 150 m, but alternative proposals, taking account of resistance to buckling, will be considered.

1.4.13 Where the side shell is longitudinally framed, the inner hull bulkheads are to be similarly constructed.

1.4.14 Provided the ship length, L , does not exceed 200 m the longitudinal bulkheads may be horizontally corrugated. Vertically corrugated centreline bulkheads may also be considered on the basis of direct calculations.

1.4.15 In general, the primary member scantlings will require to be determined by direct calculation, see also 9.1.3.

1.4.16 Alternative arrangements, which are proposed as being equivalent to the Rules, will receive individual consideration. Particular attention is to be paid to deflection of members and to the ability of the structure to resist buckling. Where necessary, additional calculations will be required.

1.4.17 For additional requirements for single hull oil tankers, see Chapter 10.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 1

1.4.18 The scantlings of structural items may be determined by direct calculation.

1.5 General definitions and symbols

1.5.1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

L , L_L , B , D , T as defined in Pt 3, Ch 1,6.

d_c = the height between the ship's base line and the bottom of the cargo pump room, in metres

DWT = deadweight, in tonnes, at the summer load waterline

b = the width of plating supported by the primary or secondary member, in metres or mm respectively

b_e = the effective width, in metres, of end brackets as determined from Pt 3, Ch 3,3

b_i = minimum distance from side shell to inner hull/outer longitudinal bulkhead of the tank in question measured inboard at right angles to the centreline at the summer load waterline, in metres, see Table 9.1.4

d_b = the distance, in metres, between the bottom of the cargo tanks and the moulded line of the bottom shell plating measured at right angles to the bottom shell plating as shown in Fig. 9.1.1 and Fig. 9.1.2

d_s = the distance, in metres, between the cargo tank boundary and the moulded line of the side shell plating measured at any cross-section at right angles to the side shell as shown in Fig. 9.1.1 and Fig. 9.1.3

h = the load height applied to the item under consideration, in metres

k_L , k = higher tensile steel factors. For the determination of these factors, see Pt 3, Ch 2,1. For mild steel, k_L , k may be taken as 1,0

l_e = effective length, in metres, of the primary or secondary member, measured between effective span points. For determination of span points, see Pt 3, Ch 3,3

s = spacing of secondary members, in mm

t = thickness of plating, in mm

I = the moment of inertia, in cm^4 , of a primary or secondary member, in association with an effective width of attached plating determined in accordance with Pt 3, Ch 3,3

L_1 = length of ship, in metres, but need not be taken greater than 190 m

P_v = pressure/vacuum relief valve positive setting, in bar

T_m = minimum operating moulded draught of the ship at amidships under any expected cargo loading condition, in metres

Z = the section modulus, in cm^3 , of the primary or secondary member, in association with an effective width of attached plating determined in accordance with Pt 3, Ch 3,3

ρ = maximum cargo density, in t/m^3 .

1.5.2 Where symbols not defined in 1.5.1 are used these are defined at the head of the Section concerned.

1.5.3 For oil tankers of double hull configuration the main structural and spatial terminology within the cargo length, as used in this Chapter, is shown in Fig. 9.1.4.

Fig. 9.1.4 Structural and spatial terminology

1.5.4 The expression 'primary member' as used in this Chapter is defined as a girder, floor, transverse, vertical web, stringer, cross-tie or buttress. 'Secondary members' are supporting members other than primary members.

1.6 Information required for CSR Double Hull Oil Tankers

1.6.1 In addition to the plans required by *IACS Common Structural Rules for Double Hull Oil Tankers (CSR)* the following additional plans and information is to be submitted.

- Rudder, stock and tiller;
- Ice Strengthening.
- Freeboard plan or equivalent showing freeboards and items relative to the conditions of assignment.

1.7 Information required for non-CSR Double Hull Oil Tankers

1.7.1 In addition to the plans required by Pt 3, Ch 1,5, plans showing the connections for all longitudinals and other framing members and arrangements at intersections of transverse and longitudinal framing are also to be submitted.

1.7.2 Any dry tanks or tanks for water ballast only, are to be indicated on the principal structural and arrangement plans.

Double Hull Oil Tankers

Part 4, Chapter 9

Sections 1, 2 & 3

1.7.3 The information required by Pt 3, Ch 4,4 is to be forwarded as soon as possible and preferably when the midship section is submitted.

1.7.4 A docking plan is to be submitted for consideration of strength requirements in association with the intended docking condition.

1.7.5 A plan showing the location of all openings in the deck is to be submitted. Where it is intended to provide holes in the deck for staging wires, these holes are also to be shown. Full particulars of the proposed closing arrangements for all deck openings are to be submitted.

1.7.6 Information is required indicating the equipment provided for the acceptable means of access to meet the minimum requirements for Close-up Surveys, see also 13.2.8, 13.2.9 and Pt 1, Ch 3,7.

1.7.7 A diagrammatic plan verifying compliance with the requirements of 1.2.17 or 1.2.18 as appropriate is to be submitted.

Section 2 Materials and protection

2.1 General

2.1.1 Materials, grades of steel and protection of materials are to comply with the requirements of Pt 3, Ch 2 and the Rules for Materials.

2.2 Corrosion protection coatings for salt water ballast spaces

2.2.1 The requirements of Pt 3, Ch 2,3.6 are to be complied with.

2.3 Aluminium structure, fittings and paint

2.3.1 Aluminium may, under certain circumstances give rise to incendive sparking on impact with steel, the following requirements are therefore to be complied with:

- (a) Aluminium fittings in tanks used for the carriage of oil, and in cofferdams and pump rooms are to be avoided wherever possible.
- (b) Where fitted, aluminium fittings, units and supports, in tanks used for the carriage of oil, cofferdams and pump rooms are to satisfy the requirements specified in Pt 3, Ch 2,3 for aluminium anodes.
- (c) The danger of mistaking aluminium anodes for zinc anodes must be emphasised. This gives rise to increased hazard if aluminium anodes are inadvertently fitted in unsuitable locations.

- (d) The underside of heavy portable aluminium structures such as gangways, etc., is to be protected by means of hard plastic or wood cover in order to avoid the creation of smears when dragged or rubbed across steel, which if subsequently struck, may create an incendive spark. It is recommended that such protection be permanently and securely attached to the structures.

2.3.2 For permissible locations of aluminium anodes, see Pt 3, Ch 2,3.4.

2.3.3 Paint containing aluminium should not be used in positions where cargo vapours may accumulate unless it has been shown by appropriate tests that the paint to be used does not increase the incendive sparking hazard. Tests need not be performed for coatings containing less than 10 per cent aluminium by weight.

2.4 Other materials

2.4.1 The suitability of coatings and their compatibility with intended cargoes are the responsibility of the Builder and the Owner. LR will, however, require the confirmation of the coating manufacturers that coatings which are used to protect the cargo tank structure are in order for the list of defined cargoes. A copy of the coating manufacturer's product resistance list is to be placed on board.

2.4.2 Attention is drawn to the requirements of Pt 3, Ch 11,7.1.4 in respect of compatibility of cargoes and hatch packing materials. The packing material is to be resistant to both the liquids and vapours to which it is exposed.

2.4.3 Some plastics and rubbers are unsuitable for certain cargoes other than oil. In such cases the manufacturer's advice should be sought.

2.4.4 Some materials or their alloys are unsuitable for certain cargoes other than oil. Where such cargoes are to be carried, the use of these materials is not permitted in locations where they may come into contact with the cargo or its vapours, see also 1.1.7.

Section 3 Longitudinal strength

3.1 General

3.1.1 The longitudinal strength standard is to comply with the relevant requirements of Pt 3, Ch 4.

3.1.2 The readout points for loading instruments, fitted in accordance with the requirements of Pt 3, Ch 4,8.3 are to be positioned at the transverse bulkheads. In general, except when the instrument calculates the maximum values between readout points, the spacing of readout points within the cargo tank length is not to exceed five per cent of the ship length with intermediate points arranged between bulkheads as necessary.

Double Hull Oil Tankers

Part 4, Chapter 9

Sections 3 & 4

3.2 Symbols

3.2.1 The symbols used in this Section are defined in 1.5.

3.3 Loading conditions

3.3.1 The loading conditions which are to be included in the Loading Manual and examined for longitudinal strength are given in Pt 3, Ch 4,5.

3.3.2 The Loading Manual is to contain the calculated still water bending moments and shear forces for the conditions proposed and the maximum permissible values calculated in accordance with Pt 3, Ch 4.

3.3.3 The strengthening of bottom forward derived in accordance with the requirements of Pt 3, Ch 5,1 is to be based on the minimum draught forward obtained using segregated ballast tanks only, without recourse to ballasting of cargo tanks.

3.3.4 Where bottom forward strengthening has not been arranged, at least one ballast departure and one ballast arrival condition providing for a forward draught of at least $0,045L$ is to be included in the Loading Manual, see also Pt 3, Ch 5,1.5.

3.3.5 Where part-load conditions are proposed with a forward draught less than that for which the bottom forward arrangements and scantlings have been approved, the Loading Manual is to provide for the addition of ballast in segregated ballast tanks only as necessary to attain the required draught in heavy weather.

3.3.6 Conditions which provide for wing and centre cargo tanks abreast to be filled, with adjacent wing and centre cargo tanks empty, should, in general, be avoided. Similarly, conditions which provide for differential loading of port and starboard wing cargo tanks with centre cargo tanks empty should also be avoided. Where such conditions are contemplated, they will be subject to special consideration which may involve additional calculation in respect of the resultant effects on transverse strength and centre tank cross-tie.

3.3.7 Where a double bottom tank is omitted in accordance with 1.3.7 a minimum operating draught T_m is to be indicated on the midship section plan, the Loading Manual and Loading Instrument.

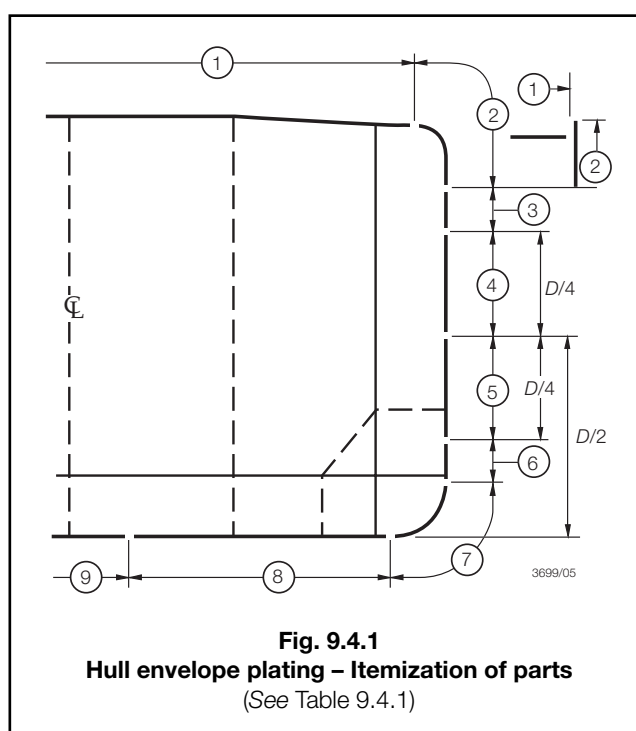

3.3.8 Tanks intended for water ballast are to be indicated in the Loading Manual.

3.3.9 Where loading conditions having partially filled tanks are contemplated, attention is drawn to the need to ensure that the scantlings of the boundary bulkheads are capable of withstanding the loads imposed by the movement of liquid in the tanks, see 6.1.2, 7.1.2 and 14.2.2.

Section 4 Hull envelope plating

4.1 General

4.1.1 The thickness of hull envelope plating amidships is to be as necessary to comply with the hull section modulus, shear strength and buckling requirements of Pt 3, Ch 4, but is to be not less than as shown in Table 9.4.1 for the parts itemised in Fig. 9.4.1. Panel stability is also to be confirmed by direct calculation taking account of shear stress and direct stresses derived from both transverse and longitudinal strength investigation.

4.1.2 For requirements in respect of structural details, bilge keels, attachments, etc., see Pt 3, Ch 10. In addition the *ShipRight FDA Procedure, Structural Detail Design Guide* (SDDG), indicates recommended structural design configurations for double hull tanker structural details to assess and improve the relative fatigue life performance of the details in critical areas.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 4

Table 9.4.1 Hull envelope plating – minimum thickness, in mm

Hull envelope plating – minimum thickness, in mm			
Longitudinally framed	Item	Item No. see Fig. 9.4.1	Transversely framed, see 1.3 for limits of application
$t = \frac{S}{J} + 2,0$ see Note 1	Deck	1	see 1.3
$t = \frac{S}{J} + 2,0$ or $t = 0,0042s \sqrt{h_{T1}k}$ whichever is the greater see Note 1	Sheerstrake and gunwale	2	$t = \frac{0,00085s}{1 + \left(\frac{S}{S}\right)^2} (0,083L_1 + 10) \sqrt{\frac{F_D}{k_L}}$ see Note 6 or $t = 0,0042s \sqrt{h_{T1}k}$ whichever is the greater see Note 1
$t = 0,001s (0,059L_1 + 7) \sqrt{\frac{F_D}{k_L}}$ see Notes 6 and 7 or $t = 0,0042s \sqrt{h_{T1}k}$ whichever is the greater see Note 1	Side shell above mid-depth	3	$t = \frac{0,00085s}{1 + \left(\frac{S}{S}\right)^2} (0,083L_1 + 10) \sqrt{\frac{F_D}{k_L}}$ see Notes 6 and 7 or $t = 0,0042s \sqrt{h_{T1}k}$ whichever is the greater see Note 1
		4	$t = 0,001s (0,059L_1 + 7) \sqrt{\frac{F_M}{k_L}}$ see Notes 6 and 7 or $t = 0,0051s \sqrt{h_{T1}k}$ whichever is the greater see Note 1
$t = 0,001s (0,059L_1 + 7) \sqrt{\frac{F_B}{k_L}}$ see Notes 6 and 7 But not less than: (a) $t = 0,0042s \sqrt{h_{T1}k}$ at mid-depth (b) $t = 0,0054s \sqrt{\frac{h_{T2}k}{2 - F_B}}$ at upper turn of bilge see Notes 1 and 2 } Intermediate thickness by interpolation	Side shell below mid-depth	5	$t = 0,0051s \sqrt{h_{T1}k}$ whichever is the greater see Note 1
		6	$t = \frac{0,00085s}{1 + \left(\frac{S}{S}\right)^2} (0,083L_1 + 10) \sqrt{\frac{F_B}{k_L}}$ see Notes 2, 6 and 7 or $t = 0,0056s \sqrt{\frac{h_{T2}k}{1,8 - F_B}}$ whichever is the greater see Note 1
$t = \frac{S}{J} + 2,0$ or $t = 0,0052s \sqrt{\frac{h_{T2}k}{1,8 - F_B}}$ mm whichever is the greater see Note 1	Bilge (see Note 4)	7	$t = \frac{0,00085s}{1 + \left(\frac{S}{S}\right)^2} (0,083L_1 + 10) \sqrt{\frac{F_B}{k_L}}$ see Notes 6 and 7 or $t = 0,0063s \sqrt{\frac{h_{T2}k}{1,8 - F_B}}$ mm whichever is the greater see Note 1
	Bottom shell	8	see 1.3
As for item 8, +2 mm, but need not exceed $25 \sqrt{k}$ mm	Keel	9	

NOTES

- The thickness is also to satisfy the buckling requirements of Pt 3, Ch 4.7.
- The thickness of side shell plating need not exceed that which would be required for the bottom shell using the spacing of the side shell longitudinals.
- In no case is the plating thickness to be less than the cargo tank minimum value given in Section 10, or the basic shell end thickness for taper given in Pt 3, Ch 5 and Ch 6.
- See also 4.6.2 concerning plating thickness where longitudinal framing is fitted at bottom and side, but omitted in way of bilge.
- Keel thickness is in no case to be less than that of the adjacent bottom shell plating.
- Where separate maximum sagging and hogging still water bending moments are assigned, F_D may be based on the sagging moment and F_B on the hogging moment.
- Outside the Rule minimum region of higher tensile steel as defined in Pt 3, Ch 3.2.6.1 the value of k_L may be taken as 1,0.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 4

4.2 Symbols

4.2.1 The symbols used in this Section are defined as follows:

F_D, F_B = as defined in Pt 3, Ch 4,5.6

F_M = the greater of F_D or F_B

$$J = 1720,5 \sqrt{\frac{1 - \frac{1}{\alpha}}{\sigma_o}} \text{ for } \alpha \leq 2$$

$$\left(J = 549,3 \sqrt{\frac{1 - \frac{1}{\alpha}}{\sigma_o}} \text{ for } \alpha \leq 2 \right)$$

$$J = 860,7 \sqrt{\frac{\alpha}{\sigma_o}} \text{ for } \alpha > 2$$

$$\left(J = 274,8 \sqrt{\frac{\alpha}{\sigma_o}} \text{ for } \alpha > 2 \right)$$

s = spacing, in mm, of longitudinals or transverse frames. Except where indicated in the text, s is not to be taken less than:

$$470 + \frac{L}{0,6} \text{ mm}$$

or 700 mm whichever is the lesser

For limitations in end regions, see Pt 3, Ch 5,3 and Ch 6,3

C_w = a wave head, in metres

$$= 7,71 \times 10^{-2} L e^{-0,0044L}$$

where

e = base of natural logarithms 2,7183

R_B = bilge radius, in mm, as defined in Table 1.5.2 in Chapter 1

S = overall span of frame, in mm, measured between deck and bottom support points or to, or between, stringers, where fitted

T_1 = T but to be taken not less than 0,05L m

$$\alpha = \frac{\sigma_o}{\sigma_c}$$

σ_c = maximum compressive hull vertical bending stress, in N/mm² (kgf/mm²) given by σ_D and σ_B as defined in Pt 3, Ch 4,5.6.1 as appropriate

For ships of normal design, not exceeding 90 m in length, the value of maximum compressive hull vertical bending stress may be determined as follows: at strength deck

$$\sigma_D = 654LB \frac{Z_{min}}{Z_D} \sigma \times 10^{-6} \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$$

at keel

$$\sigma_B = 654LB \frac{Z_{min}}{Z_B} \sigma \times 10^{-6} \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$$

where Z_{min} , Z_D , Z_B and σ are in accordance with Pt 3, Ch 4,5.

σ_o = specified minimum yield stress, in N/mm² (kgf/mm²)

h_{T1} = $T + C_w m$ but need not be taken greater than 1,36T

h_{T2} = $T + 0,5C_w m$ but need not be taken greater than 1,2T
For longitudinally framed bottom and bilge plating
 T is to be taken as T_1

Other symbols are defined in 1.5.

4.3 Deck plating

4.3.1 The midship thickness of deck plating is to be maintained for 0,4L amidships and tapered outside this region in association with the deck longitudinals in accordance with 5.5. The midship thickness may, however, be required over an increased extent if it is shown to be necessary by the bending moment curves. Where partial filling of the tanks is contemplated the deck plating is also to comply with the requirements of 6.1.2.

4.3.2 For ships not exceeding 200 m in length, the deck thickness outside 0,4L amidships is to be not less than $\frac{s}{80}$ at

any point within the cargo tank region. For lengths of 250 m and over, the thickness is to be not less than $\frac{s}{70}$

Intermediate values are to be obtained by interpolation. For the purpose of this paragraph, the minimum value of s given in 4.2.1 is not to be applied.

4.3.3 The plating thickness outside 0,4L amidships is to be not less than:

$$t = \frac{s}{J} + 2,0 \text{ mm}$$

where J is defined in 4.2.1, using σ_o of the plating at the location under consideration.

4.4 Sheerstrake

4.4.1 The midship sheerstrake thickness is to be maintained for 0,4L amidships and tapered outside this region as provided for in Pt 3, Ch 5 and Ch 6. In the taper region, however, the sheerstrake thickness need not exceed the adjacent deck or shell thickness, whichever is the greater.

4.4.2 The width of sheerstrake for 0,4L amidships is to be not less than that required by Table 2.2.1 in Pt 3, Ch 2.

4.4.3 Where a rounded sheerstrake is incorporated, the radius is not, in general, to be less than 15 times the thickness. The radius is to be made by careful cold rolling or bending.

4.5 Shell plating

4.5.1 The midship thicknesses of side and bottom shell plating are to be maintained for 0,4L amidships and tapered outside this region as provided for in Pt 3, Ch 5 and Ch 6. The midship thicknesses may be required over an increased extent if it is shown to be necessary by the bending moment or shear force curves.

4.5.2 The requirements of Pt 3, Ch 5 are to be complied with in respect of the thickness of bottom shell forward.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 4

4.6 Bilge plating

4.6.1 The midship thickness of the bilge plating is to be maintained for 0,4L amidships and tapered outside this region as provided for in Pt 3, Ch 5 and Ch 6.

4.6.2 Where longitudinal bottom and side framing is adopted, but longitudinals are omitted between the upper and lower extremities of the bilge radius, the bilge thickness is to be not less than $\frac{R_B F_B}{165k_L}$ in addition to the required minimum

thickness derived from Table 9.4.1. The spacing of transverse supports associated with such an arrangement is to comply with the requirements of 5.4.

4.6.3 Where bilge longitudinals are omitted, the plating thickness outside 0,4L amidships will be considered in relation to the support derived from the hull form and internal stiffening arrangements. Due regard will be taken of the possibility of increased loading in the forward region.

4.7 Keel

4.7.1 The midship keel thickness is to be maintained throughout the cargo tank region, except as required by Table 9.4.1, Note 5.

4.7.2 The width of the keel over the cargo tank region is to be not less than:
70B mm but need not exceed 1800 mm and is to be not less than 750 mm.

4.8 Taper of higher tensile steel

4.8.1 Where higher tensile steel is used amidships and mild steel at the ends, the thickness of bottom shell, bilge and sheerstrake is to be tapered as provided for in Pt 3, Ch 3, Ch 5 and Ch 6.

4.8.2 Higher tensile steel deck plating is to be tapered in association with attached longitudinals as provided for in 5.5.

4.9 Thicknesses at ends of erections

4.9.1 The deck plating thickness at the poop front is to extend into the poop for a distance at least equal to one-third of the breadth, B.

4.9.2 If the poop front extends to within 0,25L of amidships, the sheerstrake and the stringer plate at the break are to be increased by 20 per cent. No increase is required if the poop front is 0,3L from amidships or greater. The increase at intermediate lengths is to be obtained by interpolation and is to be applied to the tapered thickness of the sheerstrake and stringer plate.

4.9.3 Where the poop extends to within 0,3L of amidships and the enclosed machinery opening extends to within $\frac{B}{3}$ of the poop front and has a width exceeding one-half of the

breadth of the ship at the poop front, the thickness of deck plating may require to be increased. The forward corners of the casing opening are to be well rounded.

4.10 Deck openings

4.10.1 Openings in the deck are to be kept to the minimum number consistent with operational requirements.

4.10.2 Plate panels in which openings are cut are to be adequately stiffened, where necessary, against compression and shear buckling.

4.10.3 The corners of all openings are to be well rounded, and the edges smooth.

4.10.4 Where the stress concentration factor in way of the opening exceeds 2,4, edge reinforcement is generally to be fitted. This is normally to be in the form of a spigot of adequate dimensions, but alternative arrangements will be considered.

4.10.5 Alternatively, the shape of the opening is to be such that a stress concentration factor of 2,4 is not exceeded.

4.10.6 In this respect, reinforcement will not, in general, be required in way of:

- (a) elliptical openings having their major axis fore and aft and ratios of length to breadth not less than 2 to 1, or
- (b) openings of other shapes, provided it has been shown by suitable tests that the stress concentration factor does not exceed 2,4.

4.10.7 Circular openings of diameter up to 325 mm will also be accepted, provided that they are situated at such a distance from any other opening that there is an intervening width of plating of not less than five times the diameter of the smaller of the two openings.

4.10.8 Where within 0,4L amidships deck openings have a total breadth or shadow area breadth in one transverse section that exceeds the limitation given in Pt 3, Ch 3, 3.4.4 and 3.4.5, compensation will be required to restore the excess. This is generally to be arranged by increasing the deck plate thickness, but other proposals will be considered.

4.10.9 Where a deck longitudinal is cut in way of an opening, within 0,4L amidships, compensation is to be arranged to ensure full continuity of area.

4.10.10 The area of any edge reinforcement which may be required is not to be taken into account in determining the required sectional area of compensation unless such reinforcement is designed to absorb the loadings from cut longitudinals in way of opening.

Double Hull Oil Tankers

Part 4, Chapter 9

Sections 4 & 5

4.10.11 Increased scantlings and/or compensation may also be required for large openings outside 0,5L amidships, or where openings are close to breaks of superstructure or other areas of high stress in any location on the ship.

4.10.12 Where small diameter threaded openings for staging wires are arranged on the upper deck, they are to be located clear of the other openings and similar areas of stress concentration. Care is to be taken to ensure a gradual transition at the thread ends and the edges of the holes are to be smooth. The closing arrangements are to be as required by Section 13.

4.11 Shell openings

4.11.1 Sea inlets in pump rooms situated within 0,4L amidships, are, if practicable, to be fitted clear of the bilge radius. All openings are to be arranged so as to minimise discontinuity of transverse frames, longitudinals or bilge keels. Compensation is to be provided for all openings within 0,4L amidships and may also be required for openings in the vicinity of the poop front. The compensation should, if possible, take the form of an insert plate rather than a doubler.

4.11.2 If openings are not circular or oval, the corners are to be rounded with as large a radius as practicable.

4.12 Superstructures

4.12.1 The thickness of plating forming the deck and sides of forecastles and poops is to be as required by Pt 3, Ch 5, Ch 6 and Ch 8.

Section 5 Hull framing

5.1 General

5.1.1 In the cargo tank region, the scantlings of deck, bottom and side longitudinals, and of transverse side framing, where fitted, are to be in accordance with the requirements of this Section.

5.1.2 Longitudinal and transverse framing members outside the cargo tank region are to comply with the requirements of Pt 3, Ch 5,4, Ch 6,4, and Ch 7, as appropriate to their location.

5.1.3 Outside the cargo tank region the structure is to be scarfed into the end structure as provided for in Pt 3, Ch 5, Ch 6 and Ch 7.

5.2 Symbols

5.2.1 The symbols used in this Section are defined as follows:

b_f = the width of the face plate, in mm, of the side longitudinal under consideration, see Fig. 9.5.1

b_{f1} = the minimum distance, in mm, from the edge of the face plate of the side longitudinal under consideration to the centre of the web plate, see Fig. 9.5.1

b_1 = the value as defined in Table 9.5.3

$c_1 = \frac{60}{225 - 165F_D}$ at deck

= 1,0 at $\frac{D}{2}$

= $\frac{75}{225 - 150F_B}$ at base line of ship

intermediate values of c_1 by interpolation

$c_2 = \frac{165}{345 - 180F_D}$ at deck

= 1,0 at $\frac{D}{2}$

= $\frac{165}{345 - 180F_B}$ at base line of ship

intermediate values of c_2 by interpolation

d_w = depth of web, in mm

h = distance of longitudinal below deck at side, in metres. For deck longitudinals, $h = 0$

h_0 = the distance, in metres, from the mid-point of span of the stiffener to the highest point of tank, excluding hatchway

$h_1 = \left(h_0 + \frac{D_1}{8} \right)$, but in no case to be taken less than

$\frac{L_1}{56}$ m or $(0,01L_1 + 0,7)$ m, whichever is the

greater, and need not be taken greater than

$\left(0,75D + \frac{D_1}{8} \right)$, for bottom longitudinals

h_2 = distance, in metres, from mid-point of span of transverse side frame to deck at side measured at mid-length of tank, but to be taken not less than 2,5 m

$h_3 = h_0 + Rb_1$, but need not be taken greater than $(0,75D + Rb_1)$ for bottom longitudinals

l_e = effective length, in metres, of longitudinals measured between span points, but to be taken not less than 1,5 m in double bottom and 2,5 m elsewhere. For determination of span points, see Pt 3, Ch 3,3.

t_f = thickness of flange, in mm

t_s = thickness of the bilge shell plating, in mm

t_w = thickness of web, in mm

$D_1 = D$, in metres, but is to be taken not less than 10 and need not be taken greater than 16

F_B = as defined in Pt 3, Ch 4,5,6

F_D = as defined in Pt 3, Ch 4,5,6

F_1 = a factor determined from Table 9.5.1

F_2 = a factor determined from Table 9.5.2

Double Hull Oil Tankers

Part 4, Chapter 9

Section 5

$$R = \sin\theta$$

where θ is the roll angle, in degrees

$$\text{and } \sin\theta = \left(0,45 + 0,1 \frac{L}{B}\right) \left(0,54 - \frac{L}{1270}\right)$$

R_B = bilge radius, in mm, as defined in Table 1.5.2 in Chapter 1.

Other symbols are defined in 1.5.

Table 9.5.1 Values of F_1

Item	F_1
Deck longitudinals and side longitudinals above $\frac{D}{2}$	$\frac{Dc_1}{4D + 20h}$
Side longitudinals and bottom longitudinals below $\frac{D}{2}$	$\frac{Dc_1}{25D - 20h}$
NOTE Minimum $F_1 = 0,12$	

Table 9.5.2 Values of F_2

Item	F_2
Deck longitudinals and side longitudinals above $\frac{D}{2}$	$\frac{Dc_2}{D + 2,18h}$
Side longitudinals and bottom longitudinals below $\frac{D}{2}$	$\frac{Dc_2}{3,18D - 2,18h}$
NOTE Minimum $F_2 = 0,73$	

Table 9.5.3 Determination of b_1

Item No.	Structural arrangement	Location	Value of b_1 , metres
1	Where wing and double bottom ballast tanks port and starboard are interconnected	(a) Bottom longitudinals	The greater horizontal distance from ship side to the longitudinal
		(b) Side longitudinals	Breadth of ship
		(c) Deck longitudinals	(i) In way of cargo tanks and inboard ballast tanks, the greater horizontal distance from tank corner at top of tank to longitudinal, either side (ii) In way of wing ballast tanks, the greater horizontal distance from ship side to longitudinal, either side
2	Where wing ballast tanks port and starboard are separate	(a) Bottom longitudinals	The horizontal distance from ship side to longitudinal
		(b) Side longitudinals	Width of wing ballast tank

Double Hull Oil Tankers

Part 4, Chapter 9

Section 5

5.3 Deck, side and bottom longitudinals

5.3.1 The modulus of longitudinals within the cargo tank region, except as provided for in 5.3.2 and 5.5 is to be not less than the greater of the following:

(a) $Z = 0,056skh_1 I_e^2 F_1 F_s \text{ cm}^3$, or

(b) $Z = 0,0051skh_3 I_e^2 F_2 \text{ cm}^3$

where F_1 and F_2 values are as given in Tables 9.5.1 and 9.5.2 and F_s is a fatigue factor to be taken as follows:

$$F_s = \frac{1,1}{k} \left[1 - \frac{2b_{f1}}{b_f} (1 - k) \right] \text{ at } 0,6D \text{ above the base line}$$

= 1,0 at upper deck at side and at the base line, intermediate values by linear interpolation

For flat bars and bulb plates $\frac{b_{f1}}{b_f}$ may be taken as 0,5

The modulus of side longitudinals need not exceed that of a bottom longitudinal having the same spacing and configuration.

5.3.2 The modulus of bottom longitudinals is to satisfy the requirements of 5.3.1 or Table 1.6.1(3) in Chapter 1, whichever is the greater.

5.3.3 The section modulus given is that of the longitudinal and associated plating, for the extent of the associated plating, see Pt 3, Ch 3,3.2.3. The webs and flanges are to comply with the minimum thickness requirements of Section 10.

5.3.4 Where the spacing of transverses exceeds 5,5 m, the scantlings of side and bottom longitudinals in way of bulkheads and primary members, including end connections, are to be verified by direct calculation.

5.3.5 The side and bottom longitudinal scantlings derived from 5.3.1 and 5.3.2, using the midship thickness of plating, are to extend throughout the cargo tanks. Where the shell plating is inclined at an angle to the horizontal longitudinal axis of greater than 10°, the span of the longitudinals is to be measured along the member. Where the shell plating is inclined at an angle to the vertical axis of greater than 10°, the spacing of longitudinals is to be measured along the chord between members. Where the angle of attachment of side longitudinals clear of amidships varies by 20° or more from a line normal to the plane of the shell, the properties of the section are to be determined about an axis parallel to the attached plating. Angles of slope greater than 40° are to be avoided.

5.3.6 Fabricated longitudinals having the face plate welded to the underside of the web, leaving the edge of the web exposed, are not recommended for shell, inner hull or longitudinal bulkhead longitudinals. Where it is proposed to fit such sections, a symmetrical arrangement of connection to transverse members is to be incorporated. This can be achieved by fitting backing brackets on the opposite side of the transverse web or bulkhead. The primary member web stiffener and backing bracket are to be lapped to the longitudinal. Recommended examples of such backing structure can be seen in the *ShipRight FDA Procedure, Structural Detail Design Guide (SDDG)*.

5.3.7 Where partial filling of the tanks is also contemplated the deck longitudinals are to comply with the requirements of 6.1.2.

5.3.8 Stiffeners and brackets on vertical webs in wing ballast tanks, where fitted on one side and connected to higher tensile steel longitudinals between the base line and 0,8D above the base line, are to have their heels well radiused to reduce stress concentrations. Where a symmetrical arrangement is fitted, i.e. bracket or stiffening on both sides, and they are connected to higher tensile steel longitudinals, the toes of the stiffeners or brackets are to be well radiused. Alternative arrangements will be considered if supported by appropriate fatigue life assessment calculations.

5.3.9 Where higher tensile steel side longitudinals pass through transverse bulkheads in the cargo area, well radiused brackets of the same material are to be fitted on both the fore and after side of the connection between the upper turn of bilge and 0,8D above the base line. Particular attention should be given to ensuring the alignment of these brackets. Alternative arrangements will be considered if supported by appropriate fatigue life assessment calculations.

5.4 Bilge longitudinals and brackets

5.4.1 The scantlings of bilge longitudinals are to be graduated between those required for the bottom and lowest side longitudinals.

5.4.2 Where bilge longitudinals are omitted, the spacing of transverses or equivalent bilge brackets must not exceed:

$$8 \times 10^6 \frac{t_s^2}{DR_B} \sqrt{\frac{t_s}{R_B}} \text{ mm.}$$

Where no intermediate brackets are fitted between transverses, the spacing between the two outermost bottom longitudinals and between the two lowest side longitudinals is not to exceed one-third of the bilge radius or 40 times the local shell thickness, whichever is the greater.

5.4.3 Attention is drawn to 4.6.2 and 4.6.3 concerning bilge plating thickness where longitudinals are omitted.

5.5 Deck longitudinals outside 0,4L amidships

5.5.1 Within the cargo tank region, deck longitudinals may be gradually tapered outside 0,4L amidships in association with the deck plating, on the basis of area and modulus. For the requirements, see Pt 3, Ch 3,2.5 and Table 3.2.1, see also 5.3.5.

5.5.2 The midship spacing of longitudinals is, in general, to be maintained throughout the cargo tank region. The plating thickness and longitudinal depth and thickness are not to be increased at any point in the direction of the taper of area towards the ends of the ship, other than as may be required for compensation for openings. Changes of longitudinal section are, in general, to be avoided.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 5

5.5.3 Attention is also drawn to 5.3.3, which is to be complied with, where necessary, by maintaining a constant deck plating thickness in way of the ends of the cargo tank region.

5.5.4 Where the spacing of transverses in cargo tanks is not constant and variations in longitudinal scantlings are contemplated to suit differing spans, individual consideration will be given to the taper arrangements.

5.6 Stability of longitudinals

5.6.1 The lateral and torsional stability of longitudinals together with web and flange buckling criteria are to be verified in accordance with Pt 3, Ch 4,7.

5.6.2 In addition, the following requirements are to be satisfied:

- (a) Flat bar longitudinal
 - (i) when continuous at bulkheads

$$\frac{d_w}{t_w} \leq 18 \sqrt{k_L}$$
 - (ii) when non-continuous at bulkheads

$$\frac{d_w}{t_w} \leq 15 \sqrt{k_L}$$
- (b) Built sections
 - (i) $\frac{d_w}{t_w} \leq 60 \sqrt{k_L}$
 - (ii) $\frac{b_f}{t_f} \leq 15$ for asymmetric sections
 - (iii) $\frac{b_f}{t_f} \leq 30$ for symmetric sections.

5.7 Connections of longitudinals

5.7.1 Connections of longitudinals to bulkheads are to provide adequate fixity and continuity of longitudinal strength. See also the *ShipRight FDA Procedure, Structural Detail Design Guide* (SDDG), for recommended design details in critical areas.

5.7.2 Where the length of the ship exceeds 150 m, the longitudinals within 0,1D of the bottom and deck are to be continuous through the transverse bulkheads. Higher tensile steel longitudinals are to be continuous irrespective of ship length. Alternative arrangements will be individually considered.

5.7.3 Longitudinals are to be connected to transverse primary members as required by Pt 3, Ch 10,5.2.

5.8 Openings in longitudinals

5.8.1 In general, closely spaced scallops are not permitted in longitudinals within the range of cargo tanks except in way of ballast pipe suction, reinforcement in these areas will be specially considered.

5.8.2 Small air and drain holes, cut-outs at erection butts and similar widely spaced openings are, in general, to be not less than 200 mm clear of the toes of end brackets, intersections with primary supporting members and other areas of high stress. All openings are to be well rounded with smooth edges.

5.8.3 Drain holes in higher tensile steel longitudinals attached to higher tensile steel plating are to be elliptical in shape or of equivalent design to minimise stress concentrations. The opening is generally to be located clear of the welded connection to the plating, but where a flush opening is essential for drainage the weld connection is to end in a soft toe.

5.8.4 Small circular air holes may be arranged in higher tensile steel deck longitudinals.

5.8.5 Isolated openings spaced greater than 1 metre apart need not be taken into account in calculating the section modulus of the longitudinal, provided that the depth does not exceed 10 per cent of the web depth, or 75 mm, whichever is the greater, but in no case more than 25 per cent of the depth of the longitudinal.

5.8.6 Where the depths given in 5.8.5 are exceeded, the arrangements are to be such as will minimise resultant stress concentration.

5.9 Transverse side frames

5.9.1 For limits of application of transverse side framing, see 1.3.

5.9.2 The section modulus of transverse side frames is to be not less than:

$$Z = 0,01025k s h_2 l_e^2 \text{ cm}^3, \text{ where side webs are fitted;}$$

or

$$Z = 0,012k s h_2 l_e^2 \text{ cm}^3, \text{ where side webs are not fitted.}$$

5.9.3 The size of the frame is to be governed by the maximum modulus derived from the appropriate formula in 5.9.2, and is to be maintained for the full depth of the ship.

5.9.4 The section modulus given is that of the frame and associated side shell plating. The frame is to comply with the minimum thickness requirements of Section 10.

5.9.5 The inertia of transverse side frames is to be not less than:

$$\begin{aligned} \text{In the forward 0,15L: } I &= 3,5I_e \text{ cm}^4 \\ \text{Elsewhere: } I &= 3,2I_e \text{ cm}^4. \end{aligned}$$

Double Hull Oil Tankers

Part 4, Chapter 9

Section 6

Section 6 Inner hull, inner bottom and longitudinal oiltight bulkheads

6.1 General

6.1.1 The inner hull, inner bottom and longitudinal bulkheads are generally to be longitudinally framed. Longitudinal bulkheads may be plane or horizontally corrugated. Centreline longitudinal bulkheads may also be vertically corrugated, see 1.4.14. Scantlings of inner hull and longitudinal oiltight bulkheads are to be in accordance with Table 9.6.1 and panel stability is also to be confirmed from primary structure direct calculations. The calculation is to take account of the shear stress and direct stresses derived from both the transverse and longitudinal strength investigations.

6.1.2 Where tanks are intended to be partially filled, the scantlings and structural arrangements of the boundary bulkheads are to be capable of withstanding the loads imposed by the movement of liquid in the tanks. The magnitude of the predicted loadings, together with the scantling calculations, may require to be submitted.

6.2 Symbols

6.2.1 The symbols used in this Section are defined as follows:

b_1 = the greater horizontal distance in metres, from a point one third of the height of the strake above its lower edge or mid-point of the stiffener span, to the corners at the top of the tank on either side.

Where the angle α is less than $\left(32,5 - \frac{L}{20}\right)$

degrees, the distance is measured to the widest point of the tank, see Fig. 9.6.1.

α = angle, in degrees, as indicated in Fig. 9.6.1.

$$c_1 = \frac{60}{225 - 165F_D} \text{ at deck}$$

$$= 1,0 \text{ at } \frac{D}{2}$$

$$= \frac{75}{225 - 150F_B} \text{ at base line of ship}$$

intermediate values of c_1 by interpolation

$$c_2 = \frac{165}{345 - 180F_D} \text{ at deck}$$

Table 9.6.1 Inner hull and longitudinal oiltight bulkhead scantlings

Item	Horizontally stiffened/Vertically stiffened
(1) Plating thicknesses including corrugations (mm) See Notes 1 and 7	<p>(a) Within $0,1D$ of the deck: $t = t_0$</p> <p>(b) Within $0,1D$ of the bottom shell: $t = \frac{t_0}{\sqrt{2 - F_B}} \text{ (but not less than } t_1)$</p> <p>(c) Elsewhere: $t = t_1$ see Note 6</p> <p>(d) But not less than $t = 0,0009s (0,059L_1 + 7)$</p>
(2) Stiffener modulus (cm ³) See Notes 3 and 4	<p>(a) Horizontally stiffened:</p> <div style="display: flex; align-items: center;"> <div style="margin-right: 10px;"> <p>(i) $Z = 0,056k h_2 s l_e^2 F_1$</p> <p>(ii) $Z = 0,0051k h_4 s l_e^2 F_2$</p> </div> <div style="font-size: 3em; margin-right: 10px;">}</div> <p>whichever is the greater</p> </div> <p>(b) Vertically stiffened: $Z = 0,0067ks l_e^2 h_5$</p>
(3) Corrugation properties See Note 7	<p>(a) Modulus (cm³): $Z = 0,0085p h_5 l_e^2 k$</p> <p>(b) Inertia (cm⁴): $I = 0,032p h_5 l_e^3$</p>

NOTES

- The plating thicknesses are not to be less than as necessary to comply with the buckling requirements of Pt 3, Ch 4,7.
- The section modulus given by the formula is that of the stiffener and associated plating or of the corrugation over pitch, p .
- For vertical stiffeners, the ratio of web depth to web thickness is not to exceed $60 \sqrt{k}$ for stiffeners with flanges or face plates, and $18 \sqrt{k}$ for flat bars. Horizontal stiffeners are to comply with 5.6.
- The minimum thickness criteria given in Section 10 are also to be complied with and the stiffener web thickness is to be sufficient to withstand the imposed shear forces.
- The minimum moment of inertia represented by item 3(b) of the Table is not to be reduced on account of higher tensile steel being incorporated.
- In applying item 1(c) of the Table, it is necessary to calculate values of t_0 for plate panels within $0,4D$ each side of mid-depth, take the minimum value, t_m , and then determine value of t_1 .
- For vertically corrugated centreline longitudinal bulkheads see also Table 1.9.2 in Chapter 1 for deep tanks.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 6

Fig. 9.6.1 Illustration of b_1 determination

$$= 1,0 \text{ at } \frac{D}{2}$$

$$= \frac{165}{345 - 180F_B} \text{ at base line of ship}$$

intermediate values of c_2 by interpolation

h = load height, in metres measured vertically as follows:

- For bulkhead plating, the distance from a point one third of the height of the plate panel above its lower edge to the highest point of the tank, excluding hatchway
- for bulkhead stiffeners or corrugations, the distance from the mid-point of span of the stiffener or corrugation to the highest point of the tank, excluding hatchway

$$h_1 = \left(h + \frac{D_1}{8} \right), \text{ but not less than } 0,72 (h + Rb_1)$$

$$h_2 = \left(h + \frac{D_1}{8} \right), \text{ in metres, but in no case to be}$$

taken less than $\frac{L_1}{56}$ m or $(0,01L_1 + 0,7)$ m

whichever is the greater

h_3 = distance of longitudinal below deck at side, in metres, but is not to be less than 0

$$h_4 = h + Rb_1$$

$$h_5 = h_2 \text{ but is to be not less than } 0,55h_4$$

l_e = effective length, in metres, of longitudinals measured between span points, but is not to be taken less than 2,5 m. For determination of span points, see Pt 3, Ch 3,3

p = pitch of symmetrical corrugations, in mm

s = spacing, in mm, of bulkhead stiffeners for plane bulkheads. In case of symmetrical corrugations, s is to be taken as b or c in Fig. 3.3.1 in Pt 3, Ch 3, whichever is the greater

$$t_0 = 0,005s \sqrt{kh_1}$$

$$t_1 = t_0 \left(0,84 + 0,16 \left(\frac{t_m}{t_0} \right)^2 \right)$$

t_m = minimum value of t_0 within $0,4D$ each side of mid-depth of bulkhead

D_1 = D , in metres, but is to be taken not less than 10 and need not be taken greater than 16

F_B = as defined in Pt 3, Ch 4,5.6

F_D = as defined in Pt 3, Ch 4,5.6

F_1 = a factor determined from Table 9.6.2

F_2 = a factor determined from Table 9.6.3

R = $\sin \theta$

where θ is the roll angle, in degrees

$$\text{and } \sin \theta = \left(0,45 + 0,1 \frac{L}{B} \right) \left(0,54 - \frac{L}{1270} \right).$$

Other symbols are defined in 1.5.

Table 9.6.2 Values of F_1

Longitudinal bulkhead longitudinals	F_1
Above $\frac{D}{2}$	$\frac{Dc_1}{4D + 20h_3}$
Below $\frac{D}{2}$	$\frac{Dc_1}{25D - 20h_3}$
NOTE Minimum $F_1 = 0,12$	

Table 9.6.3 Values of F_2

Longitudinal bulkhead longitudinals	F_2
Above $\frac{D}{2}$	$\frac{Dc_2}{D + 2,18h_3}$
Below $\frac{D}{2}$	$\frac{Dc_2}{3,18D - 2,18h_3}$
NOTE Minimum $F_2 = 0,73$	

6.3 Inner hull and longitudinal bulkheads

6.3.1 Inner hull and longitudinal bulkheads are to extend as far forward and aft as practicable and are to be effectively scarfed into the adjoining structure.

6.3.2 Longitudinal bulkheads only may be perforated provided suitable account is taken of the applied shear forces. Proposals to fit perforated longitudinal bulkheads in cargo tanks will be individually considered. See also 7.1 concerning penetration of pump room, cofferdam and cargo tank bulkheads.

6.3.3 The thickness of inner hull and longitudinal bulkhead plating required by Table 9.6.1 is to be maintained throughout the cargo tank length, with the exception of item (1)(a) which may be gradually tapered outside $0,4L$ amidships to cargo tank minimum thickness or as required by item (1)(c), whichever is the greater, at $0,075L$ from the ends.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 6

6.3.4 The bulkhead plating thicknesses throughout the cargo tank length are to be increased as necessary to attain compliance with the shear strength requirements of Pt 3, Ch 4,6.

6.3.5 For conditions which provide for wing and centre cargo tanks abreast to be filled, with adjacent cargo tanks fore and aft empty, the thickness of longitudinal bulkheads is to comply with the requirements of 8.3.2(d) and (e), see also 3.3.6.

6.3.6 Where bulkheads are penetrated by cargo or ballast piping, the structural arrangements in way are to be capable of withstanding the loads imparted to the bulkheads by the hydraulic forces in the pipes. The requirements for cargo and ballast piping is given in Pt 5, Ch 15,2.5 and Ch 15,3.

6.3.7 Openings in horizontal stiffeners are to comply with the requirements of 5.8.

6.4 Longitudinal corrugated bulkheads

6.4.1 Where horizontally corrugated bulkheads are adopted the angle of corrugation is to be not less than 40°.

6.4.2 In ships exceeding 150 m in length the upper and lower strakes of the longitudinal bulkhead are to be plane for a distance of 0,1D from the deck and bottom.

6.4.3 Corrugations are to be aligned, and stiffening arrangements on plane members are to be arranged to give adequate support in way of flanges of abutting corrugations. Where both the longitudinal and transverse bulkheads are horizontally corrugated, the arrangements at intersections are to be designed to facilitate attachment and maintain continuity.

6.4.4 Where asymmetrical girders or webs are fitted to corrugated bulkheads, the angle of corrugation is not to exceed 60°.

6.5 Inner bottom

6.5.1 The inner bottom is to be longitudinally framed and the inner bottom plating thickness is to be not less than the greater of:

$$(a) \quad t = \frac{t_0}{\sqrt{2 - F_B}} \text{ mm, or}$$

(b) deep tank requirements of Table 1.9.1 in Chapter 1.

6.5.2 The section modulus of inner bottom longitudinals is to be in accordance with Table 9.6.1(2) or deep tank requirements of Table 1.9.1 in Chapter 1, whichever is the greater, and the unsupported span may extend to the spacing between plate floors.

6.5.3 Buckling resistance to longitudinal and transverse stresses in the inner bottom is to be confirmed by direct calculation, see also Pt 3, Ch 4,7.

6.5.4 Transverse continuity of inner bottom is to be maintained outboard of inner hull, see 6.6.3. Recommended details are shown in the *ShipRight FDA Procedure, Structural Detail Design Guide* (SDDG).

6.5.5 Particular attention is to be given to the through-thickness properties and continuity at the connection of bulkhead stools to the inner bottom. For requirements for plates with specified through thickness properties, see Ch 3,8 of the Rules for Materials.

6.5.6 Connection of inner bottom longitudinals to plate floor is to satisfy the requirements given in Pt 3, Ch 10,5.2.

6.6 Hopper side tank

6.6.1 Where a hopper side tank is fitted the sloping bulkhead plating and attached longitudinals are to be as required by Table 9.6.1.

6.6.2 A transverse is to be arranged in the hopper tank in line with each double bottom plate floor, to ensure continuity of transverse strength.

6.6.3 Particular attention is to be paid to the continuity of the inner bottom plating into the hopper side tank. Scarfing brackets are to be fitted in the hopper in line with the inner bottom at each transverse. These brackets are to be arranged each side of the transverse.

6.6.4 Knuckles in the hopper tank plating are to be supported by side girders and stringers or by a deep longitudinal.

6.6.5 Detail design guidelines for connections in way of hopper tank knuckles are shown in the *ShipRight FDA Procedure, Structural Detail Design Guide* (SDDG).

6.7 Connections

6.7.1 Horizontal and vertical stiffeners are to be connected to supporting primary members as required by Pt 3, Ch 10,5.2.

6.7.2 Stiffeners are to be bracketed or otherwise efficiently connected at their ends to provide adequate fixity, as required by Pt 3, Ch 10.

6.7.3 Connections of horizontal stiffeners to transverse bulkheads are to provide adequate fixity and continuity of longitudinal strength. Horizontal stiffeners are to be continuous through bulkheads as required by 5.7, for longitudinals.

6.7.4 Where inner hulls, longitudinal and transverse bulkheads are horizontally stiffened, consideration will be given to the stability of the arrangements at intersections. Additional calculations may be required.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 7

Section 7

Transverse oiltight bulkheads

7.1 General

7.1.1 Transverse oiltight bulkheads may be plane or with corrugations arranged horizontally or vertically. Scantlings are to be in accordance with Table 9.7.1, except as otherwise provided for in this Section. The arrangement of stiffening is to be such as will efficiently support loads transmitted by end connections of inner hull, longitudinal bulkhead, shell and deck longitudinals. The thickness of bulkhead plating is also to be confirmed by direct calculation in respect of panel stability. The calculation is to take account of the shear stresses and direct stresses derived from both the transverse and longitudinal strength investigations.

7.1.2 Where tanks are intended to be partially filled, the scantlings and structural arrangements of the boundary bulkheads are to be capable of withstanding the loads imposed by the movement of liquid in the tanks. The magnitude of the predicted loadings, together with the scantling calculations, may require to be submitted.

7.1.3 The scantlings of water ballast tank and cofferdam bulkheads not forming the boundary of a cargo tank are to be as required by Ch 1,9 for deep tanks. Where the bulkheads are boundaries of 'U' shaped tanks, the scantlings are also to be confirmed by the requirements of this Section.

7.1.4 Where the pump room acts as a cofferdam, a bulkhead which does not form part of the boundary of a cargo tank or an oil fuel bunker may be of watertight bulkhead scantlings in accordance with the requirements of Ch 1,9 provided that an inert gas system is fitted in the cargo tanks, and the corresponding notation provided for in Pt 1, Ch 2,2 is assigned.

7.1.5 Where penetration of the cofferdam or pump room bulkheads is permitted by the Rules, the integrity of the bulkhead is to be maintained, see also Pt 5, Ch 13,2, Ch 15,3 and Pt 6, Ch 2,13.

7.1.6 Where bulkheads are penetrated by cargo or ballast piping, the structural arrangements in way are to be capable of withstanding the loads imparted to the bulkheads by the hydraulic forces in the pipes.

7.1.7 Special consideration will be given to any proposals to fit permanent repair/maintenance access openings with oiltight covers in cargo tank bulkheads. Attention is drawn to the existence of National Authority Regulations concerning load line and oil outflow aspects of such arrangements.

7.2 Symbols

7.2.1 The symbols used in this Section are defined as follows:

- a = the lesser dimension of an unstiffened plate panel, in mm
- b = the greater dimension of an unstiffened plate panel, in mm
- b_1 = the greater horizontal distance, in metres, from the centre of the plate panel or mid-point of the stiffener span to the corners at the top of the tank on either side

Table 9.7.1 Transverse oiltight bulkhead scantlings

Item	Horizontally stiffened	Vertically stiffened
(1) Plating thickness (mm)	$t = 0,0044sf\sqrt{kh_1}$	
(a) Generally, including corrugations see also item 3		
(b) But not less than:	$t = \frac{a}{\left(95 + 20 \frac{a}{b}\right)\sqrt{k}}$	$t = \frac{a}{\left(85 + 30 \left(\frac{a}{b}\right)^2\right)\sqrt{k}}$
(i) For the upper $3/4$ of the bulkhead see Note 5		
(ii) For the lower $1/4$ of the bulkhead see Note 5	$t = \frac{a}{\left(80 + 20 \frac{a}{b}\right)\sqrt{k}}$	$t = \frac{a}{\left(73 + 27 \left(\frac{a}{b}\right)^2\right)\sqrt{k}}$
(2) Stiffener modulus (cm ³)	$Z = 0,0067ks_1^2 h_2$	
(3) Corrugation properties		
(a) Modulus (cm ³)	$Z = 0,0085ph_2 l_e^2 k$	
(b) Inertia (cm ⁴) see Note 4	$I = 0,032ph_2 l_e^3$	

NOTES

- The section modulus given by the formula is that of the stiffeners and associated plating or of the corrugation over pitch p .
- The ratio of web depth to web thickness is not to exceed $60\sqrt{k}$ for stiffeners with flanges or face plates and $18\sqrt{k}$ for flat bars.
- The minimum thickness criteria given in Section 10 are also to be complied with, and the stiffener web thickness is to be sufficient to withstand the imposed shear forces.
- The minimum moment of inertia required by item 3(b) of the Table is not to be reduced on account of higher tensile steel being incorporated.
- For vertically corrugated bulkheads, see Table 1.9.2 in Chapter 1 for deep tanks.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 7

$$f = 1,1 - \frac{s}{2500S_1} \text{ but not to be taken greater}$$

than 1,0

h = load height, in metres measured vertically as follows:

- (a) for bulkhead plating, the distance from a point one-third of the height of the plate panel above its lower edge to the highest point of the tank, excluding hatchway
- (b) for bulkhead stiffeners or corrugations, the distance from the mid-point of span of the stiffener or corrugation to the highest point of the tank, excluding hatchway

$$h_1 = h + \frac{D_1}{8} \text{ but not less than } 0,72 (h + Rb_1)$$

$$h_2 = h + \frac{D_1}{8} \text{ but not less than } 0,55 (h + Rb_1)$$

p = pitch of symmetrical corrugations, in mm

s = spacing, in mm, of bulkhead stiffeners or the breadth, in mm, of flange or web, whichever is the greater, of symmetrical corrugations

$D_1 = D$, in metres, but is to be taken not less than 10 and need not be taken greater than 16

$R = \sin \theta$

where θ is the roll angle, in degrees

$$\text{and } \sin \theta = \left(0,45 + 0,1 \frac{L}{B} \right) \left(0,54 - \frac{L}{1270} \right)$$

S_1 = spacing of primary members, in metres. For the span at top, span may be reduced by the depth of deck longitudinal.

Other symbols are defined in 1.5.

7.3 Corrugated bulkheads

7.3.1 Where corrugated bulkheads are adopted the angle of corrugation is to be not less than 40°, see Fig. 3.3.1 in Pt 3, Ch 3.

7.3.2 Where transverse bulkheads are vertically corrugated, adequate resistance to transverse compressive forces is to be provided by horizontal stringers or equivalent.

7.3.3 Where transverse bulkheads are horizontally corrugated, the span of the corrugations should not, in general, exceed 5,0 m. Consideration is to be given to providing an efficient connection between the corrugations and the inner hull and longitudinal bulkhead stiffeners including local reinforcement where necessary.

7.3.4 Corrugations are to be aligned and stiffening arrangements on plane members are to be arranged to give adequate support in way of flanges of abutting corrugations. Where both the longitudinal and transverse bulkheads are horizontally corrugated, the arrangements at intersections are to be designed to facilitate attachment and maintain continuity.

7.3.5 Where asymmetrical girders or webs are fitted to corrugated bulkheads, the angle of corrugation is not to exceed 60°.

7.3.6 Where corrugated bulkheads on stools are adopted, attention is to be paid to the design of end connection. The arrangements are to be in accordance with the requirements of 7.4.

7.3.7 Where vertically corrugated bulkheads are proposed without stools both flanges are to be adequately supported at deck and inner bottom. Proposals will be specially considered. Particular attention is to be given to the through thickness properties of the inner bottom plating and continuity at the connection to the inner bottom. For the requirements for plates with specified through thickness properties, see Ch 3,8 of the Rules for Materials.

7.4 Bulkheads supported by stools

7.4.1 The scantlings of vertically corrugated and double plate bulkheads supported by stools are generally to be confirmed by direct calculations which are to be submitted.

7.4.2 In addition the scantlings are to be determined in accordance with the requirements of Ch 1,9.2.1 for deep tank bulkheads with the load head h_4 , in metres, measured to the highest point of the tank, excluding hatchway, but is not to be taken less than 0,44 ($h_4 + Rb_1$).

7.4.3 The sloping stool plate thickness adjacent to the corrugation is to be not less than the thickness of the corrugation flange at mid span as required by 7.4.1 and 7.4.2. Where the plate thickness is increased locally, the vertical extent is to be not less than the width of the flange of the corrugation.

7.4.4 The stools are to be reinforced with plate diaphragms or deep webs, and in bottom stools the diaphragms are to be aligned with double bottom side girders. Continuity is also to be maintained between the diaphragms and the webs of bulkhead corrugations as far as practicable.

7.4.5 Additional double bottom girders are to be arranged extending at least to the first plate floor adjacent to the bulkhead each side and, in general, are to be spaced not more than 3,8 m apart.

7.4.6 The sloping plate of bottom stools is to be aligned with double bottom floors. Particular attention is to be given to the through thickness properties of the inner bottom plating and continuity at the connection to the inner bottom, and to the through thickness properties of the bottom stool shelf plate. For requirements for plates with specified through thickness properties, see Ch 3,8 of the Rules for Materials.

Double Hull Oil Tankers

Part 4, Chapter 9

Sections 7 & 8

7.4.7 An efficient system of reinforcement is to be arranged in line with the tank transverse bulkheads or bulkhead stools at the intersection with the sloped plating of the double bottom hopper tanks and topside tanks. The reinforcement fitted in the tanks is to consist of girders or intercostal bulb plate or equivalent stiffeners fitted between and connected to the sloped bulkhead longitudinals.

7.4.8 The shelf plates of the bulkhead stools are to be arranged to align with the longitudinals in the double bottom hopper tank and topside tanks. Where sloping shelf plates are fitted to stools suitable scarfing is to be arranged in way of the connections of the stools to the adjoining structures.

7.4.9 The arrangement of stools and adjacent structure common with the cargo tank is to be designed to avoid pockets in which gas could collect.

7.5 Connections

7.5.1 Horizontal and vertical stiffeners are to be connected to supporting primary members as required by Pt 3, Ch 10,5.2.

7.5.2 Stiffeners are to be bracketed or otherwise efficiently connected at their ends to provide adequate fixity.

7.5.3 Arrangements and scantlings of end brackets for vertical stiffeners are to be as required by Pt 3, Ch 10.

7.5.4 Horizontal stiffener end brackets are generally to satisfy the requirements of Pt 3, Ch 10. However, the length of the bracket arm at the side shell, inner hull and longitudinal bulkhead longitudinals is, in general, not to exceed the depth of the longitudinal. In order to provide the necessary weld connection, consideration may require to be given to fitting brackets on both sides of the bulkhead or to welding the stiffener to the longitudinal. The arrangements are also to be such as to maintain transverse continuity at intersections. Examples can be seen in the *ShipRight FDA Procedure, Structural Detail Design Guide (SDDG)*.

Section 8 Non-oiltight bulkheads

8.1 General

8.1.1 The requirements of this Section are applicable to longitudinal and transverse wash bulkheads, where fitted. Proposals to fit perforated longitudinal bulkheads in cargo tanks will be individually considered, see also 1.3.

8.1.2 Wash bulkheads are generally to be of plane construction, horizontally or vertically stiffened, having an area of perforations not less than 10 per cent of the total area of the bulkhead. The perforations are to be so arranged that the efficiency of the bulkhead as a support is not impaired.

8.1.3 Where tanks are intended to be partially filled, the scantlings and structural arrangements of the wash bulkheads are to be capable of withstanding the loads imposed by the movement of liquid in the tanks. The magnitude of the predicted loads, together with the scantling calculations, may require to be submitted.

8.2 Symbols

8.2.1 The symbols used in this Section are defined as follows:

- a = the horizontal length of the plate panel, in mm
- a_T = the cross sectional area of the vertical web on longitudinal bulkhead and associated bulkhead plating over one transverse space, in cm^2
- b_1 = half the distance, in metres, between members supporting floors as shown in Fig. 9.8.1
- b_L = half the distance, in metres, between members supporting horizontal girder, adjacent to the bulkhead under consideration, as shown in Fig. 9.8.1
- b_T = overall breadth of tank, in metres
- D_1 = D , in metres, but is to be taken not less than 10 and need not be taken greater than 16
- D_L = the depth of the longitudinal bulkhead, including double bottom girder, in metres
- d_L = the distance, in metres, from the top of the longitudinal bulkhead to the centre of the plate panel under consideration and need not be taken greater than the distance to the bracket toe of the double bottom transverse primary member
- h = the distance, in metres, from the centre of the load on the horizontal girder to $\frac{D_1}{8}$ m above the highest point of the tank, excluding the hatchway
- d_H = the mean depth of horizontal girders at the longitudinal bulkhead, in metres, including the depth of the end brackets as shown in Fig. 9.8.1
- l_G = the distance, in metres, from the horizontal girders to the adjacent horizontal primary member below
- $t_3 = \frac{Q_{SL} + Q_{SW}}{D_L \tau}$ mm

Q_S, Q_W = as defined in Pt 3, Ch 4,6.1.

$$\tau = \frac{110}{k_L} \text{ N/mm}^2 \quad \left(\frac{11,2}{k_L} \text{ kgf/mm}^2 \right)$$

Q_{SL} = the maximum still water shear force on the longitudinal bulkhead, in kN (tonne-f), of the loading condition in question.

Where two longitudinal bulkheads are fitted, Q_{SL} may be taken as:

$$Q_{SL} = 0,34Q_S$$

Where one longitudinal bulkhead is fitted, Q_{SL} may be taken as:

$$Q_{SL} = 0,40Q_S$$

Q_{SL} may also be derived by direct calculation to determine the distribution of shear force between the shell, inner hull and longitudinal bulkheads.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 8

Q_{SW} = design wave shear force on the longitudinal bulkhead, in kN (tonne-f).

Where two longitudinal bulkheads are fitted, Q_{SW} may be taken as:

$$Q_{SW} = 0,20Q_w$$

Where one longitudinal bulkhead is fitted, Q_{SW} may be taken as:

$$Q_{SW} = 0,28Q_w$$

l_T = overall length of tank, in metres

$$F_d = W_h S b_i \frac{d_L}{D_L}$$

l_b = the distance between the transverse bulkheads (oiltight or non-oiltight) adjacent to the bulkhead under consideration, in metres

S = spacing of the double bottom transverse primary members, in metres

T_p = the maximum operating draught of ship, in metres, where the tank with non-oiltight bulkhead is empty.

$$W_h = T_p + 0,023Le^{-0,0044L}$$

α = $\frac{S}{a}$, but not to be taken greater than 1,0

Other symbols are defined in 1.5.

Fig. 9.8.1 Horizontal girder

8.3 Scantlings

8.3.1 The thickness of plating may be the compartment minimum, see Section 10, except as given in 8.3.2 and 8.3.4.

8.3.2 Where non-oiltight **longitudinal** wash bulkheads support a bottom primary member, the following additional requirements are to be met:

- The area of perforation is to be not greater than 25 per cent of the total area of the bulkhead, and consideration is to be given to the disposition and geometry of the perforations so that the shear rigidity of the bulkhead is a maximum.
- The net section area of the bulkhead is to be not less than $0,135l_T b_T D$ cm².
- The plating thickness is to comply with Table 9.6.1(1)(d).
- The thickness of longitudinal bulkhead plating and web plating of the vertical web on longitudinal bulkhead is generally to be not less than:

$$t = 0,026 \frac{S}{1 + \alpha^2} \sqrt{\frac{F_d}{a_T}} \text{ mm.}$$

- The thickness of the longitudinal bulkheads supporting a transverse bulkhead horizontal girder is in general to be not less than:

$$(i) \quad t = \frac{0,0437 h l_G b_L k}{d_H} + \frac{0,892 t_3 k}{k_L} \text{ mm}$$

$$(ii) \quad t = 0,0011s (0,059L_1 + 7) \text{ mm}$$

whichever is the greater.

The thickness is also to satisfy the buckling requirements of Pt 3, Ch 4,7.

The increased thickness is to extend over the end bracket and buttress of the horizontal girder down to a distance of $0,5l_G$.

8.3.3 The section modulus of longitudinal wash bulkhead stiffeners is to be not less than, see also Pt 3, Ch 4,7:

$$Z = 0,0036 \left(0,54 - \frac{L}{1270} \right) b_T k s S^2 \text{ cm}^3.$$

8.3.4 Where non-oiltight **transverse** wash bulkheads support a primary fore and aft bottom centreline girder, the following additional requirements are to be met:

- The area of perforation is to be not greater than 25 per cent of the total area of the bulkhead, and consideration is to be given to the disposition and geometry of the perforations so that the shear rigidity of the bulkhead is a maximum.
- The net section area of the bulkhead is to be not less than $0,135l_b b_T D$ cm².
- The plating thickness is to comply with Table 9.7.1(1)(b). In no case is either panel dimension to exceed 180 times the thickness required by this sub-paragraph or by 8.3.1, whichever is the greater.

8.3.5 The section modulus of transverse wash bulkhead stiffeners is to be not less than:

$$Z = 0,1215k s l_b^2 \frac{l_b}{L} \text{ cm}^3.$$

8.4 Connections

8.4.1 Stiffeners are to be bracketed or otherwise efficiently connected at their ends and to primary supporting members, in accordance with the requirements of Pt 3, Ch 10.

Section 9 Primary members supporting longitudinal framing

9.1 General

9.1.1 These requirements are applicable to ships having structural arrangements in accordance with 1.4.

9.1.2 The minimum thickness and constructional detail requirements of Section 10 are also to be complied with.

9.1.3 The scantlings of primary members are, in general, to be determined from direct calculations carried out in accordance with the requirements of Section 14 or in accordance with the requirements of this Section or the relevant Sections of Chapter 10. The direct calculations are to be submitted with the plans for confirmatory purposes, *see also* 1.4.5.

9.2 Symbols

9.2.1 The symbols used in this Section are defined as follows:

b_{e1}, b_{e2} = effective end bracket leg length, in metres, at each end of the member, *see* Pt 3, Ch 3,3

d_{DB} = Rule depth of centre girder, in mm

h_c = vertical distance from the centre of the cross-ties to deck at side amidships, in metres

h_s = distance between the lower span point of the vertical web and the moulded deck line at centreline, in metres

l_b = the distance, in metres, between the transverse bulkheads (oiltight or non-oiltight) adjacent to the bulkhead under consideration

l_c = one-half the vertical distance, in metres, between the centres of the adjacent cross-ties or between the centre of the adjacent cross-tie and the centre of the adjacent bottom or deck transverse, or double bottom, *see* Fig. 9.9.1

s = spacing of transverses, in metres

A_c = cross sectional area of the cross-tie material which is continuous over the span of the cross-tie in cm^2

I_c = least moment of inertia of the cross-tie in cm^4

S_c = length of cross-tie, in metres, measured as follows:

(a) For centre tank cross-ties: S_c is the distance between the face plates of the vertical webs on the longitudinal bulkheads.

(b) For wing tank cross-ties: S_c is the distance between the face plate of the vertical web on the longitudinal bulkhead and the inner hull.

S_s = span of the vertical web, in metres, and is to be measured between end span points, *see* Fig. 9.9.1.

Other symbols are defined in 1.5.

Fig. 9.9.1 Wing tank construction

9.3 Girders and floors in double bottom

9.3.1 Girders are to be arranged at the centreline or duct keel, at the hopper side and in way of longitudinal bulkheads and bulkhead stools. Plate floors are to be arranged in way of transverse bulkheads and bulkhead stools.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 9

9.3.2 In way of vertically corrugated transverse bulkheads supported by stools, additional girders are to be arranged extending at least to the first plate floor adjacent to the bulkhead each side and spaced not more than 3,8 m apart, see 7.4.5.

9.3.3 The centre girder is to have a depth of not less than that given by:

$$d_{DB} = 28B + 205 \sqrt{T} \text{ mm}$$

The height of the double bottom is also to satisfy the requirements given in 1.3.

9.3.4 Thickness of floors and girders is to be confirmed by means of a direct calculation. Due account is to be taken of access and other openings. The minimum thickness however, is to be not less than that given by:

(a) Centre girder or duct keel:

$$t = (0,008d_{DB} + 1,0) \sqrt{k} \text{ mm}$$

(b) Floors and side girders:

$$t = (0,007d_{DB} + 1,0) \sqrt{k} \text{ mm but need not exceed } 12,0 \sqrt{k} \text{ mm.}$$

9.3.5 The scantlings of plating and stiffeners of longitudinal girders are not to be less than necessary to comply with the buckling requirements of Pt 3, Ch 4,7.

9.3.6 Floors and girders forming the boundaries of tanks are also to satisfy the requirements of tank bulkheads given in Ch 1,9.

9.3.7 Provision is to be made for the free passage of air and water from all parts of the tanks to the air pipes and suctions, account being taken of the pumping rates required. Adequate access is also to be provided to all parts of the double bottom. The edges of all openings are to be smooth. The size of the opening should not, in general, exceed 50 per cent of the double bottom depth, unless edge reinforcement is provided. In way of ends of floors and fore and aft girders at transverse bulkheads, the number and size of openings are to be kept to a minimum, and the openings are to be circular or elliptical. Edge stiffening may be required in these positions.

9.3.8 For ships intended to load or unload while aground, see Pt 3, Ch 9,9.

9.3.9 The structure of girders and duct keels is to be sufficient to withstand the forces imposed by dry-docking the ship, see also 10.10.

9.4 Vertical webs and horizontal girders in wing ballast tanks and hopper spaces

9.4.1 The width of the double skin side structure is to comply with the requirements given in 1.3.

9.4.2 Vertical webs are to be arranged in line with the floors in the double bottom to ensure continuity of transverse strength.

9.4.3 A horizontal girder is to be arranged at the top of the hopper space and is to be located close to the knuckle between the hopper and inner hull. Where additional longitudinal girders are provided to satisfy access requirements in accordance with 13.2.8, these are to be arranged in line with horizontal girders on the transverse bulkhead and wing tank cross-ties where these are fitted.

9.4.4 The scantlings of vertical webs and horizontal girders are to be determined by means of direct calculations and due account is to be taken of openings in the structure, see also the buckling requirements in Pt 3, Ch 4,7 for horizontal girders.

9.4.5 Access openings are to be kept clear of other small openings and are to have smooth edges. Edge stiffening is also to be arranged in regions of high shear stress.

9.5 Deck transverses and girders

9.5.1 Deck transverses are to be arranged in line with the vertical webs at the side and vertical transverses at longitudinal bulkheads, where fitted, to ensure continuity of transverse structure.

9.5.2 Deck girders are to be supported at transverse bulkheads by vertical webs or equivalent.

9.5.3 The scantlings of deck transverses and girders are to be determined by means of direct calculations or, alternatively, in accordance with the requirements of Ch 10,2.8 and 2.9.

9.6 Cross-ties

9.6.1 Cross-ties, where fitted, may be of plate or sectional material and are to have an area and least moment of inertia to satisfy the following:

$$A_c \geq \frac{0,765 I_c h_c s k}{\left(1 - \frac{0,45 S_c}{r \sqrt{k}}\right)} \text{ cm}^2$$

$$\text{where } r = \sqrt{\frac{I_c}{A_c}} \text{ cm.}$$

(As a first approximation the area and inertia of the cross-tie may be calculated in accordance with Ch 10,2.10.1.)

9.6.2 The scantlings of the webs and flanges of cross-ties are also to be confirmed by means of direct calculation.

9.6.3 Design of end connections is to be such that the area of the welding, including vertical brackets, where fitted, is to be not less than the minimum cross-sectional area of the cross-tie derived from 9.6.1. To achieve this, full penetration welding may be required and thickness of brackets may require further consideration. Attention is to be given to the full continuity of area of the backing structure on the vertical webs and within the wing ballast tank. Particular attention is also to be paid to the welding at the toes of all vertical end brackets on the cross-tie.

Double Hull Oil Tankers

Part 4, Chapter 9

Sections 9 & 10

9.7 Primary members supporting oiltight bulkheads

9.7.1 The scantlings of primary members supporting oiltight bulkheads are, in general, to be determined by means of direct calculation, see also 9.7.4 and 9.7.5.

9.7.2 Alternatively, the scantlings of vertical webs and horizontal girders on transverse bulkheads are to be determined in accordance with the requirements of Ch 10,4.

9.7.3 Where longitudinal oiltight bulkheads are fitted, vertical webs are to be arranged in line with the deck transverses and the double bottom floors. Particular attention is to be paid to the alignment of the bulkhead web end brackets with the double bottom floors.

9.7.4 The section modulus of vertical webs on longitudinal bulkheads in ships with one or two longitudinal bulkheads is to be not less than:

$$Z = K_3 s h_s S_s^2 k \text{ cm}^3$$

where K_3 is given in Table 9.9.1.

9.7.5 In ships with two longitudinal bulkheads, the net sectional area of the web at any section is not to be less than:

$$A = 0,12Q_x k \text{ cm}^2$$

$$\left(A = \frac{Q_x k}{0,85} \text{ cm}^2 \right)$$

where Q_x is calculated from shear force diagrams constructed as shown in Fig. 9.9.1. For this purpose the values of K_4 and K_5 and the range of application are given in Table 9.9.1.

9.7.6 The moment of inertia of vertical webs on longitudinal bulkheads is to be not less than:

$$I = \frac{7,5}{k} S_s Z \text{ cm}^4.$$

9.7.7 Where horizontal girders and vertical webs on transverse bulkheads do not form part of a ring structure, they are to be arranged with substantial end brackets forming a buttress extending to the adjacent vertical web or transverse. The shear and combined stresses in the buttress arrangements are to be examined.

9.7.8 Where the cross-ties are omitted from the transverse ring in the wing or centre tanks adjacent to the transverse bulkhead, the design of the horizontal girder, end buttress and vertical webs is to take account of the loads imposed and the deflection of the structure.

Table 9.9.1 Vertical web on longitudinal bulkhead coefficient

Number of cross-ties	K_3	K_4	K_5	Range of application
1	2,16	$0,455 - 0,316\phi$	0,103	$0,5 \leq \phi \leq 0,7$
2	1,88	$0,441 - 0,267\phi_1$	$0,498\phi_2 - 0,249$	$0,4 \leq \phi_1 \leq 0,5$ $0,65 \leq \phi_2 \leq 0,8$

9.7.9 Where, in ships exceeding 150 m in length, the longitudinal bulkhead is corrugated, the transverses are generally to be symmetrical on both sides of the bulkhead, and the scantlings may require to be increased to limit deflection.

9.8 Primary members supporting non-oiltight bulkheads

9.8.1 These requirements are applicable to primary members supporting non-oiltight transverse bulkheads. Where non-oiltight longitudinal bulkheads are proposed, the requirements for primary members will be individually considered.

9.8.2 Direct calculation procedures will generally be required where non-oiltight bulkhead primary members will interact with, or tend to support, the primary bottom, longitudinal bulkhead or side structure, and in other cases where warranted by structural design features. In general the section modulus of horizontal girders is to be not less than:

$$Z = 145k b l_e^2 \frac{l_b}{L} \text{ cm}^3.$$

9.8.3 When determining the width of plating supported and the effective breadth for calculating the section modulus, no deduction is to be made on account of perforations.

Section 10 Construction details and minimum thickness

10.1 Symbols

10.1.1 The symbols used in this Section are defined as follows:

For the primary member:

d_w = depth of member web, in mm

s_t = spacing of tripping or docking brackets on the web of the member, in metres

t_w = thickness of member web, in mm

S_w = spacing of members, in metres

For the primary member web stiffener:

d = depth of web plate panel, in mm

l_s = span of stiffeners between effective support points, in metres

s = spacing of stiffeners on the web, in mm

A_s = cross-sectional area of the web stiffener and associated web plating, in cm^2

I_s = moment of inertia of the web stiffener and associated web plating, in cm^4

For the primary member end bracket, see Fig. 9.10.2:

d_b = arm length, in metres

l_b = effective length of the free edge, in metres

t_b = thickness of the end bracket plating, in mm

A_b = cross-sectional area of the end bracket edge stiffeners and associated plating, in cm^2

I_b = moment of inertia of the end bracket edge stiffeners and associated plating, in cm^4

Other symbols are defined in 1.5.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 10

10.2 Compartment minimum thickness

10.2.1 Within the cargo tank region, including wing ballast tanks and cofferdams at the ends of or between cargo tanks, the thickness of primary member webs and face plates, hull envelope and bulkhead plating is to be not less than:

$$t = 2,15L^{0,3} \text{ mm, or}$$

$$t = 7,5 \text{ mm}$$

whichever is the greater.

10.2.2 The minimum thickness of secondary members is to be determined as above, but need not exceed 11,0 mm.

10.2.3 In pump rooms the minima apply to shell, deck, longitudinal bulkhead and associated longitudinals. For other items solely within the pump room, including transverse bulkheads separating the adjacent machinery spaces from the pump room, the minima may be reduced by 1,0 mm, subject to a lower limit of 7,5 mm.

10.2.4 Within the fore peak tank, minimum thicknesses are to be in accordance with 10.2.1 and 10.2.2 reduced by 1,0 mm but are to be not less than 7,5 mm.

10.3 Geometric properties and proportions of members

10.3.1 The depth of the web of any primary member is to be not less than 2,5 times the depth of the cut-outs for the passage of secondary members, except where compensation is arranged to provide satisfactory resistance to deflection and shear buckling in the web.

10.3.2 The area of material in the face plate of any primary member structure is not to exceed:

$$0,00667d_w t_w \text{ cm}^2$$

nor is it to be less than:

$$0,00417s_t d_w \text{ cm}^2.$$

10.3.3 The geometric properties of rolled stiffeners and built sections are to be calculated in association with an effective width of attached plating in accordance with Pt 3, Ch 3,3.

10.4 Continuity of primary members

10.4.1 Primary members are to be so arranged as to ensure effective continuity of strength throughout the range of tank structure. Abrupt changes of depth or section are to be avoided. Where members abut on both sides of a bulkhead or on other members, arrangements are to be made to ensure that they are in alignment.

10.4.2 The members are to have adequate end fixity, lateral support and web stiffening, and the structure is to be arranged to minimise hard spots or other sources of stress concentration. Openings are to have well rounded corners and smooth edges and are to be located having regard to the stress distribution and buckling strength of the plate panel.

10.5 Primary member web plate stiffening

10.5.1 The webs of primary members are to be supported and stiffened in accordance with the following requirements, which are designated as requirements 'A', 'B', 'C', 'D' and 'E'. The application of these requirements is detailed in 10.7, and the corresponding locations indicated in Fig. 9.10.1. Where webs are slotted for the passage of secondary members, the web stiffeners are to be arranged to provide adequate support for the loads transmitted, see Pt 3, Ch 10,5.2. Where direct calculations are carried out in accordance with 1.1.9 and Section 14, other stiffening arrangements will be accepted subject to compliance with the maximum permissible stress and plate panel buckling criteria given in the *ShipRight SDA Procedure, Guidance Notes on Direct Calculations: Primary Structure of Tankers*.

10.5.2 Where higher tensile steel is used for the primary members, the maximum spacing of stiffeners given in this Section is to be multiplied by \sqrt{k} .

10.5.3 In addition to these stiffeners, tripping brackets as required by 10.11 are also to be fitted.

10.5.4 For requirement 'A' stiffening:

(a) The thickness, t_w of the web is to be not less than $\frac{s}{80}$

(b) Stiffening is generally to be fitted normal to the face plate of the member, but the stiffeners parallel to the face plate will be required when the web depth, d_w , exceeds a value, d_{max} which is to be taken as:

$$\text{for } s \leq 55t_w \quad d_{max} = 3s$$

$$\text{for } s > 55t_w \quad d_{max} = \frac{45s t_w}{s - 40t_w}$$

(c) Where stiffening parallel to the face plate is required, the distance from the face plate of the member to the nearest stiffener is not to exceed $65t_w$. Further stiffeners are to be fitted at similar spacing so that the distance between the last stiffener and the shell or bulkhead plating does not exceed d_{max} . In way of end brackets to transverse bulkhead primary structure, stiffeners are to be fitted normal to the face plate of the member so that web plate panel dimensions parallel to the face plate do not exceed $80t_w$.

10.5.5 For requirement 'B' stiffening:

(a) The thickness, t_w of the web is to be not less than $\frac{s}{85}$

(b) Stiffening is generally to be fitted normal to the face plate of the member, but stiffeners parallel to the face plate will be required when the web depth, d_w , exceeds a value d_{max} , which is to be taken as:

$$\text{for } s \leq 70t_w \quad d_{max} = 3s$$

Double Hull Oil Tankers

Part 4, Chapter 9

Section 10

Fig. 9.10.1 Key to application requirements

$$\text{for } s > 70t_w \quad d_{\max} = \frac{48s t_w}{s - 54t_w}$$

- (c) Where stiffening parallel to the face plate is required, the distance from the face plate of the member to the nearest stiffener is not to exceed $80t_w$. Further stiffeners are to be fitted at similar spacing so that the distance between the last stiffener and the shell or bulkhead plating does not exceed d_{\max} .

10.5.6 For requirement 'C' stiffening:

- (a) Stiffening is generally to be fitted normal to the face plate of the member in line with alternate secondary members, but stiffeners parallel to the face plate will be required, when the web depth, d_w exceeds a value, d_{\max} which is to be taken as:

$$\text{for } s \leq 76t_w \quad d_{\max} = 3s$$

$$\text{for } s > 76t_w \quad d_{\max} = \frac{48s t_w}{s - 60t_w}$$

- (b) Where stiffening parallel to the face plate is required, the distance from the face plate of the member to the nearest stiffener is not to exceed $90t_w$. Further stiffeners are to be fitted at similar spacing so that the distance between the last stiffener and the deck plating does not exceed d_{\max} .

10.5.7 For requirement 'D' stiffening:

- (a) Stiffening parallel to the face plate will be required such that the distance between the stiffener and face plate, or between two stiffeners, does not exceed:
 $80t_w$ where $L \leq 90$ m
 $55t_w$ where $L \geq 190$ m
 with intermediate values by interpolation.
- (b) Brackets are to be fitted to support the face plates and stiffeners.

10.5.8 For requirement 'E' stiffening:

- (a) Stiffening parallel to the face plate will be required such that the distance between the stiffener and face plate, or between two stiffeners, does not exceed:
 $85t_w$ where $L \leq 90$ m
 $60t_w$ where $L \geq 190$ m
 with intermediate values by interpolation.
- (b) Brackets are to be fitted to support the face plates and stiffeners.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 10

10.6 Inertia and dimensions of stiffeners

10.6.1 The moment of inertia is to be not less than:

- (a) For stiffeners normal to the primary member face plate:

$$I_s = \rho s t_w^3 \times 10^{-4} \text{ cm}^4$$

where

t_w need not be greater than the values in Table 9.10.1 and

ρ is to be obtained from Table 9.10.2.

- (b) For stiffeners parallel to the primary member face plate:

On transverses, webs and stringers

$$I_s = 2I_s^2 A_s \text{ cm}^4$$

On longitudinal deck, side and double bottom girders, see also Pt 3, Ch 4,7

$$I_s = 2,85 I_s^2 A_s \text{ cm}^4$$

Table 9.10.1 Maximum web thickness for stiffener inertia

Requirement	Web thickness t_w , in mm
'A'	$\frac{s}{55}$
'B' and 'C'	$\frac{s}{70}$
'D'	$\frac{s}{80}$ where $L \leq 90 \text{ m}$
	$\frac{s}{55}$ where $L \geq 190 \text{ m}$ } see Note
'E'	$\frac{s}{85}$ where $L \leq 90 \text{ m}$
	$\frac{s}{60}$ where $L \geq 190 \text{ m}$ } see Note
NOTE Intermediate values by interpolation.	

10.6.2 Where stiffeners are fitted in both directions, the inertia of the stiffeners parallel to the face plate of the member is to be not less than that of the stiffeners fitted normally.

10.6.3 The depth of web stiffeners is to be not less than 75 mm.

10.6.4 Where flat bar stiffeners are used, the ratio of depth to thickness is not to exceed $18\sqrt{k}$.

Table 9.10.2 Coefficients for stiffener inertia

Aspect ratio of plate panel, $\frac{s}{d}$	1,0 or more	0,9	0,8	0,7	0,6	0,5	0,4	0,3 or less
ρ	1,5	2,1	2,9	4,2	6,1	9,2	14,6	30,0
NOTES 1. Intermediate values by interpolation. 2. The depth of panel, d , used in calculating aspect ratio may be measured from the face of the secondary member to which the primary member web stiffener is attached.								

10.7 Application of stiffening requirements

10.7.1 The requirements as detailed in 10.5 and 10.6 are to be applied in the following locations, see also Fig. 9.10.1.

- (a) For transverses at longitudinal bulkhead:

Requirement 'A' stiffening is to extend at least as far as the lower surface of the lower cross-tie. Elsewhere, requirement 'B' stiffening is to be fitted.

- (b) For deck transverses:

Requirement 'C' stiffening is to be fitted.

- (c) For stringers and horizontal girders on bulkheads:

Requirement 'A' stiffening is to extend for a distance from each end of 20 per cent of the span of the stringer or girder, but at least beyond the toes of the end brackets. Elsewhere, requirement 'B' stiffening is to be fitted.

- (d) For cross-ties:

Cross-ties are to be suitably stiffened to prevent buckling and twisting. Requirement 'D' stiffening is to be fitted to the lower or to a single cross-tie. Requirement 'E' stiffening is to be fitted to the upper cross-ties where two cross-ties are arranged.

- (e) For shell stringers and vertical webs in fore peak:

Requirement 'A' stiffening is to extend the full length of the member.

10.7.2 The application of stiffening requirements to transverse structures where no cross-ties are fitted and within double hull structures are to be based on the results of direct calculation and will be specially considered.

10.8 Stiffening of continuous longitudinal girders

10.8.1 The webs of continuous longitudinal deck and double bottom girders are to be stiffened longitudinally. Particular attention is to be given to the stiffening of docking girders, see also the buckling requirements in Pt 3, Ch 4,7.

10.8.2 The stiffeners on deck girders are to be spaced not more than $55t_w$ mm apart except in way of vertical webs and end brackets, where the spacing is not to exceed $45t_w$ mm. Alternatively, a combination of parallel stiffeners at $55t_w$ mm spacing and normal stiffeners at $45t_w$ mm spacing may be adopted. Particular attention is to be given to the stiffening of the docking girder.

10.8.3 The application of stiffening requirements to girders within double hull structures is to be based on the results of direct calculation, see also 10.10.1.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 10

10.8.4 The moment of inertia of the stiffeners is to comply with 10.6.

10.9 Stiffening of vertical webs on transverse bulkheads

10.9.1 Vertical webs are to be fitted with stiffeners parallel to the face plate of the web and spaced not more than $60t_w$ mm apart. Stiffeners normal to the face plate are to be fitted when a vertical web supports horizontal stiffeners on transverse bulkheads. The length of stiffener is to be sufficient to distribute the load transmitted, and the connection between web stiffener and bulkhead stiffener is to comply with the relevant requirements of Pt 3, Ch 10,5.2.

10.9.2 The moment of inertia of the stiffeners is to comply with 10.6.

10.10 Double bottom girders in way of docking supports

10.10.1 Additional vertical stiffeners may be required on the bottom panels of the girder to resist docking pressures.

10.11 Lateral stability of primary members

10.11.1 Tripping brackets are generally to be fitted close to the toes of end brackets, in way of cross-ties and elsewhere, so that the spacing between brackets does not exceed the lesser of 4,5 m or 15 times the width of the face plate (20 times in the case of deck transverses). Arrangements in way of the intersections of primary members are to be such as to prevent tripping. A closer spacing of brackets may be required to be adopted with asymmetrical face plates.

10.11.2 To maintain continuity of strength, substantial horizontal and vertical brackets are to be fitted to transverses or stringers at ends of cross-ties. Horizontal brackets are to be aligned with the cross-tie face plates, and vertical end brackets are to be aligned with the cross-tie web.

10.11.3 Wide face plates may require additional support between brackets.

10.11.4 In the fore peak tank, if the angle between the normal to the shell plating and the vertical webs exceeds 20° , tripping brackets are to be fitted at the toes of end brackets and elsewhere, such that their spacing does not exceed 3 m.

10.12 Openings in web plating

10.12.1 Where openings are cut in the webs of primary supporting members, the greatest dimension of the opening is not to exceed 20 per cent of the web depth. The openings are to be kept equidistant from the corners of notches for frames and stiffeners. In the case of webs supporting single skin structures the openings are to be located so that the edges are not less than 40 per cent of web depth from the face plate. Openings are to be suitably framed where required.

10.12.2 In way of cross-ties and their end connections lightening holes are not to be cut in horizontal girders on the ship's side and longitudinal bulkheads, in symmetrical webs nor in vertical webs on longitudinal bulkheads and wing ballast tanks.

10.12.3 Holes cut in primary longitudinal members within $0,1D$ of the deck and bottom are, in general, to be reinforced as required by 4.10. Access holes may be cut in deep transverses and girders with suitable compensation to provide satisfactory resistance to deflection and shear buckling in the web.

10.12.4 All holes are to have smooth edges and are to be kept well clear of notches and the toes of brackets.

10.12.5 Small air and drain holes cut in primary members are to be kept clear of the toes of brackets and are to be well rounded with smooth edges. Where holes are cut in primary longitudinal members in areas of high stress, or where primary members are of higher tensile steel, they are to be elliptical, or equivalent, to minimise stress concentration.

10.12.6 Where holes are cut for heating coils, the lower edge of the hole is to be not less than 100 mm from the inner bottom. Where large notches are cut in the transverses for the passage of longitudinal framing, adjacent to openings for heating coils, the longitudinal notches are to be collared. Examination of the buckling strength of the web plate panel between notches for longitudinals may be required.

10.13 Brackets connecting primary members

10.13.1 The arm length of brackets connecting primary supporting members should, in general, be not less than the depth of the member web, nor exceed 1,5 times the web depth. The two arms should be of approximately equal lengths.

10.13.2 In a ring system where the end bracket is integral with the webs of the members, and the face plate is carried continuously along the edges of the members and the bracket, the full area of the largest face plate is to be maintained to the mid-point of the bracket and gradually tapered to the smaller face plates. Butts in face plates are to be kept well clear of the toes of brackets. Where a wide face plate abuts on a narrower one, the taper is generally not to exceed 1 in 4. Where a thick face plate abuts against a thinner one, if the difference in thickness exceeds 3 mm, the taper on thickness is not to exceed 1 in 3.

10.13.3 The thickness of separate end brackets is generally to be not less than that of the thicker of the primary member webs being connected, but may be required to be increased locally at the toes. The bracket is to extend to adjacent tripping brackets, stiffeners or other support points. Bracket toes are to be well radiused. Where the bracket is attached to a corrugated bulkhead, suitable arrangements are to be made to dissipate the load at the bracket toe. Details of the welding to be used in way of toes of separate brackets are to be submitted, see also Pt 3, Ch 10,5.1.7.

Double Hull Oil Tankers

Part 4, Chapter 9

Sections 10 & 11

10.13.4 Brackets are to be fitted with suitable face plates and stiffeners. The maximum distance from the face plate to the first parallel stiffener is to be $30t_b$. Subsequent stiffeners lying parallel to the face may be spaced not more than $45t_b$ apart. The maximum arm length for an unstiffened triangular panel is $100t_b$, see Fig. 9.10.2. The depth of stiffeners is to be not less than 75 mm, and their moment of inertia is to comply with 10.6.

10.13.5 The area of discontinuous face plates is generally to be about 80 per cent of the area of the face plates of the adjacent members. However, where the stiffener adjacent to the face plate is of increased size, consideration will be given to the face area required. In addition, the following expression is to be satisfied:

$$\sqrt{\frac{I_b}{A_b}} \geq 2 l_b.$$

10.13.6 The ends of discontinuous face plates are to be well tapered. The taper may be 1 in 3, but where the width of the face plate exceeds 500 mm, a taper not less than 1 in 4 is generally to be adopted. Stiffeners adjacent to the face plate should be tapered 1 in 2, and other stiffeners may be cut at 45° .

10.13.7 Face plates and web stiffeners are to be suitably supported against tripping, see Fig. 9.10.2.

10.13.8 In the case of very large brackets with heavy face plates, it is recommended that the effective span, l_b , be reduced by extending the primary member main supporting brackets to provide lateral stability to the face plate, see Fig. 9.10.2.

10.14 Arrangements at intersections of continuous secondary and primary members

10.14.1 For details and connections of collars, see Pt 3, Ch 10.5.2.

Section 11 Ships for alternate carriage of oil cargo and dry bulk cargo

11.1 Application

11.1.1 The requirements of this Section apply to ships intended to carry oil in bulk with a flash point not exceeding 60°C (closed cup test) or dry bulk cargo alternatively.

11.1.2 In addition to this Chapter the requirements of Chapter 7 and Chapter 11 are also to be complied with as applicable. Particular attention is drawn to the minimum thickness requirements of Section 10.

11.2 Class notations

11.2.1 Ships complying with the requirement of this section will be eligible for one of the following class notations, as applicable.

- (a) 100A1 Oil or Bulk Carrier, ESP
- (b) 100A1 Oil or Bulk Carrier strengthened for heavy cargoes, holds ... may be empty, ESP
- (c) 100A1 Oil or Bulk Carrier strengthened for heavy cargoes, any hold may be empty, ESP
- (d) 100A1 Ore or Oil Carrier, ESP.

11.2.2 The notation **ESP** serves to identify the ship as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3,3 and Ch 3,6, see also Pt 1, Ch 2,2.3.12.

11.2.3 The above notations assume that dry cargoes and oil cargoes will not be carried simultaneously. However, oil may be retained in slop tanks when the ship is carrying dry cargo, provided that these tanks comply with the requirements of the Rules. Gas freeing, inerting, and isolating by approved arrangements of the remaining tanks and holds before loading ore or other dry cargoes is the responsibility of the Owner and is to be accordance with National and Port Authority requirements.

11.2.4 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2 to which reference should be made.

Double Hull Oil Tankers

Part 4, Chapter 9

Section 11

11.3 Structural configuration and ship arrangement

11.3.1 The requirements contained in this Section apply to the following ship types:

- (a) Oil or bulk carrier with a basic structural configuration having a single deck hull and which includes, a double skin side structure, double bottom, hopper side tanks and topside tanks fitted below the upper deck. A typical cross section is indicated in Fig. 9.11.1(a). However, consideration will be given to other arrangements on the basis of the requirements of this Section. The requirements of Chapter 7 are to be applied.
- (b) Ore or oil carrier with a basic structural configuration having a single deck hull and which includes, a double skin side structure, two longitudinal bulkheads, and a double bottom throughout the centre hold and wing tanks. A typical cross section is indicated in Fig. 9.11.1(b). The requirements of Chapter 11 are to be applied.

Fig. 9.11.1 Structural configuration

11.3.2 Where oil residues are to be retained on board, slop tanks of sufficient capacity to meet MARPOL requirements are to be provided and are to be separated from adjacent spaces by cofferdams which are to be capable of being flooded, except where the adjacent space is used as a pump room, ballast tank, or an oil fuel bunker tank, *see also* 1.2.2, Pt 5, Ch 15,1.9, and SOLAS Reg. II-2/D, 56.4.

11.3.3 Arrangements are to be provided for the mechanical ventilation of cargo spaces and any enclosed spaces adjacent to cargo spaces, *see* Pt 5, Ch 15,3. Similar arrangements are to be provided for cargo oil ducts which are used as pipe tunnels when the ship is carrying dry cargo, *see also* 11.3.5.

11.3.4 Openings which may be used for cargo operations, for example in the bottom of topside tanks, are not permitted in bulkheads and decks separating oil cargo spaces from other spaces not designed and equipped for the carriage of oil cargoes unless such openings are equipped with alternative approved means to ensure equivalent integrity.

11.3.5 For the requirements of ducts for cargo oil lines below decks on ore or oil carriers, *see* Pt 5, Ch 15,3.3.

11.3.6 For the requirements for access arrangements to pipe tunnels and spaces in the cargo area, *see* Section 13.

11.4 Bulkheads in way of dry/oil cargo holds

11.4.1 In way of cargo oil holds, the scantlings of the cargo space boundaries are to comply with 11.4.2 and 11.4.6.

11.4.2 The scantlings of vertically corrugated and double plate transverse bulkheads supported by stools are to be determined in accordance with the requirements of 7.4.1, 7.4.2 and Ch 7,10.2. In general, the bulkheads are to have stiffening or corrugations arranged vertically, supported by top and bottom end stools. Alternative arrangements will, however, be considered.

11.4.3 The longitudinal bulkheads including bulkhead forming inner hull, and the sloped bulkheads of the topside and double bottom tanks are to comply with Section 6. However, in way of cargo holds b_1 is to be taken as the horizontal distance from the plate or longitudinal under consideration to the vertical projection of the hatch side furthest away from the bulkhead. For longitudinal framing the determination of the span point may be in accordance with Pt 3, Ch 3,3. The scantlings of the sloped bulkhead of the double bottom hopper tanks in way of the dry cargo holds are to be not less than the requirements of Ch 7,9.

11.4.4 The arrangement of stools and adjacent structure common with dry cargo holds is to be designed to avoid pockets in which gas could collect.

11.4.5 Where the form of construction used for transverse bulkheads in wing tanks is different from that used in centre holds, arrangements are to be made to ensure continuity of transverse strength through the longitudinal bulkhead.

11.4.6 Where partial filling of centre holds with liquid is contemplated, the scantlings and structural arrangements of the boundary bulkheads are to be capable of withstanding the loads imposed by the movement of liquid in the holds. The magnitude of the predicted loadings, together with the scantling calculations, may require to be submitted.

Double Hull Oil Tankers

Part 4, Chapter 9

Sections 11, 12 & 13

11.5 Bulkheads in wing tanks of ore or oil carriers

11.5.1 Oiltight bulkheads in wing tanks of ore or oil carriers, see 11.3.1(b), are to comply with the requirements for transverse oiltight bulkhead plating, stiffening and primary structure given in Sections 7 and 9.

11.5.2 Non-oiltight bulkheads in wing tanks are to comply with the requirements given in Sections 8 and 9. The bulkhead plating is to be suitably reinforced in way of double bottom scarfing arrangements and the ends of centre hold deck transverses. Openings in wing tank bulkheads are to be kept clear of these areas.

11.6 Cofferdam bulkheads

11.6.1 The scantlings of cofferdam bulkheads not forming the boundary of a cargo space are to be as required by Section 7.

11.7 Hatchways

11.7.1 The scantlings of the cargo hold hatch coamings are to comply with Pt 3, Ch 11,5 and the cargo hold hatch covers with Pt 3, Ch 11,2 and Pt 4, Ch 7,12.

11.7.2 Where cargo holds are intended to be partly filled the hatch covers may require to be additionally strengthened, see also 11.4.6.

11.7.3 Slop tank hatches and cleaning openings are only permitted on open deck. Unless these openings are closed with a watertight bolted plate, the locking arrangements are to be under the control of a responsible officer.

11.8 Hatch coamings

11.8.1 The height and construction of hatch coamings are to comply with Pt 3, Ch 11,5 and Pt 4, Ch 7,13.

Section 12 Heated cargoes

12.1 General

12.1.1 This Section applies to the carriage of heated cargoes in vessels having a structural configuration as shown in Table 9.1.3 and Fig. 9.11.1.

12.2 Carriage of heated cargoes

12.2.1 Where cargoes are to be carried at temperatures above T during the voyage, temperature distribution investigations and thermal stress calculations are to be submitted. These are to be carried out using the actual temperature of the cargo during the voyage and compared with calculations carried out for a cargo temperature of T . For the purpose of

these calculations, T is to be taken as follows:

- (a) Where longitudinal framing is adopted, $T = 65^{\circ}\text{C}$.
- (b) Where transverse framing is adopted for the longitudinal bulkhead, inner hull and side shell, $T = 80^{\circ}\text{C}$.

12.2.2 The calculations are to give the resultant stresses on the hull structure, based on a sea temperature of 0°C and an air temperature of 5°C . Any proposals for reinforcement of the hull structure and/or limitation of the still water bending moment for heated cargo conditions are to be submitted.

12.2.3 Submitted proposals are to take account of non-uniform loading patterns with resultant variations in temperature distribution, where applicable.

12.3 Loading of hot oil cargoes

12.3.1 Hot oil cargoes may be loaded at the permitted carriage temperature in 12.2.1 or the temperature given below, whichever is the greater, without the need for temperature distribution and thermal stress calculations, providing the temperature specified in 12.2.1(a) and (b) is not exceeded during the voyage:

- (a) 65°C for sea temperatures of 0°C and below.
- (b) 75°C for sea temperatures of 5°C and above.
- (c) By linear interpolation between (a) and (b) above, for sea temperatures between 0°C and 5°C .

Section 13 Access arrangements and closing appliances

13.1 General

13.1.1 For requirements in respect of coamings and closing of deck openings, see Pt 3, Ch 11,7.

13.1.2 Openings in cargo oil tanks are not to be located in enclosed spaces.

13.1.3 Ladders and platforms in cargo tanks, pump rooms and cofferdams are to be securely fastened to the structure, see also 2.3.

13.2 Access to spaces in the cargo area

13.2.1 Access to cofferdams, vertical wing and double bottom ballast tanks, cargo tanks and other spaces in the cargo area shall be direct from the open deck and such as to ensure their complete inspection. Access to double bottom tanks in way of cargo oil tanks, where wing ballast tanks are omitted, is to be provided by trunks from the exposed deck led down the bulkhead. Alternative proposals will, however, be considered provided the integrity of the inner bottom is maintained. Access to double bottom spaces may also be through a cargo pump room, pump room, deep cofferdam, pipe tunnel or similar compartments, subject to consideration of ventilation aspects.

Double Hull Oil Tankers

Part 4, Chapter 9

Sections 13 & 14

13.2.2 Where a duct keel or pipe tunnel is fitted, and access is normally required for operational purposes, access is to be provided at each end and at least one other location at approximately mid-length. Access is to be directly from the exposed deck. Where an after access is to be provided from the pump room to the duct keel, the access manhole from the pump room to the duct keel is to be provided with an oiltight cover plate. Access is not to be via the engine room. Mechanical ventilation is to be provided and such spaces are to be adequately ventilated prior to entry. A notice-board is to be fitted at each entrance to the pipe tunnel stating that before any attempt is made to enter, the ventilating fan must have been in operation for an adequate period. In addition, the atmosphere in the tunnel is to be sampled by a reliable gas monitor, and where an inert gas system is fitted in cargo tanks, an oxygen monitor is to be provided.

13.2.3 In ships for the alternate carriage of oil cargo and dry bulk cargo where the boundary of a slop tank is part of a cargo pump room bulkhead any openings from the cargo pump room to the double bottom, pipe tunnel or other enclosed space are to be provided with a gas tight bolted cover.

13.2.4 Every double bottom space is to be provided with separate access without passing through other neighbouring double bottom spaces.

13.2.5 Where the tanks are of confined or cellular construction, two separate means of access from the weather deck are to be provided, one to be provided at either end of the tank space.

13.2.6 For access through horizontal openings, hatches or manholes, the dimensions are to be sufficient to allow a person wearing a self-contained air-breathing apparatus and protective equipment to ascend or descend any ladder without obstruction and also to provide a clear opening to facilitate the hoisting of an injured person from the bottom of the space. The minimum clear opening is to be not less than 600 mm x 600 mm.

13.2.7 At least one horizontal access opening of 600 mm x 800 mm clear opening is to be fitted in each horizontal girder in the vertical wing ballast space and weather deck to assist in rescue operations.

13.2.8 For access through vertical openings, or manholes providing passage through the length and breadth of the space, the minimum clear opening is to be not less than 600 mm x 800 mm at a height of not more than 600 mm from the bottom shell plating unless gratings or other footholds are provided.

13.2.9 For oil tankers of less than 5000 tonnes DWT smaller dimensions may be approved by the National Administration concerned in special circumstances, if the ability to traverse such openings or to remove an injured person can be proved to the satisfaction of the Administration.

13.2.10 In double hull construction with the wing ballast tanks having restricted access through the vertical transverse webs, permanent arrangements are to be provided within the tanks to permit access for inspection at all heights in each bay. These arrangements which should comprise fixed platforms or other means are to provide sufficiently close access to carry out Close-Up Surveys as defined in Pt 1, Ch 3,7, using limited portable equipment where appropriate. Details of these arrangements are to be submitted for approval.

13.2.11 On very large tankers it is recommended that consideration be given to providing permanent facilities for staging the interior of cargo tanks situated within the cargo tank region and of large tanks elsewhere. Suitable provisions would be:

- Staging which can be carried on board and utilised in any tank, including power-operated lift or platform systems.
- Enlargement of structural members to form permanent, safe platforms, e.g. bulkhead longitudinals widened to form stringers (in association with manholes through primary members).
- Provision of inspection/rest platforms at intervals down the length of access ladders.
- Provision of manholes in upper deck for access to staging in cargo tanks.

13.2.12 Attention is drawn to 7.1.7, concerning provision of manholes in transverse bulkheads.

Section 14 Direct calculations

14.1 Application

14.1.1 Direct calculations are to be carried out for the derivation of scantlings where they are required by the preceding Sections of this Chapter or by related provisions included in Part 3.

14.1.2 Direct calculation methods are also generally to be used where additional calculations are required by the Rules in respect of unusual structural arrangements.

14.2 Procedures

14.2.1 For details of LR's direct calculation procedures, see Pt 3, Ch 1,2. For requirements concerning use of other calculation procedures, see Pt 3, Ch 1,3.

14.2.2 Details of direct calculation procedures for determining the scantlings of boundary bulkheads for partially filled tanks are given in *ShipRight SDA Procedure, Sloshing loads and Scantling Assessment*.

Single Hull Oil Tankers

Part 4, Chapter 10

Sections 1 & 2

Section

- 1 **General**
- 2 **Primary members supporting longitudinal framing**
- 3 **Primary members supporting transverse side framing**
- 4 **Primary members supporting oiltight bulkheads**
- 5 **Primary members supporting non-oiltight bulkheads**
- 6 **Trunked construction**
- 7 **Construction details and minimum thickness**

■ Section 1 General

1.1 Application

1.1.1 The requirements specified in Chapter 9 are applicable to small conventional single hull oil tankers where relevant, together with the additional requirements of this Chapter.

1.1.2 For tankers intended to load or unload whilst aground, see Pt 3, Ch 9,9.

1.2 Class notations

1.2.1 Sea-going ships complying with the requirements of Chapter 9, where relevant, together with the additional requirements of this Chapter will be eligible to be classed **100A1 Oil Tanker, ESP**.

1.2.2 The Notation **ESP** serves to identify the ships as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3,3 and Ch 3,6, see also Pt 1, Ch 2,2.

■ Section 2 Primary members supporting longitudinal framing

2.1 General

2.1.1 These requirements are applicable to the following structural arrangements for ships with two longitudinal bulkheads:

- (a) Centre tank structure:
 - (i) Primary supporting centreline girder between oiltight transverse bulkheads, in association with up to five transverses.

- (ii) Bottom transverses spanning between longitudinal bulkheads in association with a non-primary centreline docking girder.
- (iii) Double bottom.
- (b) Wing tank structure:
 - (i) Transverse ring structure consisting of bottom, side shell, longitudinal bulkhead and deck transverses and incorporating one cross-tie or no cross-ties in tankers not exceeding 75 m in length.
 - (ii) Double bottom.

2.1.2 The requirements are also applicable to structural arrangements incorporating a single longitudinal bulkhead located on the ship's centreline without cross-ties, for tankers not exceeding 75 m in length.

2.1.3 The minimum thickness and constructional detail requirements of Section 7 are to be complied with. Particular attention is to be paid to the design of end connections between primary members and buttresses. The shear and combined stress levels in these connections are to be examined and should be within the limits specified in *ShipRight SDA Procedure, Guidance Notes on Direct Calculations*.

2.2 Symbols

2.2.1 The symbols used in this Section are defined as follows:

- b_{e1}, b_{e2} = effective end bracket leg length, in metres, at each end of the member, see Pt 3, Ch 3,3
- b_T = overall breadth of tank, in metres
- h_b = $0,75D + 2,45$ m
- h_c = vertical distance from the centre of the cross-tie to deck at side amidships, in metres
- h_s = distance between the lower span point of the side transverse and the moulded deck line at side, in metres
- l_c = one-half the vertical distance, in metres, between the cross-tie and the centre of the adjacent bottom or deck transverse, or double bottom, see Fig. 10.2.3
- l_T = overall length of tank, in metres
- s = spacing of transverses, in metres
- A = net sectional area of the web including end bracket where applicable, in cm^2
- I_G = moment of inertia of the girder, in cm^4
- I_T = moment of inertia of the transverse, in cm^4
- Q_x = shear force at the actual section under consideration, obtained from shear force diagrams constructed as indicated, in kN (tonne-f)
- S_c = length of cross-tie between the face plates on the vertical transverse webs at the cross-ties, in metres
- S_G = span of girder, in metres, and is in no case to be taken less than $(l_T - 1,8s)$ metres
- S_s = span of the side transverses, in metres, and is to be measured between end span points, see Fig. 10.2.3
- S_T = span of transverses, in metres.

2.2.2 Other symbols are defined in Ch 9,1.6.

2.3 Structural arrangements

2.3.1 The spacing of transverses is not to exceed 3,6 m.

2.3.2 Where a trunk is fitted, the scantlings of primary members are to be modified as required by Section 6.

2.4 Bottom structure coefficients

2.4.1 Where a primary supporting bottom centreline girder is fitted, in a single bottom, the requirements for the girder and transverses may be derived using bending moment and shear force coefficients K_1 and K_2 determined from Table 10.2.1. To obtain the coefficients, the following factors are required:

$$\alpha = \frac{I_T - S_G}{2s}$$

$$\beta = \frac{S_G^3 I_T}{S_T^3 I_G}$$

Initially, an estimated value of the ratio $\frac{I_T}{I_G}$ may be used, and

an iterative process adopted to obtain the final required values.

2.4.2 Where bottom transverses are fitted in association with a non-primary centreline girder the coefficients for the transverse are to be taken as:

$$K_1 = 0,083$$

$$K_2 = 0,50$$

For the requirements for the non-primary girder, see 2.6.

2.4.3 In ships with one longitudinal bulkhead, the coefficient for the bottom transverse is to be taken as:

$$K_1 = 0,177.$$

2.5 Bottom transverses

2.5.1 The section modulus of bottom transverses is to be not less than:

$$Z = 62K_1 s h_b S_T^2 k \text{ cm}^3$$

2.5.2 In ships with two longitudinal bulkheads, the depth of the bottom transverse web plate is to be not less than $0,2S_T$ and the net sectional area of the web at any section, including vertical end connections, is to be not less than:

$$A = 0,12Q_x k \text{ cm}^2$$

$$\left(A = \frac{Q_x k}{0,85} \text{ cm}^2 \right)$$

where

Q_x is calculated from shear force diagrams constructed as shown in Fig. 10.2.1. For end connections, Q_x is to be determined by projection of the shear force diagram as indicated.

2.5.3 The moment of inertia of bottom transverses is to be not less than:

$$I = \frac{10,5}{k} S_T Z \text{ cm}^4.$$

2.6 Bottom girders

2.6.1 The section modulus of the primary centreline bottom girder, where fitted, is to be not less than:

$$Z = 31K_1 b_T S_G h_b s k \text{ cm}^3.$$

2.6.2 The net sectional area of the web at any section, including vertical end connections, is to be not less than:

$$A = 0,12Q_x k \text{ cm}^2$$

$$\left(A = \frac{Q_x k}{0,85} \text{ cm}^2 \right)$$

where Q_x is calculated from a shear force diagram constructed as shown in Fig. 10.2.2. For end connections, Q_x is to be determined by projection of the shear force diagram as indicated.

2.6.3 In a single bottom the section modulus and web area of a non-primary centreline docking girder are to be not less than:

$$Z = 3,6b_T D s^2 k \text{ cm}^3$$

$$A = 0,3b_T D s k \text{ cm}^2.$$

The scantlings of this girder may, however, be required to be increased, depending upon the docking condition and support arrangements, details of which are to be submitted. Consideration may be required to be given to restricting the level of ballast tank filling for docking purposes. The loads are to be specially considered when wing tanks are ballasted for docking.

2.6.4 Consideration will be given to alternative methods of stiffening in way of the keel blocks when accompanied by supporting calculations.

2.6.5 In way of the vertical centreline web and centreline supports to horizontal girders of transverse bulkheads, the docking girder is to be increased in depth and scantlings as necessary to provide an effective support.

2.7 Side transverses

2.7.1 The section modulus of side transverses in ships with one or two longitudinal bulkheads is to be not less than:

$$Z = K_3 s h_s S_s^2 k \text{ cm}^3$$

where

K_3 is given in Table 10.2.2.

Single Hull Oil Tankers

Single Hull Oil Tankers

Part 4, Chapter 10

Section 2

Fig. 10.2.1 Bottom transverses

Fig. 10.2.2 Bottom centreline girder

2.7.2 In ships with two longitudinal bulkheads, the net sectional area of the web at any section is to be not less than:

$$A = 0,12Q_x k \text{ cm}^2$$

$$\left(A = \frac{Q_x k}{0,85} \text{ cm}^2 \right)$$

where Q_x is calculated from shear force diagrams constructed as shown in Fig. 10.2.3. For this purpose the values of K_4 and K_5 and the range of application is given in Table 10.2.2.

Fig. 10.2.3 Wing tank construction

2.7.3 The moment of inertia of side transverses is to be not less than:

$$I = \frac{7,5}{k} S_s Z \text{ cm}^4.$$

2.8 Deck transverses

2.8.1 The section modulus of deck transverses is to be not less than:

$$Z = 53,75 (0,0269sL + 0,8) (S_T + 1,83) k \text{ cm}^3$$

Where a continuous deck girder is fitted, the term S_T in the above formula is to be replaced by $\frac{S_T}{2}$.

Table 10.2.2 Side transverse coefficients

Number of cross-ties	K_3	K_4	K_5	Range of application
0	8	Not applicable		$L \leq 75 \text{ m}$, see 2.3.
1	2,16	$0,455 - 0,316\alpha$	0,103	$0,5 \leq \alpha \leq 0,7$

Single Hull Oil Tankers

Part 4, Chapter 10

Sections 2 & 3

2.8.2 The net sectional area of the web is to satisfy the requirements of 2.5.2 using a head, $h_b = \frac{L_1}{56}$ m.

2.8.3 The moment of inertia of the transverses is to be not less than:

$$I = \frac{7,5}{k} S_T Z \text{ cm}^4.$$

2.9 Deck girders

2.9.1 Where a continuous deck centreline girder supporting deck transverses is fitted, it is to have a section modulus not less than:

$$Z = 0,0476 S_G^2 b_T L k \text{ cm}^3.$$

2.9.2 The net sectional area of the web is to satisfy the requirements of 2.6.2 using a head, $h_b = \frac{L_1}{56}$ m.

2.9.3 In way of the vertical centreline web on transverse bulkheads, the continuous deck girder is to be increased in depth and scantlings as necessary to provide an effective support.

2.9.4 Where an intercostal deck girder is fitted, it is to have a depth not less than 50 per cent of the depth of the deck transverse and the area of the face flat is to be not less than that of the transverse.

2.9.5 In way of the vertical centreline web and centreline supports to horizontal girder on transverse bulkheads, the intercostal deck girder may be required to be increased in depth and scantlings to provide an effective support.

2.10 Cross-ties

2.10.1 Cross-ties, where fitted, may be of plate or sectional material and are to have an area and least moment of inertia not less than:

$$A = (64 + 1,035 I_C h_C s) k \text{ cm}^2$$

$$I = 2,45 I_C h_C s S_C^2 \text{ cm}^4.$$

2.10.2 Design of end connections is to be such that the area of the welding, including vertical brackets, where fitted, is to be not less than the minimum cross-sectional area of the cross-tie derived from 2.10.1. To achieve this full penetration may be required and thickness of brackets may require further consideration. Attention is to be given to the full continuity of area of the backing structure on the transverses. Particular attention is also to be paid to the welding at the toes of all vertical end brackets on the cross-tie.

2.11 Double bottom girders and floors

2.11.1 The scantlings of girder and floors are to satisfy the requirements of Ch 1,8.3 and Ch 1,8.5 respectively for longitudinally framed ships.

Section 3 Primary members supporting transverse side framing

3.1 General

3.1.1 The requirements of this Section are applicable to side stringers and transverse webs associated with transverse framing.

3.1.2 The minimum thickness and constructional detail requirements of Section 7 are to be complied with.

3.2 Symbols

3.2.1 The symbols used in this Section are defined as follows:

h_1 = head, in metres, from stringer to highest point of tank excluding hatchway, but not less than 2,5 m

Q_x = shear force at the actual section under consideration, obtained from shear force diagrams constructed as indicated, in kN (tonne-f)

S_1 = span, in metres, of the horizontal girder measured between span points, but to be taken not less than the lesser of $(1,2 + 0,02L)$ m or 3 m.

3.2.2 Other symbols are defined in Ch 9,1.6.

3.3 Structural arrangements

3.3.1 Side shell stringers are to be fitted as required by Table 10.3.1. Alternatively, the number of stringers may be derived by direct calculation, particular regard being given to secondary bending effects on the frames supported.

Table 10.3.1 Requirements for stringers

Ship depth, in metres	Number of stringers
$D \leq 6,0$	0
$6,0 < D \leq 7,5$	1
$7,5 < D \leq 11,0$	2

3.3.2 Where the spacing of bulkheads (oiltight or non-oiltight) exceeds 15 m, side transverses are to be fitted in line with each bottom transverse.

3.3.3 Where side transverses are not required, bottom transverses are to be adequately supported at the side shell and longitudinal bulkhead, and the lower side stringer is to be suitably buttressed from the bottom transverse.

3.3.4 Cross-ties, where fitted, are to comply with the requirements of 2.10 and are, in general, to be aligned with the stringers.

3.3.5 Where the ship is fitted with a trunk, the scantlings as given in this Section are to be modified as required by Section 6.

Single Hull Oil Tankers

Part 4, Chapter 10

Sections 3 & 4

3.4 Scantlings

3.4.1 The section modulus of side stringers is to be not less than:

$$Z = 10b h_1 S_1^2 k \text{ cm}^3.$$

3.4.2 The net sectional area of the web at any section is to be not less than:

$$A = 0,12Q_x k \text{ cm}^2$$

$$\left(A = \frac{Q_x k}{0,85} \text{ cm}^2 \right)$$

where Q_x is calculated from a shear force diagram constructed using the shear force at the span point, Q_1 given by the following:

$$Q_1 = 5,03s h_1 S_1 \text{ kN}$$

$$(Q_1 = 0,513s h_1 S_1 \text{ tonne-f}).$$

3.4.3 The moment of inertia of the stringer is to be not less than:

$$I = S_1 Z \frac{7,5}{k} \text{ cm}^4.$$

3.4.4 Where side transverses supporting side stringers are fitted, they are to have a section modulus not less than that required by 2.7. Where the side transverse does not support side stringers, the section modulus required by 2.7 may be reduced by 20 per cent.

Section 4 Primary members supporting oiltight bulkheads

4.1 General

4.1.1 These requirements are applicable to ships having two longitudinal bulkheads, and to ships not exceeding 75 m in length having one longitudinal bulkhead located on the centreline of the ship.

4.1.2 The minimum thickness and construction detail requirements of Section 7 are to be complied with. Particular attention is to be paid to the design of end connections between primary members and buttresses. Where considered necessary, the shear and combined stresses in the connections may require to be examined and the scantlings and stiffening increased.

4.2 Symbols

4.2.1 The symbols used in this Section are defined as follows:

h = the distance from the centre of the load on the member to a point 2,45 m above the highest point of the tank, excluding the hatchway, in metres

Q_x = shear force at the actual section under consideration, obtained from shear force diagrams constructed as indicated, in kN (tonne-f).

4.2.2 Other symbols are defined in Ch 9, 1.6.

4.3 Structural arrangements

4.3.1 Where horizontal girders and vertical webs do not form part of a ring structure, they are to be arranged with substantial end brackets forming a buttress extending to the adjacent vertical web or transverse.

4.3.2 Where the cross-ties are omitted from the transverse ring in the wing tank adjacent to the bulkhead, the design of the horizontal girder, of the end buttress and of the transverse is to take account of the loads imposed and the deflection of the structure.

4.3.3 The spacing of transverses on longitudinal bulkheads is not to exceed 3,6 m.

4.3.4 Where, on ships with transverse side framing, transverses are required by Section 3, vertical webs are also to be fitted in line on the longitudinal bulkhead. Where such vertical webs are not required the lower horizontal girder on the bulkhead is to be suitably buttressed from the bottom transverses.

4.4 Scantlings

4.4.1 The scantlings of vertical webs on longitudinal bulkheads are to be as required for side transverses by Section 2.

4.4.2 The section modulus of vertical webs on transverse bulkheads and of horizontal girders is to be not less than:

$$Z = 8b h l_e^2 k \text{ cm}^3.$$

4.4.3 The net sectional area of the web at any section is to be not less than:

$$A = 0,12Q_x k \text{ cm}^2$$

$$\left(A = \frac{Q_x k}{0,85} \text{ cm}^2 \right)$$

where Q_x is the shear force at the section. For the horizontal girders on ships with two longitudinal bulkheads, Q_x is calculated from shear force diagrams as shown in Fig. 10.4.1. For end connections, Q_x is to be determined by projection of the shear force diagrams as indicated.

4.4.4 The moment of inertia of vertical webs and horizontal girders is to be not less than:

$$I = \frac{10,5}{k} l_e Z \text{ cm}^4.$$

4.4.5 For the calculation of section modulus, the minimum span of horizontal girders on longitudinal bulkheads is to be taken as not less than the lesser of $(1,2 + 0,02L)$ m or 3 m.

Fig. 10.4.1 Horizontal girders

4.4.6 Where a trunk is fitted, the scantlings of primary members are to be modified as required by Section 6.

Section 5 Primary members supporting non-oiltight bulkheads

5.1 General

5.1.1 These requirements are applicable to primary members supporting non-oiltight transverse bulkheads. Where non-oiltight longitudinal bulkheads are proposed, the requirements for the primary members will be individually considered.

5.1.2 The minimum thickness and constructional detail requirements of Section 7 are to be complied with.

5.2 Symbols

5.2.1 The symbol, l_b , used in this Section is defined as follows:

l_b = the distance, in metres, between the transverse bulkheads (oiltight or non-oiltight) adjacent to the bulkhead under consideration.

5.2.2 Other symbols are defined in Ch 9,1.6.

5.3 Direct calculations

5.3.1 Direct calculation procedures will generally be required where the non-oiltight bulkhead primary members will interact with, or tend to support, the primary bottom, longitudinal bulkhead or side structure, and in other cases where warranted by structural design features.

5.4 Scantlings and arrangements

5.4.1 The section modulus of vertical webs is to be not less than that required for a vertical web on an oiltight transverse bulkhead in the same position, see Section 4

multiplied by the factor $\left(0,3 + 2 \frac{l_b}{L}\right)$.

5.4.2 The section modulus of horizontal girders is to be not less than:

$$Z = 145k b l_e^2 \frac{l_b}{L} \text{ cm}^3.$$

5.4.3 When determining the width of plating supported and the effective breadth for calculating the section modulus, no deduction is to be made on account of perforations.

Section 6 Trunked construction

6.1 General

6.1.1 The requirements of this Section are additional to those of Sections 1 to 5.

6.1.2 Where a trunk is fitted it is to extend over the full length of the cargo tanks and is to be effectively scarfed into the main hull structure.

6.1.3 The minimum thickness and constructional detail requirements of Section 7 are also to be complied with.

6.2 Symbols

6.2.1 The symbols used in this Section are defined as follows:

b_t = breadth of trunk, in metres

h_t = height of trunk, in metres, above the deck at the trunk side. Where the trunk top has excess camber, the value of h_t will be considered

D_1 = equivalent depth of ship and is to be taken as:

$$D + 0,6 \frac{b_t h_t}{B} \text{ where } \frac{b_t}{B} \leq 0,8 \text{ and}$$

$$D + h_t \left(2,6 \frac{b_t}{B} - 1,6\right), \text{ where } \frac{b_t}{B} > 0,8$$

(see Fig. 10.6.1).

6.2.2 Other symbols are defined in Ch 9,1.6.

Single Hull Oil Tankers

Part 4, Chapter 10

Section 6

Fig. 10.6.1 Equivalent depth

6.3 Structural arrangements

6.3.1 The trunk deck and sides are to be longitudinally framed, and the transverse primary members are to be aligned with the deck transverses.

6.3.2 Particular attention is to be given to the arrangements in way of the connection of the trunk side to the deck at side. The construction is to be such as to ensure adequate rigidity and continuity of strength.

6.3.3 Typical arrangements of primary structure are shown diagrammatically in Fig. 10.6.2, which also indicates the effective spans to be used in the determination of scantlings.

6.3.4 Where the trunk primary stiffening is fitted externally, individual consideration will be given to the arrangement and scantlings.

6.3.5 Where longitudinal stiffening is fitted externally to the trunk, tripping brackets are to be fitted to maintain lateral stability in way of transverse bulkheads and elsewhere as necessary.

6.3.6 Extension brackets and web stiffeners or equivalent arrangements are to be provided at the forward and after ends of the trunk to ensure full continuity of strength from the trunk into hull and superstructures.

6.3.7 Where the carriage of heated cargoes is contemplated and, in particular, bituminous cargoes, special attention is to be given to the alignment of the scarfing arrangements and softening of the extension bracket toes at the trunk ends to alleviate the effects of thermal stressing.

6.4 Trunk scantlings

6.4.1 The thickness of the trunk top and side plating is to be not less than as required by Ch 9,4 for hull envelope plating, the item numbers for these being as given in Fig. 10.6.3.

6.4.2 The section modulus of trunk longitudinals is to be not less than as required by Ch 9,5 for deck longitudinals.

6.4.3 The section modulus and moment of inertia of the transverses is to be not less than as required by 2.8 for deck transverses.

Fig. 10.6.2 Primary structure

6.5 Modification to hull scantlings

6.5.1 The thickness of the deck plating outboard of the trunk side is to be that necessary to obtain the required hull section modulus, but is to be not less than that required by Ch 9,4 multiplied by the factor

$$\frac{2BD}{2BD + b_t h_t}$$

6.5.2 The scantlings of the shell plating, framing, primary structure and bulkheads are to be determined on the basis of the equivalent ship depth D_1 , i.e. where the depth, D , enters into the calculation or structural arrangement it is to be replaced by D_1 .

6.5.3 The head to the deck at side is to be increased by $(D_1 - D)$.

6.5.4 The head to the highest point of the tank is to be replaced by the actual distance to the highest point of the tank, reduced by the amount $(D + h_t - D_1)$.

7.3.3 The geometric properties of rolled stiffeners and built sections are to be calculated in association with an effective width of attached plating in accordance with Pt 3, Ch 3.3.

7.4 Continuity of primary members

7.4.1 Primary members are to be so arranged as to ensure effective continuity of strength throughout the range of tank structure. Abrupt changes of depth or section are to be avoided. Where members abut on both sides of a bulkhead or on other members, arrangements are to be made to ensure that they are in alignment.

7.4.2 The members are to have adequate end fixity, lateral support and web stiffening, and the structure is to be arranged to minimise hard spots or other sources of stress concentration. Openings are to have well rounded corners and smooth edges and are to be located having regard to the stress distribution and buckling strength of the plate panel.

7.5 Primary member web plate stiffening

7.5.1 The webs of primary members are to be supported and stiffened in accordance with the following requirements, which are designated as requirements 'A', 'B', 'C' and 'D'. The application of these requirements is detailed in 7.5, and the corresponding locations indicated in Fig. 10.7.1. Where webs are slotted for the passage of secondary members, the web stiffeners are to be arranged to provide adequate support for the loads transmitted, see Pt 3, Ch 10.5.2.

Section 7 Construction details and minimum thickness

7.1 Symbols

7.1.1 The symbols used in this Section are defined in Ch 9, 10.1.

7.2 Compartment minimum thickness

7.2.1 The requirements of Ch 9, 10.2 are also applicable to small conventional single hull tankers.

7.3 Geometric properties and proportions of members

7.3.1 The depth of the web of any primary member is to be not less than 2.5 times the depth of the cut-outs for the passage of secondary members, except where compensation is arranged to provide satisfactory resistance to deflection and shear buckling in the web.

7.3.2 The area of material in the face plate of any primary member is not to exceed:

$$0,00667 d_w t_w \text{ cm}^2$$

nor is it to be less than:

$$0,0167 s_t d_w \text{ cm}^2 \text{ for the bottom centreline girder}$$

$$0,00417 s_t d_w \text{ cm}^2 \text{ elsewhere.}$$

Single Hull Oil Tankers

Part 4, Chapter 10

Section 7

7.5.2 Where higher tensile steel is used for the primary members, the maximum spacing of stiffeners given in this Section is to be multiplied by \sqrt{k} .

7.5.3 In addition to these stiffeners, tripping brackets as required by Ch 9, 10.11 are also to be fitted.

7.5.4 For requirement 'A' stiffening:

- (a) The thickness, t_w of the web is to be not less than $\frac{s}{80}$
- (b) Stiffening is generally to be fitted normal to the face plate of the member, but the stiffeners parallel to the face plate will be required when the web depth, d_w , exceeds a value, d_{max} which is to be taken as:
- $$\text{for } s \leq 55t_w \quad d_{max} = 3s$$
- $$\text{for } s > 55t_w \quad d_{max} = \frac{45s t_w}{s - 40t_w}$$
- (c) Where stiffening parallel to the face plate is required, the distance from the face plate of the member to the nearest stiffener is not to exceed $65t_w$. Further stiffeners are to be fitted at similar spacing so that the distance between the last stiffener and the shell or bulkhead plating does not exceed d_{max} . In way of end brackets to transverse bulkhead primary structure, stiffeners are to be fitted normal to the face plate of the member so that web plate panel dimensions parallel to the face plate do not exceed $80t_w$.

7.5.5 For requirement 'B' stiffening:

- (a) The thickness, t_w of the web is to be not less than $\frac{s}{85}$
- (b) Stiffening is generally to be fitted normal to the face plate of the member, but stiffeners parallel to the face plate will be required when the web depth, d_w , exceeds a value d_{max} , which is to be taken as:
- $$\text{for } s \leq 70t_w \quad d_{max} = 3s$$
- $$\text{for } s > 70t_w \quad d_{max} = \frac{48s t_w}{s - 54t_w}$$
- (c) Where stiffening parallel to the face plate is required, the distance from the face plate of the member to the nearest stiffener is not to exceed $80t_w$. Further stiffeners are to be fitted at similar spacing so that the distance between the last stiffener and the shell or bulkhead plating does not exceed d_{max} .

7.5.6 For requirement 'C' stiffening:

- (a) Stiffening is generally to be fitted normal to the face plate of the member in line with alternate secondary members, but stiffeners parallel to the face plate will be required, when the web depth, d_w exceeds a value, d_{max} which is to be taken as:
- $$\text{for } s \leq 76t_w \quad d_{max} = 3s$$
- $$\text{for } s > 76t_w \quad d_{max} = \frac{48s t_w}{s - 60t_w}$$
- (b) Where stiffening parallel to the face plate is required, the distance from the face plate of the member to the nearest stiffener is not to exceed $90t_w$. Further stiffeners are to be fitted at similar spacing so that the distance between the last stiffener and the deck plating does not exceed d_{max} .

7.5.7 For requirement 'D' stiffening:

- (a) Stiffening parallel to the face plate will be required such that the distance between the stiffener and face plate, or between two stiffeners, does not exceed:
- $$80t_w \text{ where } L \leq 90 \text{ m}$$
- $$55t_w \text{ where } L \geq 190 \text{ m}$$
- with intermediate values by interpolation.
- (b) Brackets are to be fitted to support the face plates and stiffeners.

7.6 Inertia and dimensions of stiffeners

7.6.1 The moment of inertia is to be not less than:

- (a) For stiffeners normal to the primary member face plate:

$$I_s = \rho s t_w^3 \times 10^{-4} \text{ cm}^4$$

Where t_w need not be greater than the values in Table 10.7.1 and ρ is to be obtained from Table 10.7.2.

- (b) For stiffeners parallel to the primary member face plate: On transverses, webs and stringers

$$I_s = 2I_s^2 A_s \text{ cm}^4$$

On longitudinal deck and bottom girders

$$I_s = 2,85I_s^2 A_s \text{ cm}^4.$$

Table 10.7.1 Maximum web thickness for stiffener inertia

Requirement	Web thickness t_w , in mm
'A'	$\frac{s}{55}$
'B' and 'C'	$\frac{s}{70}$
'D'	$\frac{s}{80}$ where $L \leq 90 \text{ m}$ $\frac{s}{60}$ where $L \geq 190 \text{ m}$
NOTE Intermediate values by interpolation.	

7.6.2 Where stiffeners are fitted in both directions, the inertia of the stiffeners parallel to the face plate of the member is to be not less than that of the stiffeners fitted normally.

7.6.3 The depth of web stiffeners is to be not less than 75 mm.

7.6.4 Where flat bar stiffeners are used, the ratio of depth to thickness is not to exceed $18\sqrt{k}$.

Single Hull Oil Tankers

Part 4, Chapter 10

Section 7

Table 10.7.2 Coefficient for stiffener inertia

Aspect ratio of plate panel, $\frac{s}{d}$	1,0 or more	0,9	0,8	0,7	0,6	0,5	0,4	0,3 or less
p	1,5	2,1	2,9	4,2	6,1	9,2	14,6	30,0
NOTES 1. Intermediate values by interpolation. 2. The depth of panel, d , used in calculating aspect ratio may be measured from the face of the secondary member to which the primary member web stiffener is attached.								

7.7 Application of stiffening requirements

7.7.1 The requirements as detailed in 7.5 and 7.6 are to be applied in the following locations, see also Fig. 10.7.1.

- (a) For bottom transverses:
In the centre tank requirement 'A' stiffening is to extend for 20 per cent of the breadth of the tank from the longitudinal bulkhead, but at least beyond the toe of the end bracket. In the wing tank, requirement 'A' stiffening is to extend at least as far as the toes of the end brackets from the longitudinal bulkhead and the shell. Elsewhere, requirement 'B' stiffening is to be fitted.
- (b) For transverses at side shell and longitudinal bulkhead:
Requirement 'A' stiffening is to extend at least as far as the lower surface of the lower cross-tie. Elsewhere, requirement 'B' stiffening is to be fitted.
- (c) For deck transverses:
Requirement 'C' stiffening is to be fitted.
- (d) For stringers and horizontal girders:
Requirement 'A' stiffening is to extend for a distance from each end of 20 per cent of the span of the stringer or girder, but at least beyond the toes of the end brackets. Elsewhere, requirement 'B' stiffening is to be fitted.
- (e) For cross-ties:
Cross-ties are to be suitably stiffened to prevent buckling and twisting. Requirement 'D' stiffening is to be fitted.
- (f) For shell stringers and vertical webs in fore peak:
Requirement 'A' stiffening is to extend the full length of the member.

7.7.2 The application of stiffening requirements to transverse wing structures in wing tanks where no cross-ties are fitted is to be based on the results of direct calculation and will be specially considered.

7.8 Stiffening of continuous longitudinal girders

7.8.1 The webs of continuous longitudinal deck and bottom girders are to be stiffened parallel to the girder face plate.

7.8.2 The stiffeners are to be spaced not more than $55t_w$ mm apart except in way of vertical webs and end brackets, where the spacing is not to exceed $45t_w$ mm. Alternatively, a combination of parallel stiffeners at $55t_w$ mm spacing and normal stiffeners at $45t_w$ mm spacing may be adopted. Particular attention is to be given to the stiffening of the docking girder.

7.8.3 The moment of inertia of stiffeners is to comply with 7.6.

7.9 Stiffening of vertical webs on transverse bulkheads

7.9.1 Vertical webs are to be fitted with stiffeners parallel to the face plate of the web and spaced not more than $60t_w$ mm apart. Stiffeners normal to the face plate are to be fitted when a vertical web supports horizontal stiffeners on transverse bulkheads. The length of stiffener is to be sufficient to distribute the load transmitted, and the connection between web stiffener and bulkhead stiffener is to comply with the relevant requirements of Pt 3, Ch 10.5.2.

7.9.2 The moment of inertia of the stiffeners is to comply with 7.6.

7.10 Docking brackets on bottom centreline girder

7.10.1 Stiffened docking brackets are to be fitted on both sides of the bottom centreline girder, midway between transverses, and are to be connected to a suitable bottom shell longitudinal. The bracket on one side is to be connected to the face plate of the girder but the other may be stopped at a suitable horizontal stiffener.

7.10.2 Additional vertical stiffeners may be required on the bottom panels of the girder to resist docking pressures.

7.11 Lateral stability of primary members

7.11.1 Tripping brackets are generally to be fitted close to the toes of end brackets, in way of cross-ties and elsewhere, so that the spacing between brackets does not exceed the lesser of 4,5 m or 15 times the width of the face plate (20 times in the case of deck transverses). Arrangements in way of the intersections of primary members are to be such as to prevent tripping. A closer spacing of brackets may be required to be adopted with asymmetrical face plates.

7.11.2 To maintain continuity of strength, substantial horizontal and vertical brackets are to be fitted to transverses or stringers at ends of cross-ties. Horizontal brackets are to be aligned with the cross-tie face plates, and vertical end brackets are to be aligned with the cross-tie web.

Single Hull Oil Tankers

Part 4, Chapter 10

Section 7

7.11.3 Tripping brackets are to be connected to the face plate of the bottom transverses. Elsewhere, other than for docking girders, the bracket is to be connected to the face plate whenever the unsupported width of the latter exceeds 150 mm. Where the width of symmetrically placed face plates exceeds 400 mm, a small bracket is to be fitted opposite, and in line with, the tripping bracket. Equivalent support arrangements are to be provided for cross-tie face plates. Particular attention is to be paid to the support of continuous face plates in way of the radius at toes of brackets.

7.11.4 Wide face plates may require additional support between brackets.

7.11.5 In the fore peak tank, if the angle to the normal of the shell plating and the vertical webs exceeds 20°, double tripping brackets are to be fitted to the web at about midspan, but in no case greater than 3,0 m apart.

7.12 Openings in web plating

7.12.1 Where openings are cut in the webs of primary supporting members, the greatest dimension of the opening is not to exceed 20 per cent of the web depth. The opening is to be located so that the edges are not less than 40 per cent of the web depth from the face, and are equidistant from the corners of notches for frames or stiffeners. Openings are to be suitably framed where required.

7.12.2 Lightening holes are not to be cut in horizontal girders on the ship's side and longitudinal bulkheads, in symmetrical webs nor in side transverses and vertical webs in way of cross-ties and their end connections.

7.12.3 Holes cut in primary longitudinal members within 0,1D of the deck and bottom are, in general, to be reinforced as required by Ch 9,4.10. Access holes may be cut in deep transverses and girders with suitable compensation to provide satisfactory resistance to deflection and shear buckling in the web.

7.12.4 All holes are to have smooth edges and are to be kept well clear of notches and the toes of brackets.

7.12.5 Small air and drain holes cut in primary members are to be kept clear of the toes of brackets and are to be well rounded with smooth edges. Where holes are cut in primary longitudinal members of higher tensile steel, they are to be elliptical or equivalent to minimise stress concentration.

7.12.6 Where holes are cut for heating coils, the lower edge of the hole is to be not less than 100 mm from the inside of the shell plating. Where large notches are cut in the transverses for the passage of longitudinal framing, adjacent to openings for heating coils, the longitudinal notches are to be collared. Examination of the buckling strength of the web plate panel between notches for longitudinals may be required.

7.13 Brackets connecting primary members

7.13.1 The requirements of Ch 9,10.13 are also applicable to small conventional single hull tankers.

7.14 Arrangements at intersections of continuous secondary and primary members

7.14.1 For details and connections of collars, see Pt 3, Ch 10,5.2.

Ore Carriers

Part 4, Chapter 11

Section 1

Section

- 1 **General**
- 2 **Materials and protection**
- 3 **Longitudinal strength**
- 4 **Hull envelope plating**
- 5 **Hull framing**
- 6 **Double bottom construction**
- 7 **Longitudinal bulkheads**
- 8 **Transverse bulkheads**
- 9 **Primary structure in wing tanks**
- 10 **Direct calculations**
- 11 **Forecasts**

■ Section 1 General

1.1 Application

1.1.1 This Chapter applies to the arrangements and scantlings within the cargo region of sea-going ore carriers, intended for the carriage of ore in centre holds.

1.1.2 The requirements of Chapter 9 are to be applied to ore carriers, except as required by the provisions of this Chapter.

1.1.3 The scantlings of structural items may be determined by direct calculation. Where the length of the ship exceeds 150 m, certain scantlings will be required to be assessed by direct calculation. In such cases, the calculations are to be submitted for approval.

1.1.4 The additional requirements for ore-carriers for the alternate carriage of oil cargo and dry bulk cargo are given in Pt 4, Ch 9,11.

1.2 Structural configuration and ship arrangement

1.2.1 The requirements contained in the Chapter apply to single deck ships with machinery aft, having two longitudinal bulkheads and a double bottom throughout the centre hold. A typical cross section is indicated in Fig. 11.1.1.

Fig. 11.1.1 Typical cross section

1.2.2 The bottom, and the deck outside the line of ore hatchways, are to be framed longitudinally within the cargo region. The side shell and longitudinal bulkheads are generally to be framed longitudinally where the length of the ship exceeds 150 m, but alternative proposals will be specially considered. Inside the line of openings, the deck is to be transversely framed.

1.3 Class notation

1.3.1 Sea-going ships complying with the requirements of this Chapter and other relevant Rule requirements for the draught required, will be eligible to be classed **100A1 ore carrier, ESP**.

1.3.2 The notation **ESP** serves to identify the ship as being subject to an Enhanced Survey Programme as detailed in Pt 1, Ch 3,3 and Ch 3,6, see also Pt 1, Ch 2,2.3.12.

1.3.3 The Regulations for classification and the assignment of class notations are given in Pt 1, Ch 2,2.

1.4 Symbols and definitions

1.4.1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

L, B, D, T as defined in Pt 3, Ch 1,6.

b = the width of plating supported by the primary member, in metres or mm

h = the load head, in metres, applied to the item under consideration

k = higher tensile steel factor. For the determination of this factor, see Pt 3, Ch 2,1. For mild steel k may be taken as 1,0

l_e = effective length of primary or secondary member, in metres, see Pt 3, Ch 3,3

s = spacing, in mm, of secondary members

Z = the section modulus, in cm^3 , of the primary or secondary member, in association with an effective width of attached plating determined in accordance with Pt 3, Ch 3,3.

Ore Carriers

Part 4, Chapter 11

Sections 1 to 5

1.4.2 The expression 'primary member' as used in this Chapter is defined as a girder, transverse, vertical web, stringer, cross tie, buttress or double bottom floor. 'Secondary members' are supporting members other than primary members.

Section 2 Materials and protection

2.1 Materials and grades of steel

2.1.1 Materials and grades of steel are to comply with the requirements of Pt 3, Ch 2.

2.2 Corrosion protection coating for salt water ballast spaces

2.2.1 The requirements of Pt 3, Ch 2,3.6 are to be complied with.

Section 3 Longitudinal strength

3.1 General

3.1.1 The longitudinal strength standard is to comply with the relevant requirements of Pt 3, Ch 4.

Section 4 Hull envelope plating

4.1 General

4.1.1 The requirements for hull envelope plating as given for oil tankers in Ch 9,4 are to be applied, except as provided for in this Section.

4.2 Deck plating in way of ore hatchways

4.2.1 The arrangement and scantlings of deck plating inside the line of ore hatchways and in way of ore hatchway corners are to be in accordance with the requirements for bulk carriers given in Ch 7,4.

4.3 Hatchways

4.3.1 The scantlings of the cargo hold hatch coamings are to comply with Pt 3, Ch 11,5 and the cargo hold hatch covers with Pt 3, Ch 11,2 and Pt 4, Ch 7,12.

4.4 Hatch coamings

4.4.1 The height and construction of hatch coamings are to comply with Pt 3, Ch 11,5 and Ch 7,13.

Section 5 Hull framing

5.1 General

5.1.1 The framing requirements given for oil tankers in Ch 9,5 are to be applied, except as provided for in this Section.

5.2 Symbols

5.2.1 The symbols used in this Section are defined as follows:

h = load height, in metres, on the weather deck for primary and secondary members between ore hatchways
 = 1,8 for secondary members forward of 0,075L from F.P.
 = 4,2 + 2,04E for primary members forward of 0,075L from F.P.
 = 1,5 between 0,075L and 0,12L from F.P.
 = 1,2 + 2,04E elsewhere

where

$E = \frac{0,0914 + 0,003L}{D - T} - 0,15$ but not to be greater than 0,147

$K_1 = 1,6$ in the forward 0,12L
 = 1,06 elsewhere

$K_2 = 0,00054$ in the forward 0,075L
 = 0,00033 elsewhere.

5.2.2 Other symbols are defined in 1.4.

5.3 Bottom longitudinals in double bottom tanks

5.3.1 The section modulus of bottom longitudinals in the double bottom in the centre hold is to satisfy the requirements of Table 1.6.1 in Chapter 1.

5.3.2 In general, the span of longitudinals in the double bottom in the centre hold is not to exceed 2,5 m or 0,01L, whichever is the greater, and the span in the wing tanks is not to exceed the greater of 3,6 m or 0,02L.

5.4 Deck structure in way of centre hold

5.4.1 Where the hatch coamings are situated inboard of the longitudinal bulkhead, the deck between the two is to be fitted with suitably supported longitudinals complying with Ch 9,5.

Ore Carriers

Part 4, Chapter 11

Sections 5 to 8

5.5 Primary and secondary members inside line of ore hatchways

5.5.1 The section modulus of secondary members between hatches is to be not less than:

$$Z = k (K_1 T D + K_2 h B l_e^2 s) \text{ cm}^3$$

but need not exceed twice the value given by the second term within the brackets in the formula.

5.5.2 The section modulus of primary members between hatches is to be not less than:

$$Z = 5,46k b h l_e^2 \text{ cm}^3$$

Forward of 0,075L from the forward perpendicular, the depth of the primary member is to be not less than twice that of the secondary member supported.

5.5.3 Particular attention is to be paid to the scarfing of deck beams into the structure outside the line of openings. Substantial brackets or equivalent arrangements are to be provided.

Section 6 Double bottom construction

6.1 General

6.1.1 The double bottom depth and scantlings are to be as required by Ch 7,8 for the double bottom structure of a bulk carrier to which the notation 'strengthened for heavy cargoes' is to be assigned. The required depth of double bottom and scantlings of double bottom structure are, however, to be verified by direct calculation. The calculation is to be submitted.

6.1.2 Where the proposed depth of double bottom exceeds 1,5 times the Rule minimum depth given in Ch 1,8, the scantlings of the floors and girders may be required to be increased to ensure adequate resistance to buckling.

6.1.3 The thickness of inner bottom plating in the cargo hold is to be not less than required by Ch 7,8 for ships having the notation 'strengthened for heavy cargoes'. The requirements of Ch 7,8.1 relating to discharge by grabs are to be applied.

6.2 Arrangement

6.2.1 In way of the cargo hold a centreline girder is to be fitted and side girders spaced not more than 3,8 m apart are generally to be arranged in way of transverse bulkheads. The side girders are to extend at least to the first plate floor adjacent to the bulkhead each side. The outboard side girder is to be continuous, forming the lower part of the longitudinal bulkhead.

6.2.2 Plate floors are to be fitted in line with each transverse in the wing tanks and in way of transverse bulkhead stools. Additional floors are to be so arranged that the spacing of floors does not exceed 2,5 m or 0,01L, whichever is the greater.

6.2.3 Attention is to be given to structural continuity and alignment between double bottom structure and transverses in wing tanks, see also 9.2.

6.2.4 Alternative arrangements will be considered on the basis of the results of direct calculations.

Section 7 Longitudinal bulkheads

7.1 General

7.1.1 The requirements for longitudinal oiltight bulkheads given in Ch 9,6 and Ch 9,9 are to be applied, together with the additional requirements of this Section.

7.1.2 Longitudinal bulkheads on ore carriers are to be plane with rolled or fabricated longitudinal stiffeners. The bulkhead may be sloped to form a hopper shape in the lower part of the hold or over its full depth.

7.1.3 Where the upper part of the bulkhead is vertical and the lower part sloped to form a hopper shape, the thickness of the bulkhead plating in way of the knuckle may be required to be increased to resist transverse compressive buckling stresses. The knuckle is to be arranged in way of a longitudinal.

7.1.4 The thickness of the lowest strake of sloped bulkhead plating is also to comply with inner bottom requirements as given in 6.1.3. Where this provision results in an increase in thickness, the latter may be gradually tapered above the lowest strake to the required longitudinal bulkhead thickness at the position of the knuckle, or at a point one-third of the depth of the bulkhead above the inner bottom, whichever is the lower.

Section 8 Transverse bulkheads

8.1 General

8.1.1 Where the form of construction used for transverse bulkheads in wing tanks is different from that used in centre holds, arrangements are to be made to ensure continuity of transverse strength through the longitudinal bulkhead.

Ore Carriers

Part 4, Chapter 11

Sections 8 to 11

8.2 Transverse watertight bulkheads in wing tanks

8.2.1 The requirements for transverse bulkhead plating, stiffening and primary structure given in Ch 1,9 for deep tank bulkheads are to be applied.

8.3 Transverse watertight bulkheads in centre holds

8.3.1 The requirements for transverse hold bulkheads given for the carriage of dry bulk cargoes in Ch 7,10 are to be applied.

8.3.2 In general, the bulkheads are to have stiffening or corrugations arranged vertically, supported by top and bottom end stools. Alternative arrangements will, however, be considered.

8.4 Non-watertight bulkheads

8.4.1 Non-watertight bulkheads in wing tanks are to comply with the requirements given in Ch 9,8 and Ch 9,9.8.

8.4.2 The bulkhead plating is to be suitably reinforced in way of double bottom scarfing arrangements and the ends of centre hold deck transverses. Openings in wing tank bulkheads are to be kept clear of these areas.

Section 9 Primary structure in wing tanks

9.1 General

9.1.1 The primary structure in the wing tanks is to comply with the requirements given in Ch 9,9.

9.2 Scarfing of double bottom

9.2.1 The inner bottom plating is to be extended into the wing tank in the form of a horizontal diaphragm, arranged to ensure a smooth structural transition in way of transverse primary members and to maintain longitudinal continuity. The diaphragms are to be of sufficient width to provide effective scarfing of the inner bottom into the wing tank structure.

9.2.2 Floors intermediate between transverses are to be backed in the wing tanks by substantial vertical brackets extending transversely over at least three bottom longitudinal spaces and vertically to a sufficient height above the horizontal diaphragms to provide effective support for the double bottom structure.

Section 10 Direct calculations

10.1 Application

10.1.1 Direct calculations are to be employed in the derivation of scantlings where required by the preceding Sections of this Chapter or by related provisions included in Part 3.

10.1.2 Direct calculation methods are also generally to be used where additional calculations are required by the Rules in respect of unusual arrangements.

10.1.3 For complex structural arrangements, e.g. a double plate transverse bulkhead with stool in a centre hold, associated with plane wing tank bulkheads supported by stringers and buttresses, an investigation of bottom primary structure over a full cargo hold length and three-dimensional analysis of the transverse bulkhead structure will generally be required, taking account of applied longitudinal hull bending effects.

10.1.4 The cross-deck structure is to be verified as being capable of supporting transverse compressive stresses resulting from lightship weight, cargo weight and inertia, hydrostatic and wave loads. The cross-deck structure is to comprise the hatch coamings and beams, the plating and attached stiffeners and the upper stool. Non-corrugated bulkhead plating may also be included.

10.2 Procedures

10.2.1 For details of Lloyd's Register's direct calculation procedures, see Pt 3, Ch 1,2. For requirements concerning use of other calculation procedures, see Pt 3, Ch 1,3.

10.2.2 Where appropriate to the structural configuration, the direct calculation procedures for tanker primary structure, see Ch 9,14, will be adapted for application to ore carriers.

Section 11 Forecastles

11.1 General

11.1.1 A forecastle is to be fitted in accordance with the requirements of Pt 4, Ch 7,14.

Dredging and Reclamation Craft

Part 4, Chapter 12

Section 1

Section

- 1 **General**
- 2 **Longitudinal strength**
- 3 **Deck structure**
- 4 **Shell envelope plating**
- 5 **Shell envelope framing**
- 6 **Bottom structure**
- 7 **Bottom strengthening for operating aground**
- 8 **Spoil space and well structure**
- 9 **Watertight bulkheads**
- 10 **Exposed casings**
- 11 **Dredging machinery seats and dredging gear**
- 12 **Ladder wells**
- 13 **Fenders**
- 14 **Rudders**
- 15 **Spoil space weirs and overflows**
- 16 **Scuppers and sanitary discharges and side scuttles**
- 17 **Split hopper dredgers and barges**
- 18 **Direct calculations**

suction pipes or similar gear are not to be regarded as hoppers unless adequate bottom doors or valves are also fitted.

- (c) Split hopper dredgers, which are designed similarly to that described in (b) but arranged such that the spoil is discharged through the bottom of the ship by means of the split hull being separated using hinges and actuating devices.
- (d) Reclamation craft, reclamation ships, etc., which work in a manner similar to dredgers but draw their spoil from dredging craft and discharge it ashore.
- (e) Hopper barges designed to carry spoil or dredged material in hoppers within the ship. For the definition of a hopper, see 1.1.1(b).
- (f) Split hopper barges, which are designed similarly to that described in (e) but arranged such that the spoil is discharged through the bottom of the ship by means of the split hull being separated using hinges and actuating devices.

1.1.2 The scantlings and arrangements are to be as required by Chapter 1, except as otherwise specified in this Chapter.

1.1.3 Where bottom dump doors or valves are fitted, hatch covers are not required. Proposals for the omission of hatch covers where bottom dump doors or valves are not fitted will be specially considered.

1.1.4 Ships which have their machinery placed on a shallow raft, rather than within a hull, will have their scantlings specially considered. Dredgers which resemble drilling rigs, or similar offshore structures, in their design or mode of operation will be considered under the Rules for such structures.

1.1.5 Ships of unusual form or proportions, or intended for unusual dredging methods, will receive individual consideration on the basis of the general standards of the Rules.

1.1.6 The requirements provide for transverse and longitudinal framing of the structure. In general, the midship region scantlings are to extend over the full length of hoppers and holds. The extent is to be not less than 0,4L amidships, and may need to be increased if the design and loading conditions of a particular ship result in its maximum bending moment occurring other than at amidships.

■ Section 1 General

1.1 Application

1.1.1 This Chapter applies, in general, to manned or unmanned self-propelled or non-self-propelled ships defined as follows:

- (a) Dredgers designed to operate wholly or generally for the purpose of raising spoil such as mud, silt, gravel, clay, sand or similar substances, general rubbish or ore, minerals, etc., for the bed of the sea, rivers, lakes, canals or harbours, etc. The dredged material may be placed in suitably designed holds or similar spaces within the ship.
- (b) Hopper dredgers, designed to raise spoil, as described in (a), and so arranged that the dredged material may be placed in one or more hoppers within the ship. For the purpose of this definition, a hopper is a hold or other space designed to carry dredged spoil and also arranged to enable such spoil to be discharged through doors or valves in the bottom of the ship. Spaces arranged to be unloaded by means of conveyor belts,

1.2 Stability

1.2.1 Attention is drawn to the thixotropic properties of certain types of dredged material which, as a result of the ship's motions, can cause the spoil to shift within spoil spaces, resulting in undesirable changes in trim or angles of heel. This can be particularly dangerous in ships with closed top spaces.

Dredging and Reclamation Craft

Part 4, Chapter 12

Section 1

1.3 Class notations

1.3.1 In general, ships complying with the requirements of this Chapter will be eligible for one of the following classes:

- (a) **100A1 dredger**. This class will be assigned to ships as defined in 1.1.1(a).
- (b) **100A1 hopper dredger**. This class will be assigned to ships as defined in 1.1.1(b).
- (c) **100A1 split hopper dredger**. This class will be assigned to ships as defined in 1.1.1(c).
- (d) **100A1 reclamation craft**. This class will be assigned to ships as defined in 1.1.1(d).
- (e) **100A1 hopper barge**. This class will be assigned to ships as defined in 1.1.1(e).
- (f) **100A1 split hopper barge**. This class will be assigned to ships as defined in 1.1.1(f).

1.3.2 These classes will be assigned to ships which are intended to make unrestricted sea-going voyages either as part of their work or while transferring from one work area to another as part of their normal operations. However, unrestricted sea-going service notations will not normally be assigned to bucket dredgers, nor to dredging and reclamation craft unless spoil spaces are provided with adequate hatch covers. Attention is drawn to the special requirements imposed by National Authorities involving loading limitations and stability requirements.

1.3.3 Ships intended to be operated only in suitable areas or conditions which have been agreed by the Committee, as defined in Pt 1, Ch 2,2.3.6, 2.3.7, 2.3.8 and 2.3.10, will receive individual consideration on the basis of the Rules with respect to the environmental conditions agreed for the design basis and approval. In particular, dredgers complying with the requirements of this Chapter, and Pt 3, Ch 13,7 for the reduced equipment requirements, will be eligible to be classed:

A1 dredger protected waters service, see Pt 1, Ch 2,2.3.6, or

100A1 dredger with service restriction notation, whichever is applicable. Hopper dredgers, split hopper dredgers, reclamation craft, hopper barges and split hopper barges would be considered similarly.

1.3.4 Where a ship complying with the requirements of this Chapter has the bottom structure additionally strengthened for operating aground in accordance with Section 7, it will be eligible for the special feature notation 'bottom strengthened for operating aground'.

1.3.5 In addition to the above notations, an appropriate descriptive note may be entered in the *Register Book* indicating the type of dredging or reclamation craft (see Pt 1, Ch 2,2.6.1), e.g. 'trailing suction dredger', 'cutter suction dredger', 'bucket dredger', 'grab dredger', 'dipper dredger', 'self-discharging sand dredger', etc.

1.3.6 The Regulations for classification and assignment of class notations are given in Pt 1, Ch 2 to which reference should be made.

1.4 Information required

1.4.1 In addition to the information and plans required by Pt 3, Ch 1,5 details of the following are to be submitted:

- Sections through hoppers, wells, pump-rooms and dredging machinery spaces.
- Hopper, hold and well bulkheads and associated weirs.
- Scarfing arrangements at hopper, hold and well ends.
- Hinges, actuating and locking arrangements, together with supporting structure, weld connection details and calculations of design forces for split hull separation devices.
- Deckhouse and deckhouse support structure.
- Outline arrangement and main scantlings of 'A' frames, gantries, positioning spuds, hopper doors and similar items, the strength and integrity of which directly affect the hull structure of the vessel. Support structure in way of 'A' frames, positioning spuds and other dredging structures. Seats of dredging machinery and pumps. If dredging equipment is stored during voyages, plans of any special arrangements for dismantling, storage and reassembly. Sufficient particulars of static and dynamic loading for these items are to accompany the details to enable verification of the strength and effectiveness of the supporting ship structure.
- A full set of stability data which is to be placed on board the ship, see Pt 1, Ch 2,3.
- Calculations of hull girder still water bending moment and shear force where applicable, see 2.1.1, for the proposed loading conditions, including densities of spoil. When the still water bending moment and block coefficient are being calculated, any water within spoil spaces should be regarded as added weight, whilst that in dredging ladder wells and spud wells should be regarded as lost buoyancy.

1.5 Symbols

1.5.1 The following symbols and definitions are applicable to this Chapter unless otherwise stated:

- B = breadth, in metres, defined as the greatest moulded breadth excluding any localised bulge on the hull associated with the attachment or handling of the dredging gear
- C_b = the moulded block coefficient at draught T but is to be taken as not less than 0,6. The block coefficient is to be determined using the length, L . Spoil spaces should be regarded as added weight, whilst dredging ladder wells and spud wells should be regarded as lost buoyancy
- C_{bm} = the moulded block coefficient at the dredging draught T_m , but is to be taken as not less than 0,6. The block coefficient is to be determined using length, L . Spoil spaces should be regarded as added weight, whilst dredging ladder wells and spud wells should be regarded as lost buoyancy
- D = moulded depth, in metres, to the uppermost continuous deck
- L = Rule length, in metres, as defined in Pt 3, Ch 1,6 for ships classed for unrestricted service. For ships classed **A1 protected waters service** where the load waterline is not required to be determined by the International Load Line Convention method, the

length is to be measured on the deepest waterline at which the ship is designed to operate. On sea-going vessels with unusual stern arrangement, or with unusual bow arrangement associated with a dredging draught in excess of the summer load line draught, the length, L , will be specially considered

M_s = design still water bending moment, in kNm (tonne-f m), at draught, T , or less

\bar{M}_s = maximum permissible still water bending moment, in kNm (tonne-f m), at draught, T , or less

M_{sm} = design still water bending moment, in kNm (tonne-f m), under dredging conditions at draught, T_m

\bar{M}_{sm} = maximum permissible still water bending moment, in kNm (tonne-f m), under dredging conditions at draught, T_m

M_w = design hull vertical wave bending moment amidships, in kN m (tonne f m), see 2.4.1

T = summer draught, in metres, as established by the method described in the International Load Line Convention, measured from top of keel amidships

T_m = maximum dredging draught, in metres, at which the ship is designed to operate. It is to be measured amidships from the top of keel and is to be taken not less than T , see 15.1.4

ρ = relative density (specific gravity) which, in general, is to be taken not less than 1,86, or as derived from the stowage rate of spoil. This stowage rate of dredged spoil is to be determined from the maximum spoil weight at dredging draught and volume of spoil space up to the sill of the uppermost overflow weir. The value used in the calculations of scantlings is to be clearly marked on the relevant plans

Hogging bending moments are positive.

1.5.2 For symbols not defined in this Chapter, see Chapter 1.

Section 2 Longitudinal strength

2.1 General

2.1.1 Longitudinal strength calculations are to be made in accordance with the relevant requirements given in Pt 3, Ch 4, except as indicated in this Section.

2.2 Loading conditions

2.2.1 Details are to be submitted of the following loading conditions for examination of longitudinal strength:

- Homogeneous load conditions (including details of densities of spoil) for both departure and arrival at draught, T , and maximum dredging draught, T_m , where this exceeds T , see also 15.1.4.
- Part loaded conditions (including details of densities of spoil) and ballast conditions for both departure and arrival.
- Any specified non-homogeneous load conditions.

2.2.2 If any dredging equipment has to be unshipped, lowered or otherwise specially arranged or stowed before the ship proceeds on a sea-going voyage, this fact is to be indicated on the longitudinal strength information required to be submitted and is also to be clearly stated in the final Loading Manual supplied to the ship.

2.2.3 For loading conditions, and any other preparations required to permit ships with a notation specifying some service limitation to undertake a sea-going voyage, either from port or building to service area or from one service area to another, see Pt 1, Ch 2,1.

2.2.4 Where a ship is arranged with two spoil spaces account is to be taken in the calculation of the still water bending moment of either one of these spaces being empty, unless such loading is specifically precluded in the Loading Manual supplied to the ship.

2.2.5 The requirements of Pt 3, Ch 4,8.3 regarding loading instruments are not applicable to dredging and reclamation craft.

2.3 Hull bending strength

2.3.1 Hull bending strength standards are to comply with the relevant requirements of Pt 3, Ch 4, taking account of the contents of 2.4 and 2.5.

2.3.2 For split hopper dredgers or barges, due account is to be taken of the lateral forces and moments on each half hull which are exerted by the pressure of the spoil and dynamic wave loading, see 17.2.

2.4 Design vertical wave bending moments

2.4.1 The design vertical wave bending moment at amidships, M_w , is to be determined from Pt 3, Ch 4,5.2 with the ship service factor, f_1 , given in Table 12.2.1.

Table 12.2.1 Ship service factor f_1

f_1		
'100A1'	'100A1 extended protected waters service'	'A1 protected water service'
0,75	0,70	0,65

2.4.2 The design hull vertical wave bending moment at amidships for dredging conditions, M_{wd} , where draught T_m exceeds T , is given by the following expression:

$$M_{wd} = 0,56f_2 M_{wo}$$

where

M_{wo} is determined from Pt 3, Ch 4,5.2, using C_{bm} in place of C_b and f_2 is given in Pt 3, Ch 4,5.2.

Dredging and Reclamation Craft

Part 4, Chapter 12

Sections 2, 3 & 4

2.5 Permissible still water bending moment for dredging conditions

2.5.1 The maximum permissible still water bending moment, \bar{M}_{sm} , for dredging conditions where draught T_m exceeds T is not to exceed:

$$|\bar{M}_{sm}| = |\bar{M}_s + f_1 f_2 M_{wo} - M_{wd}| \quad \text{kN m (tonne-f m)}$$

where M_{wd} is defined in 2.4.2.

Where applicable, the relevant loading conditions are to be included in the final Loading Manual, see 15.1.4 and Pt 3, Ch 4,8.1.

2.6 Calculation of hull section modulus

2.6.1 The hull midship section modulus is to be calculated in accordance with the requirements of Pt 3, Ch 3,3.4 taking account of 2.6.2 and 2.6.3. See also 17.1 for split hull arrangements.

2.6.2 Centreline box keels within the hopper spaces may normally be regarded as 100 per cent effective provided that they are effectively scarfed to the vertical keels or equivalent structure at each end of the hopper spaces.

2.6.3 Where a long superstructure or deckhouse is fitted extending within the midship region, the requirements for longitudinal strength in the hull and erection will be specially considered.

2.7 Hull shear strength

2.7.1 Special attention is to be paid to the actual shear forces at the spoil space end bulkheads. The inclusion of the effective thickness of longitudinal bulkheads, centre box keel plating and other longitudinal material at these positions, will be considered in relation to the arrangement of structure proposed.

2.7.2 For ships classed **A1 protected waters service**, see 4.6.1.

Section 3 Deck structure

3.1 Deck plating

3.1.1 Dredgers, hopper dredgers and hopper barges classed for unrestricted service are to have the minimum thicknesses required by Ch 1,4 increased by 2 mm for those areas of the strength deck outside line of openings which are exposed to the weather.

3.1.2 Ships classed **100A1 extended protected waters service** are to have the minimum thicknesses required by Ch 1,4 for all strength deck plating outside line of openings. The minimum value of s , used in the formulae may be taken as 550 mm.

3.1.3 Ships classed **A1 protected waters service** may have the minimum thicknesses as given in Ch 1,4 for all strength deck plating outside line of openings reduced by 1 mm, with an overall minimum of 5 mm. The minimum value of s , used in the formulae may be taken as 550 mm.

3.1.4 Strength deck plating within the line of openings in the midship region, and for 0,075L from the ends, is to have a thickness not less than:

$$t = 0,01s \text{ mm}$$

3.1.5 The deck plating thickness and supporting structure may be required to be reinforced in those areas of deck which are liable to be subjected to regular, heavy, impact loads such as could occur when maintaining or inspecting large items of dredging gear, etc. It is recommended that consideration be given to increasing the plating thickness in these areas to:

$$t = 0,02s \text{ mm}$$

with a minimum

$$t = 10 \text{ mm.}$$

3.2 Deck stiffening

3.2.1 The scantlings of deck beams or longitudinal are to comply with the requirements of Ch 1,4.3.

3.3 Deck supporting structure

3.3.1 The scantlings of the deck supporting structure are to comply with the requirements of Ch 1,4.4.

Section 4 Shell envelope plating

4.1 Keel

4.1.1 On ships over 50 m in length, where there is a centreline well, or where hopper doors are fitted on the ship's centreline, i.e. where no centreline box keel is fitted in a hopper, a keel strake is to be fitted on each side of the well or hopper door opening, dependent upon the proposed docking arrangements for the ship. The width of each keel strake is to be not less than half that required for a centreline keel nor less than 400 mm. The thickness of each keel strake is to be not less than the thickness required for a centreline keel in Ch 1,5.2.

Dredging and Reclamation Craft

Part 4, Chapter 12

Sections 4 & 5

4.2 Bottom shell

4.2.1 The minimum thickness of bottom shell plating amidships on hopper dredgers and hopper barges classed for unrestricted service is to be 15 per cent greater than that required by Ch 1,5.3. The thickness of bottom shell plating on ships classed **A1 protected waters service** is to be not less than:

$$t = (5sL \sqrt{D} \times 10^{-5} + 5) \text{ mm}$$

or that required for Ch 1,5.3 whichever is the lesser, but with an overall minimum thickness of 6 mm.

4.2.2 Where hoppers extend outside 0,4L amidships, the thicknesses required for the bottom shell amidships are to be maintained for at least two frame spaces beyond the ends of the hoppers before being tapered to the end thicknesses.

4.3 Operating aground

4.3.1 For ships intended to operate aground, see Section 7.

4.4 Bottom openings

4.4.1 The corners of hopper door openings and of bucket and ladder wells are generally to be parabolic or elliptical on all ships where L is greater than 50 m, and should generally be rounded on smaller ships. On ships where L is greater than 90 m, the arrangement of hopper and well corners within 0,5L amidships should generally be as required for deck hatch corners. The sealing arrangements for hopper doors may lie within the line of the corners, provided that the construction is such as to avoid high stress concentrations in the structure.

4.5 Ships with chines

4.5.1 On ships arranged with two chines each side, the bilge plating should generally be calculated from the bottom plating formulae. On hard chine ships, flanged chines will not generally be approved, but where a chine is formed by knuckling the shell plating, the radius of curvature, measured on the inside of the plate, is to be not less than 10 times the plate thickness. Where a solid round chine bar is fitted, the bar diameter is to be not less than 50 mm or three times the thickness of the thickest abutting plate whichever is the greater. Where welded chines are used, the welding is to be built up as necessary to ensure that the shell plating thickness is maintained across the weld.

4.6 Side shell

4.6.1 The thickness of the side shell is to be in accordance with Ch 1,5.4. On ships classed **A1 protected waters service** the thickness of the side shell throughout, including at ends, may be reduced 20 per cent from that required by Ch 1,5.4 and Pt 3, Ch 5 and Pt 3, Ch 6 as appropriate, provided that the combined shear stress does not exceed 110 N/mm² (11,2 kgf/mm²).

4.6.2 Where high compressive loads occur in the sheer-strake, the thickness may be required to be increased to minimise the likelihood of buckling.

4.7 Swim ends

4.7.1 The plating of swim ends is to have a thickness not less than that required for the bottom shell up to the waterline at draught T , see also Table 12.7.1. It is to have a thickness not less than that required for side shell in the areas more than 1 m above the waterline at draught T_m . In intermediate areas the thickness may be tapered from the bottom to the side shell requirements.

Section 5 Shell envelope framing

5.1 Longitudinal stiffening

5.1.1 The scantlings of bottom and side shell longitudinals are to comply with the requirements given in Table 12.5.1.

5.1.2 For ships intended to operate aground, see Section 7.

5.2 Transverse stiffening

5.2.1 For bottom structure with transverse framing, see Section 6.

5.2.2 For ships intended to operate aground, see Section 7.

5.2.3 The scantlings of side frames amidships are to be in accordance with Ch 1,6 for ships classed for unrestricted service or **100A1 extended protected waters service**. The modulus of side frames may be reduced by eight per cent for ships classed **A1 protected waters service**.

5.3 Primary supporting structure at sides

5.3.1 The spacing of transverses supporting side longitudinals is generally to be in accordance with Ch 1,6.4, but is not to exceed 4,0 m.

5.3.2 Transverses supporting side longitudinals are to comply with the requirements of Ch 1,6.4, except for ships classed with a service restriction notation and all ships classed **A1 protected waters service**, where the requirements are given in Table 12.5.2.

5.3.3 In way of transverse framing, web frames may be required in way of hopper cross members. Alternative arrangements may be submitted for consideration.

Dredging and Reclamation Craft

Part 4, Chapter 12

Sections 5 & 6

Table 12.5.1 Longitudinal stiffening

Position of longitudinals	Modulus
(1) Bottom	$Z = \frac{I_e^2 s H}{K_1} c \quad \text{cm}^3$ <p>where I_e = effective span of longitudinals, in metres, and is to be taken as not less than 1,85 m except as provided for in 6.3.1 In way of single bottoms $H = D$ In way of double bottoms $H = D$ on ships classed 100A1 or 100A1 extended protected waters service $= T_m$ for ships classed A1 protected waters service c = a factor varying from 1,0 at $\frac{D}{2}$ to $\frac{2060}{3620 - 1560F_B}$ at bottom, intermediate values by interpolation. For ships with hogging still water bending moments in loaded conditions and for split hull vessels, $c = 1,0$ F_B = as defined in Pt 3, Ch 4,5.1 K_1 = 120 on ships classed 100A1 or 100A1 extended protected waters service = 150 on ships classed A1 protected waters service</p>
(2) Side shell	<p>(a) For ships classed 100A1 or 100A1 extended protected waters service The minimum modulus of side longitudinals is to be in accordance with Ch 1,6.2 (b) For ships classed A1 protected waters service The modulus required by (a) and reduced by 5 per cent</p>
(3) Bilge	The scantlings of bilge longitudinals are to be graduated between those required for the bottom longitudinals and the lowest side longitudinals

5.3.4 The end connections of side transverses and web frames to deck and bottom transverses abreast of spoil spaces are to be arranged to prevent shear buckling of the members' webs.

5.3.5 For wash bulkheads fitted in lieu of web frames abreast spoil spaces, see 8.3.6.

Table 12.5.2 Primary supporting structure at sides

Symbols	Item	Requirement
h = vertical distance from mid-point of span to deck at side, in metres I_e = effective length of supporting member, in metres, see Pt 3, Ch 3,3 I = moment of inertia of supporting member, in cm^4 , see Pt 3, Ch 3,3 S = spacing, or mean spacing, of supporting member, in metres Z = section modulus of supporting member, in cm^3 , see Pt 3, Ch 3,3	Transverses supporting side longitudinals amidships	<p>All ships classed 100A1 extended protected waters service:</p> $Z = 9,5S h I_e^2 \text{ cm}^3$ <p>All ships classed A1 protected waters service:</p> $Z = 9,0S h I_e^2 \text{ cm}^3$
	Transverses and web frames supporting side longitudinals abreast of spoil spaces	Inertia of not less than: $I = 2,5I_e Z \text{ cm}^4$

Section 6 Bottom structure

6.1 General

6.1.1 This Section provides for longitudinal or transverse framing of the bottom structure of ships with single or double bottoms.

6.1.2 For ships intended to operate aground, see Section 7.

6.2 Single bottoms transversely framed

6.2.1 The scantlings of single bottom floors, extending for the full width of the ship, are to be in accordance with Ch 1,7 irrespective of the length of the ship. Floors below dredging pumps or similar items which could induce large concentrated loads or large dynamic forces, may be required to be of increased strength. Floors may be recessed locally in way of dredging pumps, etc., provided that suitable compensation is arranged.

6.2.2 The spacing of intercostals and longitudinal side girders is to be such as to ensure continuity of strength at bulkheads, ends of spoil spaces and wells and at ends of machinery seats so far as practicable, see also Ch 1,7. An intercostal is to be fitted in the buoyancy space abreast hopper openings when the distance between the hopper opening and the ship's side exceeds 4,0 m.

Dredging and Reclamation Craft

Part 4, Chapter 12

Section 6

6.2.3 Abreast of dredging wells and spoil spaces the minimum depth of floor at its inboard end is to be not less than:

$$d_w = 20 (B + l_e + 2T_m) \text{ mm}$$

The thickness of the web and area of the face plate are to be as required by Ch 1,7.2.

6.3 Single bottoms longitudinally framed

6.3.1 The spacing of transverses is to be in accordance with 5.3.1, and are to be supplemented by the following arrangements of brackets:

- On the ship's centreline, or on each side of dredging wells where there is no structure on the centreline, the brackets are to be spaced not more than 1,25 m apart and are to extend outboard to the first longitudinal, port and starboard. The longitudinals supported by the brackets may be calculated using a nominal transverse spacing of 1,6 m.
- On ships where the sides are transversely framed, the brackets are to be fitted at every frame and are to extend inboard to the first longitudinal on the flat of bottom. This longitudinal is to be based on a span equal to the spacing of the transverses.
- The thickness of these intermediate brackets is to be not less than:

$$t = (0,25B + 1,85 \sqrt{T_m}) \text{ mm.}$$

6.3.2 In areas of high shear loading, the thickness and stiffening of the web plates on transverses, etc., may have to be increased. The depth of transverses is to be not less than 2,5 times the depth of the slot for the bottom longitudinals, and thickness of the web plates is to be not less than 8 mm.

6.3.3 Bottom transverses in spoil space side buoyancy tanks in way of cross ties are to have a depth, d , of not less than:

$$d = 28B + 205 \sqrt{T_m} \text{ mm}$$

Their arrangement, scantlings and end connections are to be such as to provide proper continuity of strength across the ship. The transverses are to be fitted with stiffeners in way of every shell longitudinal. The stiffeners should, in general, be equivalent to flat bars with a depth one-eighth of the transverse at that point and a thickness not less than the thickness of the transverse.

6.4 Double bottom – General

6.4.1 Self-propelled dredgers and reclamation ships of more than 500 tons gross and intended for International voyages are to be provided with a double bottom extending from the collision bulkhead to the after peak bulkhead, as far as this is practicable and compatible with the design and proper working of the ship.

6.4.2 A double bottom need not be fitted in way of watertight compartments used exclusively for the carriage of liquids provided the safety of the ship, in the event of bottom damage, is not thereby impaired.

6.4.3 The double bottom may, however, be interrupted locally, or fitted with wells in way of dredging pumps and other equipment. Where such openings are large, their scantlings and arrangements will be specially considered.

6.4.4 The scantlings are to be in accordance with Ch 1,8 except for the following:

- The Rule thickness of centre girders may be reduced by 2,0 mm on ships classed **A1 protected waters service**.
- The Rule thickness of side girders may be reduced by 1,0 mm on ships classed **100A1 extended protected waters service**.
- The scantlings of floors, longitudinals and plating supporting the bottom of spaces intended to carry spoil are to be determined in accordance with Section 8.

6.5 Double bottom with transverse framing

6.5.1 Plate floors may be fitted at every frame or may be spaced not more than 3,0 m apart with the shell and inner bottom plating between these floors supported by bracket floors. However, plate floors are to be fitted at every frame in the following areas:

- As required for Ch 1,8.5.
- Below spaces from which dredged material will be discharged by grabs.
- In main propulsion and dredging machinery rooms and in peak tanks.
- For three frame spaces at ends of spoil spaces and dredging wells.

6.6 Double bottom with longitudinal framing

6.6.1 In locations other than below spaces intended for dredged spoil the section modulus of inner bottom longitudinals is to be not less than:

$$Z = \frac{l_e^2 s H}{K_1} c \text{ cm}^3$$

where

- l_e = effective span of longitudinals, in metres, and is to be taken as not less than 1,85 m
- s = spacing of longitudinals, in mm
- H = height, in metres, from the tank top to the deck at side, (but need not exceed T_m on ships classed **A1 protected waters service**)
- c as defined in Table 12.5.1
- K_1 = 120 in machinery spaces on ships classed **100A1**
= 150 otherwise.

6.6.2 The section modulus of longitudinals below spaces intended for dredged spoil is to comply with the requirements of 8.3.7.

6.6.3 The spacing of transverses is generally to be as for dry cargo ships but is not to exceed 4,0 m. Below main dredging machinery the transverses are generally to be spaced not more than 1,0 m apart.

Dredging and Reclamation Craft

Part 4, Chapter 12

Sections 6 & 7

6.6.4 The ends of longitudinal girders under dredging machinery are to be tapered off or efficiently scarfed into other longitudinal structural items.

Section 7

Bottom strengthening for operating aground

7.1 Application

7.1.1 The scantlings of bottom structure are to comply with the requirements given in Table 12.7.1.

7.1.2 Unless otherwise specified by the Owner, it should be assumed that non-self-propelled dredging and reclamation craft are to operate aground.

Table 12.7.1 Bottom strengthening for operating aground

Item	Requirement	
The following requirements are to be applied to the bottom structure upon which the ship is likely to be supported whilst aground		
(1) Bottom shell, keel and swim end plating	Thickness to be increased by 20% over the minimum requirements of Ch 1,5, with a minimum of 8 mm	
(2) Bottom longitudinals	Scantlings as required by Table 12.5.1(1) taking $K_1 = 74$ and $c = 1,0$	
(3) Bilge longitudinals (where fitted)	Scantlings to be the same as bottom longitudinals	
(4) Primary stiffening in way of single bottoms, see Notes 1 and 2	Transverse framing	Longitudinal framing
	(a) Floors to be fitted at every frame with vertical stiffeners spaced, in general, not more than 1,25 m apart (b) Side girders to be spaced not more than 2,2 m apart and intermediate 100 mm x 10 mm bulb plate longitudinals, or equivalent, fitted	(a) The spacing of transverses or floors is, in general, not to exceed 2,5 m outboard of wells or 1,85 m elsewhere (b) The panel size nearest the shell plating of web plates of transverses or floors is, in general, not to exceed $80t \times 80t$ where t is the actual web thickness (c) Side girders to be spaced not more than 2,2 m apart
(5) Primary stiffening in way of double bottoms, see Notes 1 and 2	(a) Plate floors are to be fitted at every frame with vertical stiffeners spaced, in general, not more than 1,25 m apart (b) Side girders to be spaced not more than 2,5 m apart and intermediate 100 mm x 10 mm bulb plate longitudinals, or equivalent, fitted (c) Where the span of floors between a hopper space and the ship's side exceeds 3,75 m, a longitudinal girder is to be fitted	(a) The spacing of plate floors is, in general, not to exceed 1,85 m (b) Side girders to be spaced not more than 2,5 m apart
NOTES		
1. The scantlings of floors, girders and transverses are to be determined in accordance with the requirements of Section 6.		
2. The number and size of holes in floors, girder and transverses are to be kept to a minimum, see Ch 1,8.		

Section 8

Spoil space and well structure

8.1 Symbols and definitions

8.1.1 The symbols used in this Section are defined as follows:

h = load head, in metres, measured vertically as follows:

- (a) For plating, the distance from a point one-third of the height of the plate above its lower edge to the sill of the uppermost overflow weir.
- (b) For stiffeners or girders, the distance from the middle of the effective length to the sill of the uppermost overflow weir.

l_e = effective length of stiffening members, in metres, see Pt 3, Ch 3,3

s = spacing of stiffeners, in mm

t = plate thickness, in mm

A_1 = cross-sectional area of flange or stiffener, in cm², including coaming plating.

8.1.2 Other symbols are defined in 1.5.1.

8.2 General

8.2.1 This Section provides for:

- (a) horizontally and vertically stiffened boundary bulkheads to hoppers, and holds intended for dredged spoil, to ladder wells and to spud wells,
- (b) protection against flooding in the event of the ladder well or adjacent bottom plating being damaged by objects dredged up by bucket dredgers, and
- (c) continuity of transverse strength in spoil spaces and wing tanks abreast of spoil spaces.

8.2.2 As an alternative to the requirements of this Section regarding primary structure, scantlings may be derived on the basis of direct calculation methods, see Section 18.

8.2.3 **Continuity of strength.** Arrangements are to be made to ensure continuity of strength at the ends of longitudinal and well side bulkheads. In general, the design should be such that the bulkheads are connected to bottom and deck girders by means of large, suitably shaped brackets arranged to give a good stress flow at their junctions with both the girders and the bulkheads.

8.2.4 **Ladder well cofferdams.** Ladder wells of trailing suction dredgers are to be isolated from the remainder of the dredger's structure by local cofferdams at least 600 mm wide, or are to be otherwise protected to prevent serious flooding due to the well side plating being breached by the ladder structure should this be damaged in service. Ladder wells of bucket dredgers are to be isolated by cofferdams, the extent and widths of which are to be sufficient to contain any damage to the well side bulkheads or bottom shell plating that could result from the impact of large objects brought up in the dredge buckets. In way of the buckets the cofferdam may be extended outboard in the form of a local watertight double bottom.

8.3 Spoil space and well boundaries

8.3.1 The minimum plating thickness of spoil space boundaries is to be the thickness required for deep tanks by Ch 1,9.2, or 8,5 mm, whichever is the greater. In the case of grab dredgers the minimum thickness is to be 10 mm. These thickness requirements also apply to the plating of watertight box keels and inner bottom plating. The value of ρ used in the calculations and the height(s) of the overflow weir(s) are to be clearly shown on the midship section plan.

8.3.2 Attention is drawn to the high rate of wear that can occur on spoil space boundaries, and it is recommended that an additional corrosion allowance of 3,0 mm be added on areas subject to particularly onerous conditions. Where such an allowance is added, the fact is to be marked on the relevant plans.

8.3.3 The thickness of plating forming the sides and ends of bucket ladder wells is to be not less than:

$$t = (0,0055s \sqrt{T_m} + 3,0) \text{ mm}$$

In no case, however, is the side plating to have a thickness less than 12 mm nor is the well end plating to have a thickness less than 8,5 mm. Plating forming the boundaries of suction pipe ladder wells is generally to be as required for shell plating. Corrosion allowance on well end plating below bucket ladders may be 2,0 mm.

8.3.4 The thickness of spoil space and ladder well bulkheads may be required to be increased where high shear forces are present.

8.3.5 Bulkheads forming the boundaries of spud wells are to be of increased strength. Each case will be considered on its merits, but in general such bulkheads should have a thickness of not less than 12 mm.

8.3.6 Where non-watertight bulkheads are fitted in the side buoyancy tanks, the thickness of the plating is to be not less than:

(a) $t = 6,5 \text{ mm}$, or

(b) $t = (5,35 + 0,024L) \text{ mm}$

whichever is the greater. Where the bulkhead is in the form of a wash bulkhead, the openings should be so arranged that, in general, the distance from lightening holes to any slots cut to accommodate side shell or bulkhead longitudinals is at least equal to 1,5 times the depth of the slot. The edges of large openings are to be stiffened.

8.3.7 The Section modulus of framing on spoil space boundaries is to be not less than:

$$Z = \frac{0,0113 \rho s h l_e^2 c}{\gamma} \text{ cm}^3$$

where

c has the value given in Table 12.8.1 for longitudinal framing and $c = 1,0$ for transverse framing

$g = 1,4$ for rolled or built sections
 $= 1,6$ for flat bars.

The section modulus of longitudinals below $\frac{D}{2}$ is to be taken not less than the value obtained at $\frac{D}{2}$.

Dredging and Reclamation Craft

Part 4, Chapter 12

Section 8

Table 12.8.1 Definition of c

Symbols	Location	c
F_B as defined in Pt 3, Ch 4.5.1	$\frac{D}{2}$ and above	1,0
	0,2D above base (see Note)	$\frac{550}{1590 - 1040F_B}$
	Base line (see Note)	$\frac{2060}{3620 - 1560F_B}$
NOTE For ships with hogging still water bending moments in loaded conditions and for split hull vessels, $c = 1,0$.		

8.3.8 The section modulus of stiffeners bounding wells and deep tanks is to satisfy the requirements of Ch 1,9.2.

8.3.9 For non-watertight bulkheads, the modulus of the stiffeners may be 50 per cent of that required for intact bulkheads. The stiffeners are to be bracketed at top and bottom.

8.3.10 Structure supporting spud well plating and bulkheads below, and in way of, 'A' frames and dredging machinery supports, is to be of substantial construction, account being taken of the dynamic loads likely to occur with the dredging machinery in operation.

8.3.11 Horizontal girders supporting stiffeners on spoil space and ladder well boundaries are, in general, to have scantlings as required by Ch 1,9.2 for deep tanks, with p and h as defined in 1.5.1 and 8.1.1 respectively and with span, l_e for horizontal girders supporting vertical stiffeners on longitudinal bulkheads, measured between bulkhead bracket and bulkhead bracket, i.e. ignoring any struts which may be fitted between spoil space girder and shell stringer. Alternatively, the section modulus of these horizontal girders may be reduced by 40 per cent from the formula value if struts are fitted on alternate frames between the spoil space girder and a shell stringer. These struts should generally be horizontal and are to have a sectional area as required for pillars by Ch 1,4.4 with p as defined in 1.5.1 and h measured from the inboard end of the strut to the height defined in 8.1.1. Web frames and girders are to have scantlings as required by Chapter 1, with p and h as defined in 1.5.1 and 8.1.1 respectively.

8.4 Cross-members

8.4.1 Cross-members are to be fitted within the hopper space in line with the bottom and side shell transverses and with the bulkheads in the side buoyancy spaces. Cross-members need not be fitted at every frame, but their spacing is not to exceed 4,0 m. Where a box keel is fitted on the centreline, webs are to be fitted within the box keel to ensure proper continuity of strength across the ship in way of the hopper cross-member. The webs required within centreline watertight box keels may have a thickness 3,5 mm less than that required for the hopper cross-members with which they are associated, but their minimum thickness is to be not less than 6,5 mm.

8.4.2 The upper edge of the hopper lower cross-members should, in general, be a height of not less than $\frac{D}{4}$ above the

above the keel in ships with the number 100 in their character of classification. The lower edge should be as low as practicable after allowing for the proper design of hopper doors, suction passages, etc. Lower cross-members may be fabricated from flat plate suitably stiffened or may take the form of a hollow box, generally of triangular cross-section.

8.4.3 The scantlings of box-type cross-members should be determined from the requirements for hopper bulkheads where applicable. When flat plate lower cross-members are fitted, the thickness of the web is to be not less than:

$$t = (0,7B + 3) \text{ mm or } 8,5 \text{ mm}$$

whichever is the greater.

8.4.4 The cross-sectional area of the cross-member web after deducting access openings, lightening holes, etc., is to be not less than:

$$A = 6h_w S_M \text{ cm}^2$$

where

h_w = height, in metres, of the uppermost hopper overflow weir above the keel

S_M = spacing of the cross-member webs, in metres.

8.4.5 The upper edge of the cross-member is to be stiffened by means of a tube having an outside diameter not less than:

$$\delta = 30l_s \text{ mm}$$

where

l_s = span, in metres, of the upper edge of the cross-member (to the centreline box girder if fitted),

and a thickness equal to the minimum required cross tie web thickness, or by an equivalent flange or structure. The lower edge of the cross-member is also to be suitably stiffened.

8.4.6 The cross-member web is to be fitted with stiffeners, spaced not more than 80t mm apart having a modulus of not less than:

$$Z = 0,04s l_e^2 \text{ cm}^3.$$

8.4.7 Upper cross-members spanning hopper spaces at or above deck level are to be designed on the basis of actual loads carried, including dynamic factors if applicable, and 60 per cent fixity. Stresses are to be as follows:

Bending stress, σ_b is not to exceed:

$$74,5 \text{ N/mm}^2 (7,6 \text{ kgf/mm}^2)$$

Shear stress, σ_s is not to exceed:

$$68,6 \text{ N/mm}^2 (7,0 \text{ kgf/mm}^2)$$

Total stress, $\sigma_c = \sqrt{\sigma_b^2 + 3\sigma_s^2}$ and is not to exceed:

$$118 \text{ N/mm}^2 (12 \text{ kgf/mm}^2)$$

The members should, in general, be connected to the centreline box keel by one or more pillars, where such a keel is fitted.

Dredging and Reclamation Craft

Part 4, Chapter 12

Sections 8 to 11

8.5 Pillars within hoppers

8.5.1 Pillars are generally to comply with the requirements of Ch 1.4.4, account being taken of the maximum forces that can be applied by rams or other gear fitted for the purpose of activating hopper doors or valves.

8.6 Continuous coamings

8.6.1 Continuous coamings are to have a plate thickness of not less than 8,5 mm. A minimum thickness of 10 mm is recommended for coamings on grab dredgers. Where the depth of the coaming exceeds 80t, the plating is to be stiffened by one or more horizontal members so spaced that the width of the upper panel of plating does not exceed 65t and the width(s) of the lower panel(s) do(es) not exceed 80t.

8.6.2 Where the coaming is stiffened with flat bar members, the members are to have a breadth not less than $0,04S_s$ and a thickness not less than 0,05 times their breadth, or 8,5 mm, whichever is the greater. They are to have a minimum inertia of:

$$I = 2S_s^2 A_1 \text{ cm}^4$$

where

A_1 and I include the coaming plating for mid-panel above to mid-panel below the stiffener, and

S_s = spacing of the brackets required by this sub-Section, in metres.

Where stiffeners other than flat bars are used, they are to have at least the same minimum thickness and inertia as required for flat bars.

8.6.3 The upper edge of the coaming is to be stiffened by a fabricated flange, box girder or equivalent structure having a width not less than $0,05S_s$ and an inertia not less than:

$$I = 2,86S_s^2 A_1 \text{ cm}^4$$

where

A_1 and I include the coaming plating down to mid-panel below

The thickness and/or attachments of the stiffening member are to be such as to minimise any likelihood of local instability under compression loading.

8.6.4 The coamings are to be supported by substantial brackets spaced generally not more than 3,0 m apart where the coamings have a height of more than 600 mm, nor more than 2,5 m where the coamings have a height of more than 1,0 m but on longitudinally framed ships the brackets are to be arranged in way of each deck transverse. Additional brackets may be required in way of the ends of hopper upper cross ties, especially those which themselves support hopper door operating rams or similar equipment.

8.6.5 The ends of continuous coamings are to be well scarfed into the ship's structure at the ends of spoil spaces. Unless longitudinal deckhouse bulkheads are fitted in this area, the coamings are to be extended beyond the end of the spoil space opening for a distance of at least one frame space, or 1,5 times the coaming height, whichever is the greater.

Section 9

Watertight bulkheads

9.1 Arrangements of bulkheads

9.1.1 The number of watertight bulkheads is to be not less than that required for dry cargo ships, see Pt 3, Ch 3.4. Their positioning is to be such that one extends the full width of the ship at each end of the spoil spaces, see also 8.2. Proposals to dispense with one or more of the watertight bulkheads in that part of the ship in way of spoil spaces may be submitted for consideration. In particular, watertight bulkheads need not be fitted within spoil spaces and an increased spacing of bulkheads in the spaces abreast of spoil spaces will generally be accepted provided that:

- (a) Suitable structural compensation is arranged; and
- (b) the stability is checked in the damaged condition.

Section 10

Exposed casings

10.1 Scantlings and access

10.1.1 Exposed casings on ships classed **A1 protected waters service** are to have scantlings as required for deck-houses on dry cargo ships classed **100A1**. On ships classed **100A1**, where T_m equals or exceeds the draught corresponding to a Type 'B-60' ship freeboard, direct access is not permitted to the machinery spaces (including dredging pump-rooms) from the freeboard deck. Doors may be fitted in exposed casing bulkheads, provided that they lead to a space which is of equivalent strength to the casing and is separated from the machinery space by a second watertight door.

Section 11

Dredging machinery seats and dredging gear

11.1 Dredging machinery seats

11.1.1 The seats supporting the main dredging machinery are to be at least as substantial as those required for the main propulsion machinery for dry cargo ships, see Pt 3, Ch 7.6. Continuity between the longitudinal and transverse members of main engine seats and the ship's bottom structure is to be arranged where practicable. Where floors are cut away below dredging pumps, they are to be fitted with face bars, and special care is to be taken to minimise stress-raising details and to ensure good workmanship.

Dredging and Reclamation Craft

Part 4, Chapter 12

Sections 11 to 15

11.2 Dredging gear

11.2.1 Where masts or derrick posts support dredging gear which will be subjected to vibration or other dynamic loads in addition to its true weight, this must be taken into account in the calculations. The dynamic multiplier should be taken between two and three according to the type of machinery and gear used.

Section 12 Ladder wells

12.1 Transverse strength at deck

12.1.1 Where ladder wells are incorporated so that the length of the well exceeds 1,5 times the width of the deck remaining on each side of the well, the portions of the ship on each side of the well are to be adequately cross connected in the region of their free ends, unless the design of the ship renders this impracticable, in which case alternative arrangements are to be made to avoid high stress concentrations at the inboard end of the well.

Section 13 Fenders

13.1 Fenders and reinforcement in way

13.1.1 Dredgers designed to work in conjunction with hopper barges are to be fitted with permanent rubbing strakes or fenders extending down to their lowest normal operating waterline. On transversely framed vessels it is recommended that the side structure in way of the lower edge of the fender be reinforced by a stringer and/or cross ties. It is recommended that, where wooden fenders are fitted to dredgers operating in tropical sea-water, the fenders be cut just above the deepest working waterline and a gap be left sufficient to prevent water soaking up into the fenders.

Section 14 Rudders

14.1 Rudders on bucket dredgers

14.1.1 Where bucket dredgers are arranged with bucket ladders at their stern, the ship's rudders are to be kept well clear of the buckets to minimise the likelihood of damage to the rudders by large objects which may be dredged up. For rudder calculations, see Pt 3, Ch 13.

Section 15 Spoil space weirs and overflows

15.1 General

15.1.1 All spoil spaces are to be arranged to allow the safe and efficient overboard discharge of excess water in all weather conditions in which the ship is classed to operate. In ships over 90 m in length and in all ships classed for unrestricted service the spoil space overflows are to be arranged via enclosed overflow trunks so designed as to keep the decks of the ship clear of spoil and water.

15.1.2 In general, bulwarks are not to be fitted in way of open top spoil spaces on dredging and reclamation craft.

15.1.3 Where a ship operates at the maximum draught that could be assigned in accordance with the *International Convention on Load Lines, 1966*, the overflow arrangements fitted should ensure that when the spoil space is loaded, this draught is not exceeded.

15.1.4 Where a hopper dredger having releasing arrangements for cargo dumping, e.g. bottom doors, etc., is permitted by an Administration to be assigned a freeboard less than that which could be assigned by the *International Convention on Load Lines, 1966*:

- (a) The structural strength and bending moments are to be acceptable for the deeper draught indicated, and
- (b) the dredger is to be operated in a zone of operation and in such weather conditions as are considered appropriate.

15.1.5 Adequate arrangements are to be fitted to prevent overloading under any condition of loading having due regard to trim. The size and position of the overflows are to be confirmed by a loading trial, which is to be carried out when the spoil space is loaded with dredgings of the same density as is likely to be loaded in service.

15.1.6 The cutting of overflow discharge trunk openings in the sheerstrake is to be avoided wherever practicable. In ships over 70 m in length, spoil space overflow discharge trunk openings are not to be cut within 800 mm of the upper edge of the sheerstrake. They are to have corner radii of not less than 150 mm, and suitable compensation is to be arranged. In no case is a discharge trunk to pierce the sheerstrake in way of discontinuities such as breaks of superstructure.

Section 16

Scuppers and sanitary discharges and side scuttles

16.1 General

16.1.1 In all areas where mechanical damage might be likely, all side scuttles, scuppers and discharges, including their valves, controls and indicators, are to be well protected. Consideration is to be given to the likelihood of impact damage to scuttles and discharges due to barges coming alongside, and to scuppers becoming blocked by sand or other spoil which may spill onto the decks or other areas being drained.

16.1.2 Consideration will be given to requests for relaxation of requirements relating to scuttles, scuppers and discharges on ships classed **A1 protected waters service**.

Section 17

Split hopper dredgers and barges

17.1 Symbols and definitions

17.1.1 The symbols used in this Section are defined as follows:

- H = height of spoil above base line, in metres
- H_s = depth of hopper seal, in metres
- L_h = length of hopper well, in metres
- M_H = design horizontal bending moment in hopper side wall, in kN m (tonne-f m). A moment giving rise to tensile stress in the side shell is to be taken as positive
- P = net pressure per metre ship length resulting from the spoil pressure and the hydrostatic load, see Fig. 12.17.2
 $= 4,9 (\rho (H - H_s)^2 - 1,025 (T - H_s)^2)$ kN/m
 $(0,5 (\rho (H - H_s)^2 - 1,025 (T - H_s)^2))$ tonne-f/m
- S_h = span between the centres of hinges, in metres

17.1.2 Other symbols are defined in 1.5.1.

17.2 Hull bending strength

17.2.1 The modulus of the cross-section of the vessel is to be not less than that required by 2.3.1. In addition, the combined stress σ_c , at any point on the cross-section of one half hull, is not to exceed the permissible combined stress σ given in Pt 3, Ch 4.5.5. The combined stress at any point on the cross-section is to be determined from the following expression:

$$\sigma_c = \left(\frac{M_N}{Z_N} + \frac{M_p}{Z_p} \right) \times 10^{-3} \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$$

where

- M_N = $\pm M_V \cos \phi \pm M_H \sin \phi$ kN m (tonne-f m)
- M_p = $\pm M_H \cos \phi \pm M_V \sin \phi$ kN m (tonne-f m)
- M_V = $\pm 0,5 (M_s + M_w)$ kN m (tonne-f m)

where the still water bending moments hogging and sagging are to be combined with the appropriate wave bending moment to give a total moment, M_V , hogging (positive) and sagging (negative)

M_w is defined in 1.5.1.

- f_1 = ship service factor, see Table 12.2.1
- $M_H = 0,125 P L_h (2S_h - L_h) \pm M_L$ kN m (tonne-f m)
- $M_L = 0,286 f_1 L^2 B$ kN m (0,029 $f_1 L^2 B$ tonne-f m)
- $P = 4,9 (\rho (H - H_s)^2 - 1,025 (T - H_s)^2)$ kN m
 $(0,5 (\rho (H - H_s)^2 - 1,025 (T - H_s)^2))$ tonne-f m

Account is to be taken of the sign of individual bending moment component in the determination of M_N , M_p , M_V and M_H

I_{NN} = second moment of area of the section of one half hull for all longitudinal continuous material about principal axis NN, in m^4

I_{PP} = second moment of area of the section of one half hull for all longitudinal continuous material about principal axis PP, in m^4

$Z_p = \frac{I_{PP}}{y_p}$ in m^3 , the modulus of section to a point y_p m,

from the principal axis PP

$Z_N = \frac{I_{NN}}{y_N}$ in m^3 , the modulus of section to a point

y_N m, from the principal axis NN

ϕ = angle of rotation of the principal axis NN with respect to the global horizontal axis YY, in degrees.

See also Fig. 12.17.1.

17.2.2 The combined stress for dredging conditions, where draught T_m exceeds T , is not to exceed the permissible combined stress σ_c obtained from 17.2.1.

The combined stress is to be obtained from the expression for σ_c given in 17.2.1, substituting the following expression of M_V :

$$M_V = \pm 0,5 (M_{sm} + M_{wd}) \text{ kN m (tonne-f m)}$$

where

$M_{wd} = 0,56 f_2 M_{w0}$ and M_{w0} is determined from Pt 3, Ch 4.5.2, using C_{bm} in place of C_b and f_2 is given in Pt 3, Ch 4.5.2.

17.3 Separation arrangements

17.3.1 Hinges, actuating and locking devices provided to facilitate separation of the split hulls to discharge spoil are to be of efficient design and of adequate strength and scantlings to ensure safe discharge operations. Hydraulic rams or other actuating devices are to have sufficient power to ensure controlled opening operations and to achieve closing of the hulls in all anticipated weather conditions.

17.3.2 Locking devices are to be of a suitable design and strength to ensure that accidental separation of the hulls cannot occur due to ship motions and vibrations.

17.3.3 Hinge pin gudgeons are to be efficiently connected to the hull structure by means of brackets or equivalent and effectively integrated with local structure which is to be suitably reinforced. Suitable reinforcement is to be fitted to local hull structure in way of anchorages for rams and locking devices to ensure efficient transmission of loading from these devices into the hull.

17.3.4 The forces acting on hinges, actuating mechanisms and locking devices are to be determined by direct calculations based on the maximum combination of loading which can be expected in any service condition. In general, this will require the resolution of the static and dynamic systems of force acting on the hulls taking due account of the relative locations of hinges, actuating mechanisms and locking devices. Fig. 12.17.2 illustrates a typical arrangement of hinges and mechanisms together with associated static loads. In general, one half of the load acting on one half hull may be assumed to act on the forward hinge assembly and one half on the after hinge assembly.

17.4 Hinge pins

17.4.1 The diameter of the hinge pins is to be determined using the maximum resultant shear force acting on the pin cross section in conjunction with an average shear stress not exceeding $\frac{62}{k}$ N/mm² $\left(\frac{6,3}{k} \text{ kgf/mm}^2 \right)$.

In no case is the diameter of the hinge pin to be less than that calculated from the following expression:

$$D_p = 20 \sqrt{\frac{L^{0,5} B D K}{n}} \text{ mm}$$

where

k = higher tensile steel factor, see Pt 3, Ch 2,1

n = the number of pin cross sections resisting shear forces

and L , B and D are defined in 1.5.1.

17.4.2 Where arrangements are such that hinge pins are subjected to significant bending, the diameter of the pins will be specially considered.

■ **Section 18**
Direct calculations

18.1 Application

18.1.1 Direct calculations may be used to assess the scantlings of primary structure in spoil spaces and adjacent structure.

18.1.2 Direct calculations may be required to be submitted in respect of unusual structural arrangements.

18.2 Procedures

18.2.1 Methods applied for direct calculations of scantlings will be given individual consideration dependent on the particular structural configuration, see also Pt 3, Ch 1,3.1.

	10.2	Type test
	10.3	Dynamic balancing
	10.4	Overspeed test
	10.5	Mechanical running test

Section	11	Mass produced engines
	11.1	Definition
	11.2	Procedure for approval of mass produced engines
	11.3	Continuous review of production
	11.4	Compliance and inspection certificate
	11.5	Type test conditions
Section	12	Mass produced turbo-chargers
	12.1	Application
	12.2	Procedure for approval of mass produced turbo-chargers
	12.3	Continuous inspection of individual units
	12.4	Compliance and certificate
Section	13	Type testing procedure for crankcase explosion relief valves
	13.1	Scope
	13.2	Purpose
	13.3	Test facilities
	13.4	Explosion test process
	13.5	Valves to be tested
	13.6	Method
	13.7	Assessment and records
	13.8	Design series qualification
	13.9	The report
	13.10	Approval
Section	14	Type testing procedure for crankcase oil mist detection and alarm equipment
	14.1	Scope
	14.2	Purpose
	14.3	Test facilities
	14.4	Equipment testing
	14.5	Functional tests
	14.6	Detectors and alarm equipment to be tested
	14.7	Method
	14.8	Assessment
	14.9	Design series qualification
	14.10	The report
	14.11	Acceptance
Section	15	Electronically controlled engines
	15.1	Scope
	15.2	Plans and particulars
	15.3	Oil fuel and hydraulic oil systems
	15.4	Electronic control systems
	15.5	FMEA analysis
Section	16	Alarms and safeguards for emergency diesel engines
	16.1	Application
	16.2	Plans and information
	16.3	Alarms and safeguards
Section	17	General requirements
	17.1	Turning gear
Section	18	Program for trials of diesel engines to assess operational capability
	18.1	Works trials (acceptance test)
	18.2	Shipboard trials
CHAPTER	3	STEAM TURBINES
Section	1	Plans and particulars
	1.1	Plans

Section	2	Materials
	2.1	General
	2.2	Materials for forgings
Section	3	Design and construction
	3.1	General
	3.2	Welded components
	3.3	Stress raisers
	3.4	Shrunk-on rotor discs
	3.5	Vibration
	3.6	External influences
	3.7	Steam supply and water system
	3.8	Turning gear
Section	4	Safety arrangements
	4.1	Overspeed protective devices
	4.2	Speed governors
	4.3	Low vacuum and overpressure protective devices
	4.4	Bled steam connections
	4.5	Steam strainers
Section	5	Emergency arrangements
	5.1	Lubricating oil failure
	5.2	Single screw ships
	5.3	Single main boiler
Section	6	Tests and equipment
	6.1	Stability testing of turbine rotors
	6.2	Balancing
	6.3	Hydraulic tests
	6.4	Indicators for movement
	6.5	Wear-down gauges
CHAPTER	4	GAS TURBINES
Section	1	General requirements
	1.1	Application
	1.2	Standard reference conditions
	1.3	Power ratings
	1.4	Gas turbine type approval
	1.5	Inclination of vessel
Section	2	Particulars to be submitted
	2.1	Plans and information
Section	3	Materials
	3.1	Materials for forgings
	3.2	Material tests and inspection

	8.1	General
	8.2	Overspeed protection and shutdown system
	8.3	Power turbine inlet over-temperature control
	8.4	Flameout
	8.5	Lubricating oil system
	8.6	Hand trip arrangement
	8.7	Fire detection, alarm and extinguishing systems
Section	9	Planned maintenance and condition monitoring procedures, and 'upkeep by exchange'
	9.1	Planned maintenance approach
	9.2	Preventive maintenance
	9.3	Unscheduled maintenance
	9.4	Condition monitoring
	9.5	Condition monitoring techniques
	9.6	Upkeep by exchange
CHAPTER	5	GEARING
Section	1	Plans and particulars
	1.1	Gearing plans
	1.2	Material specifications
Section	2	Materials
	2.1	Material properties
	2.2	Non-destructive tests
Section	3	Design
	3.1	Symbols
	3.2	Tooth form
	3.3	Tooth loading factors
	3.4	Tooth loading for surface stress
	3.5	Tooth loading for bending stress
	3.6	Factors of safety
Section	4	Construction
	4.1	Gear wheels and pinions
	4.2	Accuracy of gear cutting and alignment
	4.3	Gearcases
Section	5	Tests
	5.1	Balance of gear pinions and wheels
	5.2	Meshing tests
	5.3	Alignment

CHAPTER	6	MAIN PROPULSION SHAFTING
Section	1	Plans and particulars
	1.1	Shafting plans
Section	2	Materials
	2.1	Materials for shafts
	2.2	Ultrasonic tests
Section	3	Design
	3.1	Intermediate shafts
	3.2	Gear quill shafts
	3.3	Final gear wheel shafts
	3.4	Thrust shafts
	3.5	Screwshafts and tube shafts
	3.6	Hollow shafts
	3.7	Couplings and transitions of diameters
	3.8	Coupling bolts
	3.9	Bronze or gunmetal liners on shafts
	3.10	Keys and keyways
	3.11	Propellers
	3.12	Sternbushes
	3.13	Vibration and alignment
CHAPTER	7	PROPELLERS
Section	1	Plans and particulars
	1.1	Details to be submitted
Section	2	Materials
	2.1	Castings
Section	3	Design
	3.1	Minimum blade thickness
	3.2	Keyless propellers
Section	4	Fitting of propellers
	4.1	Propeller boss
	4.2	Shop tests of keyless propellers
	4.3	Final fitting of keyless propellers
CHAPTER	8	SHAFT VIBRATION AND ALIGNMENT
Section	1	General
	1.1	Basic requirements
	1.2	Resilient mountings
	1.3	Flexible couplings
Section	2	Torsional vibration
	2.1	General
	2.2	Particulars to be submitted
	2.3	Scope of calculations
	2.4	Symbols and definitions
	2.5	Limiting stress in propulsion shafting
	2.6	Generator sets
	2.7	Other auxiliary machinery systems
	2.8	Other machinery components
	2.9	Measurements
	2.10	Vibration monitoring
	2.11	Restricted speed and/or power ranges
	2.12	Tachometer accuracy
	2.13	Governor control

Section	3	Axial vibration
	3.1	General
	3.2	Particulars to be submitted
	3.3	Calculations
	3.4	Measurements
	3.5	Restricted speed ranges
	3.6	Vibration monitoring
Section	4	Lateral vibration
	4.1	General
	4.2	Particulars to be submitted
	4.3	Calculations
	4.4	Measurements
Section	5	Shaft alignment
	5.1	General
	5.2	Particulars to be submitted for approval – shaft alignment calculations
	5.3	Shaft alignment procedures
	5.4	Design and installation criteria
	5.5	Measurements
	5.6	Flexible couplings
CHAPTER	9	PODDED PROPULSION UNITS
Section	1	Scope
	1.1	General
Section	2	General requirements
	2.1	Pod arrangement
	2.2	Plans and information to be submitted
	2.3	Pod internal atmospheric conditions
	2.4	Global loads
	2.5	Failure Modes and Effects Analysis (FMEA)
	2.6	Ice Class requirements
Section	3	Functional capability
	3.1	General
Section	4	Materials
	4.1	General
Section	5	Structure design and construction requirements
	5.1	Pod structure
	5.2	Hull support structure
	5.3	Direct calculations
Section	6	Machinery design and construction requirements
	6.1	General
	6.2	Gearing
	6.3	Propulsion shafting
	6.4	Propeller
	6.5	Bearing lubrication system
	6.6	Steering system
	6.7	Ventilation and cooling systems
	6.8	Pod drainage requirements
	6.9	Hydraulic actuating systems
Section	7	Electrical equipment
	7.1	General

Section	8	Control engineering arrangements
	8.1	General
	8.2	Monitoring and alarms
Section	9	Testing and trials
	9.1	General
Section	10	Installation, maintenance and replacement procedures
	10.1	General
CHAPTER	10	STEAM RAISING PLANT AND ASSOCIATED PRESSURE VESSELS
Section	1	General requirements
	1.1	Application
	1.2	Definition of symbols
	1.3	Design pressure

	8.1	Access arrangements
	8.2	Torispherical and semi-ellipsoidal ends
 Section	 9	 Mountings and fittings
	9.1	General
	9.2	Receivers containing pressurised gases
 Section	 10	 Hydraulic tests
	10.1	General
	10.2	Mountings
 Section	 11	 Plate heat exchangers
	11.1	General
 CHAPTER	 12	 PIPING DESIGN REQUIREMENTS
Section	1	General
	1.1	Application
	1.2	Design symbols
	1.3	Design pressure
	1.4	Design temperature
	1.5	Classes of pipes
	1.6	Materials

Section	2	Carbon and low alloy steels
	2.1	Carbon and low alloy steel pipes, valves and fittings
	2.2	Wrought steel pipes and bends
	2.3	Pipe joints – General
	2.4	Steel pipe flanges
	2.5	Screwed-on flanges
	2.6	Welded-on flanges, butt welded joints and fabricated branch pieces
	2.7	Loose flanges
	2.8	Socket weld joints
	2.9	Welded sleeve joints
	2.10	Threaded sleeve joints
	2.11	Screwed fittings
	2.12	Other mechanical couplings
	2.13	Non-destructive testing
Section	3	Copper and copper alloys
	3.1	Copper and copper alloy pipes, valves and fittings
	3.2	Heat treatment
Section	4	Cast iron
	4.1	Spheroidal or nodular graphite cast iron
	4.2	Grey cast iron
Section	5	Plastics pipes
	5.1	General
	5.2	Design and performance criteria
	5.3	Design strength
	5.4	Fire performance criteria
	5.5	Electrical conductivity
	5.6	Manufacture and quality control
	5.7	Installation and construction
	5.8	Testing
Section	6	Valves
	6.1	Design requirements
Section	7	Flexible hoses
	7.1	General
	7.2	Applications
	7.3	Design requirements
	7.4	Testing
Section	8	Hydraulic tests on pipes and fittings
	8.1	Hydraulic tests before installation on board
	8.2	Testing after assembly on board
Section	9	Piping for LPG/LNG carriers, gas fuelled ships and classed refrigeration systems
	9.1	Scope
	9.2	Application
	9.3	Classes of pipe
	9.4	Materials
	9.5	Valves and piping components independent of temperature
	9.6	Valves for cryogenic temperature service
	9.7	Valves for refrigeration service
	9.8	Expansion bellows
	9.9	Pressure testing of piping and other piping components
	9.10	Equipment documentation

Appendix

Section 10 Guidance notes on metal pipes for water services

- 10.1 General
- 10.2 Materials
- 10.3 Steel pipes
- 10.4 Copper and copper alloy pipes
- 10.5 Flanges
- 10.6 Water velocity
- 10.7 Fabrication and installation
- 10.8 Metal pipes for fresh water services

CHAPTER 13 SHIP PIPING SYSTEMS

Section 1 General requirements

- 1.1 Application
- 1.2 Prevention of progressive flooding in damage condition
- 1.3 Plans and particulars

Section 2 Construction and installation

- 2.1 Materials
- 2.2 Pipe wall thickness
- 2.3 Valves – Installation and control
- 2.4 Attachment of valves to watertight plating
- 2.5 Ship-side valves and fittings (other than those on scuppers and sanitary discharges)
- 2.6 Piping systems – Installation
- 2.7 Provision for expansion
- 2.8 Piping in way of refrigerated chambers
- 2.9 Miscellaneous requirements
- 2.10 Testing after installation

Section 3 Drainage of compartments, other than machinery space

- 3.1 General
- 3.2 Cargo holds
- 3.3 Holds and deep tanks for alternative carriage of liquid or dry cargo
- 3.4 Tanks and cofferdams
- 3.5 Fore and after peaks
- 3.6 Spaces above fore peaks, after peaks and machinery spaces
- 3.7 Maintenance of integrity of bulkheads

Section 4 Bilge drainage of machinery space

- 4.1 General
- 4.2 Machinery space with double bottom
- 4.3 Machinery space without double bottom
- 4.4 Additional bilge suction
- 4.5 Separate machinery spaces
- 4.6 Machinery space – Emergency bilge drainage
- 4.7 Tunnel drainage

Section 5 Sizes of bilge suction pipes

- 5.1 Main bilge line
- 5.2 Branch bilge suction to cargo and machinery spaces
- 5.3 Direct bilge suction, other than emergency suction
- 5.4 Main bilge line – Tankers and similar ships
- 5.5 Distribution chest branch pipes
- 5.6 Tunnel suction

Section 6 Pumps on bilge service and their connections

- 6.1 Number of pumps
- 6.2 General service pumps
- 6.3 Capacity of pumps
- 6.4 Self-priming pumps
- 6.5 Pump connections
- 6.6 Direct bilge suction

Section	7	Piping systems and their fittings
	7.1	Main bilge line suctions
	7.2	Prevention of communication between compartments
	7.3	Isolation of bilge system
	7.4	Machinery space suctions – Mud boxes
	7.5	Hold suctions – Strum boxes
	7.6	Bilge wells
	7.7	Tail pipes
	7.8	Location of fittings
	7.9	Bilge pipes in way of double bottom tanks
	7.10	Bilge pipes in way of deep tanks
	7.11	Hold bilge non-return valves
	7.12	Blanking arrangements
Section	8	Additional requirements for bilge drainage and cross-flooding arrangements for passenger ships
	8.1	Location of bilge pumps and bilge main
	8.2	Prevention of communication between compartments in the event of damage
	8.3	Arrangement and control of bilge valves
	8.4	Cross-flooding arrangements
Section	9	Additional requirements relating to fixed pressure water spray fire-extinguishing systems
	9.1	Bilge drainage requirements
Section	10	Drainage arrangements for ships not fitted with propelling machinery
	10.1	Hand pumps
	10.2	Ships with auxiliary power
Section	11	Ballast system
	11.1	Stand-by arrangements for ballast pumping
Section	12	Air, overflow and sounding pipes
	12.1	Definitions
	12.2	Materials
	12.3	Nameplates
	12.4	Air pipes
	12.5	Termination of air pipes
	12.6	Gauze diaphragms
	12.7	Air pipe closing appliances
	12.8	Size of air pipes
	12.9	Overflow pipes
	12.10	Air and overflow systems
	12.11	Sounding arrangements
	12.12	Termination of sounding pipes
	12.13	Short sounding pipes
	12.14	Elbow sounding pipes
	12.15	Striking plates
	12.16	Sizes of sounding pipes

CHAPTER	14	MACHINERY PIPING SYSTEMS
Section	1	General requirements
	1.1	General
Section	2	Oil fuel – General requirements
	2.1	Flash point
	2.2	Special fuels
	2.3	Oil fuel sampling
	2.4	Ventilation
	2.5	Boiler insulation and air circulation in boiler room
	2.6	Funnel dampers
	2.7	Heating arrangements
	2.8	Temperature indication
	2.9	Precautions against fire
	2.10	Oil fuel contamination
Section	3	Oil fuel burning arrangements
	3.1	Oil burning units
	3.2	Gravity feed
	3.3	Starting-up unit
	3.4	Steam connections to burners
	3.5	Burner arrangements
	3.6	Quick-closing valve
	3.7	Spill arrangements
	3.8	Alternately-fired furnaces
	3.9	Oil fuel treatment for supply to main and auxiliary oil engines and gas turbines
	3.10	Booster pumps
	3.11	Fuel valve cooling pumps
	3.12	Oil-fired galleys
Section	4	Oil fuel pumps, pipes, fittings, tanks, etc.
	4.1	Transfer pumps
	4.2	Control of pumps
	4.3	Relief valves on pumps
	4.4	Pump connections
	4.5	Pipes conveying oil
	4.6	Low pressure pipes
	4.7	Valves and cocks
	4.8	Valves on deep tanks and their control arrangements
	4.9	Water drainage from settling tanks
	4.10	Relief valves on oil heaters
	4.11	Filling arrangements
	4.12	Transfer arrangements – Passenger ships
	4.13	Alternative carriage of oil fuel and water ballast
	4.14	Deep tanks for the alternative carriage of oil, water ballast or dry cargo
	4.15	Separation of cargo oils from oil fuel
	4.16	Fresh water piping
	4.17	Separate oil fuel tanks
	4.18	Oil fuel service tanks
	4.19	Arrangements for fuels with a flash point between 43° and 60°
Section	5	Steam piping systems
	5.1	Provision for expansion
	5.2	Drainage
	5.3	Pipes in way of holds
	5.4	Reduced pressure lines
	5.5	Steam for fire-extinguishing in cargo holds

Section	6	Boiler feed water and condensate systems
	6.1	Feed water piping
	6.2	Feed pumps
	6.3	Harbour feed pumps
	6.4	Condensate pumps
	6.5	Valves and cocks
	6.6	Reserve feed water
Section	7	Engine cooling water systems
	7.1	Main supply
	7.2	Standby supply
	7.3	Selection of standby pumps
	7.4	Relief valves on main cooling water pumps
	7.5	Sea inlets
	7.6	Strainers
Section	8	Lubricating oil systems
	8.1	General requirements
	8.2	Pumps
	8.3	Alarms
	8.4	Emergency supply for propulsion turbines and propulsion turbo-generators
	8.5	Maintenance of bearing lubrication
	8.6	Filters
	8.7	Cleanliness of pipes and fittings
	8.8	Lubricating oil drain tank
	8.9	Lubricating oil contamination
	8.10	Deep tank valves and their control arrangements
Section	9	Hydraulic systems
	9.1	General
	9.2	System arrangements
Section	10	Low pressure compressed air systems
	10.1	General
	10.2	Compressors and reducing valves/stations
	10.3	Air receivers
	10.4	Distribution system
	10.5	Pneumatic remote control valves
	10.6	Control arrangements
Section	11	Multi-engined ships
	11.1	General
CHAPTER	15	PIPING SYSTEMS FOR OIL TANKERS
Section	1	General requirements
	1.1	Application
	1.2	Plans and particulars
	1.3	Materials
	1.4	Design
	1.5	Dangerous spaces
	1.6	Cargo pump room
	1.7	Cargo pump room ventilation
	1.8	Non-sparking fans for hazardous areas
	1.9	Slop tanks
	1.10	Steam connections to cargo tanks

Section	2	Piping systems for bilge, ballast, oil fuel, etc.
	2.1	Pumping arrangements at ends of ship outside dangerous zones and spaces
	2.2	Cargo pump room drainage
	2.3	Deep cofferdam drainage
	2.4	Drainage of ballast tanks and void spaces within the range of the cargo tanks
	2.5	Air and sounding pipes
	2.6	Ballast piping in pump room double bottoms
Section	3	Cargo handling system
	3.1	General
	3.2	Cargo pumps
	3.3	Cargo piping system
	3.4	Terminal fittings at cargo loading stations
	3.5	Bow or stern loading and discharge arrangements
	3.6	Connections to cargo tanks
	3.7	Remote control valves
	3.8	Cargo handling controls
Section	4	Cargo tank venting, purging and gas-freeing
	4.1	Cargo tank venting
	4.2	Cargo tank purging and/or gas-freeing
	4.3	Venting, purging and gas measurement of double hull and double bottom spaces
	4.4	Gas measurement
Section	5	Cargo tank level gauging equipment
	5.1	General
	5.2	Restricted sounding device
	5.3	Closed sounding devices
Section	6	Cargo heating arrangements
	6.1	General
	6.2	Blanking arrangements
	6.3	Heating medium
	6.4	Heating circuits
	6.5	Temperature indication
Section	7	Inert gas systems
	7.1	General
	7.2	Gas supply
	7.3	Gas scrubber
	7.4	Gas blowers
	7.5	Gas distribution lines
	7.6	Venting arrangements
	7.7	Instrumentation and alarms
	7.8	Installation and tests
	7.9	Nitrogen generator systems
	7.10	Nitrogen/inert gas systems fitted for purposes other than inerting required by SOLAS Reg.II-2/4.5.5.1.1
CHAPTER	16	SPARE GEAR FOR MACHINERY INSTALLATIONS
Section	1	General
	1.1	Application
	1.2	Tables of spare parts
CHAPTER	17	REQUIREMENTS FOR FUSION WELDING OF PRESSURE VESSELS AND PIPING
Section	1	General
	1.1	Scope
	1.2	General requirements for welding plant and welding quality
	1.3	Manufacture and workmanship of fusion welded pressure vessels

Section	2	Manufacture and workmanship of fusion welded pressure vessels
	2.1	General requirements
	2.2	Materials of construction
	2.3	Tolerances for cylindrical shells
Section	3	Repairs to welds on fusion welded pressure vessels
	3.1	General
Section	4	Post weld heat treatment of pressure vessels
	4.1	General
Section	5	Welded pressure pipes
	5.1	General
	5.3	Welding workmanship
Section	6	Non-Destructive Examination
	6.1	General
CHAPTER	18	INTEGRATED PROPULSION SYSTEMS
Section	1	General requirements
	1.1	General
	1.2	Plans
Section	2	Machinery arrangements
	2.1	Main propulsion machinery
	2.2	Supply of electric power and essential services
	2.3	Controllable pitch propellers
Section	3	Control arrangements
	3.1	Bridge control
	3.2	Alarm system
	3.3	Communication
	3.4	Engine starting safeguards
	3.5	Operational safeguards
	3.6	Automatic control of essential services
	3.7	Local control
CHAPTER	19	STEERING GEAR
Section	1	General
	1.1	Application
	1.2	Definitions
	1.3	General
	1.4	Plans
	1.5	Materials
	1.6	Rudder, rudder stock, tiller and quadrant
Section	2	Performance
	2.1	General
	2.2	Rudder angle limiters

	5.1	General
	5.2	Generating arrangements
	5.3	Distribution arrangements
	5.4	Auxiliary supplies
Section	6	Testing and trials
	6.1	General

CHAPTER	21	SHIPRIGHT PROCEDURES FOR MACHINERY PLANNED MAINTENANCE AND CONDITION MONITORING
Section	1	General
	1.1	Application
	1.2	Classification notations and descriptive notes
	1.3	Information and plans required to be submitted
Section	2	Machinery Planned Maintenance Scheme
	2.1	Descriptive note MPMS
Section	3	Machinery Condition Monitoring
	3.1	Descriptive note MCM
Section	4	Turbine Condition Monitoring
	4.1	Descriptive note TCM
Section	5	Screwshaft Condition Monitoring
	5.1	Descriptive note SCM
Section	6	Reliability Centred Maintenance
	6.1	Descriptive note RCM
CHAPTER	22	PROPULSION AND STEERING MACHINERY REDUNDANCY
Section	1	General requirements
	1.1	General
	1.2	Plans and information
Section	2	Failure Mode and Effects Analysis (FMEA)
	2.1	General
Section	3	Machinery arrangements
	3.1	Main propulsion machinery
	3.2	Steering machinery
	3.3	Electrical power supply
	3.4	Essential services for machinery
	3.5	Oil fuel storage and transfer systems
Section	4	Control arrangements
	4.1	General
	4.2	Bridge control
Section	5	Separate machinery spaces ★ (star) Enhancement
	5.1	General
	5.2	Machinery arrangements
	5.3	Electrical power supply
	5.4	Essential services for machinery
	5.5	Bilge drainage arrangements
	5.6	Oil fuel storage
	5.7	FMEA
Section	6	Testing and trials
	6.1	Sea trials

General Requirements for the Design and Construction of Machinery

Part 5, Chapter 1

Section 1

Section

- 1 **General**
- 2 **Plans and particulars**
- 3 **Operating conditions**
- 4 **Machinery room arrangements**
- 5 **Trials**
- 6 **Quality Assurance Scheme for Machinery**

■ Scope

The Chapters in this Part cover the construction and installation of main propulsion and auxiliary machinery systems, together with their associated equipment, boilers, pressure vessels, pumping and piping arrangements and steering gear fitted in classed ships.

■ Section 1 General

1.1 Machinery to be constructed under survey

1.1.1 In ships built under Special Survey, all important units of equipment are to be surveyed at the manufacturer's works. The workmanship is to be to the Surveyor's satisfaction and the Surveyor is to be satisfied that the components are suitable for the intended purpose and duty. Examples of such units are:

- Main propulsion engines including their associated gearing, flexible couplings, scavenge blowers and superchargers.
- Boilers supplying steam for propulsion or for services essential for the safety or the operation of the ship at sea, including superheaters, economisers, desuper-heaters, steam heated steam generators and steam receivers. All other boilers having working pressures exceeding 3,4 bar (3,5 kgf/cm²), and having heating surfaces greater than 4,65 m².
- Auxiliary engines which are the source of power for services essential for safety or for the operation of the ship at sea.
- Steering machinery.
- Athwartship thrust units, their prime movers and control mechanisms.
- All pumps necessary for the operation of main propulsion and essential machinery, e.g. boiler feed, cooling water circulating, condensate extraction, oil fuel and lubricating oil pumps.
- All heat exchangers necessary for the operation of main propulsion and essential machinery, e.g. air, water and lubricating oil coolers, oil fuel and feed water heaters, de-aerators and condensers, evaporators and distiller units.

- Air compressors, air receivers and other pressure vessels necessary for the operation of main propulsion and essential machinery. Any other unfired pressure vessels for which plans are required to be submitted as detailed in Ch 11, 1.6.
- All pumps essential for safety of the ship, e.g. fire, bilge and ballast pumps.
- Valves and other components intended for installation in pressure piping systems having working pressures exceeding 7 bar.
- Alarm and control equipment as detailed in Pt 6, Ch 1.
- Electrical equipment and electrical propelling machinery as detailed in Pt 6, Ch 2.

1.2 Survey for classification

1.2.1 The Surveyors are to examine and test the materials and workmanship from the commencement of work until the final test of the machinery under full power working conditions. Any defects, etc., are to be indicated as early as possible. On completion, the Surveyors will submit a report and if this is found to be satisfactory by the Committee a certificate will be granted and an appropriate notation will be assigned in accordance with Pt 1, Ch 2.

1.3 Alternative system of inspection

1.3.1 Where items of machinery are manufactured as individual or series produced units the Committee will be prepared to give consideration to the adoption of a survey procedure based on quality assurance concepts utilising regular and systematic audits of the approved manufacturing and quality control processes and procedures as an alternative to the direct survey of individual items.

1.3.2 In order to obtain approval, the requirements of Section 6 are to be complied with.

1.4 Departures from the Rules

1.4.1 Where it is proposed to depart from the requirements of the Rules, the Committee will be prepared to give consideration to the circumstances of any special case.

1.4.2 Any novelty in the construction of the machinery, boilers or pressure vessels is to be reported to the Committee.

General Requirements for the Design and Construction of Machinery

Part 5, Chapter 1

Sections 2 & 3

■ Section 2 Plans and particulars

2.1 Plans

2.1.1 Before the work is commenced, plans in triplicate of all machinery items, as detailed in the Chapters giving the requirements for individual systems, are to be submitted for consideration. The particulars of the machinery, including power ratings, grade(s) of fuel and design calculations, where applicable, necessary to verify the design, are also to be submitted. Any subsequent modifications are subject to approval before being put into operation. It will not be necessary for plans and particulars to be submitted for each ship, provided the basis plans for the engine size and type have previously been approved as meeting the requirements of these Rules. Any alterations to basis design materials or manufacturing procedure are to be re-submitted for consideration.

2.2 Materials

2.2.1 The materials used in the construction are to be manufactured and tested in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials). Materials for which provision is not made therein may be accepted, provided that they comply with an approved specification and such tests as may be considered necessary.

2.2.2 Materials used in the construction of machinery and its installation should not be a recognised hazard to personnel. This includes the prohibition of asbestos except in the following applications:

- (a) Vanes used in rotary vane compressors and rotary vane pumps.
- (b) Watertight joints and linings used for the circulation of fluids when at high temperature (in excess of 350°C) or pressure (in excess of 70 bar (7 MPa)) there is a risk of fire, corrosion or toxicity.
- (c) Supple and flexible thermal insulation assemblies used for temperatures above 1000°C.

2.3 Welding

2.3.1 Welding consumables, plant and equipment are to be in accordance with the requirements specified in Ch 13, 1.8 of the Rules for Materials.

2.3.2 Welding procedures and welder qualifications are to be tested and qualified in accordance with the requirements specified in Chapter 12 of the Rules for Materials.

2.3.3 Production weld tests are to be carried out where specified in the subsequent chapters of these Rules.

2.3.4 All finished welds are to be subjected to non-destructive examination in accordance with the requirements specified in Ch 13, 2.12 of the Rules for Materials and or the requirements specified in the subsequent chapters of these Rules.

■ Section 3 Operating conditions

3.1 Availability for operation

3.1.1 The design and arrangement are to be such that the machinery can be started and controlled on board ship, without external aid, so that the operating conditions can be maintained under all circumstances.

3.1.2 Machinery is to be capable of operating at defined power ratings with a range of fuel grades specified by the engine manufacturer and agreed by the Owner/Operator.

3.2 Fuel

3.2.1 The flash point (closed cup test) of oil fuel for use in ships classed for unrestricted service is, in general, to be not less than 60°C.

3.2.2 For emergency generator engines, fuel having a flash point of not less than 43°C may be used.

3.2.3 Fuels with flash points lower than 60°C, but not less than 43°C unless specially approved, may be used in ships intended for service restricted to geographical limits where it can be ensured that the temperature of the machinery and boiler spaces will always be 10°C below the flash point of the fuel. In such cases, safety precautions and the arrangements for storage and pumping will be specially considered.

3.2.4 The use of fuel having a lower flash point than specified in 3.2.1 to 3.2.3 as applicable may be permitted provided that such fuel is not stored in any machinery space and the arrangements for the complete installation are specially approved.

3.2.5 For engines operating on 'boil-off' vapours from the cargo, see Lloyd's Register's (hereinafter referred to as 'LR') *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk*.

3.3 Power ratings

3.3.1 In the Chapters where the dimensions of any particular component are determined from shaft power, P , in kW (H , in shp), and revolutions per minute, R , the values to be used are to be derived from the following:

- For main propelling machinery, the maximum shaft power and corresponding revolutions per minute giving the maximum torque for which the machinery is to be classed.
- For auxiliary machinery, the maximum continuous shaft power and corresponding revolutions per minute which will be used in service.

General Requirements for the Design and Construction of Machinery

Part 5, Chapter 1

Section 3

3.4 Definitions

3.4.1 Main propulsion engines and turbines are defined as those which drive main propelling machinery directly or indirectly through mechanical shafting and which may also drive electrical generators to provide power for auxiliary services. Auxiliary engines and turbines are defined as those coupled to electrical generators which provide power for auxiliary services, for electrical main propulsion motors or a combination of both.

3.4.2 Units and formulae included in the Rules are shown in SI units followed by metric units in brackets, where appropriate.

3.4.3 Where the metric version of shaft power, i.e. (shp), appears in the Rules, 1 shp is equivalent to 75 kgf m/s or 0,735 kW.

3.4.4 Pressure gauges may be calibrated in bar, where:
 $1 \text{ bar} = 0,1 \text{ N/mm}^2 = 1,02 \text{ kgf/cm}^2$.

3.5 Ambient reference conditions

3.5.1 The rating for classification purposes of main and essential auxiliary machinery intended for installation in sea-going ships to be classed for unrestricted (geographical) service is to be based on a total barometric pressure of 1000 mb, an engine room ambient temperature or suction air temperature of 45°C, a relative humidity of 60 per cent and sea-water temperature or, where applicable, the temperature of the charge air coolant at the inlet of 32°C. The engine manufacturer is not expected to provide simulated ambient reference conditions at a test bed.

3.5.2 In the case of a ship to be classed for restricted service, the rating is to be suitable for the temperature conditions associated with the geographical limits of the restricted service, see Pt 1, Ch 2.

3.6 Ambient operating conditions

3.6.1 Main and essential auxiliary machinery and equipment is to be capable of operating satisfactorily under the conditions shown in Table 1.3.1.

3.6.2 Where it is intended to allow for operation in ambient temperatures outside those shown in Table 1.3.1, the permissible temperatures and associated periods of time are to be specified and details are to be submitted for consideration. Propelling and essential auxiliary machinery, see Pt 1, Ch 2,2.8.1, is to retain a continuous level of functional capability under these conditions and any level of degraded performance is to be defined. Operation under these circumstances is not to be the cause of damage to equipment in the system and is additionally to be acceptable to the National Authority of the country in which the ship is to be registered.

Table 1.3.1 Ambient operating conditions

Air		
Installations, Components	Location, arrangement	Temperature range (°C)
Machinery and electrical installations	In enclosed spaces	0 to +45, see Note 1
	On machinery component, boilers. In spaces subject to higher and lower temperatures	According to specific local conditions, see Note 2
	On the open deck	–25 to +45, see Note 1
Water		
Coolant		Temperature (°C)
Sea-water or charge air coolant inlet to charge air cooler		–2 to +32, see Notes 1 and 3
NOTES 1. For ships intended to be classed for restricted service, a deviation from the temperatures stated may be considered. 2. Details of local environmental conditions are stated in Annex B of IEC 60092: <i>Electrical installations in ships – Part 101: Definitions and general requirements</i> . 3. Charge air cooling arrangements utilising re-circulated cooling to maintain temperatures in a different range are accepted where the machinery and equipment operation is not degraded with a primary supply of cooling in the temperature range stated in this Table.		

3.7 Inclination of ship

3.7.1 Main and essential auxiliary machinery is to operate satisfactorily under the conditions as shown in Table 1.3.2.

3.7.2 Any proposal to deviate from the angles given in Table 1.3.2 will be specially considered taking into account the type, size and service conditions of the ship.

3.7.3 The dynamic angles of inclination in Table 1.3.2 may be exceeded in certain circumstances dependent upon ship type and operation. The Shipbuilder is, therefore, to ensure that the machinery is capable of operating under these angles of inclination.

3.8 Power conditions for generator sets

3.8.1 Auxiliary engines coupled to electrical generators are to be capable under service conditions of developing continuously the power to drive the generators at full rated output (kW) and in the case of oil engines and gas turbines, of developing for a short period (15 minutes) an overload power of not less than 10 per cent, see Pt 6, Ch 2,8.2.

General Requirements for the Design and Construction of Machinery

Part 5, Chapter 1

Sections 3 & 4

Table 1.3.2 Inclination of ship

Installations, components	Angle of inclination, degrees, see Note 1			
	Athwartships		Fore-and-aft	
	Static	Dynamic	Static	Dynamic
Main and auxiliary machinery essential to the propulsion and safety of the ship	15	22,5	5 see Note 2	7,5
Emergency machinery and equipment fitted in accordance with Statutory Requirements	22,5 see Note 3	22,5	10	10
NOTES 1. Athwartships and fore-and-aft inclinations may occur simultaneously. 2. Where the length of the ship exceeds 100 m, the fore-and-aft static angle of inclination may be taken as: $\frac{500}{L} \text{ degrees}$ where L = length of ship, in metres. 3. In ships for the carriage of liquefied gas and of liquid chemicals the emergency machinery and equipment fitted in accordance with Statutory Requirements is also to remain operable with the ship flooded to a final athwartships inclination to a maximum angle of 30°.				

3.8.2 Engine builders are to satisfy the Surveyors by tests on individual engines that the above requirements, as applicable, can be complied with, due account being taken of the difference between the temperatures under test conditions and those referred to in 3.5. Alternatively, where it is not practicable to test the engine/generator set as a unit, type tests (e.g. against a brake) representing a particular size and range of engines may be accepted. With oil engines and gas turbines any fuel stop fitted is to be set to permit the short period overload power of not less than 10 per cent above full rated output (kW) being developed.

3.9 Astern power

3.9.1 Sufficient astern power is to be provided to maintain control of the ship in all normal circumstances.

3.9.2 Astern turbines are to be capable of maintaining in free route astern 70 per cent of the ahead revolutions, corresponding to the maximum propulsion shaft power for which the machinery is to be classed, for a period of at least 30 minutes without undue heating of the ahead turbines and condensers.

3.10 Machinery interlocks

3.10.1 Interlocks are to be provided to prevent any operation of engines or turbines under conditions that could hazard the machinery and personnel. These are to include 'turning gear engaged', 'low lubricating oil pressure', where oil pressure is essential for the prevention of damage during start up, 'shaft brake engaged' and where machinery is not available due to maintenance or repairs. The interlock system is to be arranged to be 'fail safe'.

3.10.2 Where machinery is provided with manual turning gear, warning devices or notices may be provided as an alternative to interlocks as required by 3.10.1.

Section 4 Machinery room arrangements

4.1 Accessibility

4.1.1 Accessibility, for attendance and maintenance purposes, is to be provided for machinery plants.

4.2 Machinery fastenings

4.2.1 Bedplates, thrust seatings and other fastenings are to be of robust construction, and the machinery is to be securely fixed to the ship's structure to the satisfaction of the Surveyor.

4.3 Resilient mountings

4.3.1 The dynamic angles of inclination in Table 1.3.2 may be exceeded in certain circumstances dependent upon ship type and operation. The Shipbuilder is, therefore, to ensure that the vibration levels of flexible pipe connections, shaft couplings and mounts remain within the limits specified by the component manufacturer for the conditions of maximum dynamic inclinations to be expected during service, start-stop operation and the natural frequencies of the system. Due account is to be taken of any creep that may be inherent in the mount.

4.3.2 Anti-collision chocks are to be fitted together with positive means to ensure that manufacturers' limits are not exceeded. Suitable means are to be provided to accommodate the propeller thrust.

4.3.3 A plan showing the arrangement of the machinery together with documentary evidence of the foregoing is to be submitted.

4.4 Ventilation

4.4.1 All spaces including engine and cargo pump spaces, where flammable or toxic gases or vapours may accumulate, are to be provided with adequate ventilation under all conditions.

General Requirements for the Design and Construction of Machinery

Part 5, Chapter 1

Sections 4 & 5

4.4.2 Machinery spaces shall be sufficiently ventilated so as to ensure that when machinery or boilers therein are operating at full power in all weather conditions, including heavy weather, a sufficient supply of air is maintained to the spaces for the operation of the machinery.

4.5 Fire protection

4.5.1 All surfaces of machinery where the surface temperature may exceed 220°C and where impingement of flammable liquids may occur are to be effectively shielded to prevent ignition. Where insulation covering these surfaces is oil-absorbing or may permit penetration of oil, the insulation is to be encased in steel or equivalent.

4.6 Means of escape

4.6.1 For means of escape from machinery spaces, see SOLAS 1974 as amended Regulation II-2/13.4.1 or 13.4.2 or Pt 6, Ch 4,3.4, as applicable.

4.7 Communications

4.7.1 Two independent means of communication are to be provided between the bridge and engine room control station from which the engines are normally controlled, see also Pt 6, Ch 1,2.

4.7.2 One of these means is to visually indicate the order and response, both at the engine room control station and on the bridge.

4.7.3 At least one means of communication is to be provided between the bridge and any other control position(s) from which the propulsion machinery may be controlled.

4.8 Category A machinery spaces

4.8.1 'Machinery spaces of Category A' are those spaces and trunks to such spaces which contain:

- (a) internal combustion machinery used for main propulsion; or
- (b) internal combustion machinery used for purposes other than main propulsion where such machinery has in the aggregate a total power output of not less than 375 kW; or
- (c) any oil-fired boiler or oil fuel unit.

Section 5 Trials

5.1 Inspection

5.1.1 Tests of components and trials of machinery, as detailed in the Chapters giving the requirements for individual systems, are to be carried out to the satisfaction of the Surveyors.

5.2 Sea trials

5.2.1 For all types of installation, the sea trials are to be of sufficient duration, and carried out under normal manoeuvring conditions, to prove the machinery under power. The trials are also to demonstrate that any vibration which may occur within the operating speed range is acceptable.

5.2.2 The trials are to include demonstrations of the following:

- (a) The adequacy of the starting arrangements to provide the required number of starts of the main engines.
- (b) The ability of the machinery to reverse the direction of thrust of the propeller in sufficient time, under normal manoeuvring conditions, and so bring the ship to rest from maximum service speed. Results of the trials are to be recorded.
- (c) In turbine installations, the ability to permit astern running at 70 per cent of the full power ahead revolutions without adverse effects. This astern trial need only be of 15 minutes' duration, but may be extended to 30 minutes at the Surveyor's discretion.

5.2.3 Where controllable pitch propellers are fitted, the free route astern trial is to be carried out with the propeller blades set in the full pitch astern position. Where emergency manual pitch setting facilities are provided, their operation is to be demonstrated to the satisfaction of the Surveyors.

5.2.4 In geared installations, prior to full power sea trials, the gear teeth are to be suitably coated to demonstrate the contact markings, and on conclusion of the sea trials all gears are to be opened up sufficiently to permit the Surveyors to make an inspection of the teeth. The marking is to indicate freedom from hard bearing, particularly towards the ends of the teeth, including both ends of each helix where applicable. The contact is to be not less than that required by Ch 5,4.2 or Ch 5,5.2, as applicable.

5.2.5 The following information is to be available on board for the use of the master and designated personnel:

- The results of trials to determine stopping times, ship headings and distance;
- For ships having multiple propellers, the results of trials to determine the ability to navigate and manoeuvre with one or more propellers inoperative.

5.2.6 Where the ship is provided with supplementary means for manoeuvring or stopping, the effectiveness of such means are to be demonstrated and recorded as referred to in 5.2.5.

5.2.7 The stopping distance achieved when ship is initially proceeding ahead with a speed of at least 90 per cent of the ship's speed corresponding to 85 per cent of the maximum rated propulsion power should not exceed 15 ship lengths after the astern order has been given. However, if the displacement of the ship makes this criterion impracticable then in no case should the stopping distance exceed 20 ship lengths.

5.2.8 All trials are to be to the Surveyor's satisfaction.

General Requirements for the Design and Construction of Machinery

Part 5, Chapter 1

Section 6

■ Section 6 Quality Assurance Scheme for Machinery

6.1 General

6.1.1 This certification scheme is applicable to both individual and series produced items manufactured under closely controlled conditions and will be restricted to works where the employment of quality control procedures is well established. LR will have to be satisfied that the practices employed will ensure that the quality of finished products is to standards which would be demanded when using traditional survey techniques.

6.1.2 The Committee will consider proposed designs for compliance with LR's Rules or other appropriate requirements and the extent to which the manufacturing processes and control procedure ensure conformity of the product to the design. A comprehensive survey will be made by the Surveyors of the actual operation of the quality control programme and of the adequacy and competence of the staff to implement it.

6.1.3 The procedures and practices of manufacturers which have been granted approval will be kept under review.

6.1.4 Approval by another organisation will not be accepted as sufficient evidence that a manufacturer's arrangements comply with LR's requirements.

6.2 Requirements for approval

6.2.1 **Facilities.** The manufacturer is required to have adequate equipment and facilities for those operations appropriate to the level of design, development and manufacture being undertaken.

6.2.2 **Experience.** The manufacturer is to demonstrate that the firm has experience consistent with technology and complexity of the product type for which approval is sought and that the firm's products have been of a consistently high standard.

6.2.3 **Quality policy.** The manufacturer is to define management policies and objectives or quality and ensure that these policies and objectives are implemented and maintained throughout all phases of the work.

6.2.4 **Quality system documentation.** The manufacturer is to establish and maintain a documented quality system capable of ensuring that material or services conform to the specified requirements, including the requirements of this Section.

6.2.5 **Management representative.** The manufacturer is to appoint a management representative preferably independent of other functions, who is to have defined authority and responsibilities for the implementation and maintenance of the quality system.

6.2.6 **Responsibility and authority.** The responsibilities and authorities of senior personnel within the quality system are to be clearly documented.

6.2.7 **Internal audit.** The manufacturer is to conduct internal audits to ensure continued adherence to the system. An audit programme is to be established with audit frequencies scheduled on the basis of the status and importance of the activity and adjusted on the basis of previous results.

6.2.8 **Management review.** The quality system established in accordance with the requirements of this Section is to be systematically reviewed at appropriate intervals by the manufacturer to ensure its continued effectiveness. Records of such management reviews are to be maintained and be made available to the Surveyors.

6.2.9 **Contract review.** The manufacturer is to establish and implement procedures for conducting a contract review prior to and after acceptance to ensure that:

- (a) the requirements of the contract are adequately defined and documented;
- (b) any requirements differing from those specified in the original enquiry/tender are resolved; and
- (c) the manufacturer has the capability to meet and verify compliance to the specified requirements.

6.2.10 **Work instruction.** The manufacturer is to establish and maintain clear and complete written work instructions that prescribe the communication of specified requirements and the performance of work in design, development and manufacture which would be adversely affected by lack of such instructions.

6.2.11 **Documentation and change control.** The manufacturer is to establish and maintain control of all documentation that relates to the requirements of this scheme. This control is to ensure that:

- (a) documents are reviewed and approved for adequacy by authorised personnel prior to use, are uniquely identified and include indication of approval and revision status;
- (b) all changes to documentation are in writing and are processed in a manner that will ensure their availability at the appropriate location and preclude the use of non-applicable documents;
- (c) provision is made for the prompt removal of obsolete documentation from all points of issue or use; and
- (d) documents are to be re-issued after a practical number of changes have been issued.

6.2.12 **Records.** The manufacturer is to develop and maintain a system for collection, use and storage of quality records. The period of retention of such records is to be established in writing and is to be subject to agreement by the Committee.

6.2.13 **Design.** The manufacturer is to establish and maintain a design control system appropriate to the level of design being undertaken. Documented design procedures are to be established which:

- (a) identify the design practices of the manufacturer's organisation including departmental instructions to ensure the orderly and controlled preparation of design and subsequent verification;

General Requirements for the Design and Construction of Machinery

Part 5, Chapter 1

Section 6

- (b) make provision for the identification, documentation and appropriate approval of all design change and modifications;
- (c) prescribe methods for resolving incomplete, ambiguous or conflicting requirements; and
- (d) identify design inputs such as sources of data, preferred standard parts or materials and design information and provide procedures for their selection and review by the manufacturer for adequacy.

6.2.14 Purchasing. The manufacturer is to ensure that purchased material and services conform to specified requirements.

6.2.15 Selection and approval of sub-contractors and suppliers. The manufacturer is to establish and maintain records of acceptable suppliers and sub-contractors. The selection of such sources, and the type and extent of control exercised, are to be appropriate to the type of product or service and the suppliers' or sub-contractors' previously demonstrated capability and performance. Documented procedures for approval of new suppliers are to be established and records of vendor assessments (where carried out) are to be maintained and made available to the Surveyors upon request.

6.2.16 Purchasing data. Each purchasing document should contain a clear description of the material or service ordered including as applicable, the following:

- (a) The type, class, grade, or other precise identification;
- (b) The title or other positive identification and applicable issue of specifications, drawings, process requirements, inspection instructions and other relevant data.

6.2.17 Verification of purchased material and services. The manufacturer is to ensure that the Surveyors are afforded the right to verify at source or upon receipt that purchased material and services conform to specified requirements. Verification by the Surveyors shall not relieve the manufacturer of his responsibility to provide acceptable material nor is it to preclude subsequent rejection.

6.2.18 Product identification. The manufacturer is to establish and maintain a system for identification of the product to relevant drawings, specifications or other documents during all stages of production, delivery and installation.

6.2.19 Manufacturing control. The manufacturer is to ensure that those operations which directly affect quality are carried out under controlled conditions. These are to include the following:

- (a) Written work instructions wherever the absence of such instructions could adversely affect compliance with specified requirements. These should define the method of monitoring and control of product characteristics.
- (b) Established criteria for workmanship through written standards or representative samples.

6.2.20 Special processes. Those processes where effectiveness cannot be verified by subsequent inspection and test of the product are to be subjected to continuous monitoring in accordance with documented procedures in addition to the requirements specified in 6.2.19.

6.2.21 Receiving inspection. The manufacturer is to ensure that all incoming material is not to be used or processed until it has been inspected or otherwise verified as conforming to specified requirements. In establishing the amount and nature of receiving inspection, consideration is to be given to the control exercised by the supplier and documented evidence of quality conformance supplied.

6.2.22 In-process inspection. The manufacturer is to:

- (a) perform inspection during manufacture on all characteristics that cannot be inspected at a later stage;
- (b) inspect test and identify products in accordance with specified requirements;
- (c) establish product conformance to specified requirements by use of process monitoring and control methods where appropriate;
- (d) hold products until the required inspections and tests are completed and verified; and
- (e) clearly identify non-conforming products to prevent unauthorised use, shipment, or mixing with conforming material.

6.2.23 Final inspection. The manufacturer is to perform all inspections and tests on the finished product necessary to complete the evidence of conformance to the specified requirements. The procedures for final inspection and test are to ensure that:

- (a) all activities defined in the specification, quality plan or other documented procedure have been completed;
- (b) all inspections and tests that should have been conducted at earlier stages have been completed and that the data is acceptable; and
- (c) no product is to be dispatched until all the activities defined in the specifications, quality plan or other documented procedure have been completed, unless products have been released with the permission of the Surveyors.

6.2.24 Inspection equipment. The manufacturer is to be responsible for providing, controlling, calibrating and maintaining the inspection, measuring and test equipment necessary to demonstrate the conformance of material and services to the specified requirements or used as part of the manufacturing control system required by 6.2.19 and 6.2.20.

6.2.25 Inspection and test status. The manufacturer is to establish and maintain a system for the identification of inspection status of all material, components and assemblies by suitable means which distinguish between conforming, non-conforming and uninspected items. The relevant inspection and test procedures and records are to identify the authority responsible for the release of conforming products.

6.2.26 Control of non-conforming material.

- (a) The manufacturer is to establish and maintain procedures to ensure that material that does not conform to the specified requirements is controlled to prevent inadvertent use, mixing or shipment. Repair, rework or concessions on non-conforming material and reinspection is to be in accordance with documented procedures.
- (b) Records clearly identifying the material, the nature and extent of non-conformance and the disposition are to be maintained.

General Requirements for the Design and Construction of Machinery

Part 5, Chapter 1

Section 6

6.2.27 Sampling procedures. Where sampling techniques are used by the manufacturer to verify the acceptability of groups of products, the procedures adopted are to be in accordance with the specified requirements or are to be subject to agreement by the Surveyors.

6.2.28 Corrective action. The manufacturer is to establish and maintain documented procedures for the review of non-conformances and their disposition. These should provide for:

- (a) monitoring of process and work operations and analysis of records to detect and eliminate potential causes of non-conforming material;
- (b) continuing analysis of concessions granted and material scrapped or reworked to determine causes and the corrective action required;
- (c) an analysis of customer complaints;
- (d) the initiation of appropriate action with suppliers or sub-contractors with regard to receipt of non-conforming material; and
- (e) an assurance that corrective actions are effective.

6.2.29 Purchaser supplied material. The manufacturer is to establish and maintain documented procedures for the control of purchaser supplied material.

6.2.30 Handling, storage, and delivery.

- (a) The manufacturer is to establish and maintain a system for the identification preservation, segregation and handling of all material from the time of receipt through the entire production process. The system is to include methods of handling that prevent abuse, misuse, damage or deterioration.
- (b) Secure storage areas or rooms are to be provided to isolate and protect material pending use. To detect deterioration, at an early stage, the condition of material is to be periodically assessed.
- (c) The manufacturer is to arrange for the protection of the quality of his product during transit. The manufacturer is to ensure, in so far as it is practicable, the safe arrival and ready identification of the product at destination.

6.2.31 Training. The manufacturer is to follow a policy for recruitment and training which provides an adequate labour force with such skills as are required for each type of work operation. Appropriate records are to be maintained to demonstrate that all personnel performing process control, special processes inspection and test or quality system maintenance activities have appropriate experience or training.

6.3 Arrangements for acceptance and certification of purchased material

6.3.1 The manufacturer is to establish and maintain procedures and controls to ensure compliance with LR's requirements for certification of materials and components at the supplier's plant. The manufacturer's system for control of such purchased material may be based on one of the following alternatives subject to the approval of LR:

- (a) Product certification by LR's Surveyors at the supplier's works in accordance with the requirements of the Rules for Materials.

- (b) Agreed Inspection Procedures at the manufacturer's plant combined with documentary evidence of vendor assessments, vendor rating records and annual surveillance visits to the suppliers.
- (c) Recognition of quality agreements between the manufacturer and his suppliers which are to provide for initial vendor assessments and regular surveillance visits (a minimum of four per year). The quality agreement must identify the individual in the supplier's plant who is charged with the responsibility for release of materials or components and the procedures to be adopted.

6.3.2 The alternatives proposed in 6.3.1(b) and (c) are not acceptable to LR for the following items:

- (a) Engine components for which testing is a Rule requirement; and
 - (i) the cylinder bore is equal to or exceeds 300 mm; or
 - (ii) which are made by open forging techniques.
- (b) Cast crankshafts where the journal diameter exceeds 85 mm.

6.3.3 Where the manufacturer's system for control of purchased material is based upon 6.3.1(b) or (c) the Surveyors shall also make surveillance visits to the supplier's works at the minimum specified intervals. The manufacturer is also to make available to the Surveyors documentary evidence of the operation of quality agreements or Agreed Inspection Procedures where applicable.

6.4 Information required for approval

6.4.1 Manufacturers applying for approval under this scheme are to submit the following information:

- (a) A description of the products for which certification is required including, where applicable, model or type number.
- (b) Applicable plans and details of material used.
- (c) An outline description of all important manufacturing plant and equipment.
- (d) A summary of equipment used for measuring and testing during manufacture and completion.
- (e) The Quality Manual.
- (f) A typical production flow chart and quality plan covering all stages from ordering of materials to delivery of the finished product.
- (g) The system used for the identification of raw materials, semi-finished and finished products.
- (h) The number and qualifications of all staff engaged in testing, inspection and quality control duties.
- (j) A list of suppliers of components and manufacturers, proposed procedures to ensure compliance with LR's requirements for certification of materials and components at the supplier's plant.

6.5 Assessment of works

6.5.1 After receipt and appraisal of the information requested in 6.4 an inspection of the works is to be carried out by the Surveyors to examine in detail all aspects of production, and in particular the arrangements for quality control.

General Requirements for the Design and Construction of Machinery

Part 5, Chapter 1

Section 6

6.5.2 The Surveyors will not specify in detail acceptable quality control procedures, but will consider the arrangements proposed by the works in relation to the manufacturing processes and products.

6.5.3 In the event of procedures being considered inadequate, the Surveyors will advise the manufacturer how such procedures are to be revised in order to be acceptable to LR.

6.5.4 Gauging, measuring and testing devices are to be made available to the Surveyors, and where appropriate, personnel for the operation of such devices.

6.6 Approval of works

6.6.1 If the initial assessment of the works confirms that the manufacturing and quality control procedures are satisfactory, the Committee will issue to the manufacturer a Quality Assurance Approval Certificate which will include details of the products for which approval has been given. This Certificate will be valid for three years with renewal subject to satisfactory performance and to a satisfactory triennial re-assessment.

6.6.2 An extension of approval in respect of product type may be given at the discretion of the Committee without any additional survey of the works.

6.6.3 LR will publish a list of manufacturers whose works have been approved.

6.7 Maintenance of approval

6.7.1 The arrangements authorised at each works are to be kept under review by the Surveyors in order to ensure that the approved procedures for manufacture and quality control are being maintained in a satisfactory manner. This is to be carried out by:

- (a) regular and systematic surveillance;
- (b) intermediate audits at intervals of six months;
- (c) triennial re-assessment of the entire quality system.

6.7.2 For the purpose of regular and systematic surveillance the Surveyors are to visit the works at intervals determined by the type of product and the rate of production. The Surveyors are to advise a senior member of the quality control department in regard to any matter with which they are not satisfied.

6.7.3 When minor deficiencies in the approved procedures are disclosed during the systematic surveillance the Surveyors may, at their discretion, apply more intensive supervision, including the direct inspection of products.

6.7.4 Any noteworthy departures from the approved plans of specifications are to be reported to the Surveyors and their written approval obtained prior to despatch of the item.

6.7.5 Minor alterations in the approved procedures may be permitted provided that the Surveyors are advised and their prior concurrence obtained.

6.7.6 In addition to the regular visits by the Surveyors, an intermediate audit is to be carried out every six months. This will normally be carried out by Surveyors other than those regularly in attendance at the works. This audit is to consist of an examination of part of the manufacturer's quality system. An audit plan will be established indicating those areas of the quality system which will be examined during every intermediate audit and the frequency of examination of other areas such that all areas are subject to audit before re-assessment is due.

6.7.7 The manufacturer's entire quality system is to be subject to re-assessment at three-yearly intervals. This is to be conducted by Surveyors nominated by Headquarters.

6.8 Suspension or withdrawal of approval

6.8.1 When the Surveyors have drawn attention to significant faults or deficiencies in the manufacturing or quality control procedures and these have not been rectified, approval of the works will be suspended. In these circumstances the manufacturer will be notified in writing of the Committee's reasons for the suspension of approval.

6.8.2 When approval has been suspended and the manufacturer does not effect corrective measures within a reasonable time, the Committee will withdraw the Quality Assurance Approval Certificate.

6.9 Identification of products

6.9.1 In addition to the normal marking by the manufacturer, all certified products are to be hard stamped on a principal component with a suitable identification, LR's brand and the number of the approved works.

6.9.2 After issue of the Quality Assurance Approval Certificate, products may be dispatched with certificates signed on behalf of the manufacturer by an authorised senior member of the quality control department or by an authorised deputy. These certificates are to be countersigned by the Surveyor to certify that the approved arrangements are being kept under review by regular and systematic auditing of the manufacturer's quality system.

6.9.3 The following declarations are to be included on each certificate:

- (a) 'This is to certify that the items described above have been constructed and tested with satisfactory results in accordance with the Rules of Lloyd's Register.
Signed.....
Manager of QC Department.'
- (b) 'This certificate is issued by the manufacturer in accordance with the arrangements authorised by Lloyd's Register in Quality Assurance Approval Certificate No. QA.M..... I certify that these arrangements are being kept under review by regular and systematic auditing of the approved manufacturing and quality control procedures.
Signed.....
Surveyor to Lloyd's Register'.

General Requirements for the Design and Construction of Machinery

Part 5, Chapter 1

Section 6

6.9.4 In the event of noteworthy departures from the approved plan or specification being accepted, a standard 'Concession' form is to be completed and signed by the following authorised persons: the Design Manager, the Quality Control Manager or their deputies. In all cases, where strength or functioning may be affected, the form is to be submitted to the Surveyors for approval and endorsement.

Section

- 1 **Plans and particulars**
- 2 **Materials**
- 3 **Design**
- 4 **Construction and welded structures**
- 5 **Safety arrangements on engines**
- 6 **Crankcase safety fitting**
- 7 **Piping**
- 8 **Starting arrangements and air compressors**
- 9 **Component tests and engine type testing**
- 10 **Turbo-chargers**
- 11 **Mass produced engines**
- 12 **Mass produced turbo-chargers**
- 13 **Type testing procedure for crankcase explosion relief valves**
- 14 **Type testing procedure for crankcase oil mist detection and alarm equipment**
- 15 **Electronically controlled engines**
- 16 **Alarms and safeguards for emergency diesel engines**
- 17 **General requirements**
- 18 **Program for trials of diesel engines to assess operational capability**

■ Scope

The requirements of this Chapter are applicable to oil engines (generally known as diesel engines) for main propulsion and to engines intended for essential auxiliary services. Section 3 is not applicable to auxiliary engines having powers of less than 110 kW.

The requirements for type testing of engines at the manufacturer's works are also included.

Arrangements for dual fuel engines will be specially considered.

■ Section 1 Plans and particulars

1.1 Plans

1.1.1 The following plans and particulars as applicable are to be submitted for consideration:

- Crankshaft assembly plan (for each crank-throw).
- Crankshaft details plan (for each crank-throw).
- Thrust shaft or intermediate shaft (if integral with engine).
- Output shaft coupling bolts.
- Main engine securing arrangements where non-metallic chocks are used.
- Type and arrangement of crankcase explosion relief valves.
- Arrangement and welding specifications with details of the procedures for fabricated bedplate, thrust bearing bedplate, crankcases, frames and entablatures. Details of materials welding consumables, fit-up conditions fabrication sequence and heat treatments are to be included.
- Schematic layouts of the following systems. See also 1.1.4:
 - Starting air.
 - Oil fuel.
 - Lubricating oil.
 - Cooling water.
 - Control and safety.
 - Hydraulic oil (for valve lift).
- Shielding of high pressure fuel pipes.
- Combustion pressure-displacement relationship.
- Crankshaft design data as outlined in Section 3.
- High pressure parts for fuel oil injection system with specification of pressures, pipe dimensions and materials.
- For new engine types that have not been approved by LR, the proposed type test programme.
- The type test report on completion of type testing for a new engine type. For mass produced engines a separate report is to be submitted for each engine requiring approval, see 11.5.
- The specification for a mass produced engine including manufacturing processes and quality control procedures, see 11.1.4 and 11.2.3.
- Schematic layouts showing details and arrangements of oil mist detection/monitoring and alarm systems.

1.1.2 The following plans are to be submitted for information:

- Longitudinal and transverse cross-section.
- Cast bedplate, thrust bearing bedplate, crankcase and frames.
- Cylinder head assembly.
- Cylinder liner.
- Piston assembly.
- Tie rod.
- Connecting rod, piston rod, and crosshead assemblies.
- Camshaft drive and camshaft general arrangement.
- Shielding and insulation of exhaust pipes.
- Details of turbochargers, see Section 10.
- Operation and service manuals.
- Vibration dampers/detuners and moment compensators.
- Thrust bearing assembly (if integral with engine and not integrated in the bedplate).
- Counterweights, where attached to crank-throw, including fastening.
- Main engine holding down arrangement (metal chocks).

1.1.3 Material specifications covering the listed components in 1.1.1 and 1.1.2 are to be forwarded together with details of any surface treatments, non-destructive testing and hydraulic tests.

1.1.4 Where engines incorporate electronic control systems, a failure mode and effects analysis (FMEA) is to be submitted to demonstrate that failure of an electronic control system will not result in the loss of essential services for the operation of the engine and that operation of the engine will not be lost or degraded beyond an acceptable performance criteria of the engine. This is concerned with the functioning of the control system and not failure of the software itself.

1.1.5 Where considered necessary Lloyd's Register (hereinafter referred to as 'LR') may require additional documentation to be submitted.

1.1.6 For engine types built under license it is intended that the above documentation be submitted by the Licensor. Each Licensee is then to submit the following:

- A list, based on the above, of all documents required with the relevant drawing numbers and revision status from both Licensor and Licensee.
- The associated documents where the Licensee proposes design modifications to components. In such cases a statement is to be made confirming the Licensor's acceptance of the proposed changes.

In all cases a complete set of endorsed documents will be required by the Surveyor(s) attending the Licensee's works.

1.1.7 Plans and details for dead ship condition starting arrangements are to be submitted for appraisal, see 8.1.

2.2 Material test and inspections

2.2.1 Components for engines are to be tested as indicated in Table 2.2.1 and in accordance with the relevant requirements of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

2.2.2 For components of novel design special consideration will be given to the material test and non-destructive testing requirements.

■ Section 2 Materials

2.1 Crankshaft materials

2.1.1 The specified minimum tensile strength of castings and forgings for crankshafts is to be selected within the following general limits:

- (a) Carbon and carbon-manganese steel castings – 400 to 550 N/mm²
- (b) Carbon and carbon-manganese steel forgings (normalised and tempered) – 400 to 600 N/mm²
- (c) Carbon and carbon-manganese steel forgings (quenched and tempered) – not exceeding 700 N/mm²
- (d) Alloy steel castings – not exceeding 700 N/mm²
- (e) Alloy steel forgings – not exceeding 1000 N/mm²
- (f) Spheroidal or nodular graphite iron castings – 370 to 800 N/mm².

2.1.2 Where it is proposed to use alloy castings, micro alloyed or alloy steel forgings or iron castings, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval.

Table 2.2.1 Test requirements for oil engine components

Component	Material tests	Non-destructive tests	
		Magnetic particle or Liquid penetrant	Ultrasonic
Crankshaft	all	all	all
Crankshaft coupling flange (non-integral) for main propulsion engines	above 400 mm bore	–	–
Crankshaft coupling bolts	above 400 mm bore	–	–
Steel piston crowns	above 400 mm bore	above 400 mm bore	all
Piston rods	above 400 mm bore	above 400 mm bore	above 400 mm bore
Connecting rods, including bearing caps	all	all	above 400 mm bore
Crosshead	above 400 mm bore	–	–
Cylinder liner	above 300 mm bore	–	–
Cylinder cover	above 300 mm bore	above 400 mm bore	all
Steel castings for welded bedplates	all	all	all
Steel forgings for welded bedplates	all	–	–
Plates for welded bedplates, frames and entablatures	all	–	–
Crankcases, welded or cast	all	–	–
Tie rods	all	above 400 mm bore	–
Turbo-charger, shaft and rotor	above 300 mm bore	–	–
Bolts and studs for cylinder covers, crossheads, main bearings, connecting rod bearings	above 300 mm bore	above 400 mm bore	–
Steel gear wheels for camshaft drives	above 400 mm bore	above 400 mm bore	–
<p>NOTES</p> <ol style="list-style-type: none"> 1. For closed-die forged crankshafts the ultrasonic examination may be confined to the initial production and to subsequent occasional checks. 2. Magnetic particle or liquid penetrant testing of tie rods may be confined to the threaded portions and the adjacent material over a length equal to that of the thread. 3. Cylinder covers and liners manufactured from spheroidal or nodular graphite iron castings may not be suitable for ultrasonic NDE, depending upon the grain size and geometry. An alternative NDE procedure is to be agreed with LR. 4. Bore dimensions refer to engine cylinder bores. 5. All required material tests are to be witnessed by the Surveyor unless alternative arrangements have been specifically agreed by LR. 6. For mass produced engines, see Section 11. 			

Section 3 Design

3.1 Scope

3.1.1 The formulae given in this Section are applicable to solid, or semi-built crankshafts, having a main support bearing adjacent to each crankpin, and are intended to be applied to a single crankthrow analysed by the static determinate method.

3.1.2 Alternative methods, including a fully documented stress analysis, will be specially considered.

3.1.3 Calculations are to be carried out for the maximum continuous power rating for all intended operating conditions.

3.1.4 Designs of crankshafts not included in this scope will be subject to special consideration.

3.2 Information to be submitted

3.2.1 In addition to detailed dimensioned plans, the following information is required to be submitted:

- Engine type – 4SCSA/2SCSA/in-line/vee.
- Output power at maximum continuous rating (MCR), in kW.
- Output speed at maximum continuous power, in rpm.
- Maximum cylinder pressure, in bar g.
- Mean indicated pressure, in bar g.
- Cylinder air inlet pressure, in bar g.
- Digitised gas pressure/crank angle cycle for MCR.
- Maximum pressure/speed relationship.
- Compression ratio.
- Vee angle and firing interval (if applicable), in degrees.
- Firing order numbered from driving end, see Fig. 2.3.1.
- Cylinder diameter, in mm.
- Piston stroke, in mm.
- Mass of connecting rod (including bearings), in kg.
- Centre of gravity of connecting rod from large end centre, in mm.
- Radius of gyration of connecting rod, in mm.

Fig. 2.3.1 Designation of cylinders

- Length of connecting rod between bearing centres, in mm.
- Mass of single crankweb (indicate if webs either side of pin are of different mass values), in kg.
- Centre of gravity of crankweb mass from shaft axis, in mm.
- Mass of counterweights fitted (for complete crankshaft) indicate positions fitted, in kg.
- Centre of gravity of counterweights (for complete crankshaft) measured from shaft axis, in mm.
- Mass of piston (including piston rod and crosshead where applicable), in kg.

- All individual reciprocating masses acting on one crank, in kg.
- Material specification(s).
- Specified minimum UTS, in N/mm².
- Specified minimum yield strength, in N/mm².
- Method of manufacture.
- Details of fatigue enhancement process (if applicable).
- For semi-built crankshafts – minimum and maximum diametral interference, in mm.

3.3 Symbols

3.3.1 For the purposes of this Chapter the following symbols apply, see also Fig. 2.3.2:

- h = radial thickness of web, in mm
- k_e = bending stress factor
- B = transverse breadth of web, in mm
- D_p, D_j = outside diameter of pin or main journal, in mm
- D_{pi}, D_{ji} = internal diameter of pin or main journal, in mm
- D_s = shrink diameter of main journal in web, in mm
- d_o = diameter of radial oil bore in crankpin, in mm
- F = alternating force at the web centreline, in N
- K_1 = fatigue enhancement factor due to manufacturing process
- K_2 = fatigue enhancement factor due to surface treatment
- M_b = alternating bending moment at web centreline, in N-mm (NOTE: alternating is taken to be 1/2 range value)
- M_{BON} = alternating bending moment calculated at the outlet of crankpin oil bore
- M_p, M_j = undercut of fillet radius into web measured from web face, in mm
- R_p, R_j = fillet radius at junction of web and pin or journal, in mm
- S = stroke, in mm
- T = axial thickness of web, in mm
- T_a = alternating torsional moment at crankpin or crank journal, in N-mm (NOTE: alternating is taken to be 1/2 range value)

Fig. 2.3.2(a) Crank dimensions necessary for the calculation of stress concentration factors

Fig. 2.3.2(b)

Crank dimensions for crankshaft without overlap

$$U = \text{pin overlap} \\ = \frac{(D_p + D_j - S)}{2} \text{ mm}$$

- α_B = bending stress concentration factor for crankpin
- α_T = torsional stress concentration factor for crankpin
- β_B = bending stress concentration factor for main journal
- β_Q = direct shear stress concentration factor for main journal
- β_T = torsional stress concentration factor for main journal
- γ_B = bending stress concentration factor for radially drilled oil hole in the crankpin
- γ_T = torsional stress concentration factor for radially drilled oil hole in the crankpin
- σ_{ax} = alternating axial stress, in N/mm²
- σ_b = alternating bending stress, in N/mm²
- σ_{BON} = alternating bending stress in the outlet of the oil bore, in N/mm²
- σ_p, σ_j = maximum bending stress in pin and main journal taking into account stress raisers, in N/mm²
- σ_{BO} = maximum bending stress in the outlet of the oil bore, in N/mm²
- σ_Q = alternating direct stress, in N/mm²
- σ_U = specified minimum UTS of material, in N/mm²
- σ_y = specified minimum yield stress of material, in N/mm²
- τ_a = alternating torsional stress, in N/mm²
- τ_p, τ_j = maximum torsional stress in pin and main journals taking into account stress raisers, in N/mm²
- τ_{tob} = maximum torsional stress in outlet of crankpin oil bore taking into account stress raisers, in N/mm².

3.4 Stress concentration factors

3.4.1 **Geometric factors.** Crankshaft variables to be used in calculating the geometric stress concentrations together with their limits of applicability are shown in Table 2.3.1.

Table 2.3.1 Crankshaft variables

Variable	Range	
	Lower	Upper
$b = B/D_p$	1,10	2,20
$d_j = D_{ji}/D_p$	0,00	0,80
$d_p = D_{pi}/D_p$	0,00	0,80
$m_j = M_i/D_p$	0,00	r_{jB}
$m_p = M_p/D_p$	0,00	r_p
$r_{jB} = R_j/D_p$	0,03	0,13
$r_{jT} = R_j/D_j$	0,03	0,13
$r_p = R_p/D_p$	0,03	0,13
$t = T/D_p$	0,20	0,80
$t = T_{red}/D_p$ see Note 3	0,20	0,80
$d = d_o/D_p$	0,00	0,20
$u = U/D_p$ see Note 2		0,50

NOTES

- Where variables fall outside the range, alternative methods are to be used and full details submitted for consideration.
- A lower limit of u can be extended down to large negative values provided that:
 - If calculated $f(\text{rec}) < 1$ then the factor $f(\text{rec})$ is not to be considered ($f(\text{rec}) = 1$)
 - If $u < -0,5$ then $f(\text{ut})$ and $f(\text{ru})$ are to be evaluated replacing actual value of u by $-0,5$.
- For crankshafts without overlap see also 3.4.6.

3.4.2 Crankpin stress concentration factors:

• Bending

$$\alpha_B = 2,70 f(\text{ut}). f(t). f(b). f(r). f(\text{dp}). f(\text{dj}). f(\text{rec})$$

where

$$f(\text{ut}) = 1,52 - 4,1t + 11,2t^2 - 13,6t^3 + 6,07t^4 - u(1,86 - 8,26t + 18,2t^2 - 18,5t^3 + 6,93t^4) - u^2(3,84 - 25,0t + 70,6t^2 - 87,0t^3 + 39,2t^4)$$

$$f(t) = 2,18t^{0,717}$$

$$f(b) = 0,684 - 0,0077b + 0,147b^2$$

$$f(r) = 0,208r_p^{(-0,523)}$$

$$f(\text{dp}) = 1 + 0,315(d_p) - 1,52(d_p)^2 + 2,41(d_p)^3$$

$$f(\text{dj}) = 1 + 0,27d_j - 1,02(d_j)^2 + 0,531(d_j)^3$$

$$f(\text{rec}) = 1 + (m_p + m_j)(1,8 + 3,2u)$$

valid only between $u = -0,5$ and $0,5$.

• Torsion

$$\alpha_T = 0,8 f(\text{ru}). f(b). f(t)$$

where

$$f(\text{ru}) = r_p^{-(0,22 + 0,1u)}$$

$$f(b) = 7,9 - 10,65b + 5,35b^2 - 0,857b^3$$

$$f(t) = t^{(-0,145)}$$

3.4.3 Crank journal stress concentration factors (not applicable to semi-built crankshafts):

- Bending

$$\beta_B = 2,71f_B(ut) \cdot f_B(t) \cdot f_B(b) \cdot f_B(r) \cdot f_B(dj) \cdot f_B(dp) \cdot f(rec)$$
 where

$$f_B(ut) = 1,2 - 0,5t + 0,32t^2 - u(0,80 - 1,15t + 0,55t^2) - u^2(2,16 - 2,33t + 1,26t^2)$$

$$f_B(t) = 2,24t^{0,755}$$

$$f_B(b) = 0,562 + 0,12b + 0,118b^2$$

$$f_B(r) = 0,191r_{JB}^{(-0,557)}$$

$$f_B(dj) = 1 - 0,644d_j + 1,23(d_j)^2$$

$$f_B(dp) = 1 - 0,19d_p + 0,0073(d_p)^2$$

$$f(rec) = 1 + (m_p + m_i)(1,8 + 3,2u)$$
 valid only between $u = -0,5$ and $0,5$.
- Direct shear

$$\beta_Q = 3,01f_Q(u) \cdot f_Q(t) \cdot f_Q(b) \cdot f_Q(r) \cdot f_Q(dp) \cdot f(rec)$$
 where

$$f_Q(u) = 1,08 + 0,88u - 1,52u^2$$

$$f_Q(t) = \frac{t}{0,0637 + 0,937t}$$

$$f_Q(b) = b - 0,5$$

$$f_Q(r) = 0,533r_{JB}^{(-0,204)}$$

$$f_Q(dp) = 1 - 1,19d_p + 1,74(d_p)^2$$

$$f(rec) = 1 + (m_p + m_i)(1,8 + 3,2u)$$
 valid only between $u = -0,5$ and $0,5$.
- Torsion
 where

$$\beta_T = 0,8f(ru) \cdot f(b) \cdot f(t)$$

$$f(ru) = r_{JT}^{(-0,22 + 0,1u)}$$

$$f(b) = 7,9 - 10,65b + 5,35b^2 - 0,857b^3$$

$$f(t) = t^{(-0,145)}$$

3.4.4 Crankpin oil bore stress concentration factors for radially drilled oil holes:

- Bending

$$\gamma_B = 3 - 5,88 \cdot d_o + 34,6 \cdot d_o^2$$
- Torsion

$$\gamma_T = 4 - 6 \cdot d_o + 30 \cdot d_o^2$$

3.4.5 Where experimental measurements of the stress concentrations are available these may be used. The full documented analysis of the experimental measurements is to be submitted for consideration.

3.4.6 In the case of semi-built crankshafts when $M_p > R_p$ the web thickness is to be taken as:

$$T_{red} = T - (M_p - R_p) \text{ and the web width } B \text{ is to be taken in way of the crankpin fillet radius centre see Fig. 2.3.2.}$$

3.5 Nominal stresses

3.5.1 The nominal alternating bending stress, σ_b , is to be calculated from the maximum and minimum bending moment at the web centreline taking into account all forces being applied to the crank throw in one working cycle with the crank throw simply supported at the mid length of the main journals.

3.5.2 Nominal bending stresses are referred to the web bending modulus.

3.5.3 Nominal alternating bending stress:

$$\sigma_b = \pm \frac{M_b}{Z_{web}} k_e \text{ N/mm}^2$$

$$S_{web} = \frac{BT^2}{6} \text{ mm}^3$$

$$k_e = 0,8 \text{ for crosshead engines} \\ = 1,0 \text{ for trunk piston engines.}$$

3.5.4 Nominal alternating bending stress in the outlet of the crankpin oil bore:

$$\sigma_{BON} = \pm \frac{M_{BON}}{Z_{crankpin}}$$

where

$$M_{BON} \text{ is taken as the } \frac{1}{2} \text{ range value } M_{BON} = \pm \frac{1}{2} (M_{BOmax} - M_{BOmin})$$

and

$$M_{BO} = (M_{BTO} \cos \psi + M_{BRO} \sin \psi) \text{ see Fig. 2.3.3}$$

The two relevant bending moments are taken in the crankpin cross-section through the oil bore.

M_{BRO} = bending moment of the radial component of the connecting-rod force

M_{BTO} = bending moment of the tangential component of the connecting-rod force

$$S_{crankpin} = \frac{\pi}{32} \frac{D^4 - d^4}{D} S_{crankpin} \text{ related to the cross-section of axially bored crankpin.}$$

Fig. 2.3.3 Crankpin section through the oil bore

3.5.5 The nominal direct shear stress in the web for the purpose of assessing the main journal is to be added algebraically to the bending stress, using the alternating forces which have been used in deriving M_b in 3.5.3.

3.5.6 Nominal stress is referred to the web cross-section area or the pin cross-section area as applicable.

3.5.7 Nominal alternating direct shear stress:

$$\sigma_Q = \pm \frac{F}{A_{web}} k_e \text{ N/mm}^2$$

where

$$A_{web} = BT \text{ mm}^2.$$

3.5.8 The nominal alternating torsional stress, τ_a , is to be taken into consideration. The value is to be derived from forced-damped vibration calculations of the complete dynamic system. Alternative methods will be given consideration. The engine designer is to advise the maximum level of alternating vibratory stress that is permitted.

3.5.9 The results of torsional vibration calculations for the full dynamic system, carried out in accordance with Ch 8,2.2, are to be submitted.

3.5.10 Nominal alternating torsional stress:

$$\tau_a = \pm \frac{T_a}{Z_T} \text{ N/mm}^2$$

where

S_T = torsional modulus of crankpin and main journal

$$= \frac{\pi}{16} \left[\frac{(D^4 - d^4)}{D} \right] \text{ mm}^3$$

D = outside diameter of crankpin or main journal, in mm

d = inside diameter of crankpin or main journal, in mm

τ_a is to be ascertained from assessment of the torsional vibration calculations where the maximum and minimum torques are determined for every mass point of the complete dynamic system and for the entire speed range by means of a harmonic synthesis of the forced vibrations from the 1st order up to and including the 15th order for 2-stroke cycle engines and from the 0,5th order up to and including the 12th order for 4-stroke cycle engines. Whilst doing so, allowance must be made for the damping that exists in the system and for unfavourable conditions (misfiring in one of the cylinders when no combustion occurs but only compression cycle). The speed step calculation shall be selected in such a way that any resonance found in the operational speed range of the engine shall be detected.

3.5.11 For the purpose of the crankshaft assessment, the nominal alternating torsional stress considered in calculations is to be the highest calculated value, according to the method described in 3.5.9, occurring at the most torsionally loaded mass point of the crankshaft system.

3.5.12 The approval of the crankshaft will be based on the installation having the largest nominal alternating torsional stress (but not exceeding the maximum figure specified by the engine manufacturer). For each installation it is to be ensured by calculation that the maximum approved nominal alternating torsional stress is not exceeded.

3.5.13 In addition to the bending stress, σ_b , the axial vibratory stress, σ_{ax} , is to be taken into consideration, for crosshead type engines. For trunk type engines, $\sigma_{ax} = 0$. The value is to be derived from forced-damped vibration calculations of the complete dynamic system. Alternative methods will be given consideration. The engine designer is to advise the maximum level of alternating vibratory stress that is permitted. The corresponding crankshaft free-end deflection is also to be stated.

3.6 Maximum stress levels

3.6.1 Crankpin fillet.

- Maximum alternating bending stress:

$$\sigma_p = \alpha_B (\sigma_b + \sigma_{ax}) \text{ N/mm}^2$$

where

α_B = bending stress concentration, see 3.4.2

- Maximum alternating torsional stress:

$$\tau_p = \alpha_T \tau_a \text{ N/mm}^2$$

where

α_T = torsional stress concentration, see 3.4.2

τ_a = nominal alternating torsional stress in crankpin N/mm².

3.6.2 Outlet of crankpin oil bore.

- Maximum alternating bending stress:

$$\sigma_{BO} = \gamma_B (\sigma_{BON} + \sigma_{ax}) \text{ N/mm}^2$$

where

γ_B = bending stress concentration factor, see 3.4.4

- Maximum alternating torsional stress:

$$\tau_{tob} = \gamma_T \tau_a \text{ N/mm}^2$$

where

γ_T = torsional stress concentration factor, see 3.4.4

τ_a = nominal alternating torsional stress in crankpin N/mm².

3.6.3 Crank journal fillet (not applicable to semi-built crankshafts).

- Maximum alternating bending stress:

$$\sigma_j = \beta_B (\sigma_b + \sigma_{ax}) + \beta_Q \sigma_Q \text{ N/mm}^2$$

where

β_B = bending stress concentration, see 3.4.3

β_Q = direct stress concentration, see 3.4.3

- Maximum alternating torsional stress:

$$\tau_j = \beta_T \tau_a \text{ N/mm}^2$$

where

β_T = torsional stress concentration, see 3.4.3

τ_a = nominal alternating torsional stress in main journal N/mm².

3.7 Equivalent alternating stress

3.7.1 Equivalent alternating stress of the crankpin, σ_{ep} , or crank journal σ_{ej} , is defined as:

$$\sigma_{ep}, \sigma_{ej} = \sqrt{(\sigma + 10)^2 + 3\tau^2} \text{ N/mm}^2$$

where

$$\sigma = \sigma_p \text{ or } \sigma_j \text{ N/mm}^2$$

$$\tau = \tau_p \text{ or } \tau_j \text{ N/mm}^2.$$

Oil Engines

Part 5, Chapter 2

Section 3

3.7.2 Equivalent alternating stress for the outlet of the crankpin oil bore σ_{eob} , is defined as:

$$\sigma_{eob} = \pm \frac{1}{3} \sigma_{bo} \left(1 + 2 \sqrt{1 + \frac{9}{4} \frac{\tau_{to}}{\sigma_{bo}}^2} \right) \text{ N/mm}^2$$

3.8 Fatigue strength

3.8.1 The fatigue strength of a crankshaft is based upon the crankpin and crank journal as follows:

$$\sigma_{fp} = K_1 K_2 (0,42\sigma_u + 39,3) \left(0,264 + 1,073D_p^{-0,2} + \frac{785 - \sigma_u}{4900} + \frac{196}{\sigma_u} \sqrt{\frac{1}{R_p}} \right)$$

To calculate the fatigue strength in the oil bore area, replace R_p with $\frac{1}{2}d_o$ and σ_{fp} with σ_{fob} .

$$\sigma_{fj} = K_1 K_2 (0,42\sigma_u + 39,3) \left(0,264 + 1,073D_j^{-0,2} + \frac{785 - \sigma_u}{4900} + \frac{196}{\sigma_u} \sqrt{\frac{1}{R_j}} \right)$$

where

- σ_u = UTS of crankpin or crank journal as appropriate
- K_1 = fatigue endurance factor appropriate to the manufacturing process
 - = 1,05 for continuous grain-flow (CGF) or die-forged
 - = 1,0 for freeform forged (without CGF)
 - = 0,93 for cast steel manufactured using a LR approved cold rolling process
- K_2 = fatigue enhancement factor for surface treatment.

These treatments are to be applied to the fillet radii. A value for K_2 will be assigned upon application by the engine designers. Full details of the process, together with the results of full scale fatigue tests will be required to be submitted for consideration. Alternatively, the following values may be taken (surface hardened sone to include fillet radii):

- K_2 = 1,15 for induction hardened
- = 1,25 for nitrided

Where a value of K_1 or K_2 greater than unity is to be applied then details of the manufacturing process are to be submitted.

3.9 Acceptability criteria

3.9.1 The acceptability factor, Q, is to be greater than 1,15:

$$Q = \frac{\sigma_f}{\sigma_e} \text{ for crankpin, journal and the outlet of crankpin oil bore}$$

where

- σ_f = σ_{fp} or σ_{fj} or σ_{fob}
- σ_e = σ_{ep} or σ_{ej} or σ_{eob} .

3.10 Oil hole

3.10.1 The junction of the oil hole with the crankpin or main journal surface is to be formed with an adequate radius and smooth surface finish down to a minimum depth equal to 1,5 times the oil bore diameter.

3.10.2 Fatigue strength calculations or alternatively fatigue test results may be required to demonstrate acceptability.

3.10.3 When journal diameter is equal or larger than the crankpin diameter, the outlets of main journal oil bores are to be formed in a similar way to the crankpin oil bores, otherwise separate fatigue strength calculations or, alternatively, fatigue test results may be required.

3.11 Shrink fit of semi-built crankshafts

3.11.1 The maximum permissible internal diameter in the journal pin is to be calculated in accordance with the following formula:

$$D_{ji} = D_s \sqrt{1 - \frac{4000 \text{FoS } M_{\max}}{\mu \pi D_s^2 L_s \sigma_{yj}}}$$

where the symbols are as defined in 3.11.7.

3.11.2 When 3.11.1 cannot be complied with, then 3.11.7 is not applicable. In such cases δ_{\min} and δ_{\max} are to be established from FEM calculations.

3.11.3 The following formulae are applicable to crankshafts assembled by shrinking main journals into the crankwebs.

3.11.4 In general, the radius of transition, R_j , between the main journal diameter, D_j , and the shrink diameter, D_s , is to be not less than $0,015D_j$ or $0,5(D_s - D_j)$.

3.11.5 The distance, y , between the underside of the pin and the shrink diameter should be greater than $0,05D_s$.

3.11.6 Deviations from these parameters will be specially considered.

3.11.7 The proposed diametral interference is to be within the following limits, see also Fig. 2.3.4:

The minimum required diametral interference is to be taken as the greater of:

$$\delta_{\min} = \frac{12,156 \times 10^6 (\text{FoS})}{TD_s \mu E} \frac{P}{R} (1 + C) \frac{k^2 - l^2}{(k^2 - 1)(1 - l^2)} \text{ mm}$$

or

$$\delta_{\min} = \frac{\sigma_y D_s}{E} \text{ mm}$$

where

h = minimum radial thickness of the web around the diameter D_s , mm

$$k = \frac{D_o}{D_s}$$

$$l = \frac{D_{ji}}{D_s}$$

C = ratio of torsional vibratory torque to the mean transmitted torque at the P/R rating being considered

$$D_o = D_s + 2h, \text{ in mm}$$

$$D_s = \text{shrink diameter, in mm}$$

E = Young's modulus of elasticity of crankshaft material, in N/mm²

FoS = Factor of Safety against rotational slippage to be taken as 2,0. A value less than 2,0 may be used where documented by experiments to demonstrate acceptability

P = output power, in kW

R = speed at associated power, in rpm
 T = crankweb thickness, in mm
 μ = coefficient of static friction to be taken as 0,2 for degreased surfaces. A value greater than 0,2 may be used where documented by experiments to demonstrate acceptability
 σ_{yj} = minimum yield strength of material for journal pin
 M_{\max} = absolute maximum value of the torque taking Ch 8,2 into consideration
 L_s = length of shrink fit, in mm.

Maximum diametral interference, δ_{\max} , is not to be greater than:

$$\delta_{\max} = \frac{\sigma_y D_s}{E} + \frac{0,8 D_s}{1000} \text{ mm.}$$

Fig. 2.3.4 Crank throw of semi-built crankshaft

3.11.8 Reference marks are to be provided on the outer junction of the crankwebs with the journals.

Section 4 Construction and welded structures

4.1 Crankcases

4.1.1 Crankcases and their doors are to be of robust construction to withstand anticipated crankcase pressures that may arise during a crankcase explosion, taking into account the installation of explosion relief valves required by Section 6 and the doors are to be securely fastened so that they will not be readily displaced by a crankcase explosion.

4.2 Welded joints

4.2.1 Bedplates and major components of engine structures are to be made with a minimum number of welded joints.

4.2.2 Double welded butt joints are to be adopted wherever possible in view of their superior fatigue strength.

4.2.3 Girder and frame assemblies should, so far as possible, be made from one plate or slab, shaped as necessary, rather than by welding together a number of small pieces.

4.2.4 Steel castings are to be used for parts which would otherwise require complicated weldments.

4.2.5 Care is to be taken to avoid stress concentrations such as sharp corners and abrupt changes in section.

4.2.6 Joints in parts of the engine structure which are stressed by the main gas or inertia loads are to be designed as continuous full strength welds and for complete fusion of the joint. They are to be so arranged that, in general, welds do not intersect, and that welding can be effected without difficulty and adequate inspection can be carried out. Abrupt changes in plate section are to be avoided and where plates of substantially unequal thickness are to be butt welded, the thickness of the heavier plate is to be gradually tapered to that of the thinner plate. Tee joints are to be made with full bevel or equivalent weld preparation to ensure full penetration.

4.2.7 In single plate transverse girders the castings for main bearing housings are to be formed with web extensions which can be butt welded to the flange and vertical web plates of the girder. Stiffeners in the transverse girder are to be attached to the flanges by full penetration welds.

4.3 Materials and construction

4.3.1 Plates, sections, forgings and castings are to be of welding quality in accordance with the requirements of the Rules for Materials, and with a carbon content generally not exceeding 0,23 per cent. Steels with higher carbon contents may be approved subject to satisfactory results from welding procedure tests.

4.3.2 Welding is to be carried out in accordance with the requirements of Chapter 13 of the Rules for Materials, using welding procedures and welders that have been qualified in accordance with Chapter 12 of the Rules for Materials.

4.3.3 Before welding is commenced the component parts of bedplates and framework are to be accurately fitted and aligned.

4.3.4 The welding is to be carried out in positions free from draughts and is to be downhand (flat) wherever practicable. Welding consumables are to be suitable for the materials being joined. Preheating is to be adopted when heavy plates or sections are welded. The finished welds are to have an even surface and are to be free from undercutting.

4.3.5 Welds attaching bearing housings to the transverse girders are to have a smooth contour and, if necessary, are to be made smooth by grinding.

Oil Engines

Part 5, Chapter 2

Sections 4 & 5

4.4 Post-weld heat treatment

4.4.1 Bedplates are to be given a stress relieving heat treatment except engine types where the bedplate as a whole is not subjected to direct loading from the cylinder pressure. For these types, only the transverse girder assemblies need be stress relieved.

4.4.2 Stress relieving is to be carried out by heating the welded structure uniformly and slowly to a temperature between 580°C and 620°C, holding that temperature for not less than one hour per 25 mm of maximum plate thickness and thereafter allowing the structure to cool slowly in the furnace.

4.4.3 Omission of post-weld heat treatment of bedplates and their sub-assemblies will be considered on application by the engine builder with supporting evidence in accordance with Ch 13,2.10.4 of the Rules for Materials.

4.5 Inspection

4.5.1 Welded engine structures are to be examined during fabrication, special attention being given to the fit of component parts of major joints prior to welding.

4.5.2 Inspection of welds is to be in accordance with the requirements of Ch 13,1.11 of the Rules for Materials.

4.5.3 Welds in transverse girder assemblies are to be crack detected by an approved method to the satisfaction of the Surveyors. Other joints are to be similarly tested if required by the Surveyors.

Section 5 Safety arrangements on engines

5.1 Cylinder relief valves

5.1.1 Scavenge spaces in open connection with cylinders are to be provided with explosion relief valves.

5.2 Main engine governors

5.2.1 An efficient governor is to be fitted to each main engine so adjusted that the speed does not exceed that for which the engine is to be classed by more than 15 per cent.

5.2.2 Oil engines coupled to electrical generators which are the source of power for main electric propulsion motors are to comply with the requirements for auxiliary engines in respect of governors and overspeed protection devices.

5.3 Auxiliary engine governors

5.3.1 Auxiliary engines intended for driving electric generators are to be fitted with governors which, with fixed setting, are to control the speed within 10 per cent momentary variation and 5 per cent permanent variation when full load is suddenly taken off or, when after having run on no-load for at least 15 minutes, load is suddenly applied as follows:

- (a) For engines with BMEP less than 8 bar, full load, or
- (b) For engines with BMEP greater than 8 bar, $\frac{800}{\text{BMEP}}$ per

cent, but not less than one-third, of full load, the full load being attained in not more than two additional equal stages as rapidly as possible.

5.3.2 Emergency engines are to comply with 5.3.1 except that the initial load required by 5.3.1(b) is to be not less than the total connected emergency statutory load, or if their total consumer load is applied in steps, the following requirements are to be met:

- (a) the total load is supplied within 45 seconds from power failure on the main switchboard;
- (b) the maximum step load is declared and demonstrated; and
- (c) the power distribution system is designed such that the declared maximum step loading is not exceeded.

5.3.3 Compliance of time delays and loading sequence with the requirements of 5.3.2 is to be demonstrated at ship's trials.

5.3.4 For alternating current installations, the permanent speed variation of the machines intended for parallel operation are to be equal within a tolerance of $\pm 0,5$ per cent. Momentary speed variations with load changes in accordance with 5.3.1 are to return to and remain within one per cent of the final steady state speed. This should normally be accomplished within five but in no case more than eight seconds. For quality of power supplies, see Pt 6, Ch 2,1.7.

5.4 Overspeed protective devices

5.4.1 Each main engine developing 220kW (300 shp) or over which can be declutched or which drives a controllable (reversible) pitch propeller, also each auxiliary engine developing 220 kW (300 shp) and over for driving an electric generator, is to be fitted with an approved overspeed protective device.

5.4.2 The overspeed protective device, including its driving mechanism, is to be independent of the governor required by 5.2 or 5.3 and is to be so adjusted that the speed does not exceed that for which the engine and its driven machinery are to be classed by more than 20 per cent for main engines and 15 per cent for auxiliary engines.

Section 6 Crankcase safety fitting

NOTE

For the purpose of this Section, starting air compressors are to be treated as auxiliary engines.

6.1 Relief valves

6.1.1 Crankcases are to be provided with lightweight spring-loaded valves or other quick-acting and self-closing devices, to relieve the crankcases of pressure in the event of an internal explosion and to prevent any inrush of air thereafter. The valves are to be designed and constructed to open quickly and be fully open at a pressure not greater than 0,2 bar.

6.1.2 The valve lids are to be made of ductile material capable of withstanding the shock of contact with stoppers at the full open position.

6.1.3 Each valve is to be fitted with a flame arrester that permits flow for crankcase pressure relief and prevents the passage of flame following a crankcase explosion. The valves are to be type tested in a configuration that represent the installation arrangements that will be used on an engine and in accordance with Section 13. The valves are to be positioned on engines to minimise the possibility of danger and damage arising from emission of the crankcase atmosphere. Where shielding from the emissions is fitted to a valve, the valve is to be type tested to demonstrate that the shielding does not adversely affect the operational effectiveness of the valve.

6.1.4 The valves are to be provided with a copy of the manufacturer's installation and maintenance manual for the size and type of valve being supplied for installation on a particular engine. The manual is to contain the following information:

- Description of valve with details of function and design limits.
- Copy of type test certification.
- Installation instructions.
- Maintenance and in service instructions to include testing and renewal of any sealing arrangements.
- Actions required after a crankcase explosion.

6.1.5 A copy of the installation and maintenance manual required by 6.1.4 is to be provided on board the ship.

6.1.6 Plans showing details and arrangements of the relief valves are to be submitted for approval, see 1.1.

6.1.7 The valves are to be provided with suitable markings that include the following information:

- Name and address of manufacturer.
- Designation and size.
- Month/Year of manufacture.
- Approved installation orientation.

6.2 Number of relief valves

6.2.1 In engines having cylinders not exceeding 200 mm bore or having a crankcase gross volume not exceeding 0,6 m³, relief valves may be omitted.

6.2.2 In engines having cylinders exceeding 200 mm but not exceeding 250 mm bore, at least two relief valves are to be fitted; each valve is to be located at or near the ends of the crankcase. Where the engine has more than eight crank throws an additional valve is to be fitted near the centre of the engine.

6.2.3 In engines having cylinders exceeding 250 mm but not exceeding 300 mm bore, at least one relief valve is to be fitted in way of each alternate crank throw with a minimum of two valves. For engines having 3, 5, 7, 9, etc., crank throws, the number of relief valves is not to be less than 2, 3, 4, 5, etc., respectively.

6.2.4 In engines having cylinders exceeding 300 mm bore at least one valve is to be fitted in way of each main crank throw.

6.2.5 Additional relief valves are to be fitted for separate spaces on the crankcase, such as gear or chaincases for camshaft or similar drives, when the gross volume of such spaces exceeds 0,6 m³.

6.3 Size of relief valves

6.3.1 The combined free area of the crankcase relief valves fitted on an engine is to be not less than 115 cm²/m³ based on the volume of the crankcase.

6.3.2 The free area of each relief valve is to be not less than 45 cm².

6.3.3 The free area of the relief valve is the minimum flow area at any section through the valve when the valve is fully open.

6.3.4 In determining the volume of the crankcase for the purpose of calculating the combined free area of the crankcase relief valves, the volume of the stationary parts within the crankcase may be deducted from the total internal volume of the crankcase.

6.4 Vent pipes

6.4.1 Through ventilation, and any arrangement which could produce a flow of external air within the crankcase, is in principle not permitted except for trunk piston type dual fuel engines where crankcase ventilation is to be provided. Where crankcase vent or breather pipes are fitted, they are to be made as small as practicable and/or as long as possible to minimise the inrush of air after an explosion. Vents or breather pipes from crankcases of main engines are to be led to a safe position on deck or other approved position.

Oil Engines

Part 5, Chapter 2

Section 6

6.4.2 If provision is made for the extraction of gases from within the crankcase, e.g. for oil mist detection purposes, the vacuum within the crankcase is not to exceed 25 mm of water.

6.4.3 Lubricating oil drain pipes from engine sump to drain tank are to be submerged at their outlet ends. Where two or more engines are installed, vent pipes, if fitted, and lubrication oil drain pipes are to be independent to avoid intercommunication between crankcases.

6.5 Alarms

6.5.1 Alarms giving warning of the overheating of engine running parts, indicators of excessive wear of thrusts and other parts, and crankcase oil mist detectors are recommended as means for reducing the explosion hazard. These devices should be arranged to give an indication of failure of the equipment or of the instrument being switched off when the engine is running.

6.6 Warning notice

6.6.1 A warning notice is to be fitted in a prominent position, preferably on a crankcase door on each side of the engine, or alternatively at the engine room control station. This warning notice is to specify that whenever overheating is suspected in the crankcase, the crankcase doors or sight holes are not to be opened until a reasonable time has elapsed after stopping the engine, sufficient to permit adequate cooling within the crankcase.

6.7 Crankcase access and lighting

6.7.1 Where access to crankcase spaces is necessary for inspection purposes, suitably positioned rungs or equivalent arrangements are to be provided as considered appropriate.

6.7.2 When interior lighting is provided it is to be flame-proof in relation to the interior and details are to be submitted for approval. No wiring is to be fitted inside the crankcase.

6.8 Fire-extinguishing system for scavenge manifolds

6.8.1 Crosshead type engine scavenge spaces in open connection with cylinders are to be provided with approved fixed or portable fire-extinguishing arrangements which are to be independent of the fire-extinguishing system of the engine room.

6.9 Oil mist detection/monitoring

6.9.1 Where crankcase oil mist detection/monitoring arrangements are fitted, they are to be of a type approved by LR, tested in accordance with Section 14 and comply with 6.9.2 to 6.9.15.

6.9.2 The oil mist detection/monitoring system and arrangements are to be installed in accordance with the engine designer's and oil mist detection equipment manufacturer's instructions/recommendations. The following particulars are to be included in the instructions:

- (a) Schematic layout of engine oil mist detection/monitoring and alarm system showing locations of engine crankcase sample points and piping arrangements together with pipe dimensions to detector/monitor.
- (b) Evidence of study to justify the selected locations of sample points and sample extraction rate (if applicable) in consideration of the crankcase arrangements and geometry and the predicted crankcase atmosphere where oil mist can accumulate.
- (c) The manufacturer's maintenance and test manual.
- (d) Information relating to type or in-service testing of the engine with engine protection system test arrangements having approved types of oil mist monitoring equipment.

6.9.3 A copy of the oil mist detection/monitoring equipment maintenance and test manual required by 6.9.2 is to be provided on board ship.

6.9.4 Oil mist monitoring and alarm information is to be capable of being read from a safe location away from the engine.

6.9.5 In the case of multi engine installations, each engine is to be provided with oil mist detection/monitoring and a dedicated alarm.

6.9.6 Oil mist detection/monitoring and alarm systems are to be capable of being tested on the test bed and on board when the engine is at a standstill and when the engine is running at normal operating conditions in accordance with test procedures that are acceptable to LR.

6.9.7 Alarms and shutdowns for the oil mist detection/monitoring system are to be in accordance with Pt 6, Ch 1 as applicable.

6.9.8 The oil mist detection/monitoring arrangements are to provide an alarm indication in the event of a foreseeable functional failure in the equipment and installation arrangements. See Pt 6, Ch 1,2.4.6.

6.9.9 The oil mist detection/monitoring system is to provide an indication that any lenses fitted in the equipment and used in determination of the oil mist level have been partially obscured to a degree that will affect the reliability of the information and alarm indication.

6.9.10 Where oil mist detection/monitoring equipment includes the use of programmable electronic systems, the arrangements are to be in accordance with Pt 6, Ch 1 as applicable.

6.9.11 Schematic layouts showing details and arrangements of oil mist detection/monitoring and alarm systems are to be submitted. See Pt 5, Ch 1,1.

6.9.12 The equipment together with detectors/monitors is to be tested when installed on the test bed and on board ship to demonstrate that the detection/monitoring and alarm system functions correctly. The testing arrangements are to be to the satisfaction of the Surveyor.

6.9.13 Where sequential oil mist detection/monitoring arrangements are provided, the sampling frequency and time is to be as short as reasonably practicable.

6.9.14 Where alternative methods are provided for the prevention of the build-up of oil mist that may lead to a potentially explosive condition within the crankcase, detailed information is to be submitted for consideration. The information is to include:

- (a) Engine particulars – type, power, speed, stroke, bore and crankcase volume.
- (b) Details of arrangements designed to prevent the build up of potentially explosive conditions within the crankcase, e.g., bearing temperature monitoring, oil splash temperature monitoring, crankcase pressure monitoring, and recirculation arrangements.
- (c) Evidence to demonstrate that the arrangements are effective in preventing the build up of potentially explosive conditions together with details of in-service experience.
- (d) Operating instructions and the maintenance and test instructions.

6.9.15 Where it is proposed to use the introduction of inert gas into the crankcase to minimise a potential crankcase explosion, details of the arrangements are to be submitted for consideration.

■ Section 7 Piping

7.1 Oil fuel systems

7.1.1 All external high pressure fuel delivery lines between the high pressure fuel pumps and fuel injectors are to be protected with a jacketed piping system capable of containing fuel from a high pressure line failure. If flexible hoses are used for shielding purposes, these arrangements are to be approved.

7.1.2 The protection is to prevent oil fuel or oil fuel mist from reaching a source of ignition on the engine or its surroundings. Suitable drainage arrangements are to be made for draining any oil fuel leakage to collector tank(s) fitted in a safe position. An alarm is to be provided to indicate that leakage is taking place.

7.1.3 Oil fuel pipe systems in general, tanks and their fittings are to comply with the requirements of Chapter 14 and Part 3.

7.1.4 Diesel engine fuel system components are to be designed to accommodate the maximum peak pressures experienced in service. In particular this applies to the fuel injection pump supply and spill line piping which may be subject to high-pressure pulses from the pump. Connections on such piping systems should be chosen to minimise the risk of pressurised oil fuel leaks.

7.1.5 Where multi-engined installations are supplied from the same fuel source, means of isolating the fuel supply and spill piping to individual engines are to be provided. These means of isolation are not to affect the operation of the other engines and are to be operable from a position not rendered inaccessible by a fire on any of the engines.

7.2 High pressure oil systems

7.2.1 Where flammable oils are used in high pressure systems, the oil pipe lines between the high pressure oil pump and actuating oil pistons are to be protected with a jacketed piping system capable of preventing oil spray from a high-pressure line failure.

7.3 Exhaust systems

7.3.1 Where the surface temperature of the exhaust pipes and silencer may exceed 220°C, they are to be water cooled or efficiently lagged to minimise the risk of fire and to prevent damage by heat. Where lagging covering the exhaust piping system including flanges is oil-absorbing or may permit penetration of oil, the lagging is to be encased in sheet metal or equivalent. In locations where the Surveyor is satisfied that oil impingement could not occur, the lagging need not be encased.

7.3.2 Where the exhaust is led overboard near the waterline, means are to be provided to prevent water from being siphoned back to the engine. Where the exhaust is cooled by water spray, the exhaust pipes are to be self-draining overboard.

7.3.3 Where the exhausts of two or more engines are led to a common silencer or exhaust gas-heated boiler or economiser, an isolating device is to be provided in each exhaust pipe.

7.3.4 For alternatively fired furnaces of boilers using exhaust gases and oil fuel, the exhaust gas inlet pipe is to be provided with an isolating device and interlocking arrangements whereby oil fuel can only be supplied to the burners when the isolating device is closed to the boiler.

7.3.5 In two-stroke main engines fitted with exhaust gas turbo-blowers which operate on the impulse system, provision is to be made to prevent broken piston rings entering the turbine casing and causing damage to blades and nozzle rings.

Oil Engines

Part 5, Chapter 2

Sections 7 & 8

7.4 Starting air pipe systems and safety fittings

7.4.1 In designing the compressed air installation, care is to be taken that the compressor air inlets will be located in an atmosphere reasonably free from oil vapour or, alternatively, an air duct from outside the machinery space is to be led to the compressors.

7.4.2 The air discharge pipe from the compressors is to be led direct to the starting air receivers. Provision is to be made for intercepting and draining oil and water in the air discharge for which purpose a separator or filter is to be fitted in the discharge pipe between compressors and receivers.

7.4.3 The starting air pipe system from receivers to main and auxiliary engines is to be entirely separate from the compressor discharge pipe system. Stop valves on the receivers are to permit slow opening to avoid sudden pressure rises in the piping system. Valve chests and fittings in the piping system are to be of ductile material.

7.4.4 Drain valves for removing accumulations of oil and water are to be fitted on compressors, separators, filters and receivers. In the case of any low-level pipelines, drain valves are to be fitted to suitably located drain pots or separators.

7.4.5 The starting air piping system is to be protected against the effects of explosions by providing an isolating non-return valve or equivalent at the starting air supply to each engine.

7.4.6 In direct reversing engines bursting discs or flame arresters are to be fitted at the starting valves on each cylinder; in non-reversing and auxiliary engines at least one such device is to be fitted at the supply inlet to the starting air manifold on each engine. The fitting of bursting discs or flame arresters may be waived in engines where the cylinder bore does not exceed 230 mm.

7.4.7 Alternative safety arrangements may be submitted for consideration.

8.1.3 Where the emergency source of power is an emergency generator which fully complies with the requirements of Pt 6, Ch 2, this generator may be used for restoring operation of the main propulsion plant, boilers and auxiliaries where any power supplies necessary for engine operation are also protected to a similar level as the starting arrangements.

8.1.4 Where there is no emergency generator installed or an emergency generator does not comply with Pt 6, Ch 2, the arrangements for bringing main and auxiliary machinery into operation are to be such that the initial charge of starting air or initial electrical power and any power supplies for engine operation can be developed on board ship without external aid. If for this purpose an emergency air compressor or an electric generator is required, these units are to be powered by a hand-starting oil engine or a hand-operated compressor. The arrangements for bringing main and auxiliary machinery into operation are to have capacity such that the starting energy and any power supplies for engine operation are available within 30 minutes of a dead ship condition.

8.1.5 For cargo ships of less than 500 gross tons and which are not required to comply with the *International Convention for the Safety of Life at Sea, 1974*, as amended (SOLAS 74), alternative arrangements to those specified in 8.1.3 or 8.1.4 may be proposed for consideration. Details of the alternative arrangements are to be included in the plans and details required by 1.1.6 and are to demonstrate that the arrangements provide for starting from the dead ship condition and are in accordance with any applicable statutory requirements of the National Authority of the country in which the ship is to be registered.

8.2 Air compressors

8.2.1 Two or more air compressors are to be fitted having a total capacity, together with a topping-up compressor where fitted, capable of charging the air receivers within 1 hour from atmospheric pressure, to the pressure sufficient for the number of starts required by 8.3. At least one of the air compressors is to be independent of the main propulsion unit and the capacity of the main air compressors is to be approximately equally divided between them. The capacity of an emergency compressor which may be installed to satisfy the requirements of 8.1 is to be ignored.

8.2.2 The compressors are to be so designed that the temperature of the air discharged to the starting air receivers will not substantially exceed 93°C in service. A small fusible plug or an alarm device operating at 121°C is to be provided on each compressor to give warning of excessive air temperature. The emergency air compressor is excepted from these requirements.

Section 8 Starting arrangements and air compressors

8.1 Dead ship condition starting arrangements

8.1.1 Means are to be provided to ensure that machinery can be brought into operation from the dead ship condition without external aid.

8.1.2 Dead ship condition for the purpose of 8.1.1 is to be understood to mean a condition under which the main propulsion plant, boilers and auxiliaries are not in operation. In restoring propulsion, no stored energy for starting and operating the propulsion plant is assumed to be available. Additionally, neither the main source of electrical power nor other essential auxiliaries are assumed to be available for starting and operating the propulsion plant.

Oil Engines

Part 5, Chapter 2

Sections 8 & 9

8.2.3 Each compressor is to be fitted with a safety valve so proportioned and adjusted that the accumulation with the outlet valve closed will not exceed 10 per cent of the maximum working pressure. The casings of the cooling water spaces are to be fitted with a safety valve or bursting disc so that ample relief will be provided in the event of the bursting of an air cooler tube. It is recommended that compressors be cooled by fresh water.

8.3 Air receiver capacity

8.3.1 Where the main engine is arranged for air starting the total air receiver capacity is to be sufficient to provide without replenishment, not less than 12 consecutive starts of the main engine, alternating between ahead and astern if of the reversible type and not less than six consecutive starts if of the non-reversible type. At least two air receivers of approximately equal capacity are to be provided. For scantlings and fittings of air receivers, see Chapter 11.

8.3.2 For multi-engine installations, the number of starts required for each engine will be specially considered.

8.4 Electric starting

8.4.1 Where main engines are fitted with electric starters, two batteries are to be fitted. Each battery is to be capable of starting the engines when cold and the combined capacity is to be sufficient without recharging to provide the number of starts of the main engines as required by 8.3. In other respects batteries are to comply with the requirements of Pt 6, Ch 2, 11.

8.4.2 Electric starting arrangements for auxiliary engines are to have two separate batteries or be supplied by separate circuits from the main engine batteries when such are provided. Where one of the auxiliary engines only is fitted with an electric starter one battery will be acceptable.

8.4.3 The combined capacity of the batteries for starting the auxiliary engines is to be sufficient for at least three starts for each engine.

8.4.4 Engine starting batteries are to be used only for the purposes of starting the engines and for the engines' own monitoring arrangements. Means are to be provided to ensure that the stored energy in the batteries is maintained at a level required to start the engines, as defined in 8.4.1 and 8.4.3.

8.4.5 Where engines are fitted with electric starting batteries, an alarm is to be provided for low battery charge level.

8.4.6 For cargo ships of less than 500 gross tons which are not required to comply with the *International Convention for the Safety of Life at Sea, 1974*, as amended (SOLAS 74), the emergency source of electrical power may be used as one of the sources of energy required by 8.4.1 or 8.4.2 for electric starting. Where the emergency source of electrical power is an accumulator battery and it is to be used for electric starting, it is to have the additional capacity required to ensure emergency supplies are not compromised and is to be adequately protected and suitably located for use in an emergency.

8.5 Starting of the emergency source of power

8.5.1 Emergency generators are to be capable of being readily started in their cold conditions down to a temperature of 0°C. If this is impracticable, or if lower temperatures are likely to be encountered, consideration is to be given to the provision and maintenance of heating arrangements, so that ready starting will be assured.

8.5.2 Each emergency generator that is arranged to be automatically started is to be equipped with an approved starting system having two independent sources of stored energy, each of which is sufficient for at least three consecutive starts. When hand (manual) starting is demonstrated to be effective, only one source of stored energy need be provided. However, this source of stored energy is to be protected against depletion below the level required for starting.

8.5.3 Provision is to be made to maintain continuously the stored energy at all times, and for this purpose:

- (a) Electrical and hydraulic starting systems are to be maintained from the emergency switchboard.
- (b) Compressed air starting systems may be maintained by the main or auxiliary compressed air receivers, through a suitable non-return valve, or by an emergency air compressor energised by the emergency switchboard.
- (c) All these starting, charging and energy storing devices are to be located in the emergency generator room. These devices are not to be used for any purpose other than the operation of the emergency generator.

8.5.4 When automatic starting is not required by the Rules and where it can be demonstrated as being effective, hand (manual) starting is permissible, such as manual cranking, inertial starters, manual hydraulic accumulators, powder charge cartridges.

8.5.5 When hand (manual) starting is not practicable, the provisions under 8.5.2 and 8.5.3 are to be complied with except that starting may be manually initiated.

8.5.6 Engine starting batteries are to be used only for the purposes of starting the engines and for the engines' own monitoring arrangements.

■ Section 9 Component tests and engine type testing

9.1 Hydraulic tests

9.1.1 In general, items are to be tested by hydraulic pressure as indicated in Table 2.9.1. Where design features are such that modifications to the test requirements shown in Table 2.9.1 are necessary, alternative proposals for hydraulic tests are to be submitted for special consideration.

Oil Engines

Part 5, Chapter 2

Sections 9 & 10

Table 2.9.1 Test pressures for oil engine components

Item	Test pressure
Fuel injection system { Pump body, pressure side Valve Pipe }	The lesser of $1,5p$ or $p + 295$ bar
Cylinder cover, cooling space Cylinder liner, over the whole length of cooling space Piston crown, cooling space (where piston rod seals cooling space, test after assembly)	7,0 bar
Cylinder jacket, cooling space Exhaust valve, cooling space Turbo-charger, cooling space Exhaust pipe, cooling space Coolers, each side Engine driven pumps (oil, water, fuel, bilge)	The greater of 4,0 bar or $1,5p$
Air compressor, including cylinders, covers, intercoolers and aftercoolers	Air side: $1,5p$ Water side: The greater of 4,0 bar or $1,5p$
Scavenge pump cylinder	4,0 bar
NOTES 1. p is the maximum working pressure in the item concerned. 2. Pumps used in jerk or timed pump systems need only have the assembled high pressure-containing components hydraulically tested. 3. Turbo-charger air coolers need only be tested on the water side. 4. For forged steel cylinder covers alternative testing methods will be specially considered.	

9.1.2 Where a manufacturer has demonstrated to LR that they have an acceptable quality management system, a manufacturer's hydraulic test certificate may be accepted for engine driven pumps as detailed in Table 2.9.1. Recognition and acceptance of the works quality control processes can be by one of the following routes:

- Approval under the LR Quality Scheme for Machinery.
- Approval of an alternative quality scheme recognised by LR.
- Approval by LR through auditing of the manufacturer's quality system.

9.2 Alignment gauges

9.2.1 All main and auxiliary oil engines exceeding 220 kW (300 shp) are to be provided with an alignment gauge which may be either a bridge wear-down gauge, or a micro-meter clock gauge for use between the crankwebs. Only one micrometer clock gauge need be supplied for each ship provided the gauge is suitable for use on all engines.

9.3 Engine type testing

9.3.1 New engine types or developments of existing types are to be subjected to an agreed programme of type testing to complement the design appraisal and review of documentation.

9.3.2 Guidelines for type testing of engines will be supplied on application.

9.3.3 An engine type is defined in terms of:

- basic engine data: e.g. bore, stroke
- working cycle: 2 stroke, 4 stroke
- cylinder arrangement: in-line, vee
- cylinder rating
- fuel supply: e.g. direct, or indirect injection, dual fuel
- gas exchange: natural aspiration, pressure charging arrangement.

9.3.4 Where an engine type has subsequently proved satisfactory in service with a number of applications a maximum uprating of 10 per cent may be considered without a further complete type test.

9.3.5 A type test will be considered to cover engines of a given design for a range of cylinder numbers in a given cylinder arrangement.

Section 10 Turbo-chargers

10.1 Plans and particulars

10.1.1 The following plans and particulars are to be submitted for information:

- Cross sectional plans of the assembled turbocharger with main dimensions.
- Fully dimensioned plans of the rotor.
- Material particulars with details of welding and surface treatments.
- Turbo-charger operating and test data.
- A selected turbocharger is to be type tested.
- Manufacturer's burst test assessment.

Oil Engines

Part 5, Chapter 2

Sections 10 & 11

10.2 Type test

10.2.1 A type test is to consist of a hot gas running test of at least one hour duration at the maximum permissible speed and maximum permissible temperature. Following the test the turbocharger is to be completely dismantled for examination of all parts.

10.2.2 Alternative arrangements will be specially considered.

10.3 Dynamic balancing

10.3.1 All rotors are to be dynamically balanced on final assembly to the Surveyor's satisfaction.

10.4 Overspeed test

10.4.1 All fully bladed rotor sections and impeller/inducer wheels are to be overspeed tested for three minutes at either 20 per cent above the maximum permissible speed at room temperature or 10 per cent above the maximum permissible speed at the normal working temperature.

10.5 Mechanical running test

10.5.1 Turbo-chargers are to be given a mechanical running test of 20 minutes duration at the maximum permissible speed.

10.5.2 Upon application, with details of an historical audit covering previous testing of turbochargers manufactured under an approved quality assurance scheme, consideration will be given to confining the test outlined in 10.5.1 to a representative sample of turbochargers.

11.1.2 Castings, forgings and other parts for use in mass produced engines are also to be produced by methods similar to those given in 11.1.1(a), (b) and (c), with appropriate inspection.

11.1.3 Pressure testing of components is to comply with 9.1.1.

11.1.4 The specification of a mass produced engine is to define the limits of manufacture of all component parts. The total production output is to be certified by the manufacturer and verified as may be required, by LR in accordance with the agreed manufacturer's quality assurance scheme, see 11.1.1(a).

11.2 Procedure for approval of mass produced engines

11.2.1 The procedure outlined in 11.2.2 to 11.2.5 applies to the inspection and certification of mass produced oil engines having a bore not exceeding 300 mm.

11.2.2 For the approval of a mass produced engine type, the manufacturer is to submit, in addition to the plans and particulars required by 1.1 and information required by 3.2, a list of subcontractors for main parts.

11.2.3 The manufacturer is to supply full information regarding the manufacturing processes and quality control procedures applied in the workshops. The information is to address the following:

- (a) Organisation of quality control systems.
- (b) Recording of quality control operations.
- (c) Qualification and independence of personnel in charge of quality control.

11.2.4 A running type test of at least 100 hours duration is to be carried out on an engine chosen from the production line. The type testing is to comply with 11.5.

11.2.5 LR reserves the right to limit the duration of validity of approval of a mass produced engine. LR is to be informed, without delay, of any change in the design of the engine, in the manufacturing or control processes, in the selection of materials or in the list of subcontractors for main parts.

11.3 Continuous review of production

11.3.1 LR Surveyors are to be provided free access to the manufacturer's workshops and to the quality control files.

11.3.2 The control of production, which is subject to survey, is to include the following:

- (a) Inspection and testing records are to be maintained to the satisfaction of the Surveyor.
- (b) The system for identification of parts is to be in accordance with recognised practice, and acceptable to LR.

Section 11 Mass produced engines

11.1 Definition

11.1.1 Mass produced engines, for main and auxiliary purposes, are defined as those which are produced under the following criteria:

- (a) In quantity under strict quality control of material and parts, according to a quality assurance scheme acceptable to LR.
- (b) By the use of jigs and automatic machine tools designed to machine parts to specified tolerances for interchangeability, and which are verified on a regular inspection basis.
- (c) By assembly with parts taken from stock and requiring little or no fitting.
- (d) With bench tests carried out on individual assembled engines according to a specified programme.
- (e) With appraisal by final examination of engines selected at random after workshop testing.

- (c) The manufacturer is to provide full information about the quality control of the parts supplied by subcontractors for which certification may be required. LR reserves the right to apply direct and individual inspection procedures for parts supplied by subcontractors when deemed necessary.
- (d) At the request of an attending LR surveyor, a workshop test may be required for an individual engine.

11.4 Compliance and inspection certificate

11.4.1 Each engine which is to be installed on a ship classed by LR is to be supplied with a statement certifying that the engine is identical to the one which underwent the tests specified in 11.2.4, and state the test and inspection results. The statement is to be made on a form agreed with LR. Each statement is to include the identification number which appears on the engine. A copy of this statement is to be submitted to LR.

11.5 Type test conditions

11.5.1 The requirements in this section are applicable to the type testing of mass produced internal combustion engines where the manufacturer has requested approval. Omission or simplification of the type test requirements will be considered by LR for engines of an established type on application by the manufacturer.

11.5.2 The engine to be tested is to be selected from the production line and agreed by LR.

11.5.3 The duration and programme of type tests is to include the following:

- (a) 80 h at rated output.
- (b) 8 h at 110 per cent overload.
- (c) 10 h at varying partial loads (25 per cent, 50 per cent, 75 per cent and 90 per cent of rated output).
- (d) 2 h at maximum intermittent loads.
- (e) Starting tests.
- (f) Reverse running of direct reversing engines.
- (g) Testing of speed governor.
- (h) Testing of over-speed device.
- (j) Testing of lubricating oil system failure alarm device.
- (k) Testing of the engine with turbocharger out of action when applicable.
- (l) Testing of minimum speed for main propulsion engines and the idling speed for auxiliary engines.

11.5.4 The type tests in 11.5.3 at the required outputs are to be combined together in working cycles for the whole duration within the limits indicated. *See also* 11.5.10 and 11.5.11.

11.5.5 The overload testing required by 11.5.3 is to be carried out with the following conditions:

- (a) 110 per cent of rated power at 103 per cent revolutions per minute for engines directly driving propellers.
- (b) 110 per cent of rated power at 100 per cent revolutions per minute for engines driving electrical generators or for other auxiliary purposes.

11.5.6 For prototype engines, the duration and programme of tests are to be specially agreed between the manufacturer and LR.

11.5.7 As far as practicable during type testing the following particulars are to be continuously recorded:

- (a) Ambient air temperature.
- (b) Ambient air pressure.
- (c) Atmospheric humidity.
- (d) External cooling water temperature.
- (e) Fuel and lubrication oil characteristics.

11.5.8 In addition to the particulars stated in 11.5.7 and as far as practicable, the following are also to be continuously measured and recorded:

- (a) Engine revolutions per minute.
- (b) Brake power.
- (c) Torque.
- (d) Maximum combustion pressure.
- (e) Indicator pressure diagrams where practicable.
- (f) Exhaust smoke (with an approved smoke meter).
- (g) Lubricating oil pressure and temperature.
- (h) Exhaust gas temperature in exhaust manifold, and, where facilities are available, from each cylinder.
- (j) For turbocharged engines:
 - Turbocharger revolutions per minute.
 - Air temperature and pressures before and after turbo-blower and charge cooler.
 - Exhaust gas temperature and pressures before and after the turbine.
 - The cooling water inlet temperature to the charge air cooler.

11.5.9 After the type test, the main parts and especially those subject to wear are to be dismantled for examination by LR Surveyors.

11.5.10 For engines that are required to be approved for different purposes (multi-purpose engines), and that have different performances for each purpose, the programme and duration of test is to be modified to cover the whole range of the engine performance, taking into account the most severe conditions and intended purpose(s).

11.5.11 The rated output for which the engine is to be tested is the output corresponding to that declared by the manufacturer and agreed by LR, i.e. actual maximum power which the engine is capable of delivering continuously between the normal maintenance intervals stated by the manufacturer at the rated speed and under the stated ambient conditions.

■ Section 12 Mass produced turbo-chargers

12.1 Application

12.1.1 The following procedure applies to the inspection of exhaust driven turbo chargers which are manufactured on the basis of mass production methods similar to 11.1 as applicable and for which the maker has requested the approval.

12.2 Procedure for approval of mass produced turbo-chargers

12.2.1 The procedure outlined in 12.2.2 to 12.2.5 applies to the inspection and certification of mass produced turbo-chargers when a simplified method of inspection has been requested by the manufacturers.

12.2.2 For the approval of a mass produced turbo-charger, the manufacturer is to submit, in addition to the plans and particulars required by 10.1.1, a list of main current suppliers and subcontractors for rotating parts and an operation and maintenance manual.

12.2.3 The manufacturer will supply full information regarding the material and quality control system used in the organisation as well as the inspection methods, the way of recording and proposed frequency, and the method of material testing of important parts.

12.2.4 A Type test, see 10.2, is to be carried out on a standard unit taken from the assembly line and is to be witnessed by the Surveyor. The performance data which may have to be verified are to be made available at the time of the type test. For manufacturers who have facilities for testing the turbo-charger unit on an engine for which the turbo-charger is intended, substitution of the hot running test by a test run of one hour's duration at overload (110 per cent of the rated output) may be considered.

12.2.5 LR reserves the right to limit the duration of validity of approval of a mass produced turbo-charger. LR is to be informed, without delay, of any change in the design of the turbo-charger, in the manufacturing or control processes, in the selection of materials or in the list of subcontractors for main parts.

12.3 Continuous inspection of individual units

12.3.1 LR Surveyors are to be provided with free access to the manufacturer's workshop to inspect at random the quality control measures and to witness the tests required by 12.3.3 to 12.3.7 as deemed necessary, and to have free access to all control records and subcontractor's certificates.

12.3.2 Each individual unit is to be tested in accordance with 12.3.4 to 12.3.7 by the maker who is to issue a final certificate.

12.3.3 Rotating parts of the turbo-charger blower are to be marked for easy identification with the appropriate certificate.

12.3.4 Material tests of the rotating parts are to be carried out by the maker or his subcontractor in accordance with the requirements of the Rules for Materials as applicable. The relevant certificate is to be produced and filed to the satisfaction of the Surveyor.

12.3.5 Pressure tests are to be carried out in accordance with Table 2.9.1. Special consideration will be given where design or testing features may require modification of the test requirements.

12.3.6 Dynamic balancing and overspeed tests are to be carried out, see 10.3 and 10.4, in accordance with the approved procedure for quality control. If each forged wheel is individually controlled by an approved non-destructive examination method, then no overspeed test may be required except for wheels of the test unit.

12.3.7 A mechanical running test, see 10.5, is to be carried out. The duration of the running test may be reduced to 10 minutes provided that the manufacturer is able to verify the distribution of defects established during the running tests on the basis of a sufficient number of tested turbo-chargers. For manufacturers who have facilities in their works for testing the turbo-chargers on an engine for which the turbo-chargers are intended, the bench test may be replaced by a test run of 20 minutes at overload (110 per cent of the rated output) on this engine.

12.4 Compliance and certificate

12.4.1 For every turbo-charger unit liable to be installed on an engine intended for a ship classed by LR, the manufacturer is to supply a statement certifying that the turbo-charger is identical with one that underwent the tests specified in 12.2.4 and that prescribed tests were carried out. Results of these tests are to be also stated. This statement is to be made on a form agreed with LR and a copy is to be sent to LR. Each statement must have a number which is to appear on the turbo-charger.

■ Section 13 Type testing procedure for crankcase explosion relief valves

13.1 Scope

13.1.1 To specify type tests and identify standard test conditions using methane gas and air mixture to demonstrate that LR requirements are satisfied for crankcase explosion relief valves intended to be fitted to engines and gear cases.

13.1.2 The test procedure is only applicable to explosion relief valves fitted with flame arresters. Where internal oil wetting of a flame arrester is a design feature of an explosion relief valve, alternative testing arrangements that demonstrate compliance with these requirements may be proposed by the manufacturer. The alternative testing arrangements are to be submitted to LR for approval.

13.2 Purpose

13.2.1 The purpose of type testing crankcase explosion relief valves is fourfold:

- (a) To verify the effectiveness of the flame arrester.
- (b) To verify that the valve closes after an explosion.
- (c) To verify that the valve is gas/air tight after an explosion.
- (d) To establish the level of over-pressure protection provided by the valve.

13.3 Test facilities

13.3.1 Test houses carrying out type testing of crankcase explosion relief valves are to meet the following requirements:

- (a) The test houses where testing is carried out are to be accredited to a National or International Standard for the testing of explosion protection devices such as ISO/IEC 17025.
- (b) The test facilities are to be acceptable to LR.
- (c) The test facilities are to be equipped so that they can perform and record explosion testing in accordance with this procedure.
- (d) The test facilities are to have equipment for controlling and measuring a methane gas in air concentration within a test vessel to an accuracy of $\pm 0,1$ per cent.
- (e) The test facilities are to be capable of effective point-located ignition of a methane gas in air mixture.
- (f) The pressure measuring equipment is to be capable of measuring the pressure in the test vessel in at least two positions, one at the valve and the other at the test vessel centre. The measuring arrangements are to be capable of measuring and recording the pressure changes throughout an explosion test at a frequency recognising the speed of events during an explosion. The result of each test is to be documented by video recording and by recording with a heat sensitive camera.
- (g) The test vessel for explosion testing is to have documented dimensions. The dimensions are to be such that the vessel is not pipe-like with the distance between dished ends being not more than 2,5 times the diameter. The internal volume of the test vessel is to include any standpipe arrangements.
- (h) The test vessel is to be provided with a flange, located centrally at one end at 90 degrees to the vessel longitudinal axis for mounting the explosion relief valve. The test vessel is to be arranged in an orientation consistent with how the valve will be installed in service, i.e., in the vertical plane or the horizontal plane.
- (i) A circular flat plate is to be provided for fitting between the pressure vessel flange and valve to be tested with the following dimensions:
 - (i) Outside diameter of 2 times the outer diameter of the valve top cover.

- (ii) Internal bore having the same internal diameter as the valve to be tested.
- (k) The test vessel is to have connections for measuring the methane in air mixture at the top and bottom.
- (l) The test vessel is to be provided with a means of fitting an ignition source at a position as specified in 13.4.3.
- (m) The test vessel volume is to be as far as practicable, related to the size and capability of the relief valve to be tested. In general, the volume is to correspond to the requirement in 6.3.1 for the free area of explosion relief valve to be not less than $115 \text{ cm}^2/\text{m}^3$ of crankcase gross volume, e.g., the testing of a valve having 1150 cm^2 of free area, would require a test vessel with a volume of 10 m^3 . The following is to apply:
 - (i) Where the free area of relief valves is greater than $115 \text{ cm}^2/\text{m}^3$ of the crankcase gross volume, the volume of the test vessel is to be consistent with the design ratio.
 - (ii) In no case is the volume of the test vessel to vary by more than ± 15 per cent from the design cm^2/m^3 volume ratio.

13.4 Explosion test process

13.4.1 All explosion tests to verify the functionality of crankcase explosion relief valves are to be carried out using an air and methane mixture with a volumetric methane concentration of 9,5 per cent $\pm 0,5$ per cent. The pressure in the test vessel is to be not less than atmospheric and is not to exceed the opening pressure of the relief valve.

13.4.2 The concentration of methane in the test vessel is to be measured at the top and bottom of the vessel and these concentrations are not to differ by more than 0,5 per cent.

13.4.3 The ignition of the methane and air mixture is to be made at the centreline of the test vessel at a position approximately one third of the height or length of the test vessel opposite to where the valve is mounted.

13.4.4 The ignition is to be made using a maximum 100 joule explosive charge.

13.5 Valves to be tested

13.5.1 The valves used for type testing (including testing specified in 13.5.3) are to be selected from the manufacturer's normal production line for such valves by the LR Surveyor witnessing the tests.

13.5.2 For approval of a specific valve size, three valves are to be tested in accordance with 13.5.3 and 13.6. For a series of valves, see 13.8.

13.5.3 The valves selected for type testing are to have been previously tested at the manufacturer's works to demonstrate that the opening pressure is in accordance with the specification within a tolerance of ± 20 per cent and that the valve is air tight at a pressure below the opening pressure for at least 30 seconds. This test is to verify that the valve is air tight following assembly at the manufacturer's works and that the valve begins to open at the required pressure demonstrating that the correct spring has been fitted.

13.5.4 The type testing of valves is to recognise the orientation in which they are intended to be installed on the engine or gear case. Three valves of each size are to be tested for each intended installation orientation, i.e. in the vertical and/or horizontal positions.

13.6 Method

13.6.1 The following requirements are to be satisfied at explosion testing:

- (a) The explosion testing is to be witnessed by a LR Surveyor.
- (b) Where valves are to be installed on an engine or gear case with shielding arrangements to deflect the emission of explosion combustion products, the valves are to be tested with the shielding arrangements fitted.
- (c) Successive explosion testing to establish a valve's functionality is to be carried out as quickly as possible during stable weather conditions.
- (d) The pressure rise and decay during all explosion testing is to be recorded.
- (e) The external condition of the valves is to be monitored during each test for indication of any flame release by video and heat sensitive camera.

13.6.2 The explosion testing is to be in three stages for each valve that is required to be approved as being type tested.

13.6.3 Stage 1. Two explosion tests are to be carried out in the test vessel with the circular plate as specified in 13.3.1(j) fitted and the opening in the plate covered by a 0,05 mm thick polythene film. These tests establish a reference pressure level for determination of the capability of a relief valve in terms of pressure rise in the test vessel, see 13.7.1(f).

13.6.4 Stage 2:

- (a) Two explosion tests are to be carried out on three different valves of the same size. Each valve is to be mounted in the orientation for which approval is sought i.e., in the vertical or horizontal position with the circular plate described in 13.3.1(j) located between the valve and pressure vessel mounting flange.
- (b) The first of the two tests on each valve is to be carried out with a 0,05mm thick polythene bag, having a minimum diameter of three times the diameter of the circular plate and volume not less than 30 per cent of the test vessel, enclosing the valve and circular plate. Before carrying out the explosion test the polythene bag is to be empty of air. The polythene bag is required to provide a readily visible means of assessing whether there is flame transmission through the relief valve following an explosion. During the test, the explosion

pressure will open the valve and some unburned methane/air mixture will be collected in the polythene bag. When the flame reaches the flame arrester and if there is flame transmission through the flame arrester, the methane/air mixture in the bag will be ignited and this will be visible.

- (c) Provided that the first explosion test successfully demonstrated that there was no indication of combustion outside the flame arrester and there are no signs of damage to the flame arrester or valve, a second explosion test without the polythene bag arrangement is to be carried out as quickly as possible after the first test. During the second explosion test, the valve is to be visually monitored for any indication of combustion outside the flame arrester and video records are to be kept for subsequent analysis. The second test is required to demonstrate that the valve can still function in the event of a secondary crankcase explosion.
- (d) After each explosion, the test vessel is to be maintained in the closed condition for at least 10 seconds to enable the tightness of the valve to be ascertained. The tightness of the valve can be verified during the test from the pressure/time records or by a separate test after completing the second explosion test.

13.6.5 Stage 3. Carry out two further explosion tests as described in Stage 1. These further tests are required to provide an average baseline value for assessment of pressure rise, recognising that the test vessel ambient conditions may have changed during the testing of the explosion relief valves in Stage 2.

13.7 Assessment and records

13.7.1 For the purposes of verifying compliance with the requirements of this Section, the assessment and records of the valves used for explosion testing is to address the following:

- (a) The valves to be tested are to have evidence of appraisal/approval by LR, see also 13.5.1.
- (b) The designation, dimensions and characteristics of the valves to be tested are to be recorded. This is to include the free area of the valve and of the flame arrester and the amount of valve lift at 0,2 bar.
- (c) The test vessel volume is to be determined and recorded.
- (d) For acceptance of the functioning of the flame arrester there is not to be any indication of flame or combustion outside the valve during an explosion test.
- (e) The pressure rise and decay during an explosion is to be recorded, with indication of the pressure variation showing the maximum overpressure and steady under-pressure in the test vessel during testing. The pressure variation is to be recorded at two points in the pressure vessel.

- (f) The effect of an explosion relief valve in terms of pressure rise following an explosion is ascertained from maximum pressures recorded at the centre of the test vessel during the three stages. The pressure rise within the test vessel due to the installation of a relief valve is the difference between average pressure of the four explosions from Stages 1 and 3 and the average of the first tests on the three valves in Stage 2. The pressure rise is not to exceed the limit specified by the manufacturer.
- (g) The valve tightness is to be ascertained by verifying from the records at the time of testing that an under-pressure of at least 0,3 bar is held by the test vessel for at least 10 seconds following an explosion. This test is to verify that the valve has effectively closed and is reasonably gas-tight following dynamic operation during an explosion.
- (h) After each explosion test in Stage 2, the external condition of the flame arrester is to be examined for signs of serious damage and/or deformation that may affect the operation of the valve.
- (j) After completing the explosion tests, the valves are to be dismantled and the condition of all components ascertained and documented. In particular, any indication of valve sticking or uneven opening that may affect the operation of the valve is to be noted. Photographic records of the valve condition are to be taken and included in the report.

13.8 Design series qualification

13.8.1 The qualification of quenching devices to prevent the passage of flame can be evaluated for other similar devices of identical type where one device has been tested and found satisfactory.

13.8.2 The quenching ability of a flame arrester depends on the total mass of quenching lamellas/mesh. Provided the materials, thickness of materials, length of lamellas/thickness of mesh layer and the quenching gaps are the same, then the same quenching ability can be qualified for different size of flame arresters subject to (a) and (b) being satisfied.

$$(a) \quad \frac{n_1}{n_2} = \sqrt{\frac{S_1}{S_2}}$$

$$(b) \quad \frac{A_1}{A_2} = \frac{S_1}{S_2}$$

where

n_1 = total depth of flame arrester corresponding to the number of lamellas of size 1 quenching device for a valve with a relief area equal to S_1

n_2 = total depth of flame arrester corresponding to the number of lamellas of size 2 quenching device for a valve with a relief area equal to S_2

A_1 = free area of quenching device for a valve with a relief area equal to S_1

A_2 = free area of quenching device for a valve with a relief area equal to S_2 .

13.8.3 The qualification of explosion relief valves of larger sizes than that which has been previously satisfactorily tested in accordance with 13.6 and 13.7 can be evaluated where valves are of identical type and have identical features of construction subject to the following:

- (a) The free area of a larger valve does not exceed three times +5 per cent that of the valve that has been satisfactorily tested.
- (b) One valve of the largest size, subject to (a), requiring qualification is subject to satisfactory testing required by 13.5.3 and 13.6.4 except that a single valve will be accepted in 13.6.4(a) and the volume of the test vessel is not to be less than one third of the volume required by 13.3.1(m).
- (c) The assessment and records are to be in accordance with 13.7, noting that 13.7.1(f) will only be applicable to Stage 2 for a single valve.

13.8.4 The qualification of explosion relief valves of smaller sizes than that which has been previously satisfactorily tested in accordance with 13.6 and 13.7 can be evaluated where valves are of identical type and have identical features of construction subject to the following:

- (a) The free area of a smaller valve is not less than one third of that of the valve that has been satisfactorily tested.
- (b) One valve of the smallest size, subject to (a), requiring qualification is subject to satisfactory testing required by 13.5.3 and 13.6.4 except that a single valve will be accepted in 13.6.4(a) and the volume of the test vessel is not to be more than the volume required by 13.3.1(m).
- (c) The assessment and records are to be in accordance with 13.7, noting that 13.7.1(f) will only be applicable to Stage 2 for a single valve.

13.9 The report

13.9.1 The test house is to deliver a full report that includes the following information and documents:

- (a) Test specification.
- (b) Details of test pressure vessel and valves tested.
- (c) The orientation in which the valve was tested, (vertical or horizontal position).
- (d) Methane in air concentration for each test.
- (e) Ignition source.
- (f) Pressure curves for each test.
- (g) Video recordings of each valve test.
- (h) The assessment and records stated in 13.7.

13.10 Approval

13.10.1 The approval of an explosion relief valve is at the discretion of LR based on the appraisal of plans and particulars and the test facility's report of the results of type testing.

Section 14 Type testing procedure for crankcase oil mist detection and alarm equipment

14.1 Scope

14.1.1 To specify the tests required to demonstrate that crankcase oil mist detection and alarm equipment intended to be fitted to diesel engines satisfy LR requirements.

14.1.2 This test procedure is also applicable to oil mist detection and alarm arrangements intended for gear cases.

14.2 Purpose

14.2.1 The purpose of type testing crankcase oil mist detection and alarm equipment is seven fold:

- To verify the functionality of the system.
- To verify the effectiveness of the oil mist detectors.
- To verify the accuracy of oil mist detectors.
- To verify the alarm set points.
- To verify time delays between oil mist leaving the source and alarm activation.
- To verify functional failure detection.
- To verify the influence of optical obscuration on detection.

14.3 Test facilities

14.3.1 Test houses carrying out type testing of crankcase detection and alarm equipment are to satisfy the following criteria:

- A full range of facilities for carrying out the environmental and functionality tests required by this procedure shall be available and be acceptable to LR.
- The test house that verifies the functionality of the equipment is to be equipped so that it can control, measure and record oil mist concentration levels in terms of mg/l to an accuracy of ± 10 per cent in accordance with this procedure.

14.4 Equipment testing

14.4.1 The range of tests is to include the following for the alarm/monitoring panel:

- Functional tests described in 14.5.
- Electrical power supply failure test.
- Power supply variation test.
- Dry heat test.
- Damp heat test.
- Vibration test.
- EMC test.
- Insulation resistance test.
- High voltage test.
- Static and dynamic inclinations, if moving parts are contained.

14.4.2 The range of tests is to include the following for the detectors:

- Functional tests described in 14.5.
- Electrical power supply failure test.
- Power supply variation test.
- Dry heat test.
- Damp heat test.
- Vibration test.
- EMC test.
- Insulation resistance test.
- High voltage test.
- Static and dynamic inclinations.

14.5 Functional tests

14.5.1 All tests to verify the functionality of crankcase oil mist detection and alarm equipment are to be carried out in accordance with 14.5.2 to 14.5.6 with an oil mist concentration in air, known in terms of mg/l to an accuracy of ± 10 per cent.

14.5.2 The concentration of oil mist in the test chamber is to be measured in the top and bottom of the chamber and these concentrations are not to differ by more than 10 per cent. See 14.7.2(a).

14.5.3 The oil mist monitoring arrangements are to be capable of detecting oil mist in air concentrations of between 0 and 10 per cent of the lower explosive limit (LEL), which corresponds to an oil mist concentration of approximately 50 mg/l (13 per cent oil-air mixture) or between 0 and a percentage corresponding to a level not less than twice the maximum oil mist concentration alarm set point.

14.5.4 The alarm set point for oil mist concentration in air is to provide an alarm at a maximum setting corresponding to not more than 5 per cent of the LEL or approximately 2,5 mg/l.

14.5.5 Where alarm set points can be altered, the means of adjustment and indication of set points are to be verified against the equipment manufacturer's instructions.

14.5.6 Where oil mist is drawn into a detector via piping arrangements, the time delay between the sample leaving the crankcase and operation of the alarm is to be determined for the longest and shortest lengths of pipes recommended by the manufacturer. The pipe arrangements are to be in accordance with the manufacturer's instructions/recommendations.

14.5.7 Detector equipment that is in contact with the crankcase atmosphere and may be exposed to oil splash and spray from engine lubricating oil is to be tested to demonstrate that openings do not occlude or become blocked under continuous oil splash or spray conditions. Testing is to be in accordance with arrangements proposed by the manufacturer and agreed by LR.

Oil Engines

Part 5, Chapter 2

Section 14

14.5.8 Detector equipment may be exposed to water vapour from the crankcase atmosphere which may affect the sensitivity of the equipment, it is to be demonstrated that exposure to such conditions will not affect the functional operation of the detector equipment. Where exposure to water vapour and/or water condensation has been identified as a possible source of equipment malfunctioning, testing is to demonstrate that any mitigating arrangements such as heating are effective. Testing is to be in accordance with arrangements proposed by the manufacturer and agreed by LR. This testing is in addition to that required by 14.4.2(e) and is concerned with the effects of condensation caused by the detection equipment being at a lower temperature than the crankcase atmosphere.

14.6 Detectors and alarm equipment to be tested

14.6.1 The detectors and alarm equipment selected for the type testing are to be selected from the manufacturer's normal production line by the LR Surveyor witnessing the tests.

14.6.2 Two detectors are to be tested. One is to be tested in the clean condition and the other in a condition representing the maximum level of lens obscuration specified by the manufacturer.

14.7 Method

14.7.1 The requirements of 14.7 are to be satisfied at type testing.

14.7.2 Oil mist generation is to satisfy the following:

- (a) Oil mist is to be generated with suitable equipment using an SAE 80 monograde mineral oil or equivalent and supplied to a test chamber having a volume of not less than 1 m³. The oil mist produced is to have a maximum droplet size of 5 µm. The oil droplet size is to be checked using the sedimentation method.
- (b) The oil mist concentrations used are to be ascertained by the gravimetric deterministic method or equivalent. For this test, the gravimetric deterministic method is a process where the difference in weight of a 0,8 µm pore size membrane filter is ascertained from weighing the filter before and after drawing 1 litre of oil mist through the filter from the oil mist test chamber. The oil mist chamber is to be fitted with a recirculating fan.
- (c) Samples of oil mist are to be taken at regular intervals and the results plotted against the oil mist detector output. The oil mist detector is to be located adjacent to where the oil mist samples are drawn off.
- (d) The results of a gravimetric analysis are considered invalid and are to be rejected if the resultant calibration curve has an increasing gradient with respect to the oil mist detection reading. This situation occurs when insufficient time has been allowed for the oil mist to become homogeneous. Single results that are more than 10 per cent below the calibration curve are to be rejected. This situation occurs when the integrity of the filter unit has been compromised and not all of the oil is collected on the filter paper.

- (e) The filters require to be weighed to a precision of 0,1 mg and the volume of air/oil mist sampled to 10 ml.

14.7.3 The testing is to be witnessed by an LR Surveyor where type testing approval is required by LR.

14.7.4 Oil mist detection equipment is to be tested in the orientation (vertical, horizontal or inclined) in which it is intended to be installed on an engine or gear case as specified by the equipment manufacturer.

14.7.5 Type testing is to be carried out for each type of oil mist detection and alarm equipment for which a manufacturer seeks LR approval. Where sensitivity levels can be adjusted, testing is to be carried out at the extreme and mid-point level settings.

14.8 Assessment

14.8.1 Assessment of oil mist detection equipment devices after testing is to address the following:

- (a) The equipment to be tested is to have evidence of design appraisal/approval by LR, *See also* 14.6.1.
- (b) Details of the detection equipment to be tested are to be recorded, such as name of manufacturer, type designation, oil mist concentration assessment capability and alarm settings.
- (c) After completing the tests, the detection equipment is to be examined and the condition of all components ascertained and documented. Photographic records of the monitoring equipment condition are to be taken and included in the report.

14.9 Design series qualification

14.9.1 The approval of one type of detection equipment may be used to qualify other devices having identical construction details. Proposals are to be submitted for consideration.

14.10 The report

14.10.1 The test house is to provide a full report which includes the following information and documents:

- (a) Test specification.
- (b) Details of equipment tested.
- (c) Results of tests.

14.11 Acceptance

14.11.1 Acceptance of crankcase oil mist detection equipment is at the discretion of LR based on the appraisal of plans and particulars and the test house report of the results of type testing.

14.11.2 The following information is to be submitted to LR for acceptance of oil mist detection equipment and alarm arrangements:

- (a) Description of oil mist detection equipment and system including alarms.

- (b) Copy of the test house report identified in 14.10.
- (c) Schematic layout of engine oil mist detection arrangements showing location of detectors/sensors and piping arrangements and dimensions.
- (d) Maintenance and test manual which is to include the following information:
 - Intended use of equipment and its operation.
 - Functionality tests to demonstrate that the equipment is operational and that any faults can be identified and corrective actions notified.
 - Maintenance routines and spare parts recommendations.
 - Limit setting and instructions for safe limit levels.
 - Where necessary, details of configurations in which the equipment is and is not to be used.

Section 15

Electronically controlled engines

15.1 Scope

15.1.1 The requirements of this Section are applicable to engines for propulsion, auxiliary or emergency power purposes with software-based electronic control of fuel injection timing and duration, and which may also control air or exhaust systems. Other systems with software-based electronic control, such as starting air, control air and cylinder oil lubrication systems when essential to the operation of the engine, are to be included and all applicable requirements of this Section are to be applied.

15.1.2 These engines may be of the slow, medium or high-speed type. They generally have no direct camshaft driven fuel, air or exhaust systems, but have common rail fuel/hydraulic arrangements and may have hydraulic actuating systems for the functioning of the air or exhaust systems.

15.1.3 The operation of these engines relies on the effective monitoring of a number of parameters such as crank angle, engine speed, temperatures and pressures using one or more electronic control systems to provide the services essential for the operation of the engine such as fuel injection, air inlet, exhaust and speed control.

15.1.4 Deviation from Rule requirements are to be submitted and will be considered on the basis of technical justification by the Enginebuilder.

15.1.5 During the life of the engine any changes to hardware, software, control and monitoring systems which may affect the safety and reliable operation of the engine are to be submitted and approved by LR.

15.2 Plans and particulars

15.2.1 In addition to the plans and particulars required by Section 1 the following information is to be submitted:

- (a) A general overview of the operating principles, supported by schematics explaining the functionality of individual systems and sub-systems. The information is to relate to the engine capability and functionality under defined operating and emergency conditions such as recovery from a failure or malfunction, with particular reference to the functioning of electronic control systems and any sub-systems. The information is also to indicate if the engine has different modes of operation, such as to limit exhaust gas emissions and/or to run under an economic fuel consumption mode or any other mode that can be controlled by electronic control systems.
- (b) Details of hydraulic systems for actuation of sub-systems (fuel injection, air inlet or exhaust), to include details of the design/construction of pipes, pumps, valves, accumulators and the control of valves/pumps. Details of pump drive arrangements are also to be included.
- (c) Failure Modes and Effects Analysis (FMEA) of the mechanical, pressure containing and electrical systems and arrangements that support the operation of the engine. The analysis is to demonstrate that suitable risk mitigation has been achieved so that a system will tolerate a single failure in equipment or loss of an associated sub-system such that operation of the engine will not be lost or degraded beyond acceptable performance criteria of the engine. See 15.5.
- (d) A schedule of testing and trials to demonstrate that the engine is capable of operating as described in the design statement, and any testing required to verify the conclusions of the FMEA. The schedule is to include integration tests to verify that the response of the complete mechanical, hydraulic and electronic system is as predicted for all intended operational modes. The scope of these tests shall be agreed with LR for selected cases based on the FMEA required in (c).
- (e) Operating manuals which describe the particulars of each system and, together with maintenance instructions, include reference to the arrangements for making modifications and changes to electronic control systems and for the functioning of sub-systems.
- (f) Quality plan for sourcing, design, installation and testing of all components used in the oil fuel and hydraulic oil systems installed with the engine for engine operation.
- (g) Fatigue analysis for all high pressure oil fuel and hydraulic oil piping arrangements required for engine operation where failure of the pipe or its connection or a component would be the cause of engine unavailability. The analysis is to concentrate on high pressure components and sub-systems and recognise the pressures and fluctuating stresses that the pipe system may be subject to in normal service.
- (h) Schedule of testing at engine builders, pre-sea trial commissioning and sea trials. The test schedules are to identify all modes of engine operation and the sea trials are to include typical port manoeuvres under all intended engine operating modes.

Oil Engines

Part 5, Chapter 2

Section 15

- (j) Evidence of type testing of the engine with electronic controls, or a proposed test plan at the engine builders with the electronic controls functioning, to verify the functionality and behaviour under all operating and fault conditions of the electronic control system.

15.2.2 In addition to the plans and particulars required by Pt 6, Ch 1 the following information for control, alarm, monitoring and safety systems relating to the operation of an electronically controlled engine is to be submitted:

- (a) System requirements specification.
- (b) Description of operation with explanatory diagrams.
- (c) Line diagrams of control circuits.
- (d) List of monitored points.
- (e) List of control points.
- (f) List of alarm points.
- (g) List of safety functions and details of any overrides, including consequences of use.
- (h) Details of hardware configuration.
- (j) Hardware certification details.
- (k) Software quality plan.
- (l) System integration plan.
- (m) Failure Mode and Effects Analysis (FMEA). See Ch 2,1.1.4.
- (n) Factory acceptance, integration, harbour and sea trials/test schedules for hardware and software.
- (o) Software certification details.
- (p) Quality plan for sourcing, design installation and testing of all components used in the control, alarm, monitoring and safety systems installed with the engine for engine operation.

15.3 Oil fuel and hydraulic oil systems

15.3.1 Oil fuel and hydraulic oil piping systems arrangements are to comply with Chapters 2, 11, 12, 13 and 14 as applicable.

15.3.2 Where pumps are essential for engine operation, not less than two oil fuel and two hydraulic oil pressure pumps are to be provided for their respective service and arranged such that failure of one pump does not render the other inoperative. Each oil fuel pump and hydraulic oil pump is to be capable of supplying the quantity of oil for engine operation at its maximum continuous rating and arranged ready for immediate use.

15.3.3 The oil fuel pressure piping between the oil fuel high pressure pumps and the fuel injectors is to be protected with a jacketed piping system capable of containing oil fuel leakage from a high pressure pipe failure.

15.3.4 The hydraulic oil pressure piping between the high pressure hydraulic pumps and hydraulic actuators is to be protected with a jacketed piping system capable of containing hydraulic oil leakage from a high pressure pipe failure.

15.3.5 Accumulators and associated high pressure piping are to be designed, manufactured and tested in accordance with a standard applicable to the maximum pressure and temperature rating of the system.

15.3.6 All valves, cocks and screwed connections are to be of a type-tested type applicable to the maximum service conditions anticipated in normal service.

15.3.7 Isolating valves and cocks are to be located as near as practicable to the equipment to be isolated. All valves forming part of the oil fuel and hydraulic oil installation are to be capable of being controlled from readily accessible positions above the working platform.

15.3.8 High pressure oil fuel and high pressure hydraulic oil piping systems are to be provided with high pressure alarms with set points that do not exceed the system design pressures.

15.3.9 High pressure oil fuel and high pressure hydraulic piping systems are to be provided with suitable relief valves on any part of the system that can be isolated and in which pressure can be generated. The settings of the relief valves are not to exceed the design pressures. The valves are to be of adequate size and so arranged as to avoid an undue rise in pressure above the design pressures.

15.3.10 Equipment fitted for monitoring pressures and temperatures in the high pressure oil fuel and high pressure hydraulic oil systems is to comply with a Recognised Standard suitable to the anticipated vibration and temperature conditions.

15.3.11 A fatigue analysis is to be carried out in accordance with a standard applicable to the system under consideration and all anticipated pressure, pulsation and vibration loads are to be addressed. The analysis is to demonstrate that the design and arrangements are such that the likelihood of failure is as low as reasonably practicable. The analysis is to identify all assumptions made and standards to be applied during manufacture and testing of the system. Any potential weak points which may develop due to incorrect construction or assembly are also to be identified.

15.3.12 For high pressure oil containing and mechanical power transmission systems, the quality plan for sourcing, design, installation and testing of components is to address the following issues:

- (a) Design and manufacturing standard(s) applied.
- (b) Materials used for construction of key components and their sources.
- (c) Details of the quality control system applied during manufacture and testing.
- (d) Details of type approval, type testing or approved type status assigned to the machinery or equipment.
- (e) Details of installation and testing recommendations for the machinery or equipment.

15.4 Electronic control systems

15.4.1 Plans and details of electronic control systems are to comply with Pt 6, Ch 1 and Ch 2 as applicable.

15.4.2 For electronic control systems and electrical actuating systems, the quality plan for sourcing, design, installation and testing of components is to address the following issues:

- (a) Standard(s) applied.
- (b) Details of the quality control system applied during manufacture and testing.
- (c) Details of type approval, type testing or approved type status assigned to the equipment.
- (d) Details of installation and testing recommendations for the equipment.
- (e) Details of any local and/or remote diagnostic arrangements where assessment and alteration of control parameters can be made which can affect the operation of the engine.
- (f) Details of arrangements for software upgrades.

15.4.3 The system integration plan is required to identify the process for verification of the functional outputs from the electronic control systems with particular reference to system integrity, consistency, security against unauthorised changes to software and maintaining the outputs within acceptable tolerances for safe and reliable operation of the engine within stated performance criteria.

15.5 FMEA analysis

15.5.1 A Failure Mode and Effects Analysis (FMEA) is to demonstrate that a failure of the functioning of an electronic control system:

- (a) Will not result in the loss of the ability to provide the services essential for the operation of the engine, see Pt 6, Ch 1,2.5.8 and 2.12.2;
- (b) will not affect the normal operation of the services essential for the operation of the engine other than those services dependent upon the failed part, see Pt 6, Ch 1,2.13.4 and 2.13.5; and
- (c) will not leave either the engine, or any equipment or machinery associated with the engine, or the ship in an unsafe condition, see Pt 6, Ch 1,2.3.12, 2.4.6, 2.5.4, 2.10.3, 2.13.5.

15.5.2 Where FMEA analysis is required to be carried out the reports submitted are to address the following issues:

- (a) Identify the standards used for analysis and system design.
- (b) Identify the objectives of the analysis.
- (c) Identify any assumptions made in the analysis.
- (d) Identify the equipment, system or sub-system, mode of operation and the equipment.
- (e) Identify potential failure modes and their causes.
- (f) Evaluate the local effects (e.g. fuel injection failure) and the effects on the system as a whole (e.g. loss of propulsion power) of each failure mode.
- (g) Identify measures for reducing the risks associated with each failure mode. This may be through system design, provision of redundant systems and/or quality control procedures for sourcing, manufacture and testing.
- (h) Identify trials and testing necessary to prove conclusions.

15.5.3 At sub-system level it is acceptable to consider failure of equipment items and their functions, e.g. failure of a pump to produce flow or pressure head. It is not required that the failure of components within that pump be analysed, and failure need only be dealt with as a cause of failure of the pump.

15.5.4 In an electronically controlled engine it is necessary to define the essential services on which the operation of the engine relies and the control functions, alarm functions and safety functions for the equipment and machinery providing these services. Examples of essential services are:

- (a) Starting arrangements.
- (b) Fuel supply arrangements.
- (c) Lubricating oil arrangements.
- (d) Hydraulic oil arrangements.
- (e) Cooling arrangements.
- (f) Power supply arrangements.

Section 16 Alarms and safeguards for emergency diesel engines

16.1 Application

16.1.1 These requirements apply to emergency diesel engines required to be immediately available in an emergency and capable of being controlled remotely or automatically.

16.2 Plans and information

16.2.1 Plans, information and test schedules to be submitted for design appraisal are to be in accordance with Pt 6, Ch 1.

16.3 Alarms and safeguards

16.3.1 Alarm and safety systems are to comply with the requirements of Pt 6, Ch 1.

16.3.2 Alarms and safeguards are to be fitted in accordance with Table 2.16.1.

16.3.3 The safety and alarm systems are to be designed to 'fail safe'. The characteristics of the 'fail safe' operation are to be evaluated on the basis not only of the system and its associated machinery, but also the complete installation, as well as the ship.

16.3.4 Regardless of the engine output, if shutdowns additional to those specified in Table 2.16.1 are provided except for the overspeed shutdown, they are to be automatically overridden when the engine is in automatic or remote control mode during navigation.

16.3.5 Grouped alarms of at least those items listed in Table 2.14.1 are to be arranged on the bridge.

Oil Engines

Part 5, Chapter 2

Sections 16, 17 & 18

Table 2.16.1 Alarms and safeguards for emergency diesel engines

Item	Alarm	Alarm	Note
Emergency Diesel Engine	≥ 220 kW	<220 kW	
Fuel oil leakage from pressure pipes	Leakage	Leakage	See 7.1.2
Lubricating oil temperature	High	—	—
Lubricating oil pressure	Low	Low	—
Oil mist concentration in crankcase	High	—	See Note
Coolant pressure or flow	Low	—	—
Coolant Temperature (can be air)	High	High	—
Overspeed	High	—	Automatic shutdown

NOTE

For engines having a power of more than 2250 kW or a cylinder bore of more than 300 mm.

16.3.6 In addition to the fuel oil control from outside the space, a local means of engine shutdown is to be provided.

16.3.7 Local indications of at least those items listed in Table 2.14.1 are to be provided within the same space as the diesel engines and are to remain operational in the event of failure of the alarm and safety systems.

Section 17 General requirements

17.1 Turning gear

17.1.1 Turning gear is to be provided for all engines to facilitate operating and maintenance regimes as required by the manufacturer.

17.1.2 The turning gear for all main propulsion engines is to be power-driven and, if electric, is to be continuously rated at a value to ensure protection to the weakest part of the machinery.

17.1.3 The turning gear for auxiliary engines may be hand operated (manual) except where this is not practicable, in which case the provision of 17.1.2 is to be complied with.

17.1.4 The turning gear for all engines is to be fitted with safety interlocks which prevent engine operation when engaged, see Ch 1,3.10. Indication of engaged/not engaged is to be provided at all start positions.

17.1.5 The remote control device of power-driven turning gear is to be so designed that power is removed from the turning gear when the operating switch is released.

17.1.6 Means are to be provided to secure the turning gear when disengaged.

17.1.7 Overload protection arrangements are to be provided to prevent damage to the electric motor and the turning gear train.

Section 18 Program for trials of diesel engines to assess operational capability

18.1 Works trials (acceptance test)

18.1.1 Diesel engines which are to be subjected to trials on the test bed at the manufacturer's works and under attendance by the Surveyor(s) are to be tested in accordance with the scope of works trials specified in 18.1.2 to 18.1.10. The scope of the trials is to be agreed between the LR Surveyor and the manufacturer prior to testing. At the discretion of the Surveyor, the scope of the trials may be extended depending on the engine application.

18.1.2 For electronically controlled engines integration tests are required, see 15.2.1(d).

18.1.3 For all stages of the works trials the pertaining operation values are to be measured and recorded by the engine manufacturer. All results are to be compiled in an acceptance protocol to be issued by the engine manufacturer.

18.1.4 In each case given in Table 2.18.1, all measurements conducted at the various load points shall be carried out at steady operating conditions. The readings for 100 per cent power (rated power at rated speed) are to be taken twice at an interval of at least 30 minutes.

18.1.5 The data to be measured and recorded, when testing the engine at various load points, are to include all necessary parameters for the engine operation. The crankshaft deflection is to be checked when this check is required by the manufacturer during the operating life of the engine. Crankshaft deflection measurements are to be taken before (cold condition) and after (hot condition) works acceptance trials.

18.1.6 Checks of components to be presented for inspection after the works trials are left to the discretion of the Surveyor.

18.1.7 The Surveyor may require that after the trials the fuel delivery system is restricted so as to limit the engines to run at not more than 100 per cent power. The setting of the restriction is to be made as applicable to the intended fuel. Any restriction settings, and other changes to the engine's fuel injection equipment required for operation on special fuels, are to be recorded and included by the engine manufacturer.

Oil Engines

Part 5, Chapter 2

Section 18

Table 2.18.1 Scope of works trials for diesel engines

Main engines driving propellers and waterjets		
Trial condition	Duration	Note
100% power (rated power) at rated engine speed, R	≥ 60 minutes	After having reached steady conditions
110% power at engine speed corresponding to $1,032 \cdot R$	30–45 minutes	After having reached steady conditions (1)
90% (or maximum continuous power), 75%, 50% and 25%	—	Powers in accordance with the nominal propeller curve
Starting and reversing manoeuvres	—	—
Testing of governor and independent overspeed protective device	—	See 5.2
Shut down device	—	See 5.4
Engines driving generators		
Trial condition	Duration	Note
100% power (rated power) at rated engine speed, R	≥ 50 minutes	After having reached steady conditions (2)
110% power	15 minutes	After having reached steady conditions (2) (3)
75%, 50% and 25% power and idle run	—	(2)
Start-up tests	—	—
Testing of governor and independent overspeed protective device	—	See 5.3
Shut-down device	—	See 5.4
NOTES 1. After running on the test bed, the fuel delivery system of main engines is normally to be so adjusted that overload power cannot be given in service. 2. The test is to be performed at rated speed with a constant governor setting. 3. After running on the test bed, the fuel delivery system of diesel engines driving generators must be adjusted such that overload (110%) power can be given in service after installation on board, so that the governing characteristics including the activation of generator protective devices can be fulfilled at all times.		

18.1.8 For the duration of the acceptance test, no interventions or adjustments will be made to the machinery under test.

18.1.9 The testing of exhaust gas emissions is to comply with MARPOL as applicable.

18.1.10 For all stages that the engine is to be tested and where no duration is specified in Table 2.18.1, the load point is to be maintained for a sufficient period to allow pertaining values to be measured and recorded when the engine has achieved a steady operating condition.

18.2 Shipboard trials

18.2.1 After the conclusion of the running-in programme prescribed by the engine manufacturer, engines are to undergo shipboard trials as specified in Table 2.18.2. The scope of the trials is to be agreed between the LR Surveyor and the Shipyard prior to testing.

18.2.2 Engines driving generators or important auxiliaries are to be subjected to an operational test for at least 4 hours. During the test, the set concerned is required to operate at its rated power for an extended period. It is to be demonstrated that the engine is capable of supplying 100 per cent of its rated power, and in the case of shipboard generating sets account shall be taken of the times needed to actuate the generator's overload protection system.

18.2.3 In addition to 18.2.2, for engines driving generators for electric propulsion motors as well as auxiliaries, an operational test is to be carried out of at least 4 hours duration at a load which corresponds to 100 per cent of the electric propulsion motor(s) rated power. The astern/ahead manoeuvring capability of the propulsion system is to be demonstrated.

18.2.4 The suitability of an engine to burn residual or other special fuels is to be demonstrated, if the machinery installation is arranged to burn such fuels in service. See also Pt 6, Ch 1,7.2.1.

Oil Engines

Part 5, Chapter 2

Section 18

Table 2.18.2 Scope of shipboard trials for diesel engines

Main engines driving fixed-pitch propellers (1) (2)		
Trial condition	Duration	Note
At rated engine speed, R	≥ 4 hours	—
At engine speed corresponding to normal continuous power	≥ 2 hours	—
At engine speed corresponding to $1,032 \cdot R$	30 minutes	Where the engine adjustment permits, see 18.1.7
At minimum on-load speed	—	—
Starting and reversing manoeuvres	—	See Section 8
In reverse direction of propeller rotation during the dock or sea trials at a minimum engine speed of $0,7 \cdot R$	10 minutes	—
Monitoring, alarms and safety systems	—	—
Where imposed, test to ensure engine can pass safely through barred speed range	—	—
Single main engines solely driving generators for propulsion		
Trial condition	Duration	Note
100% power (rated propulsion power) see 18.2.3	≥ 4 hours	(3) (4)
At normal continuous propulsion power	≥ 2 hours	(3) (4)
110% power (rated propulsion power)	30 minutes	—
In reverse direction of propeller rotation at a minimum speed of 70% of the nominal propeller speed	10 minutes	(3) (4)
Starting manoeuvres	—	—
Monitoring, alarm and safety systems	—	—
NOTES 1. For main propulsion engines driving controllable pitch propellers, waterjets or reversing gears, the tests for main engines driving fixed-pitch propellers apply as appropriate. 2. Controllable pitch propellers are to be tested with various propeller pitches. 3. The tests are to be performed at rated speed with a constant governor setting. 4. Tests are to be based on the rated electrical powers of the electric propulsion motors.		

18.2.5 At the discretion of the attending Surveyor, the scope of the trials may be expanded in consideration of special operating conditions, such as towing, trawling, etc.

■ Cross-references

The pumping arrangements, including cooling water and lubricating oil systems, are to comply with the requirements of Chapter 14.

For spare gear, see Chapter 16.

Steam Turbines

Part 5, Chapter 3

Sections 1, 2 & 3

Section

- 1 **Plans and particulars**
- 2 **Materials**
- 3 **Design and construction**
- 4 **Safety arrangements**
- 5 **Emergency arrangements**
- 6 **Tests and equipment**

■ Scope

The requirements of this Chapter are applicable to steam turbines for main propulsion and also, where powers exceed 110 kW (150 shp), to those for essential auxiliary services.

■ Section 1 Plans and particulars

1.1 Plans

1.1.1 The following plans are to be submitted for consideration, together with particulars of materials, maximum shaft powers and revolutions per minute, see Ch 1,3.3. The pressures and temperatures applicable at maximum shaft power and under the emergency conditions of 5.2 are to be stated or indicated on the plans.

- General arrangement.
- Sectional assembly.
- Rotors and couplings.
- Casings.

1.1.2 For the emergency conditions of 5.3, full particulars of the means proposed for emergency propulsion are to be submitted.

1.1.3 Where rotors and castings are of welded construction, details of the welded joints are also to be submitted for consideration.

1.1.4 In general, plans for auxiliary turbines need not be submitted.

■ Section 2 Materials

2.1 General

2.1.1 In the selection of materials, consideration is to be given to their creep strength, corrosion resistance and scaling properties at working temperatures to ensure satisfactory performance and long life under service conditions.

2.1.2 Grey cast iron is not to be used for temperatures exceeding 260°C.

2.2 Materials for forgings

2.2.1 Turbine rotors and discs are to be of forged steel. For carbon and carbon-manganese steel forgings, the specified minimum tensile strength is to be selected within the limits of 400 and 600 N/mm² (41 and 61 kgf/mm²). For alloy steel rotor forgings, the specified minimum tensile strength is to be selected within the limits of 500 and 800 N/mm² (51 and 82 kgf/mm²). For discs and other alloy steel forgings, the specified minimum tensile strength is to be selected within the limits of 500 and 1000 N/mm² (51 and 102 kgf/mm²).

2.2.2 For alloy steels, details of the proposed chemical composition, heat treatment and mechanical properties are to be submitted for approval.

2.2.3 When it is proposed to use material of higher tensile strength, full details are to be submitted for approval.

■ Section 3 Design and construction

3.1 General

3.1.1 In the design and arrangement of turbine machinery, adequate provision is to be made for the relative thermal expansion of the various turbine parts, and special attention is to be given to minimising casing and rotor distortion under all operating conditions.

3.1.2 Turbine bearings are to be so disposed and supported that lubrication is not adversely affected by heat flow from adjacent hot parts of the turbine. Effective means are to be provided for intercepting oil leakage and preventing oil from reaching high temperature glands and casings and steam pipes. Drainage openings and drain pipes from oil baffle pockets are to be sufficiently large to prevent excessive accumulation and leakage of oil.

Steam Turbines

Part 5, Chapter 3

Section 3

3.2 Welded components

3.2.1 Turbine rotors, cylinders and associated components fabricated by means of welding will be considered for acceptance if constructed by firms whose works are properly equipped to undertake welding to equivalent standards, for rotors and cylinders respectively, to those required by the Rules for Class 1 and Class 2/1 welded pressure vessels, see Ch 17, Sections 1 to 7.

3.2.2 Welding is to be carried out in accordance with the requirements of Ch 13.4 of the *Rules for Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials) using welding procedures and welders that have been qualified in accordance with Chapter 12 of the Rules for Materials.

3.2.3 Before work is commenced, manufacturers are to submit for consideration details of proposed welding procedures and their proposals for routine examination of joints by non-destructive means.

3.2.4 Materials used in the construction of turbine rotors, cylinders, diaphragms, condensers, etc., are to be of welding quality.

3.2.5 Where it is proposed to construct rotors from two or more forged components joined by welding, full details of the chemical composition, mechanical properties and heat treatment of the materials, together with particulars of the welding consumables, an outline of the welding procedure, method of fabrication and heat treatment, are to be submitted for consideration.

3.2.6 Joints in rotors and major joints in cylinders are to be designed as full-strength welds and for complete fusion of the joint.

3.2.7 Adequate preheating is to be employed for mild steel cylinders and components and where the metal thickness exceeds 44 mm, and for all low alloy steel cylinders and components and for any part where necessitated by joint restraint.

3.2.8 Stress relief heat treatment is to be applied to all cylinders and associated components on completion of the welding of all joints and attached structures. For details of stress relief procedure, temperature and duration, see Ch 13.4.11 of the Rules for Materials.

3.2.9 For all welded components, weld procedure tests are to be in accordance with Ch 12.2.7 of the Rules for Materials.

3.2.10 Production weld tests are to be performed according to the requirements of Ch 13.4.5 of the Rules for Materials.

3.3 Stress raisers

3.3.1 Smooth fillets are to be provided at abrupt changes of section of rotors, spindles, discs, blade roots and tenons. The rivet holes in blade shrouds are to be rounded and radiused on top and bottom surfaces, and tenons are to be radiused at their junction with blade tips. Balancing holes in discs are to be well rounded and polished.

3.3.2 Surveyors are to be satisfied as to the workmanship and riveting of blades to shroud bands, and that the blade tenons are free from cracks, particularly with high tensile blade material. Test samples are to be sectioned and examined, and pull-off tests made if considered necessary by the Surveyors.

3.4 Shrunk-on rotor discs

3.4.1 Main turbine rotor discs fitted by shrinking are to be secured with keys, dowels or other approved means.

3.5 Vibration

3.5.1 Care is to be taken in the design and manufacture of turbine rotors, rotor discs and blades to ensure freedom from undue vibration within the operating speed range. Consideration of blade vibration should include the effect of centrifugal force, blade root fixing, metal temperature and disc flexibility where appropriate.

3.5.2 For the vibration and alignment of main propulsion systems formed by the turbines geared to the line shafting, see Chapter 8.

3.6 External influences

3.6.1 Pipes and ducts connected to turbine casings are to be so designed that no excessive thrust loads or moments are applied by them to the turbines. Gratings and any fittings in way of sliding feet or flexible-plate supports are to be so arranged that casing expansion is not restricted. Where main turbine seatings incorporate a tank structure, consideration is to be given to the temperature variation of the tank in service to ensure that turbine alignment will not be adversely affected.

3.7 Steam supply and water system

3.7.1 In the arrangement of the gland sealing system, the pipes are to be made self-draining and every precaution is to be taken against the possibility of condensed steam entering the glands and turbines. The steam supply to the gland sealing system is to be fitted with an effective drain trap. In the air ejector re-circulating water system, the connection to the condenser is to be so located that water cannot impinge on the L.P. rotor or casing.

Steam Turbines

Part 5, Chapter 3

Sections 3, 4 & 5

3.8 Turning gear

3.8.1 Turning gear is to be provided for all turbines to facilitate operating and maintenance regimes as required by the manufacturer.

3.8.2 The turning gear for all propulsion turbines is to be power-driven and, if electric, is to be continuously rated.

3.8.3 The turning gear for auxiliary turbines may be hand operated (manual) except where this is not practicable, in which case the provision of 3.8.2 is to be complied with.

3.8.4 The turning gear for all turbines is to be fitted with safety interlocks which prevent steam valve actuation for turbine operation when engaged see Ch 1,3.9. Indication of engaged/not engaged is to be provided at all start positions.

3.8.5 The remote control device of power-driven turning gear is to be so designed that power is removed from the turning gear when the operating switch is released.

3.8.6 Means are to be provided to secure the turning gear when disengaged.

4.3 Low vacuum and overpressure protective devices

4.3.1 In order to provide a warning, due to excessive pressure, to personnel in the vicinity of the exhaust ends of main turbines, sentinel relief valves are to be provided at the exhaust ends or other approved positions. The relief valve discharge outlets are to be visible and suitably guarded if necessary. Where a low vacuum cut-out device is provided, the sentinel relief valve at the L.P. exhaust may be omitted.

4.3.2 In order to provide a warning, due to excessive pressure, to personnel in the vicinity of the exhaust ends of auxiliary turbines, sentinel relief valves are to be provided at the exhaust ends. The relief valve discharge outlets are to be visible and suitably guarded if necessary. Low vacuum or overpressure cut-out devices, as appropriate, are also to be provided for auxiliary turbines not installed with their own condensers.

4.4 Bled steam connections

4.4.1 Non-return or other means, which will prevent steam and water returning to the turbines, are to be fitted in bled steam connections.

4.5 Steam strainers

4.5.1 Efficient steam strainers are to be provided close to the inlets to ahead and astern high pressure turbines, or alternatively at the inlets to the manoeuvring valves.

■ Section 4 Safety arrangements

4.1 Overspeed protective devices

4.1.1 An overspeed protective device is to be provided for main and auxiliary turbines to shut-off the steam automatically and prevent the maximum designed speed being exceeded by more than 15 per cent.

4.1.2 Where two or more turbines of a compound main turbine installation are separately coupled to the same main gear wheel, and one overspeed protective device is provided, this is to be fitted to the L.P. ahead turbine. Hand trip gear for shutting off the steam in an emergency is to be provided at the manoeuvring platform.

4.2 Speed governors

4.2.1 Where a turbine installation incorporates a reverse gear, electric transmission or reversible propeller, a speed governor in addition to, or in combination with, the overspeed protective device is to be fitted, and is to be capable of controlling the speed of the unloaded turbine without bringing the overspeed protective device into action.

4.2.2 Auxiliary turbines intended for driving electric generators are to be fitted with speed governors which, with fixed setting, are to control the speed within 10 per cent momentary variation and 5 per cent permanent variation when full load is suddenly taken off or put on. The permanent speed variations of alternating current machines intended for parallel operations are to equalise within a tolerance of $\pm 0,5$ per cent.

■ Section 5 Emergency arrangements

5.1 Lubricating oil failure

5.1.1 Arrangements are to be made for the steam to the ahead propulsion turbines to be automatically shut-off in the event of failure of the lubricating oil pressure; however, steam is to be made available at the astern turbine for braking purposes in such an emergency, see Chapter 14 for emergency oil supply.

5.1.2 Auxiliary turbine arrangements are to be such that steam supply is automatically shut-off in the event of failure of the lubricating oil pressure.

Steam Turbines

Part 5, Chapter 3

Sections 5 & 6

5.2 Single screw ships

5.2.1 In single screw ships fitted with cross compound steam turbine installations in which two or more turbines are separately coupled to the same main gear wheel, the arrangements are to be such as to enable safe navigation when the steam supply is led direct to the L.P. turbine and either the H.P. or L.P. turbine can exhaust direct to the condenser. Adequate arrangements and controls are to be provided for these emergency operating conditions so that the pressure and temperature of the steam will not exceed those which the turbines and condenser can safely withstand.

5.2.2 The necessary pipes and valves or fittings for these arrangements are to be readily available and properly marked. A fit up test of all combinations of pipes and valves is to be performed prior to the first sea trials.

5.2.3 The permissible power/speeds of the operating turbines(s) when operating without one of the turbines (all combinations) is to be specified and information provided on board.

5.2.4 The operation of the turbines under emergency conditions is to be assessed for the potential influence on shaft alignment and gear teeth loading conditions.

5.3 Single main boiler

5.3.1 Ships intended for unrestricted service, fitted with steam turbines and having a single main boiler, are to be provided with means to ensure emergency propulsion in the event of failure of the main boiler.

Section 6 Tests and equipment

6.1 Stability testing of turbine rotors

6.1.1 All solid forged H.P. turbine rotors intended for main propulsion service where the inlet steam temperature exceeds 400°C are to be subjected to at least one thermal stability test. This requirement is also applicable to rotors constructed from two or more forged components joined by welding. The test may be carried out at the forge or turbine builders' works:

- (a) after heat treatment and rough machining of the forging; or
- (b) after final machining; or
- (c) after final machining and blading of the rotor.

The stabilising test temperature is to be not less than 28°C above the maximum steam temperature to which the rotor will be exposed, and not more than the tempering temperature of the rotor material. For details of a recommended test procedure and limits of acceptance, see the Rules for Materials. Other test procedures may be adopted if approved.

6.1.2 Where main turbine rotors are subjected to thermal stability tests at both forge and turbine builders' works, the foregoing requirements are applicable to both tests. It is not required that auxiliary turbine rotors be tested for thermal stability, but, if such tests are carried out, the requirement for main turbine rotors will be generally applicable.

6.2 Balancing

6.2.1 All rotors as finished-bladed and complete with half-coupling are to be dynamically balanced to the Surveyor's satisfaction, in a machine of sensitivity appropriate to the size of rotor.

6.3 Hydraulic tests

6.3.1 Manoeuvring valves are to be tested to twice the working pressure. The nozzle boxes of impulse turbines are to be tested to 1,5 times the working pressure.

6.3.2 The cylinders of all turbines are to be tested to 1,5 times the working pressure in the casing, or to 2,0 bar (2,0 kgf/cm²), whichever is the greater.

6.3.3 For test purposes, the cylinders may be subdivided with temporary diaphragms for distribution of test pressures.

6.3.4 Condensers are to be tested in the steam space to 1,0 bar (1,0 kgf/cm²). The water space is to be tested to the maximum pressure which the pump can develop at ship's full draught with the discharge valve closed plus 0,7 bar (0,7 kgf/cm²), with a minimum test pressure of 2,0 bar (2,0 kgf/cm²). Where the operating conditions are not known, the test pressure is to be not less than 3,4 bar (3,5 kgf/cm²), see Chapter 14.

6.4 Indicators for movement

6.4.1 Indicators for determining the axial position of rotors relative to their casings, and for showing the longitudinal expansion of casings at the sliding feet, if fitted, are to be provided for main turbines. The latter indicators should be fitted at both sides and be readily visible.

6.5 Wear-down gauges

6.5.1 Main and auxiliary turbines are to be provided with bridge wear-down gauges for testing the alignment of the rotors.

■ *Cross-references*

The pumping arrangements, including cooling water and lubricating oil systems, are to comply with the requirements of Chapters 13 and 14.

For lists of spare gear to be carried, see Chapter 16.

Gas Turbines

Part 5, Chapter 4

Sections 1 & 2

Section

- 1 **General requirements**
- 2 **Particulars to be submitted**
- 3 **Materials**
- 4 **Design and construction**
- 5 **Piping systems**
- 6 **Starting arrangements**
- 7 **Tests**
- 8 **Control, alarm and safety systems**
- 9 **Planned maintenance and condition monitoring procedures, and 'upkeep by exchange'**

■ Scope

The requirements of this Chapter are applicable to gas turbines for main propulsion and also, where powers exceed 110 kW (150 shp), to those for essential auxiliary services. The requirements do not apply to exhaust gas turbo-blowers.

Approval will be in respect of the mechanical integrity of the gas turbine (including gas generator and power turbine), intake and exhaust ducting configuration, acoustic enclosure configuration (where appropriate), fuel, lubricating oil and starter systems, control alarm and monitoring systems and other critical support systems.

Type approval of the gas turbine bare engine will be required as part of the approval process for first of type.

■ Section 1 General requirements

1.1 Application

1.1.1 This Chapter is to be read in conjunction with Chapter 1 *General Requirements for the Design and Construction of Machinery*, Pt 6, Ch 1 *Control Engineering Systems*, and Pt 6, Ch 2 *Electrical Engineering*.

1.2 Standard reference conditions

1.2.1 Where power, efficiency, heat rate or specific consumption refer to standard conditions (ISO 2314), such conditions are to be:

- (a) for the intake air at the compressor flange (compressor intake flare):
 - a total pressure of 101,3 kPa;
 - an ambient temperature of 15°C;
 - a relative humidity of 60 per cent; and

- (b) for the exhaust at the turbine exhaust flange (or recuperator outlet):
 - a static pressure of 101,3 kPa.

1.3 Power ratings

1.3.1 Where the dimensions of any particular component are determined from shaft power, P , in kW, and revolutions per minute, R , the values are those defined in Chapter 1.

1.4 Gas turbine type approval

1.4.1 New gas turbine types or developments of existing types are to be type approved in accordance with Lloyd's Register's (hereinafter referred to as 'LR') *Type Approval System Procedure – Test Specification GT04*.

1.4.2 Where a gas turbine type has subsequently proved satisfactory in service with a number of applications, a maximum power uprating of 10 per cent may be considered without a further complete design re-assessment and type test.

1.5 Inclination of vessel

1.5.1 Gas turbines are to operate satisfactorily under the conditions of inclinations as shown in Table 1.3.2 in Chapter 1.

■ Section 2 Particulars to be submitted

2.1 Plans and information

2.1.1 The following plans are to be submitted for consideration:

- Casings.
- Combustion chambers, intercoolers and heat exchangers.
- Compressor and gas generator rotating components.
- Control engineering systems, see Pt 6, Ch 1.
- Cooling and sealing air arrangements for compressor and gas generator components: Schematic only.
- Cooling water system: Schematic only, where applicable.
- Fuel systems: Schematic only.
- Gas turbine unit acoustic enclosure, if applicable, including ventilation and drainage systems: Schematic only.
- Inlet and exhaust ducting arrangement.
- Lubricating oil systems: Schematic only.
- Nozzles, blades and blade attachments.
- Oil fuel systems: Schematic only.
- Power turbine components.
- Rotors, bearings and couplings.
- Sectional assembly.
- Securing arrangement, including details of resilient mounts, where applicable.
- Starting system: Schematic only.

Gas Turbines

Part 5, Chapter 4

Sections 2, 3 & 4

2.1.2 The following information and calculations, where applicable, are to be submitted:

- (a) Operational requirements:
 - Proposed field of application and operational limitations.
 - Power/speed operational envelope.
 - Calculations and information for short-term high power operation.
 - Operation and maintenance manuals including the declared lives of critical components and overhaul schedules recommended by the manufacturer.
- (b) Calculations of the critical speeds of blade and rotor vibration, giving full details of the basic assumptions, see also 4.3.1.
- (c) Analysis of the effect of rotor blade release together with details of operating experience, see also 4.3.2.
- (d) High temperature characteristics of the materials, including (at working temperatures) the associated creep rate and rupture strength for the designed service life, fatigue strength, corrosion resistance and scaling properties.
- (e) Material requirements:
 - Particulars of heat treatment, including stress relief.
 - Material specifications covering the listed components together with details of any surface treatments, non-destructive testing and hydraulic tests.
- (f) The most onerous pressures and temperatures to which each component may be subjected are to be indicated on plans or provided as part of the design specification.
- (g) Calculations of the steady state stresses, including the effect of stress raisers, etc., in the compressor and turbine rotors and blading at the maximum speed and temperature in service. Such calculations are to indicate the designed service life and be accompanied, where possible, by test results substantiating the limiting criteria.
- (h) Details of calculations and tests to establish the service life of other stressed or safety critical components, including bearings, seals, couplings and gearing. Calculations and tests are to take account of all relevant environmental factors including the particular type of service and fuel intended to be used.
- (j) Mounting requirements:
 - Securing arrangements, including details of resilient mounts.
 - Calculations concerning the amplitude and frequency of vibration associated with resilient type mountings.
- (k) A Failure Mode and Effects Analysis (FMEA).
- (l) Miscellaneous:
 - Design standard of intake filtration for water particulate and corrosive marine salts.
 - Details of compressor washing system.
 - Fuel specification.

2.1.3 Components fabricated by means of welding will be considered for acceptance if constructed by firms whose works are properly equipped to undertake welding of the standards appropriate to the components. Details are to be submitted for consideration.

2.1.4 Before work is commenced, manufacturers are to submit for consideration details of proposed welding procedures and their proposals for routine examination of joints by non-destructive means.

2.1.5 The manufacturer's proposals for testing the gas turbine are to be submitted for consideration and are to include rotor balancing techniques, methods of determining the soundness of pressure casings and heat exchanger tests, see Section 1.

Section 3 Materials

3.1 Materials for forgings

3.1.1 Details of materials for rotors and discs are to be submitted for approval.

3.2 Material tests and inspection

3.2.1 Components are to be tested in accordance with the relevant requirements of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

3.2.2 For components of novel design, special consideration will be given to the material test and non-destructive testing requirements.

Section 4 Design and construction

4.1 General

4.1.1 All parts of compressors, turbines, etc., are to have clearances and fits consistent with adequate provision for the relative thermal expansion of the various components. Provision is to be made to limit the distortion of the casing and rotor under all normal operating conditions.

4.1.2 Gas generator and power turbine bearings are to be so disposed and supported that lubrication is not adversely affected by heat flow from adjacent hot parts. Effective means are to be provided for intercepting oil leakage and preventing oil from reaching high temperature glands and casings.

Gas Turbines

Part 5, Chapter 4

Section 4

4.2 Vibration

4.2.1 The design and manufacture of compressor and turbine rotors, rotor discs and rotor blades are to ensure freedom from undue vibration within the full operating speed range. Where critical speeds are found by calculation to occur within the operating speed range, vibration tests may be required in order to verify the calculations, see *also* Chapter 8.

4.2.2 Vibration monitoring is to form an integral part of the gas turbine safety and control system. The vibration monitoring system is to be capable of detecting the out-of-balance of major parts with means being provided to shutdown the gas turbine, before an over-critical situation occurs, i.e. multiple rotor blade or disc release.

4.3 Containment

4.3.1 Gas turbines and power turbines are to be designed and installed, so far as is practicable, to contain debris in the event of rotor blade release.

4.3.2 In the event of a major component failure, when the turbine casing may not contain the debris; oil fuel, lubricating oil and other potentially hazardous systems or equipment are, where practicable, to be located outside of the plane of high speed rotating parts. This requirement also applies to fire detection and extinction equipment, see *also* Section 5.

4.3.3 Gas turbine ancillaries containing flammable products are to be segregated or protected from high temperature areas.

4.4 Intake and exhaust ducts

4.4.1 Air intakes are to be designed and located to minimise the possibility of ingestion of harmful objects. Means are also to be provided for detecting and preventing icing up of air intakes.

4.4.2 Suitable intake filtration is to be provided to control the ingestion of water, particulate and corrosive marine salts within the gas turbine manufacturer's specified limits.

4.4.3 Where an air intake enclosure forms the connection between the ship's dwtake and the gas turbine installation, a suitable alarm function is to be provided to give warning when an unacceptable air intake pressure loss is reached at the air inlet (bellmouth) of the gas turbine.

4.4.4 Intakes are to be designed such that material cannot become detached due to air flow or corrosion. Fixing bolts and fastenings are to be positively locked so that they cannot work loose.

4.4.5 Multi-engine installations are to have separate intakes and exhausts so arranged as to prevent induced circulation through a stopped gas turbine unit.

4.4.6 The arrangement of the exhaust duct is to be such as to prevent, under normal conditions of ship motion and atmospheric conditions, exhaust gases being drawn into machinery spaces, air conditioning systems and intakes.

4.4.7 Where the exhaust is led overboard near the waterline, means are to be provided to prevent water from being siphoned back into the gas turbine. Where the exhaust is cooled by water spray, the exhaust pipes are to be self-draining overboard. Erosion/corrosion-resistant shut-off flaps or other devices are to be fitted on the hull side shell or pipe end with suitable arrangements made to prevent water flooding the machinery space.

4.5 External influences

4.5.1 Pipes and ducting connected to casings are to be so designed that they apply no excessive loads or moments to the compressors and turbines.

4.5.2 Platform gratings and fittings in way of the supports are to be so arranged that casing expansion is not restricted.

4.5.3 Where the gas turbine seating incorporates a tank structure, any temperature variation of the tank in service is not to adversely affect the gas generator and power turbine alignment.

4.5.4 For machinery fastening arrangements, including resilient mounting, see Chapter 1.

4.6 Corrosive deposits

4.6.1 Means are to be provided for periodic removal of salt deposits and atmospheric contaminants from blading and internal surfaces.

4.7 Acoustic enclosures

4.7.1 Acoustic enclosures, where fitted, are to be provided with an access door, adequate internal lighting and one or more observation windows to allow the viewing of critical parts of the gas turbine.

4.7.2 A suitable ventilation system, designed to maintain all components within their safe working temperature under all operating conditions is to be provided.

4.7.3 The ventilation system is to be fitted with shut-off flaps arranged to close automatically upon activation of the enclosure's fire detection and extinguishing system.

4.7.4 Acoustic enclosure fire safety arrangements are to comply with the requirements of Pt 6, Ch 1 and the *International Convention for the Safety of Life at Sea, 1974*, as amended (SOLAS 74), see *also* 8.7.1.

Gas Turbines

Part 5, Chapter 4

Sections 4 & 5

4.8 Thermal insulation

4.8.1 Where surfaces of the gas generator, power turbine and exhaust volute exceed a temperature of 220°C during operation, these are to be suitably insulated and clad to minimise the risk of fire and prevent damage by heat to adjacent components, see 5.1.5.

4.9 Welded construction

4.9.1 Welding is to be carried out in accordance with the requirements of Chapter 13 of the Rules for Materials, using welding procedures and welders that have been qualified in accordance with Chapter 12 of the Rules for Materials.

4.9.2 Stress relief heat treatment is to be applied to all cylinders, rotors and associated components on completion of all welding, see Chapter 17.

4.10 Turning gear

4.10.1 Gas generator turning gear is to be provided to facilitate operating and maintenance regimes as required by the manufacturer.

4.10.2 The turning gear may be hand operated (manual) except where this is not practicable. If electrically driven, the motor is to be continuously rated.

4.10.3 The turning gear is to be fitted with safety interlocks which prevent engine operation when engaged, see Ch 1.3.9. Indication of engaged/not engaged is to be provided at all start positions.

4.10.4 The remote control device of power-driven turning gear is to be so designed that power is removed from the turning gear when the operating switch is released.

4.10.5 If permanently attached, means are to be provided to secure the turning gear when disengaged.

5.1.3 Corrosion resistant materials are to be used in all fuel pipes between the treatment and combustion systems.

5.1.4 Suitable fuel treatment systems, including filtration and centrifuging, are to be provided to control the level of water and particulate contamination within the engine manufacturer's specified limits.

5.1.5 The gas turbine design and construction are to minimise the possibility of a fire fed by fuel or lubricating oil leaks.

5.1.6 In dual-fuel applications, provision is to be made for automatic isolation of both primary and standby fuel supplies to the engine in the event of a fire.

5.2 Oil fuel systems

5.2.1 Oil fuel arrangements are to comply with the requirements of Chapter 14.

5.2.2 All external high pressure oil fuel delivery lines between the pressure fuel pumps and fuel metering valves are to be protected with a jacketed piping system capable of containing fuel from a high pressure line failure to prevent oil fuel or oil fuel mist from reaching a source of ignition on the engine or its surroundings.

5.2.3 Suitable arrangements are to be made for draining any oil fuel leakage from the protection required by 5.2.2 and to prevent contamination of the lubricating oil by oil fuel. An alarm is to be provided to indicate that leakage is taking place.

5.2.4 At least two filters are to be fitted in the oil fuel supply lines to the gas turbine and be so arranged that any filter may be cleaned without interrupting the supply of filtered oil fuel to the gas turbine.

5.3 Lubricating oil systems

5.3.1 Lubricating oil arrangements are to comply with the requirements of Chapter 14.

5.3.2 Where the lubricating oil for gas turbines is circulated under pressure, provision is to be made for the efficient filtration of the oil. At least two filters are to be fitted in the lubricating oil supply lines to the gas turbine and be so arranged that any filter may be cleaned without interrupting the supply of filtered lubricating oil to the gas turbine.

5.4 Cooling systems

5.4.1 Cooling water arrangements are to comply with the requirements of Chapter 14, where appropriate.

Section 5 Piping systems

5.1 General

5.1.1 Gas turbine piping systems are, in general, to comply with the requirements given in Chapter 12 and Chapter 14, due regard being paid to the particular type of installation. For the burning of compressed natural gas, see the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases*.

5.1.2 The materials and/or their surface treatment used for the storage and distribution of oil fuel are to be selected such that they do not introduce contamination or modify the properties of the fuel.

Gas Turbines

Part 5, Chapter 4

Sections 6, 7 & 8

■ Section 6 Starting arrangements

6.1 General

6.1.1 Equipment for initial starting of gas turbines is to be provided and arranged such that the necessary initial charge of starting air, hydraulic or electrical power can be developed on board the ship without external aid. If, for this purpose, an emergency air compressor or electric generator is required, these units are to be power-driven by manually-started oil engines, except in the case of small installations where a hand-operated compressor of approved capacity may be accepted.

6.1.2 Alternatively, other devices of approved type may be accepted as a means of providing the initial start.

6.1.3 Where the integrity of the starting system is susceptible to overspeed conditions, appropriate alarm and/or trip functions are to be provided, see also Pt 6, Ch 1.

6.2 Purging before ignition

6.2.1 Means are to be provided to clear all parts of the gas turbine of the accumulation of oil fuel or for purging gaseous fuel before ignition commences on starting, or recommences after failure to start. The purge is to be of sufficient duration to displace at least three times the volume of the exhaust system.

6.3 Air starting

6.3.1 Where the gas turbine is arranged for air starting, the total air receiver capacity is to be sufficient to provide, without replenishment, not less than six consecutive starts. At least two air receivers of approximately equal capacity are to be provided to satisfy the plant air start requirements. For scantlings and fittings of air receivers, see Chapter 11.

6.3.2 For multi-engine installations, three consecutive starts per engine are required.

6.4 Electric starting

6.4.1 Where the gas turbine is fitted with electric starters powered from batteries, two batteries are to be fitted. Each battery is to be capable of starting the gas turbine and the combined capacity is to be sufficient without recharging to provide the number of starts required by 6.3.1 or 6.3.2.

6.4.2 The requirements for battery installations are given in Pt 6, Ch 2.

6.5 Hydraulic starting

6.5.1 Where the gas turbine is arranged for hydraulic starting, the capacity of the power pack is to be sufficient to provide the number of starts of the gas turbine as required by 6.3.1 or 6.3.2.

■ Section 7 Tests

7.1 Dynamic balancing

7.1.1 All compressor and turbine rotors as finished-bladed and complete with all relevant parts such as half-couplings, are to be dynamically balanced in accordance with the manufacturer's specification in a machine of sensitivity appropriate to the size of rotor.

7.2 Hydraulic testing

7.2.1 Where design permits, casings are to be tested to a hydraulic pressure equal to 1,5 times the highest pressure in the casing during normal operation, or 1,5 times the pressure during starting, whichever is the higher. For test purposes, if necessary, the casings may be subdivided with temporary diaphragms for distribution of test pressure. Where the operating temperature exceeds 300°C the test pressure is to be suitably corrected.

7.2.2 Where hydraulic testing is impracticable, 100 per cent non-destructive tests by ultrasonic or radiographic methods are to be carried out on all casing parts with satisfactory results. Where ultrasonic tests have been carried out, the manufacturer is to provide documentary evidence that ultrasonic examination has been carried out by an approved operator and that there were no indications of defects which could be expected to have a prejudicial effect on the operational performance of the gas turbine.

7.2.3 The shell and tube arrangement of intercoolers and heat exchangers are to be tested to 1,5 times their maximum working pressure.

7.3 Overspeed tests

7.3.1 Before installation, it is to be satisfactorily demonstrated that the gas turbine is capable of safe operation for five minutes at 5 per cent above the nominal setting of the overspeed protective device, or 15 per cent above the maximum design speed, whichever is the higher.

7.3.2 Where it is impracticable to overspeed the complete installation, each compressor and turbine rotor completely bladed and with all relevant parts such as half-couplings, are to be overspeed-tested individually at the appropriate speed.

■ Section 8 Control, alarm and safety systems

8.1 General

8.1.1 Control alarm and safety systems are to comply with the requirements of Pt 6, Ch 1.

8.2 Overspeed protection and shutdown system

8.2.1 The gas turbine is to be protected against over-speed by the provision of a suitable device(s) capable of shutting-down the gas turbine safely before a dangerous overspeed condition occurs.

8.3 Power turbine inlet over-temperature control

8.3.1 The power turbine is to be protected against over-temperature by the provision of a suitable device(s) capable of controlling the temperature within acceptable limits or shutting-down the gas turbine safely to prevent damage.

8.4 Flameout

8.4.1 Indication is to be provided for identifying poor combustion from each combustion chamber, flame-out and failure to ignite conditions, see *also* 6.2.1.

8.5 Lubricating oil system

8.5.1 Means are to be provided to accurately determine the pressure and temperature of the lubricating oil supply to the various parts of the gas generator and power turbine, and scavenge oil and return systems to ensure safe operation.

8.5.2 Means are to be provided to ensure that the temperature of the lubrication oil supply is automatically controlled to maintain steady-state conditions throughout the normal operating range of the gas turbine.

8.5.3 Where the oil supply to the power turbine is fed from a separate supply system, similar arrangements to those detailed above are to be provided.

8.6 Hand trip arrangement

8.6.1 Means are to be provided, at both the local and remote control/operating positions, to manually initiate the shut-down of the gas turbine in an emergency.

8.7 Fire detection, alarm and extinguishing systems

8.7.1 The gas turbine installation is to be provided with a fire detection, alarm and extinguishing system. The requirements of Pt 6, Ch 1 and the *International Convention for the Safety of Life at Sea, 1974* as amended (SOLAS 74) are to be complied with.

Section 9

Planned maintenance and condition monitoring procedures, and 'upkeep by exchange'

9.1 Planned maintenance approach

9.1.1 Suitable gas turbine installation Planned Maintenance and Condition Monitoring Schemes (MPMS, MCM) will be accepted as part of LR's Continuous Survey Machinery (CSM) cycle provided the principles defined in 9.2 to 9.4 are satisfied, see *also* Chapter 21.

9.2 Preventive maintenance

9.2.1 Preventive maintenance requires items to be opened out for inspection and overhaul at specified time periods or after a specified number of running hours.

9.2.2 Maintenance is normally carried out irrespective of the condition of the gas turbine in order to retain it in a satisfactory operational condition.

9.3 Unscheduled maintenance

9.3.1 The planned maintenance scheme is to be capable of dealing effectively with breakdown or corrective maintenance, i.e. unscheduled maintenance.

9.4 Condition monitoring

9.4.1 Condition monitoring requires the use of instrumentation to make regular or continuous measurements of certain parameters, in order to indicate the physical state of the gas turbine, without disturbing its normal operation.

9.4.2 The data collected is to be used to determine the actual condition of the gas turbine at any given time or, based on the trend characteristics of the condition, used for predicting the remaining useful life before complete deterioration or loss of performance terminates its ability to carry out its required function.

9.5 Condition monitoring techniques

9.5.1 The condition monitoring techniques, to support the trend away from preventive maintenance, listed in Table 4.9.1 are considered the minimum acceptable to obviate the need for a fully opened out inspection of engine components at Periodical Survey.

9.5.2 Alternative arrangements to those in Table 4.9.1, which provide an equivalent level of confidence in the condition of the gas turbine installation, will be considered.

Table 4.9.1 Condition monitoring techniques

Method	Requirement
Visual inspection	Periodic inspection of intakes and exhaust ducts, inlet guide vanes, compressor 1st stage, compressor and gas generator casings and auxiliary components and systems. The running clearances and dimensional changes, where practicable
Visual inspection by borescope/endoscope	Periodic inspection of compressor stators, guide vanes and blades, combustion chambers, turbine nozzles and blades and power turbine
Vibration monitoring	Continuous monitoring and trend analysis of gas generator and power turbine rotor vibration. The equipment used for vibration measurement should be capable of determining vibration throughout the operating range of the gas turbine
Lubrication, oil trend analysis programme	<ul style="list-style-type: none"> • Periodic inspection of magnetic particle detectors (manual records and/or automatic recording via debris counters in oil scavenge lines) • Periodic inspection of oil filters • Periodic sampling and laboratory analysis of lubricant quality
Fuel quality	<ul style="list-style-type: none"> • Maintenance of fuel bunker/marine gas oil analysis records • Periodic sampling and laboratory analysis of fuel quality
Performance monitoring	Continuous monitoring and trend analysis of critical gas turbine operating parameters including: <ul style="list-style-type: none"> • Compressor conditions (inlet and exit temperature, delivery pressure and speed) • Power turbine (inlet entry temperature and speed) • Engine breather temperature • Low cycle fatigue counter See Note.
NOTE Manual recording and trend analysis methods may also be acceptable.	

9.6 Upkeep by exchange

9.6.1 Where the gas turbine is maintained using an 'upkeep by exchange' policy, details of the system are to be submitted to LR for approval.

9.6.2 Where an 'upkeep by exchange' system has been approved, details of units that can be changed independently of each other are not required to be submitted provided there have been no changes since the original approval. The manufacture and testing of the replacement units are to be in accordance with relevant Rule requirements.

9.6.3 Records of each 'upkeep by exchange' are to be kept on board the ship and LR Surveyors are to witness running tests on load after each exchange. A record history is to be maintained for each exchange unit in the engine logbook.

■ Scope

The requirements of this Chapter, except where otherwise stated are applicable to oil engine gearing for main propulsion purposes and for oil engine gearing for driving auxiliary machinery which is essential for the safety of the ship or for safety of persons on board where the transmitted powers exceed 220 kW (300 shp) for propulsion drives, and 110 kW (150 shp) for auxiliary drives. In any mesh, the terms pinion and wheel refer to the smaller and larger gear respectively. For turbine gearing the loading factors K_A , K_{Fa} , $K_{F\beta}$, K_{Ha} , $K_{H\beta}$ and K_γ will be specially considered. Bevel gears will be specially considered on the basis of a conversion to equivalent helical gears. For torsional vibration requirements, see Ch 8,2.3.

■ Section 1 Plans and particulars

1.1 Gearing plans

1.1.1 Particulars of the gearing are to be submitted with the plans for all propulsion gears and for auxiliary gears where the transmitted power exceeds 110 kW (150 shp), as follows:

- Shaft power and revolution for each pinion.
- Number of teeth in each gear.
- Reference diameters.
- Helix angles at reference diameters.
- Normal pitches of teeth at reference diameters.
- Tip diameters.
- Root diameters.
- Face widths and gaps, where applicable.
- Pressure angles of teeth (normal or transverse) at reference diameters.
- Accuracy grade Q in accordance with ISO 1328 or an equivalent Standard.
- Surface texture of tooth flanks and roots.
- Minimum backlash.
- Centre distance.
- Basic rack tooth form.
- Protuberance and final machining allowance.
- Details of post hobbing processes, if any.
- Details of tooth flank corrections, if adopted.
- Case depth for surface-hardened teeth.
- Shrinkage allowance for shrunk-on rims and hubs.
- Type of coupling proposed for oil engine applications.

1.2 Material specifications

1.2.1 Specifications for materials of pinions, pinion sleeves, wheel rims, gear wheels, and quill shafts, giving chemical composition, heat treatment and mechanical properties, are to be submitted for approval with the plans of gearing.

1.2.2 Where the teeth of a pinion or gear wheel are to be surface hardened, i.e. carburised, nitrided, tufftrided or induction-hardened, the proposed specification and details of the procedure are to be submitted for approval.

■ Section 2 Materials

2.1 Material properties

2.1.1 In the selection of materials for pinions and wheels, consideration is to be given to their compatibility in operation. Except in the case of low reduction ratios, for gears of through-hardened steels, provision is also to be made for a hardness differential between pinion teeth and wheel teeth. For this purpose, the specified minimum tensile strength of the wheel rim material is not to be more than 85 per cent of that of the pinion.

2.1.2 Subject to 2.1.1, the specified minimum tensile strength is to be selected within the following limits:

Pinion and pinion sleeves	550 to 1050 N/mm ² (56 to 107 kgf/mm ²)
Gear wheels and rims	400 to 850 N/mm ² (41 to 87 kgf/mm ²)

A tensile strength range is also to be specified and is not to exceed 120 N/mm² (12 kgf/mm²) when the specified minimum tensile strength is 600 N/mm² (61 kgf/mm²) or less. For higher strength steels, the range is not to exceed 150 N/mm² (15 kgf/mm²).

2.1.3 Unless otherwise agreed, the full specified minimum tensile strength of the core is to be 800 N/mm² (82 kgf/mm²) for induction-hardened or nitrided gearing and 750 N/mm² (76 kgf/mm²) for carburised gearing.

2.1.4 For nitrided gearing, the full depth of the hardened zone is to be not less than 0,5 mm and the hardness is to be not less than 500 HV for a depth of 0,25 mm.

2.2 Non-destructive tests

2.2.1 An ultrasonic examination is to be carried out on all gear blanks where the finished diameter of the surfaces, where teeth will be cut, is in excess of 200 mm.

2.2.2 Magnetic particle or liquid penetrant examination is to be carried out on all surface-hardened teeth. This examination may also be requested on the finished machined teeth of through-hardened gears.

Section 3 Design

3.1 Symbols

3.1.1 For the purposes of this Chapter the following symbols apply:

- a = centre distance, in mm
- b = face width, in mm
- d = reference diameter, in mm
- d_a = tip diameter, in mm
- d_{an} = virtual tip diameter, in mm
- d_b = base diameter, in mm
- d_{bn} = virtual base diameter, in mm
- d_{en} = virtual diameter to the highest point of single tooth pair contact, in mm
- d_f = root diameter, in mm
- d_{fn} = virtual root diameter, in mm
- d_n = virtual reference diameter, in mm
- d_s = shrink diameter, in mm
- d_w = pitch circle diameter, in mm
- f_{ma} = tooth flank misalignment due to manufacturing errors, in μm
- f_{pb} = maximum base pitch deviation of wheel, in μm
- f_{Sh} = tooth flank misalignment due to wheel and pinion deflections, in μm
- f_{Sho} = intermediary factor for the determination of f_{Sh}
- g_α = length of line of action for external gears, in mm:

$$= 0,5\sqrt{(d_{a1}^2 - d_{b1}^2)} + 0,5\sqrt{(d_{a2}^2 - d_{b2}^2)} - a \sin \alpha_{tw}$$
 for internal gears:

$$= 0,5\sqrt{(d_{a1}^2 - d_{b1}^2)} - 0,5\sqrt{(d_{a2}^2 - d_{b2}^2)} + a \sin \alpha_{tw}$$
- h = total depth of tooth, in mm
- h_{ao} = basic rack addendum of tool, in mm
- h_F = bending moment arm for root stress, in mm
- m_n = normal module, in mm
- n = rev/min of pinion
- q = machining allowances, in mm
- q_s = notch parameter
- q' = intermediary factor for the determination of C_γ
- u = gear ratio = $\frac{\text{Number of teeth in wheel}}{\text{Number of teeth in pinion}} \geq 1$
- v = linear speed at pitch circle, in m/s
- x = addendum modification coefficient
- y_α = running in allowance, in μm
- y_β = running in allowance, in μm
- z = number of teeth
- z_n = virtual number of teeth

$$= \frac{z}{\cos^2 \beta_b \cos \beta}$$
- C_γ = tooth mesh stiffness (mean total mesh stiffness per unit face width), in N/mm μm
- F_t = nominal tangential tooth load, in N

$$= \frac{P}{nd} 19,098 \times 10^6$$
- F_β = total tooth alignment deviation (maximum value specified), in μm
- $F_{\beta x}$ = actual longitudinal tooth flank deviation before running in, in μm
- $F_{\beta y}$ = actual longitudinal tooth flank deviation after running in, in μm

- HV = Vickers hardness number
- K_A = application factor
- K_{Fa} = transverse load distribution factor
- $K_{F\beta}$ = longitudinal load distribution factor
- K_{Ha} = transverse load distribution factor
- $K_{H\beta}$ = longitudinal load distribution factor
- K_v = dynamic factor
- K_{va} = dynamic factor for spur gears
- $K_{v\beta}$ = dynamic factor for helical gears
- K_y = load sharing factor
- P = transmitted power, in kW
- P_r = radial pressure at shrinkage surface, in N/mm²
- P_{ro} = protuberance of tool, in mm
- Q = accuracy grade from ISO 1328 – 1975
- R_a = surface roughness – arithmetical mean deviation (C.L.A.) as determined by an instrument having a minimum wavelength cut-off of 0,8 mm and for a sampling length of 2,5 mm, in μm
- S_{pr} = residual undercut left by protuberance in mm
- S_{Fmin} = minimum factor of safety for bending stress
- S_{Fn} = tooth root chord in the critical section, in mm
- S_{Hmin} = minimum factor of safety for Hertzian contact stress
- Y_D = design factor
- Y_F = tooth form factor
- Y_{RrelT} = relative surface finish factor
- Y_S = stress concentration factor
- Y_{ST} = stress correction factor
- Y_x = size factor
- Y_β = helix angle factor
- $Y_{\delta relT}$ = relative notch sensitivity factor
- Z_E = material elasticity factor
- Z_H = zone factor
- Z_R = surface finish factor
- Z_V = velocity factor
- Z_X = size factor
- Z_β = helix angle factor
- Z_ϵ = contact ratio factor
- α_{en} = pressure angle at the highest point of single tooth contact, in degrees
- α_n = normal pressure angle at reference diameter, in degrees
- α_t = transverse pressure angle at reference diameter, in degrees
- α_{tw} = transverse pressure angle at pitch circle diameter, in degrees
- α_{Fen} = angle for application of load at the highest point of single tooth contact, in degrees
- β = helix angle at reference diameter, in degrees
- β_b = helix angle at base diameter, in degrees
- γ = intermediary factor for the determination of f_{Sh}
- ϵ_α = transverse contact ratio

$$= \frac{g_\alpha \cos \beta}{\pi m_n \cos \alpha_t}$$
- ϵ_{an} = virtual transverse contact ratio
- ϵ_β = overlap ratio

$$= \frac{b \sin \beta}{\pi m_n}$$
- ϵ_γ = total contact ratio
- ρ_{ao} = tip radius of tool, in mm
- ρ_c = relative radius of curvature at pitch point, in mm

$$= \frac{a \sin \alpha_{tw} u}{\cos \beta_b (1 + u)^2}$$

Gearing

Part 5, Chapter 5

Section 3

- ρ_F = tooth root fillet radius at the contact of the 30° tangent, in mm
 σ_Y = yield or 0,2 per cent proof stress, in N/mm²
 σ_B = ultimate tensile strength, in N/mm²
 σ_F = bending stress at tooth root, in N/mm²
 $\sigma_{F\text{lim}}$ = endurance limit for bending stress in N/mm²
 σ_{FP} = allowable bending stress at the tooth root, in N/mm²
 σ_H = Hertzian contact stress at the pitch circle, in N/mm²
 $\sigma_{H\text{lim}}$ = endurance limit for Hertzian contact stress, in N/mm²
 σ_{HP} = allowable Hertzian contact stress, in N/mm²
 Subscript:
 1 = pinion
 2 = wheel
 0 = tool.

3.2 Tooth form

3.2.1 The tooth profile in the transverse section is to be of involute shape, and the roots of the teeth are to be formed with smooth fillets of radii not less than 0,25 m_n .

3.2.2 All sharp edges left on the tips and ends of pinion and wheel teeth after hobbing and finishing are to be removed.

3.3 Tooth loading factors

3.3.1 For values of application factor, K_A see Table 5.3.1.

Table 5.3.1 Values of K_A

Main and auxiliary gears	K_A
Main propulsion oil engine reduction gears:	
Hydraulic coupling or equivalent on input	1,10
High elastic coupling on input	1,30
Other coupling	1,50
Auxiliary gears:	
Electric and diesel engine drives with hydraulic coupling or equivalent on input	1,00
Diesel engine drives with high elastic coupling on input	1,20
Diesel engine drives with other couplings	1,40

3.3.2 Load sharing factor, K_γ . The value for K_γ is to be taken as 1,15 for multi-engine drives or split torque arrangements. Otherwise K_γ is to be taken as 1,0. Alternatively, where measured data exists, a derived value will be considered.

3.3.3 Dynamic factor, K_V :

- For helical gears with $\varepsilon_\beta \geq 1$:
 $K_V = 1 + Q^2 v_{Z1} 10^{-5} = K_{V\beta}$
 For helical gears with $\varepsilon_\beta < 1$:
 $K_V = K_{V\alpha} - \varepsilon_\beta (K_{V\alpha} - K_{V\beta})$
 For spur gears:
 $K_V = 1 + 1,8 Q^2 v_{Z1} 10^{-5} = K_{V\alpha}$

where $\frac{v_{Z1}}{100} > 14$ for heli gears, and

where $\frac{v_{Z1}}{100} > 10$ for spur gears the value of K_V will be specially considered.

3.3.4 Longitudinal load distribution factors, $K_{H\beta}$ and $K_{F\beta}$:

$$K_{H\beta} = 1 + \frac{b F_{\beta y} C_\gamma}{2 F_t K_A K_\gamma K_V}$$

Calculated values of $K_{H\beta} > 2$ are to be reduced by improved accuracy and helix correction as necessary:

where

- $F_{\beta y} = F_{\beta x} - y_\beta$ and
 $F_{\beta x} = 1,33 f_{Sh} + f_{ma}$
 $f_{ma} = \frac{2}{3} F_\beta$ at the design stage, or
 $f_{ma} = \frac{1}{3} F_\beta$ where helix correction has been applied

$$f_{Sh} = f_{Sho} \frac{F_t K_A K_\gamma K_V}{b} \text{ where}$$

- $f_{Sho} = 23\gamma 10^{-3} \mu\text{m mm/N}$ for gears without helix correction and without end relief, or
 $= 16\gamma 10^{-3} \mu\text{m mm/N}$ for gears without helix correction but with end relief, where

$$\gamma = \left(\frac{b}{d_1} \right)^2 \text{ for single helical and spur gears}$$

$$= 3 \left(\frac{b}{2d_1} \right)^2 \text{ for double helical gears}$$

The following minimum values are applicable, these also being the values where helix correction has been applied:

- $f_{Sho} = 10 \times 10^{-3} \mu\text{m mm/N}$ for helical gears, or
 $= 5 \times 10^{-3} \mu\text{m mm/N}$ for spur gears

For through-hardened steels and surface hardened steels running on through-hardened steels:

$$y_\beta = \frac{320}{\sigma_{H\text{lim}}} F_{\beta x} \text{ when}$$

$$y_\beta \leq \frac{12800}{\sigma_{H\text{lim}}} \mu\text{m, and}$$

For surface hardened steels, when

$$y_\beta = 0,15 F_{\beta x}$$

$$y_\beta \leq 6 \mu\text{m}$$

$$K_{F\beta} = K_{H\beta}^n$$

where

$$n = \frac{\left(\frac{b}{h} \right)^2}{1 + \frac{b}{h} + \left(\frac{b}{h} \right)^2}$$

NOTES

- $\frac{b}{h}$ is to be taken as the smaller of $\frac{b_1}{h_1}$ or $\frac{b_2}{h_2}$
- For double helical gears $\frac{b}{2}$ is to be substituted for b in the equation for n .

Gearing

Part 5, Chapter 5

Section 3

3.3.5 Transverse load distribution factors, $K_{H\alpha}$ and $K_{F\alpha}$

$$K_{H\alpha} = K_{F\alpha} \geq 1,00$$

where

$$\varepsilon_\gamma \leq 2$$

$$K_{H\alpha} = \frac{\varepsilon_\gamma}{2} \left\{ 0,9 + \frac{0,4C_\gamma (f_{pb} - y_\alpha) b}{F_t K_A K_\gamma K_V K_{H\beta}} \right\}$$

where

$$\varepsilon_\gamma > 2$$

$$K_{H\alpha} = 0,9 + 0,4 \sqrt{\frac{2(\varepsilon_\gamma - 1)}{\varepsilon_\gamma}} \left\{ \frac{C_\gamma (f_{pb} - y_\alpha) b}{F_t K_A K_\gamma K_V K_{H\beta}} \right\}, \text{ but}$$

$$K_{H\alpha} \leq \frac{\varepsilon_\gamma}{\varepsilon_\alpha Z_\varepsilon^2} \text{ and}$$

$$K_{F\alpha} \leq \frac{\varepsilon_\gamma}{0,25\varepsilon_\gamma + 0,75}$$

When tip relief is applied f_{pb} is to be half of the maximum specified value:

$$y_\alpha = \frac{160}{\sigma_{H \text{ lim}}} f_{pb} \text{ for through-hardened steels, when}$$

$$y_\alpha \leq \frac{6400}{\sigma_{H \text{ lim}}} \mu\text{m and}$$

$$y_\alpha = 0,075f_{pb} \text{ for surface hardened steels, when}$$

$$y_\alpha \leq 3 \mu\text{m}$$

When pinion and wheel are manufactured from different materials:

$$y_\alpha = \frac{y_{\alpha 1} + y_{\alpha 2}}{2}$$

3.3.6 Tooth mesh stiffness, C_γ :

$$C_\gamma = \frac{0,8}{q'} \cos \beta (0,75\varepsilon_\alpha + 0,25) \text{ N/mm } \mu\text{m}$$

where

$$q' = 0,04723 + \frac{0,1551}{z_{n1}} + \frac{0,25791}{z_{n2}} - 0,00635x_1 - \frac{0,11654x_1}{z_{n1}} - 0,00193x_2 - \frac{0,24188x_2}{z_{n2}} + 0,00529x_1^2 + 0,00182x_2^2$$

For internal gears $z_{n2} = \infty$

Other calculation methods for C_γ will be specially considered.

3.4 Tooth loading for surface stress

3.4.1 The Hertzian contact stress, σ_H , at the pitch circle is not to exceed the allowable Hertzian contact stress, σ_{HP} .

$$\sigma_H = Z_H Z_E Z_\varepsilon Z_\beta \sqrt{\frac{F_t(u+1)}{d_1 b u}} K_A K_\gamma K_V K_{H\beta} K_{H\alpha} \text{ and}$$

$$\sigma_{HP} = \frac{\sigma_{H \text{ lim}} Z_R Z_V Z_X}{S_{H \text{ min}}} \text{ for the pinion/wheel combination}$$

where

$$Z_H = \sqrt{\frac{2 \cos \beta_b \cos \alpha_{tw}}{\cos^2 \alpha_t \sin \alpha_{tw}}}$$

$$Z_E = 189,8 \text{ for steel}$$

$$Z_\varepsilon = \sqrt{\frac{4 - \varepsilon_\alpha}{3} (1 - \varepsilon_\beta) + \frac{\varepsilon_\beta}{\varepsilon_\alpha}} \text{ for } \varepsilon_\beta < 1 \text{ and}$$

$$Z_\varepsilon = \sqrt{\frac{1}{\varepsilon_\alpha}} \text{ for } \varepsilon_\beta \geq 1$$

$$Z_\beta = \sqrt{\cos \beta}$$

$$Z_R = \left(\frac{1}{R_a} \right)^{0,11} \text{ but } Z_R \leq 1,14$$

Where R_a is the surface roughness value of the tooth flanks. When pinion and wheel tooth flanks differ then the larger value of R_a is to be taken.

$$Z_V = 0,88 + 0,23 \left(0,8 + \frac{32}{v} \right)^{-0,5}$$

For values of Z_X , see Table 5.3.2

$\sigma_{H \text{ lim}}$, see Table 5.3.3

$S_{H \text{ lim}}$, see Table 5.3.4.

Table 5.3.2 Values of Z_X

Pinion heat treatment		Z_X
Carburised and induction-hardened	$m_n \leq 10$	1,00
	$10 < m_n < 30$	$1,05 - 0,005m_n$
	$30 \leq m_n$	0,9
Nitrided	$m_n < 7,5$	1,00
	$7,5 < m_n < 30$	$1,08 - 0,011m_n$
	$30 \leq m_n$	0,75
Through-hardened	All modules	1,00

Table 5.3.3 Values of endurance limit for Hertzian contact stress, $\sigma_{H \text{ lim}}$

Heat treatment		$\sigma_{H \text{ lim}} \text{ N/mm}^2$
Pinion	Wheel	
Through-hardened	Through-hardened	$0,46\sigma_{B2} + 255$
Surface-hardened	Through-hardened	$0,42\sigma_{B2} + 415$
Carburised, nitrided or induction-hardened	Soft bath nitrided (Tufftrided)	1000
Carburised, nitrided or induction-hardened	Induction-hardened	$0,88 \text{ HV}_2 + 675$
Carburised or nitrided	Nitrided	1300
Carburised	Carburised	1500

Gearing

Part 5, Chapter 5

Section 3

Table 5.3.4 Factors of safety

	$S_{H \min}$	$S_{F \min}$
Main propulsion gears	1,4	1,8
Main propulsion gears for yachts and small craft, single screw	1,25	1,50
Main propulsion gears for yachts and small craft, multiple screw	1,20	1,45
Auxiliary gears	1,15	1,40
NOTE For the purposes of the above, yachts and small craft are considered to be pleasure craft not engaged in trade, passenger carrying or intended for charter service. Small craft are considered to be generally not greater than 24 m in length.		

3.5 Tooth loading for bending stress

3.5.1 The bending stress at the tooth root, σ_F is not to exceed the allowable tooth root bending stress σ_{FP}

$$\sigma_F = \frac{F_t}{b m_n} Y_F Y_S Y_\beta K_A K_V K_{F\beta} K_{F\alpha} \text{ N/mm}^2$$

$$\sigma_{FP} = \frac{\sigma_{F \lim} Y_{ST} Y_{\delta \text{ rel T}} Y_{R \text{ rel T}} Y_x}{S_{F \min} Y_D} \text{ N/mm}^2$$

For values of $S_{F \min}$, see Table 5.3.4

$\sigma_{F \lim}$, see Table 5.3.5

Stress correction factor $Y_{ST} = 2$.

3.5.2 Tooth form factor, Y_F :

$$Y_F = \frac{6 \frac{h_F}{m_n} \cos \alpha_{F \text{ en}}}{\left(\frac{S_{Fn}}{m_n} \right)^2 \cos \alpha_n}$$

where h_F , $\alpha_{F \text{ en}}$ and S_{Fn} are shown in Fig. 5.3.1.

$$\frac{S_{Fn}}{m_n} = z_n \sin \left(\frac{\pi}{3} - v \right) + \sqrt{3} \left(\frac{G}{\cos v} - \frac{p_{ao}}{m_n} \right)$$

where

$$v = \frac{2G}{z_n} \tan v - H$$

$$G = \frac{p_{ao}}{m_n} - \frac{h_{ao}}{m_n} + x$$

$$H = \frac{2}{z_n} \left(\frac{\pi}{2} - \frac{E}{m_n} \right) - \frac{\pi}{3}$$

$$E = \frac{\pi}{4} m_n - h_{ao} \tan \alpha_n + \frac{S_{pr}}{\cos \alpha_n} - (1 - \sin \alpha_n) \frac{p_{ao}}{\cos \alpha_n}$$

E , h_{ao} , α_n , S_{pr} and p_{ao} are shown in Fig. 5.3.2

$$\frac{p_F}{m_n} = \frac{p_{ao}}{m_n} + \frac{2G^2}{\cos v (z_n \cos^2 v - 2G)}$$

$$d_{en} = \frac{2z}{|z|} \left\{ \left[\sqrt{\left(\frac{d_{an}}{2} \right)^2 - \left(\frac{d_{bn}}{2} \right)^2} - \frac{\pi d \cos \beta \cos \alpha_n}{|z|} (\epsilon_{an} - 1) \right]^2 + \left(\frac{d_{bn}}{2} \right)^2 \right\}^{1/2}$$

where

$$d_{an} = d_n + d_a - d$$

$$d_n = \frac{d}{\cos^2 \beta_b}$$

$$d_{bn} = d_n \cos \alpha_n$$

$$\epsilon_{an} = \frac{\epsilon_a}{\cos^2 \beta_b}$$

$$\gamma_e = \frac{\frac{\pi}{2} + 2x \tan \alpha_n}{z_n} + \text{inv. } \alpha_n - \text{inv. } \alpha_{en}$$

where

$$\alpha_{en} = \arccos \frac{d_{bn}}{d_{en}}$$

$$\frac{h_F}{m_n} = \frac{1}{2} \left[(\cos \gamma_e - \sin \gamma_e \tan \alpha_{F \text{ en}}) \frac{d_{en}}{m_n} - \right.$$

$$\left. z_n \cos \left(\frac{\pi}{3} - v \right) - \frac{G}{\cos v} + \frac{p_{ao}}{m_n} \right]$$

where

$$\alpha_{F \text{ en}} = \alpha_{en} - \gamma_e.$$

Table 5.3.5 Values of endurance limit for bending stress, $\sigma_{F \lim}$

Heat treatment	$\sigma_{F \lim}$ N/mm ²
Through-hardened carbon steel	$0,09\sigma_B + 150$
Through-hardened alloy steel	$0,1\sigma_B + 185$
Soft bath nitrided (Tufftrided)	330
Induction hardened	$0,35 \text{ HV} + 125$
Gas nitrided	390
Carburised A	450
Carburised B	410
NOTES 1. A is applicable for Cr Ni Mo carburising steels. 2. B is applicable for other carburising steels.	

3.5.3 For internal tooth forms the form factor is calculated, as an approximation, for a substitute gear rack with the form of the basic rack in the normal section, but having the same tooth depth as the internal gear:

$$\frac{S_{Fn2}}{m_n} = 2 \left[\frac{\pi}{4} + \tan \alpha \left(\frac{h_{ao2} - p_{ao2}}{m_n} \right) + \left(\frac{p_{ao2} - S_{pr}}{m_n \cos \alpha_n} - \frac{p_{ao2}}{m_n} \cos \frac{\pi}{6} \right) \right], \text{ and}$$

Gearing

Part 5, Chapter 5

Section 3

$$\frac{h_{F2}}{m_n} = \frac{d_{en2} - d_{fn2}}{2m_n} - \left[\frac{\pi}{4} + \left(\frac{h_{ao2}}{m_n} - \frac{d_{en2} - d_{fn2}}{2m_n} \right) \tan \alpha_n \right] \tan \alpha_n - \frac{p_{ao2}}{m_n} \left(1 - \sin \frac{\pi}{6} \right)$$

where $\alpha_{F en}$ is taken as being equal to α_n

$$p_{F2} = \frac{p_{ao2}}{2}$$

d_{en2} is calculated as d_{en} for external gears, and
 $d_{fn} = d - d_f - d_n$.

3.5.4 Stress concentration factor, Y_s

$$Y_s = (1,2 + 0,13L) q_s \left(\frac{1}{1,21 + 2,3/L} \right)$$

where

$$L = \frac{S_{Fn}}{h_F}$$

$$q_s = \frac{S_{Fn}}{2p_F}$$

when $q_s < 1$ the value of Y_s is to be specially considered.
 The formula for Y_s is applicable to external gears with $\alpha_n = 20^\circ$ but may be used as an approximation for other pressure angles and internal gears.

3.5.5 Helix angle factor Y_β

$$Y_\beta = 1 - \left(\epsilon_\beta \frac{\beta}{120} \right), \text{ if } \epsilon_\beta > 1 \text{ let } \epsilon_\beta = 1$$

but $Y_\beta \geq 1 - 0,25\epsilon_\beta \geq 0,75$.

3.5.6 Relative notch sensitivity factor, $Y_{\delta \text{ rel T}}$

$$Y_{\delta \text{ rel T}} = 1 + 0,036 (q_s - 2,5) \left(1 - \frac{\sigma_y}{1200} \right) \text{ for through-hardened steels}$$

$$Y_{\delta \text{ rel T}} = 1 + 0,008 (q_s - 2,5) \text{ for carburised and induction-hardened steels, and}$$

$$Y_{\delta \text{ rel T}} = 1 + 0,04 (q_s - 2,5) \text{ for nitrided steels.}$$

3.5.7 Relative surface finish factor, $Y_{R \text{ rel T}}$

$$Y_{R \text{ rel T}} = 1,674 - 0,529 (6R_a + 1)^{0,1} \text{ for through-hardened, carburised and induction hardened steels, and}$$

$$Y_{R \text{ rel T}} = 4,299 - 3,259 (6R_a + 1)^{0,005} \text{ for nitrided steels.}$$

3.5.8 Size factor, Y_x

$$Y_x = 1,00, \text{ when } m_n \leq 5$$

$$Y_x = 1,03 - 0,006m_n \text{ for through hardened steels}$$

$$Y_x = 0,85, \text{ when } m_n \geq 30$$

$$Y_x = 1,05 - 0,01m_n \text{ for surface-hardened steels}$$

$$Y_x = 0,80, \text{ when } m_n \geq 25.$$

3.5.9 Design factor, Y_D

$$Y_D = 0,83 \text{ for gears treated with a controlled shot peening process}$$

$$Y_D = 1,5 \text{ for idler gears}$$

$$Y_D = 1,25 \text{ for shrunk on gears, or}$$

$$Y_D = 1 + \frac{0,2d_s^2 d P_r b}{F_t \sigma_{F \text{ lim}} (d_f^2 - d_s^2)}, \text{ otherwise}$$

$$Y_D = 1,00.$$

3.6 Factors of safety

3.6.1 Factors of safety are shown in Table 5.3.4.

Section 4 Construction

4.1 Gear wheels and pinions

4.1.1 Where castings are used for wheel centres, any radial slots in the periphery are to be fitted with permanent chocks before shrinking-on the rim.

4.1.2 Where bolts are used to secure side plates to rim and hub, the bolts are to be a tight fit in the holes and the nuts are to be suitably locked by means other than welding.

4.1.3 Where welding is employed in the construction of wheels, the welding procedure is to be approved by the Surveyors before work is commenced. For this purpose, welding procedure approval tests are to be carried out with satisfactory results. Such tests are to be representative of the joint configuration and materials. Wheels are to be stress relieved after welding. All welds are to have a satisfactory surface finish and contour. Magnetic particle or liquid penetrant examination of all important welded joints is to be carried out to the satisfaction of the Surveyors.

4.1.4 In general, arrangements are to be made so that the interior structure of the wheel may be examined. Alternative proposals will be specially considered.

4.2 Accuracy of gear cutting and alignment

4.2.1 The machining accuracy (Q grade) of pinions and wheels is to be demonstrated to the satisfaction of the Surveyors. For this purpose records of measurements should be available for review by Surveyors on request.

4.2.2 Where allowance has been given for end relief or helix correction the normal shop meshing tests are to be supplemented by tooth alignment traces or other approved means to demonstrate the effectiveness of such modifications.

4.3 Gearcases

4.3.1 Gearcases and their supports are to be designed sufficiently stiff such that misalignment at the mesh due to movements of the external foundations and the thermal effects under all conditions of service do not disturb the overall tooth contact.

4.3.2 For gearcases fabricated by fusion welding the carbon content of steels should generally not exceed 0,23 per cent. Steels with higher carbon content may be approved subject to satisfactory results from weld procedure tests.

4.3.3 Gearcases are to be stress relief heat treated on completion of all welding.

4.3.4 Inspection openings are to be provided at the peripheries of gearcases to enable the teeth of pinions and wheels to be readily examined. Where the construction of gearcases is such that sections of the structure cannot readily be moved for inspection purposes, access openings of adequate size are also to be provided at the ends of the gearcases to permit examination of the structure of the wheels. Their attachment to the shafts is to be capable of being examined by removal of bearing caps or by equivalent means.

■ Section 5
 Tests

5.1 Balance of gear pinions and wheels

5.1.1 All rotating elements, (e.g. pinion and wheel shaft assemblies and coupling parts), are to be appropriately balanced.

5.1.2 The permissible residual unbalance, U , is defined as follows:

$$U = \frac{60m}{N} \times 10^3 \text{ g mm for } N \leq 3000$$

$$U = \frac{24m}{N} \times 10^3 \text{ g mm for } N > 3000$$

where

- m = mass of rotating element, kg
- N = maximum service rev/min of the rotating element.

5.1.3 Where the size or geometry of a rotating element precludes measurement of the residual unbalance, a full speed running test of the assembled gear unit at the manufacturer's works will normally be required to demonstrate satisfactory operation.

5.2 Meshing tests

5.2.1 Initially, meshing gears are to be carefully matched on the basis of the accuracy measurements taken. The alignment is to be demonstrated in the workshop by meshing in the gearbox without oil clearance in the bearings. Meshing is to be carried out with the gears locating in their light load positions and a load sufficient to overcome pinion weight and axial movement is to be imposed.

5.2.2 The gears are to be suitably coated to demonstrate the contact marking. The marking is to reflect the accuracy grade specified and end relief of helix correction, where these have been applied.

5.2.3 For gears without helix correction the marking is to be not less than shown in Table 5.5.1.

Table 5.5.1 No load tooth contact marking

ISO accuracy grade	Contact marking area
$Q \leq 5$	40% h_w for 50% b and 20% h_w for a further 40% b
$Q \geq 6$	40% h_w for 35% b and 20% h_w for a further 35% b
NOTES 1. Where b is face width and h_w is working tooth depth. 2. For spur gears the values of h_w should be increased by a further 10%.	

5.2.4 For gears with end relief of helix correction the marking is to correspond to the designed no load contact pattern.

5.2.5 A permanent record is to be made of the meshing contact for purpose of checking the alignment when installed on board ship.

5.2.6 The full load tooth contact marking is to be not less than shown in Table 5.5.2.

Table 5.5.2 Full load tooth contact marking

ISO accuracy grade	Contact marking area
$Q \leq 5$	70% h_w for 60% b and 50% h_w for a further 30% b
$Q \geq 6$	60% h_w for 45% b and 40% h_w for a further 35% b
NOTES 1. Where b is face width and h_w is working tooth depth. 2. For spur gears the values of h_w should be increased by a further 10%.	

5.3 Alignment

5.3.1 Reduction gears with sleeve bearings, for main and auxiliary purposes are to be provided with means for checking the internal alignment of the various elements in the gearcases.

5.3.2 In the case of separately mounted reduction gearing for main propulsion, means are to be provided by the gear manufacturer to enable the Surveyors to verify that no distortion of the gearcase has taken place, when chocked and secured to its seating on board ship.

5.3.3 Further requirements are given in Ch 8,5.

■ Cross-reference

For lubricating oil systems, see Chapter 14.

Main Propulsion Shafting

Part 5, Chapter 6

Sections 1 & 2

Section

1 Plans and particulars

2 Materials

3 Design

■ Scope

The requirements of this Chapter relate, in particular, to formulae for determining the diameters of shafting for main propulsion installations, but requirements for couplings, coupling bolts, keys, keyways, sternbushes and other associated components are also included. The diameters may require to be modified as a result of alignment considerations and vibration characteristics, see Chapter 8, or the inclusion of stress raisers, other than those contained in this Chapter.

Alternative calculation methods for determining the diameters of shafting for main propulsion and their permissible torsional stresses will be considered by LR. Any alternative calculation method is to include all relevant loads on the complete dynamic shafting system under all permissible operating conditions. Consideration is to be given to the dimensions and arrangements of all shaft connections. Moreover, an alternative calculation method is to take into account design criteria for continuous and transient operating loads (dimensioning for fatigue strength) and for peak operating loads (dimensioning for yield strength). The fatigue strength analysis may be carried out separately for different load assumptions, for example as given below.

Shafts complying with the applicable Rules in Chapter 6 and Chapter 8 satisfy the following:

- (a) Low cycle fatigue criterion (typically $<10^4$), i.e. the primary cycles represented by zero to full load and back to zero, including reversing torque if applicable. This is addressed by the formulas in Ch 6,3.1, 3.5 and 3.6.
- (b) High cycle fatigue criterion (typically $>>10^7$), i.e. torsional vibration stresses permitted for continuous operation as well as reverse bending stresses and the accumulated fatigue due to torsional vibration when passing through a barred speed range or any other transient condition with associated stresses beyond those permitted for continuous operation. This is addressed by the formulas in Ch 8,2.5. The influence of reverse bending stresses is addressed by the safety margins inherent in the formulas from Ch 6,3.1, 3.5 and 3.6.

■ Section 1 Plans and particulars

1.1 Shafting plans

1.1.1 The following plans, together with the necessary particulars of the machinery, including the maximum power and revolutions per minute, are to be submitted for consideration before the work is commenced:

- Final gear shaft.
- Thrust shaft.
- Intermediate shafting.
- Tube shaft, where applicable.
- Screwshaft.
- Screwshaft oil gland.
- Sternbush.

1.1.2 The specified minimum tensile strength of each shaft is to be stated.

1.1.3 In addition, a shafting arrangement plan indicating the relative positions of the main engines, flywheel, flexible coupling, gearing, thrust block, line shafting and bearings, sterntube, 'A' bracket and propeller, as applicable, is to be submitted for information.

■ Section 2 Materials

2.1 Materials for shafts

2.1.1 The specified minimum tensile strength of forgings for shafts is to be selected within the following general limits:

- (a) Carbon and carbon-manganese steel – 400 to 760 N/mm² (41 to 77,5 kgf/mm²). See also 3.5.1.
- (b) Alloy steel – not exceeding 800 N/mm² (82 kgf/mm²).

2.1.2 Where it is proposed to use alloy steel, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval.

2.1.3 Where shafts may experience vibratory stresses close to the permissible stresses for transient operation, the materials are to have a specified minimum tensile strength of 500 N/mm² (51 kgf/mm²).

2.1.4 Where materials with greater specified or actual tensile strengths than the limitations given above are used, reduced shaft dimensions or higher permissible vibration stresses are not acceptable when derived from the formulae used in Section 3.1, 3.5, 3.6 and Ch 8,2.5.

2.2 Ultrasonic tests

2.2.1 Ultrasonic tests are required on shaft forgings where the diameter is 250 mm or greater.

Main Propulsion Shafting

Part 5, Chapter 6

Section 3

Section 3 Design

3.1 Intermediate shafts

3.1.1 The diameter, d , of the intermediate shaft is to be not less than determined by the following formula:

$$d = Fk \sqrt[3]{\frac{P}{R} \left(\frac{560}{\sigma_u + 160} \right)} \text{ mm}$$

$$\left(d = Fk \sqrt[3]{\frac{H}{R} \left(\frac{57}{\sigma_u + 16} \right)} \text{ mm} \right)$$

where

$k = 1,0$ for shafts with integral coupling flanges complying with 3.7 or with shrink fit couplings, see 3.1.4

$= 1,10$ for shafts with keyways in tapered or cylindrical connections, where the fillet radii in the transverse section of the bottom of the keyway are to be not less than $0,0125d$

$= 1,10$ for shafts with transverse or radial holes where the diameter of the hole (d_h) is not greater than $0,3d$

$= 1,20$ for shafts with longitudinal slots, see 3.1.6

$F = 95(86)$ for turbine installations, electric propulsion installations and oil engine installations with slip type couplings

$= 100(90,5)$ for other oil engine installations

$P(H)$ and R are defined in Ch 1,3.3 (losses in gearboxes and bearings are to be disregarded)

σ_u = specified minimum tensile strength of the shaft material, in N/mm^2 (kgf/mm^2), see 2.1.3

After a length of $0,2d$ from the end of a keyway, transverse hole or radial hole and $0,3d$ from the end of a longitudinal slot, the diameter of the shaft may be gradually reduced to that determined with $k = 1,0$.

3.1.2 For shafts with design features other than stated in 3.1.1, the value of k will be specially considered.

3.1.3 The Rule diameter of the intermediate shaft for oil engines, turbines and electric propelling motors may be reduced by 3,5 per cent for ships classed exclusively for smooth water service, and by 1,75 per cent for ships classed exclusively for service on the Great Lakes.

3.1.4 For shrink fit couplings k refers to the plain shaft section only. Where shafts may experience vibratory stresses close to the permissible stresses for continuous operation, an increase in diameter to the shrink fit diameter is to be provided, e.g. a diameter increase of 1 to 2 per cent and a blending radius as described in 3.8.

3.1.5 Keyways are in general not to be used in installations with a barred speed range.

3.1.6 The application of $k = 1,20$ is limited to shafts with longitudinal slots having a length of not more than $0,8d$ and a width of not more than $0,1d$ and a diameter of central hole d_i of not more than $0,8d$, see 3.7. The end rounding of the slot is not to be less than half the width. An edge rounding should preferably be avoided as this increases the stress concentration slightly. The values of C_K , see Table 8.2.1 in Pt 5, Ch 8, are valid for 1, 2 and 3 slots, i.e. with slots at 360, 180 and 120 degrees apart respectively.

3.2 Gear quill shafts

3.2.1 The diameter of the quill shaft is to be not less than given by the following formula:

$$\text{Diameter of quill shaft} = 101 \sqrt[3]{\frac{P}{R \sigma_u}} \text{ mm}$$

$$\left(91 \sqrt[3]{\frac{H}{R \sigma_u}} \text{ mm} \right)$$

where

$P(H)$ and R are as defined in Ch 1,3.3

σ_u = specified minimum tensile strength of the material, in N/mm^2 (kgf/mm^2) but is not to exceed 1100 N/mm^2 (112 kgf/mm^2).

3.3 Final gear wheel shafts

3.3.1 Where there is only one pinion geared into the final wheel, or where there are two pinions which are set to subtend an angle at the centre of the shaft of less than 120 degrees, the diameter of the shaft at the final wheel and the adjacent journals is to be not less than 1,15 times that required for the intermediate shaft.

3.3.2 Where there are two pinions geared into the final wheel opposite, or nearly opposite, to each other, the diameter of the shaft at the final wheel and the adjacent journals is to be not less than 1,1 times that required for the intermediate shaft.

3.3.3 In both 3.3.1 and 3.3.2, abaft the journals, the shaft may be gradually tapered down to the diameter required for an intermediate shaft determined according to 3.1, where σ_u is to be taken as the specified minimum tensile strength of the final wheel shaft material, in N/mm^2 (kgf/mm^2).

3.4 Thrust shafts

3.4.1 The diameter at the collars of the thrust shaft transmitting torque, or in way of the axial bearing where a roller bearing is used as a thrust bearing, is to be not less than that required for the intermediate shaft in accordance with 3.1 with a k value of 1,10. Outside a length equal to the thrust shaft diameter from the collars, the diameter may be tapered down to that required for the intermediate shaft with a k value of 1,0. For the purpose of the foregoing calculations, σ_u is to be taken as the minimum tensile strength of the thrust shaft material, in N/mm^2 (kgf/mm^2).

Main Propulsion Shafting

Part 5, Chapter 6

Section 3

3.5 Screwshafts and tube shafts

3.5.1 The diameter, d_p of the screwshaft immediately forward of the forward face of the propeller boss or, if applicable, the forward face of the screwshaft flange, is to be not less than determined by the following formula:

$$d_p = 100k \sqrt[3]{\frac{P}{R} \left(\frac{560}{\sigma_u + 160} \right)} \text{ mm}$$

$$(d_p = 90,5k \sqrt[3]{\frac{P}{R} \left(\frac{57}{\sigma_u + 16} \right)} \text{ mm})$$

where

$k = 1,22$ for a shaft carrying a keyless propeller fitted on a taper, or where the propeller is attached to an integral flange, and where the shaft is fitted with a continuous liner or is oil lubricated and provided with an approved type of oil sealing gland

$k = 1,26$ for a shaft carrying a keyed propeller and where the shaft is fitted with a continuous liner or is oil lubricated and provided with an approved type of oil sealing gland

P (H) and R are defined in Ch 1,3.3, (losses in gearboxes and bearings are to be disregarded)

σ_u = specified minimum tensile strength of the shaft material, in N/mm² (kgf/mm²) but is not to be taken as greater than 600 N/mm² (61 kgf/mm²). See 2.1.3.

3.5.2 The diameter, d_p of the screwshaft determined in accordance with the formula in 3.5.1 is to extend over a length not less than that to the forward edge of the bearing immediately forward of the propeller or $2,5d_p$ whichever is the greater.

3.5.3 The diameter of the portion of the screwshaft and tube shaft, forward of the length required by 3.5.2 to the forward end of the forward stern tube seal, is to be determined in accordance with the formula in 3.5.1 with a k value of 1,15. The change of diameter from that determined with $k = 1,22$ or 1,26 to that determined with $k = 1,15$ should be gradual, see 3.7.

3.5.4 Screwshafts which run in sterntubes and tube shafts may have the diameter forward of the forward stern tube seal gradually reduced to the diameter of the intermediate shaft. Abrupt changes in shaft section at the screwshaft/tube shaft to intermediate shaft couplings are to be avoided, see 3.7.

3.5.5 Unprotected screwshafts and tube shafts of corrosion-resistant material will be specially considered.

3.5.6 For shafts of non-corrosion-resistant materials which are exposed to sea-water, the diameter of the shaft is to be determined in accordance with the formula in 3.5.1 with a k value of 1,26 and σ_u taken as 400 N/mm² (41 kgf/mm²).

3.6 Hollow shafts

3.6.1 Where the thrust, intermediate and tube shafts and screwshafts have central holes, the outside diameters of the shafts are to be not less than given by the following formula:

$$d_o = d \sqrt[3]{\frac{1}{1 - \left(\frac{d_i}{d_o}\right)^4}}$$

where

d_o = outside diameter, in mm

d = Rule size diameter of solid shaft, in mm

d_i = diameter of central hole, in mm.

However, where the diameter of the central hole does not exceed 0,4 times the outside diameter, no increase over Rule size need be provided.

3.7 Couplings and transitions of diameters

3.7.1 The minimum thicknesses of the coupling flanges are to be equal to the diameters of the coupling bolts at the face of the couplings as required by 3.8 and, for this purpose, the minimum tensile strength of the bolts is to be taken as equivalent to that of the shafts. For intermediate shafts, thrust shafts and the inboard end of the screwshaft, the thickness of the coupling flange is in no case to be less than 0,20 of the diameter of the intermediate shaft as required by 3.1.

3.7.2 The fillet radius at the base of the coupling flange is to be not less than 0,08 of the diameter of the shaft at the coupling but, in the case of crankshafts, the fillet radius at the centre coupling flanges may be 0,05 of the diameter of the shaft at the coupling. The fillets are to have a smooth finish and are not to be recessed in way of nut and bolt heads.

3.7.3 Where the propeller is attached by means of a flange, the thickness of the flange is to be not less than 0,25 of the actual diameter of the adjacent part of the screwshaft. The fillet radius at the base of the coupling flange is to be not less than 0,125 of the diameter of the shaft at the coupling.

3.7.4 All couplings which are attached to shafts are to be of approved dimensions.

3.7.5 Where couplings are separate from the shafts, provision is to be made to resist the astern pull.

3.7.6 Where a coupling is shrunk on to the parallel portion of a shaft or is mounted on a slight taper, e.g. by means of the oil pressure injection method, full particulars of the coupling including the interference fit are to be submitted for special consideration.

3.7.7 Transitions of diameters are to be designed with either a smooth taper or a blending radius. In general, a blending radius equal to the change in diameter is recommended.

Main Propulsion Shafting

Part 5, Chapter 6

Section 3

3.8 Coupling bolts

3.8.1 Close tolerance fitted bolts transmitting shear are to have a diameter, at the joining faces of the couplings not less than given by the following formula:

$$\text{Diameter of coupling bolts} = \sqrt{\frac{240}{nD} \frac{10^6}{\sigma_u} \frac{P}{R}} \text{ mm}$$

where

n = number of bolts in the coupling

D = pitch circle diameter of bolts, in mm

σ_u = specified minimum tensile strength of bolts, in N/mm²

P (H) and R are as defined in Ch 1,3.3.

3.8.2 At the joining faces of couplings, other than within the crankshaft and at the thrust shaft/crankshaft coupling, the Rule diameter of the coupling bolts defined in 3.8.1 may be reduced by 5,2 per cent for ships classed exclusively for smooth water service, and 2,6 per cent for ships classed exclusively for service on the Great Lakes.

3.8.3 Where dowels or expansion bolts are fitted to transmit torque in shear they are to comply with the requirements of 3.8.1. The expansion bolts are to be installed, and the bolt holes in the flanges are to be correctly aligned, in accordance with manufacturer's instructions.

3.8.4 The minimum diameter of tap bolts or of bolts in clearance holes at the joining faces of coupling flanges, pretensioned to 70 per cent of the bolt material yield strength value, is not to be less than:

$$d_R = 1,348 \sqrt{\left(\frac{120 \cdot 10^6 F P (1 + C)}{R D} + Q \right) \frac{1}{n \sigma_y}}$$

where d_R is taken as the lesser of:

(a) Mean of effective (pitch) and minor diameters of the threads.

(b) Bolt shank diameter away from threads. (Not for waisted bolts which will be specially considered.)

P (H) and R are as defined in Ch 1,3.3.

F = 2,5 where the flange connection is not accessible from within the ship

= 2,0 where the flange connection is accessible from within the ship

C = ratio of vibratory/mean torque values at the rotational speed being considered

D = pitch circle diameter of bolt holes, in mm

Q = external load on bolt in N (+ve tensile load tending to separate flange, -ve)

n = number of tap or clearance bolts

σ_y = bolt material yield stress in N/mm².

3.8.5 Consideration will be given to those arrangements where the bolts are pretensioned to loads other than 70 per cent of the material yield strength.

3.8.6 Where clamp bolts are fitted they are to comply with the requirements of 3.8.4 and are to be installed, and the bolt holes in the flanges correctly aligned, in accordance with manufacturer's instructions.

3.9 Bronze or gunmetal liners on shafts

3.9.1 The thickness, t , of liners fitted on screwshafts or on tube shafts, in way of the bushes, is to be not less, when new, than given by the following formula:

$$t = \frac{D + 230}{32} \text{ mm}$$

where

t = thickness of the liner, in mm

D = diameter of the screwshaft or tube shaft under the liner, in mm.

3.9.2 The thickness of a continuous liner between the bushes is to be not less than 0,75t.

3.9.3 Continuous liners should preferably be cast in one piece.

3.9.4 Where liners consist of two or more lengths, these are to be butt welded together. In general, the lead content of the gunmetal of each length forming a butt welded liner is not to exceed 0,5 per cent. The composition of the electrodes or filler rods is to be substantially lead-free.

3.9.5 The circumferential butt welds are to be of multi-run, full penetration type. Provision is to be made for contraction of the weld by arranging for a suitable length of the liner containing the weld, if possible about three times the shaft diameter, to be free of the shaft. To prevent damage to the surface of the shaft during welding, a strip of heat resisting material covered by a copper strip should be inserted between the shaft and the liner in way of the joint. Other methods for welding this joint may be accepted if approved. The welding is to be carried out by an approved method and to the Surveyor's satisfaction.

3.9.6 Each continuous liner or length of liner is to be tested by hydraulic pressure to 2,0 bar (2,0 kgf/cm²) after rough machining.

3.9.7 Liners are to be carefully shrunk on, or forced on, to the shafts by hydraulic pressure. Pins are not to be used to secure the liners.

3.9.8 Effective means are to be provided for preventing water from reaching the shaft at the part between the after end of the liner and the propeller boss.

3.10 Keys and keyways

3.10.1 Round ended or sled-runner ended keys are to be used, and the keyways in the propeller boss and cone of the screwshaft are to be provided with a smooth fillet at the bottom of the keyways. The radius of the fillet is to be at least 0,0125 of the diameter of the screwshaft at the top of the cone. The sharp edges at the top of the keyways are to be removed.

Main Propulsion Shafting

Part 5, Chapter 6

Section 3

3.10.2 Two screwed pins are to be provided for securing the key in the keyway, and the forward pin is to be placed at least one-third of the length of the key from the end. The depth of the tapped holes for the screwed pins is not to exceed the pin diameter, and the edges of the holes are to be slightly bevelled.

3.10.3 The distance between the top of the cone and the forward end of the keyway is to be not less than 0,2 of the diameter of the screwshaft at the top of the cone.

3.10.4 The effective sectional area of the key in shear, is to be not less than $\frac{d^3}{2,6d_1}$ mm²

where

d = diameter, in mm, required for the intermediate shaft determined in accordance with 3.1, based on material having a specified minimum tensile strength of 400 N/mm² (41 kgf/mm²) and $k = 1$

d_1 = diameter of shaft at mid-length of the key, in mm.

3.11 Propellers

3.11.1 For keyed and keyless propellers, see Chapter 7.

3.12 Sternbushes

3.12.1 The length of the bearing in the sternbush next to and supporting the propeller is to be as follows:

- (a) For water lubricated bearings which are lined with lignum vitae, rubber composition or staves of approved plastics material, the length is to be not less than four times the diameter required for the screwshaft under the liner.
- (b) For water lubricated bearings lined with two or more circumferentially spaced sectors of an approved plastics material, in which it can be shown that the sectors operate on hydrodynamic principles, the length of the bearing is to be such that the nominal bearing pressure will not exceed 5,5 bar (5,6 kgf/cm²). The length of the bearing is to be not less than twice its diameter.
- (c) For oil lubricated bearings of synthetic material the flow of lubricant is to be such that overheating, under normal operating conditions, cannot occur. The acceptable nominal bearing pressure will be considered upon application and is to be supported by the results of an agreed test programme. In general, the length of the bearing is not to be less than 2,0 times the rule diameter of the shaft in way of the bearing.
- (d) For bearings which are white-metal lined, oil lubricated and provided with an approved type of oil sealing gland, the length of the bearing is to be approximately twice the diameter required for the screwshaft and is to be such that the nominal bearing pressure will not exceed 8,0 bar (8,1 kgf/cm²). The length of the bearing is to be not less than 1,5 times its diameter.
- (e) For bearings of cast iron and bronze which are oil lubricated and fitted with an approved oil sealing gland, the length of the bearing is, in general, to be not less than four times the diameter required for the screwshaft.
- (f) For bearings which are grease lubricated, the length of the bearing is to be not less than four times the diameter required for the screwshaft.

3.12.2 Forced water lubrication is to be provided for all bearings lined with rubber or plastics and for those bearings lined with lignum vitae where the shaft diameter is 380 mm or over. The supply of water may come from a circulating pump or other pressure source. Flow indicators are to be provided for the water service to plastics and rubber bearings. The water grooves in the bearings are to be of ample section and of a shape which will be little affected by wear down, particularly for bearings of the plastics type.

3.12.3 Bearings of synthetic material are to be supplied finished machined to design dimensions within a rigid bush. Means are to be provided to prevent rotation of the lining within the bush during operation.

3.12.4 All sternbushes are to be adequately secured in the sterntube/housings.

3.12.5 The shut-off valve or cock controlling the supply of water is to be fitted direct to the after peak bulkhead, or to the sterntube where the water supply enters the sterntube forward of the bulkhead.

3.12.6 Oil sealing glands fitted in ships classed for unrestricted service must be capable of accommodating the effects of differential expansion between hull and line of shafting in sea temperatures ranging from arctic to tropical. This requirement applies particularly to those glands which span the gap and maintain oiltightness between the sterntube and the propeller boss.

3.12.7 Where a tank supplying lubricating oil to the sternbush is fitted, it is to be located above the load water-line and is to be provided with a low level alarm device in the engine room.

3.12.8 Where sternbush bearings are oil lubricated, provision is to be made for cooling the oil by maintaining water in the after peak tank above the level of the sterntube or by other approved means. Means for ascertaining the temperature of the oil in the sterntube are also to be provided.

3.12.9 Where there is compliance with the terms of 3.12.1(c) and (d) to the Surveyor's satisfaction, a screwshaft will be assigned the notation **OG** in the *Supplement to the Register Book* for Periodical Survey purposes, see Pt 1, Ch 3.

3.12.10 Screwshafts which are grease lubricated are not eligible for the **OG** notation.

3.12.11 Where an ***IWS** (In-water Survey) notation is to be assigned, see Pt 1, Ch 2,2.3.11, means are to be provided for ascertaining the clearance in the sternbush with the vessel afloat.

3.13 Vibration and alignment

3.13.1 For the requirements for torsional, axial and lateral vibration, and for alignment of the shafting, see Chapter 8.

Section

- 1 **Plans and particulars**
- 2 **Materials**
- 3 **Design**
- 4 **Fitting of propellers**

Section 1 Plans and particulars

1.1 Details to be submitted

1.1.1 A plan, in triplicate, of the propeller is to be submitted for approval, together with the following particulars using the symbols shown:

- (a) Maximum blade thickness of the expanded cylindrical section considered, T , in mm.
- (b) Maximum shaft power, see Ch 1,3.3, P , in kW (H , in shp).
- (c) Estimated ship speed at design loaded draught in the free running condition at maximum shaft power and corresponding revolutions per minute, see (b) and (d).
- (d) Revolutions per minute of the propeller at maximum power, R .
- (e) Propeller diameter, D , in metres.
- (f) Pitch at 25 per cent radius (for solid propellers only), $P_{0,25}$, in metres.
- (g) Pitch at 35 per cent radius (for controllable pitch propellers only), $P_{0,35}$, in metres.
- (h) Pitch at 60 per cent radius $P_{0,6}$, in metres.
- (i) Pitch at 70 per cent radius $P_{0,7}$, in metres.
- (k) Length of blade section of the expanded cylindrical section at 25 per cent radius (for solid propellers only), $L_{0,25}$, in mm.
- (l) Length of blade section of the expanded cylindrical section at 35 per cent radius (for controllable pitch propellers only) $L_{0,35}$, in mm.
- (m) Length of blade section of the expanded cylindrical section at 60 per cent radius, $L_{0,6}$, in mm.
- (n) Rake at blade tip measured at shaft axis (backward rake positive, forward rake negative), A , in mm.
- (o) Number of blades, N .
- (p) Developed area ratio, B .
- (q) Material: type and specified minimum tensile strength.
- (r) θ_s , skew angle, in degrees, see Fig. 7.1.1.
- (s) Connection of propeller to shaft – details of fit, push-up, securing, etc.

1.1.2 For propellers having a skew angle equal to or greater than 50° , in addition to the particulars detailed in 1.1.1, details are to be submitted of:

- (a) Full blade section details at each radial station defined for manufacture.
- (b) A detailed blade stress computation supported by the following hydrodynamic data for the ahead mean wake condition and when absorbing full power:

Fig. 7.1.1 Definition of skew angle

- (i) Radial distribution of lift and drag coefficients, section inflow velocities and hydrodynamic pitch angles.
- (ii) Section pressure distributions calculated by either an advised inviscid or viscous procedure.

1.1.3 For blades of fixed pitch propellers with skew angle of 30° or greater, the stresses in the propeller blade during astern operation are not to exceed 80 per cent of the propeller blade material proof stress. Consideration is to be given to failure conditions and a factor of safety of 1,5 is to be attained using an acceptable fatigue failure criteria. Documentary evidence confirming that these criteria are satisfied is to be submitted.

1.1.4 The maximum skew angle of a propeller blade is defined as the angle, in projected view of the blade, between a line drawn through the blade tip and the shaft centreline and a second line through the shaft centreline which acts as a tangent to the locus of the mid-points of the helical blade sections, see Fig. 7.1.1.

1.1.5 Where propellers and similar devices of unusual design are intended for more than one operating regime, such as towing or trawling, then a detailed blade stress calculation for each operating condition, indicating the rotational and ship speed, is to be submitted for consideration.

1.1.6 Where it is proposed to fit the propeller to the screwshaft without the use of a key, plans of the boss, tapered end of screwshaft, propeller nut and, where applicable, the sleeve, are to be submitted.

Propellers

Part 5, Chapter 7

Sections 1, 2 & 3

1.1.7 Where a sleeve is fitted, details of the proposed type of material and mechanical properties are also to be submitted.

1.1.8 In cases where the ship has been the subject of model wake field tests, a copy of the results is to be submitted.

Section 2 Materials

2.1 Castings

2.1.1 Castings for propellers and propeller blades are to comply with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials). The specified minimum tensile strength is to be not less than stated in Table 7.2.1.

2.1.2 Where it is proposed to use materials which are not included in Table 7.2.1, details of the chemical composition, mechanical properties and density are to be submitted for approval.

2.1.3 Spheroidal cast iron load transmitting components of controllable pitch mechanisms, are to be manufactured, tested and certified in accordance with Chapter 7 of the Rules for Materials, and have an elongation of not less than 12 per cent.

Section 3 Design

3.1 Minimum blade thickness

3.1.1 For propellers having a skew angle of less than 25°, as defined in 1.1.4, the minimum blade thickness, T , of the propeller blades at 25 per cent radius for solid propellers, 35 per cent radius for controllable pitch propellers, neglecting any increase due to fillets, and at 60 per cent radius, is to be not less than:

$$T = \frac{KCA}{EFULN} + 100 \sqrt{\frac{3150MP}{EFRULN}} \text{ mm}$$

$$\left(T = \frac{KCA}{9,81EFULN} + 27,4 \sqrt{\frac{3150MH}{EFRULN}} \text{ mm} \right)$$

where

$$L = L_{0,25}, L_{0,35}, \text{ or } L_{0,6}, \text{ as appropriate}$$

$$K = \frac{GBD^3R^2}{675}$$

$$G = \text{density, in g/cm}^3, \text{ see Table 7.2.1}$$

$$U = \text{allowable stress, in N/mm}^2 \text{ (kgf/mm}^2\text{) see 3.1.2, 3.1.3, 3.1.4, and Table 7.2.1}$$

$$E = \frac{\text{actual face modulus}}{0,09T^2L}$$

For aerofoil sections with and without trailing edge washback, E may be taken as 1,0 and 1,25 respectively

Table 7.2.1 Materials for propellers

Material	SI units			Metric units		
	Specified minimum tensile strength N/mm ²	G Density g/cm ³	U Allowable stress N/mm ²	Specified minimum tensile strength kgf/mm ²	G Density g/cm ³	U Allowable stress kgf/mm ²
Grey cast iron	250	7,2	17,2	25	7,2	1,75
Spheroidal or nodular graphite cast iron	400	7,3	20,6	41	7,3	2,1
Carbon steels	400	7,9	20,6	41	7,9	2,1
Low alloy steels	440	7,9	20,6	45	7,9	2,1
13% chromium stainless steels	540	7,7	41	55	7,7	4,2
Chromium-nickel austenitic stainless steel	450	7,9	41	46	7,9	4,2
Duplex stainless steels	590	7,8	41	60	7,8	4,2
Grade Cu 1 Manganese bronze (high tensile brass)	440	8,3	39	45	8,3	4,0
Grade Cu 2 Ni-Manganese bronze (high tensile brass)	440	8,3	39	45	8,3	4,0

Propellers

Part 5, Chapter 7

Section 3

$$\left. \begin{aligned} C &= 1,0 \\ F &= \frac{P_{0,25}}{D} + 0,8 \\ M &= 1,0 + \frac{3,75D}{P_{0,7}} + 2,8 \frac{P_{0,25}}{D} \end{aligned} \right\} \text{for solid propellers at 25 per cent radius}$$

$$\left. \begin{aligned} C &= 1,4 \\ F &= \frac{P_{0,35}}{D} + 1,6 \\ M &= 1,35 + \frac{5D}{P_{0,7}} + 2,6 \frac{P_{0,35}}{D} \end{aligned} \right\} \text{for controllable pitch propellers at 35 per cent radius}$$

$$\left. \begin{aligned} C &= 1,6 \\ F &= \frac{P_{0,6}}{D} + 4,5 \\ M &= 1,35 + \frac{5D}{P_{0,7}} + 1,35 \frac{P_{0,6}}{D} \end{aligned} \right\} \text{for all propellers at 60 per cent radius}$$

3.1.2 The fillet radius between the root of a blade and the boss of a propeller is to be not less than the Rule thickness of the blade or equivalent at this location. Composite radiused fillets or elliptical fillets which provide a greater effective radius to the blade are acceptable and are to be preferred. Where fillet radii of the required size cannot be provided, the value of U is to be multiplied by $\left(\frac{r}{T}\right)^{0,2}$

where

r = proposed fillet radius at the root, in mm

T = Rule thickness of the blade at the root, in mm

Where a propeller has bolted-on blades, consideration is also to be given to the distribution of stress in the palms of the blades. In particular, the fillets of recessed bolt holes and the lands between bolt holes are not to induce stresses which exceed those permitted at the outer end of the fillet radius between the blade and the palm.

3.1.3 For propellers having skew angles of 25° or greater, but less than 50°, the mid-chord thickness, $T_{sk0,6}$, at the 60 per cent radius is to be not less than:

$$T_{sk0,6} = 0,54T_{0,6} \sqrt{1 + 0,1\theta_s} \quad \text{mm}$$

The mid-chord thickness, $T_{sk \text{ root}}$, at 25 or 35 per cent radius, neglecting any increase due to fillets, is to be not less than:

$$T_{sk \text{ root}} = 0,75T_{\text{root}} \sqrt[4]{1 + 0,1\theta_s} \quad \text{mm}$$

where

θ_s = proposed skew angle as defined in 1.1.4

$T_{0,6}$ = thickness at 60 per cent radius, calculated by 3.1.1, in mm

T_{root} = thickness at 25 per cent radius or 35 per cent radius, calculated by 3.1.1, in mm

The thicknesses at the remaining radii are to be joined by a fair curve and the sections are to be of suitable aerofoil section.

3.1.4 Results of detailed calculations where carried out, are to be submitted.

3.1.5 For cases where the composition of the propeller material is not specified in Table 7.2.1, or where propellers of the cast irons and carbon and low alloy steels shown in this Table are provided with an approved method of cathodic protection, special consideration will be given to the value of U .

3.1.6 The value U may be increased by 10 per cent for twin screw and outboard propellers of triple screw ships.

3.1.7 Where the design of a propeller has been based on analysis of reliable wake survey data in conjunction with a detailed fatigue analysis and is deemed to permit scantlings less than required by 3.1.1 or 3.1.3, a detailed stress computation for the blades is to be submitted for consideration.

3.2 Keyless propellers

3.2.1 The symbols used in 3.2.2 (oil injection method of fitting) and 3.2.3 to 3.2.7 (dry fitting cast iron sleeve) are defined as follows:

d_1 = diameter of the screwshaft cone at the mid-length of the boss or sleeve, in mm

d_2 = outside diameter of the sleeve at its mid-length, in mm

d_3 = outside diameter of the boss at its mid-length, in mm

d_i = bore diameter of screwshaft, in mm

$$h = \frac{2}{E_2} \left(\frac{1}{k_1^2 - 1} \right)$$

$$k_1 = \frac{d_2}{d_1}$$

$$k_2 = \frac{d_3}{d_2}$$

$$k_3 = \frac{d_3}{d_1}$$

$$l = \frac{d_i}{d_1}$$

$$p_1 = \frac{2M}{A_1\theta_1V_1} \left(-1 + \sqrt{1 + V_1 \left(\frac{F_1^2}{M^2} + 1 \right)} \right)$$

$$p_2 = \frac{2M}{A_2\theta_2V_2} \left(-1 + \sqrt{1 + V_2 \left(\frac{F_2^2}{M^2} + 1 \right)} \right)$$

$$p_{10} = \frac{2M}{A_1\theta_1V_1} \left(-1 + \sqrt{1 + V_1 \left(\frac{F_{10}^2}{M^2} + 1 \right)} \right)$$

$$p_{20} = \frac{2M}{A_2\theta_2V_2} \left(-1 + \sqrt{1 + V_2 \left(\frac{F_{20}^2}{M^2} + 1 \right)} \right)$$

A_1 = contact area of fitting at screwshaft, in mm²

A_2 = contact area of fitting at outside of sleeve, in mm²

$$B_1 = \frac{1}{E_2} \left(\frac{k_1^2 + 1}{k_1^2 - 1} + v_2 \right) + \frac{1}{E_1} \left(\frac{1 + l^2}{1 - l^2} - v_1 \right)$$

Propellers

Part 5, Chapter 7

Section 3

$$B_2 = \frac{1}{E_3} \left(\frac{k_2^2 + 1}{k_2^2 - 1} + \nu_3 \right) + \frac{1}{E_2} \left(\frac{k_1^2 + 1}{k_1^2 - 1} - \nu_2 \right)$$

$$B_3 = \frac{1}{E_3} \left(\frac{k_3^2 + 1}{k_3^2 - 1} + \nu_3 \right) + \frac{1}{E_1} \left(\frac{1 + l^2}{1 - l^2} - \nu_1 \right)$$

$C = 0$ for turbine installations

= vibratory torque at the maximum service speed
mean torque at the maximum service speed

for oil engine installations

E_1 = modulus of elasticity of screwshaft material, in N/mm² (kgf/mm²)

E_2 = modulus of elasticity of sleeve material, in N/mm² (kgf/mm²)

E_3 = modulus of elasticity of propeller material, in N/mm² (kgf/mm²)

$$F_1 = \frac{2Q}{d_1} (1 + C)$$

$$F_2 = \frac{2Q}{d_2} (1 + C)$$

$$F_{10} = \frac{2Q}{d_1} \left(1 + C + \frac{I_f}{100} \right)$$

$$F_{20} = \frac{2Q}{d_2} \left(1 + C + \frac{I_f}{100} \right)$$

I_f = percentage increase for Ice Class 1D, obtained from Ch 9,3.2.1

M = propeller thrust, in N (kgf)

Q = mean torque corresponding to P (H) and R as defined in Ch 1,3.3, in N mm (kgf mm)

T_1 = temperature at time of fitting propeller on shaft, in °C

T_2 = temperature at time of fitting sleeve into boss, in °C

$$V_1 = 0,51 \left(\frac{\mu_1}{\theta_1} \right)^2 - 1$$

$$V_2 = 0,51 \left(\frac{\mu_2}{\theta_2} \right)^2 - 1$$

$$Y = B_1 B_2 - h^2 k_1^2$$

α_1 = coefficient of linear expansion of screwshaft material, in mm/mm/°C

α_2 = coefficient of linear expansion of sleeve material, in mm/mm/°C

α_3 = coefficient of linear expansion of propeller material, in mm/mm/°C

θ_1 = taper of the screwshaft cone, but is not to exceed

$$\frac{1}{15} \text{ on the diameter, i.e. } \theta_1 \leq \frac{1}{15}$$

θ_2 = taper of the outside of the sleeve

μ_1 = coefficient of friction for fitting of boss assembly on shaft

= 0,13 for oil injection method of fitting

μ_2 = coefficient of friction for fitting sleeve into the boss

ν_1 = Poisson's ratio for screwshaft material

ν_2 = Poisson's ratio for sleeve material

ν_3 = Poisson's ratio for propeller material

Consistent sets of units are to be used in all formulae.

3.2.2 Where it is proposed to fit a keyless propeller by the oil shrink method, the pull-up, δ on the screwshaft is to be not less than:

$$\delta_T = \frac{d_1}{\theta_1} (\rho_1 B_3 + (\alpha_3 - \alpha_1)(35 - T_1)) \text{ mm}$$

or, where Ice Class notation is required, the greater of δ_T or δ_O , where

$$\delta_O = \frac{d_1}{\theta_1} (\rho_{10} B_3 - (\alpha_3 - \alpha_1) T_1) \text{ mm}$$

The yield stress or 0,2 per cent proof stress, σ_o of the propeller material is to be not less than:

$$\sigma_o = \frac{1,4}{B_3} \left(\frac{\theta_1 \delta_p}{d_1} + T_1 (\alpha_3 - \alpha_1) \right) \frac{\sqrt{3k_3^4 + 1}}{k_3^2 - 1} \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$$

where

δ_p = proposed pull-up at the fitting temperature

The start point load, W , to determine the actual pull-up is to be not less than:

$$W = A_1 \left(0,002 + \frac{\theta_1}{20} \right) \left(\rho_1 + \frac{18}{B_3} (\alpha_3 - \alpha_1) \right) \text{ N (kgf)}$$

3.2.3 Where a cast iron sleeve is first fitted to the bore of the propeller boss by an interference fit, the push-up load of the sleeve into the boss, W_2 , is to be not less than:

$$W_{2T} = \frac{A_2}{B_2} \left(\mu_2 + \frac{\theta_2}{2} \right) (B_2 \rho_2 - h \rho_1 + (\alpha_3 - \alpha_2)(35 - T_2)) \text{ N (kgf)}$$

or, where Ice Class notation is required, the greater of W_{2T} or W_{20} where

$$W_{20} = \frac{A_2}{B_2} \left(\mu_2 + \frac{\theta_2}{2} \right) (B_2 \rho_{20} - h \rho_{10} - (\alpha_3 - \alpha_2) T_2) \text{ N (kgf)}$$

The pull-up of the sleeve in the boss at the fitting temperature is to be in accordance with the following formula:

$$\delta_2 = \frac{W_2 B_2 d_2}{A_2 \left(\mu_2 + \frac{\theta_2}{2} \right) \theta_2} \text{ mm}$$

The push-up load, W_1 , of the combined boss and sleeve on a steel screwshaft is to be not less than:

$$W_{1T} = A_1 \left(\mu_1 + \frac{\theta_1}{2} \right) \left(\rho_1 + \frac{h k_1^2}{Y} (\alpha_3 - \alpha_2)(35 - T_1) \right) \text{ N (kgf)}$$

or where Ice Class notation is required, the greater of W_{1T} or W_{10} where

$$W_{10} = A_1 \left(\mu_1 + \frac{\theta_1}{2} \right) \left(\rho_{10} - \frac{h k_1^2}{Y} (\alpha_3 - \alpha_2) T_1 \right) \text{ N (kgf)}$$

The push-up distance of the combined boss and sleeve on a steel screwshaft is to be in accordance with the following formula:

$$\delta_1 = \frac{W_1 d_1 Y}{A_1 B_2 \theta_1 \left(\mu_1 + \frac{\theta_1}{2} \right)} \text{ mm}$$

Propellers

Part 5, Chapter 7

Sections 3 & 4

3.2.4 Where a cast iron sleeve is fitted into the boss by means of Araldite, the conditions are to satisfy those of 3.2.3 except that the value of W_2 is to be taken as equivalent to:

$$W_2 = A_2 \left(0,25 + \frac{\theta_2}{2} \right) \left(\rho_A + \frac{(\alpha_3 - \alpha_2)(18 - T_2)}{B_2} \right) \text{ N (kgf)}$$

where

$$\begin{aligned} \rho_A &= 3,5 \text{ N/mm}^2 \\ (\rho_A &= 0,35 \text{ kgf/mm}^2) \end{aligned}$$

3.2.5 For the triple element keyless propeller, the yield stress or 0,2 per cent proof stress of the propeller material, σ_o is to be not less than:

$$\sigma_o = 1,4\rho_3 \sqrt{\frac{3k_2^4 + 1}{k_2^2 - 1}} \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$$

where

$$\begin{aligned} \rho_3 &= \frac{W_1 h}{A_1 B_2 \left(\mu_1 + \frac{\theta_1}{2} \right)} + \frac{W_2}{A_2 \left(\mu_2 + \frac{\theta_2}{2} \right)} + \\ &\quad \frac{\alpha_3 - \alpha_2}{B_2} \left(T_2 + \frac{h^2 k_1^2}{Y} T_1 \right) \end{aligned}$$

3.2.6 Where the sleeve is manufactured of material having an elongation in excess of five per cent, the yield point or 0,2 per cent proof stress of the sleeve material, σ_o is to be not less than:

$$\sigma_o = \frac{1,6}{k_1^2 - 1} \sqrt{3k_1^4 (\rho_3 - \rho_5)^2 + (\rho_3 k_1^2 - \rho_5)^2} \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$$

or

$$\sigma_o = \frac{1,6}{k_1^2 - 1} \sqrt{3k_1^4 (\rho_4 - \rho_6)^2 + (\rho_4 k_1^2 - \rho_6)^2} \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$$

where

$$\rho_4 = \rho_3 - \frac{35B_1}{Y} (\alpha_3 - \alpha_2)$$

$$\rho_5 = \frac{W_1}{A_1 \left(\mu_1 + \frac{\theta_1}{2} \right)} + \frac{h k_1^2}{Y} (\alpha_3 - \alpha_2) T_1$$

$$\rho_6 = \rho_5 - \frac{35h k_1^2}{Y} (\alpha_3 - \alpha_2)$$

3.2.7 Where the sleeve is manufactured of material having an elongation not more than five per cent, the minimum specified ultimate tensile strength σ_u , based on the ruling section, is to be not less than:

$$\sigma_u = \frac{2,4}{k_1^2 - 1} \left(\rho_5 \left(\frac{5k_1^2 + 3}{4} \right) - 2\rho_3 k_1^2 \right) \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$$

or

$$\sigma_u = \frac{2,4}{k_1^2 - 1} \left(\rho_6 \left(\frac{5k_1^2 + 3}{4} \right) - 2\rho_4 k_1^2 \right) \text{ N/mm}^2 \text{ (kgf/mm}^2\text{)}$$

3.2.8 Where it is proposed to use a sleeve manufactured from a material other than cast iron, full details are to be submitted for consideration.

Section 4 Fitting of propellers

4.1 Propeller boss

4.1.1 The propeller boss is to be a good fit on the screw-shaft cone. The forward edge of the bore of the propeller boss is to be rounded to about a 6 mm radius. In the case of keyed propellers, the length of the forward fitting surface is to be about one diameter and where the fitting is by means of a hydraulic nut, the requirements of 4.2 and 4.3, where appropriate, are applicable.

4.2 Shop tests of keyless propellers

4.2.1 The bedding of the propeller, or the sleeve where applicable with the shaft, is to be demonstrated in the shop to the satisfaction of the Surveyors. Sufficient time is to be allowed for the temperature of the components to equalise before bedding. Alternative means for demonstrating the bedding of the propeller will be considered.

4.2.2 Means are to be provided to indicate the relative axial position of the propeller boss on the shaft taper.

4.3 Final fitting of keyless propellers

4.3.1 After verifying that the propeller and shaft are at the same temperature and the mating surfaces are clean and free from oil or grease, the propeller is to be fitted on the shaft to the satisfaction of the Surveyors. The propeller nut is to be securely locked to the shaft.

4.3.2 Permanent reference marks are to be made on the propeller boss, nut and shaft to indicate angular and axial positioning of the propeller. Care is to be taken in marking the inboard end of the shaft taper to minimise stress raising effects.

4.3.3 The outside of the propeller boss is to be hard stamped with the following details:

- For the oil injection method of fitting, the start point load and the axial pull-up at 0°C and 35°C.
- For the dry fitting method, the push-up load at 0°C and 35°C.

4.3.4 A copy of the fitting curve relative to temperature and means for determining any subsequent movement are to be placed on board.

Shaft Vibration and Alignment

Part 5, Chapter 8

Sections 1 & 2

Section

- 1 **General**
- 2 **Torsional vibration**
- 3 **Axial vibration**
- 4 **Lateral vibration**
- 5 **Shaft alignment**

1.2 Resilient mountings

- 1.2.1 For resilient mountings, see Ch 1,4.3.

1.3 Flexible couplings

- 1.3.1 Where the shafting system incorporates flexible couplings, the effects of such couplings on the various modes of vibration are to be considered, see Sections 2, 3 and 4.

■ Scope

The requirements of this Chapter are applicable to the following systems:

- (a) Main propulsion systems formed by oil engines, turbines or electric motors, directly driven or geared to the shafting.
- (b) Machinery driven at constant speed by oil engines, developing 110 kW and over, for essential auxiliary services including generator sets which are the source of power for main electric propulsion motors.

Unless otherwise advised, it is the responsibility of the Shipbuilder as main contractor to ensure, in co-operation with the Enginebuilders, that the information required by this Chapter is prepared and submitted.

■ Section 2 Torsional vibration

2.1 General

- 2.1.1 In addition to the shafting complying with the requirements of Chapters 1 to 7 and 20 (where applicable), approval is also dependent on the torsional vibration characteristics of the complete shafting system(s) being found satisfactory.

- 2.1.2 Further to the Scope of this Chapter, the requirements of this Section are not applicable to ships that are not:

- (a) required to comply with the *International Convention for the Safety at Sea, 1974*, as amended, (SOLAS); or
- (b) where a main engine does not have a power output exceeding 500 kW.

2.2 Particulars to be submitted

- 2.2.1 Torsional vibration calculations, showing the mass elastic values, associated natural frequencies and an analysis of the vibratory torques and stresses for the full dynamic system.

- 2.2.2 Particulars of the division of power and utilisation, throughout the speed range, for turbines, multi-engine or other combined power installations, and those with power take-off systems. For multi-engined installations, special considerations associated with the possible variations in the mode of operation and phasing of engines.

- 2.2.3 Enginebuilder's harmonic torque data used in the torsional vibration calculations, see 2.3.3.

- 2.2.4 Details of operating conditions encountered in service for prolonged periods, e.g. idling speed, range of trawling revolutions per minute, combinator characteristics for installations equipped with controllable pitch propellers.

- 2.2.5 Details, obtained from the manufacturers, of the principal characteristics of machinery components such as dampers and couplings, confirming their capability to withstand the effects of vibratory loading including, where appropriate, heat dissipation. Evidence that the data which is used to represent the characteristics of components, which has been quoted from other sources, is supported by a programme of physical measurement and control.

■ Section 1 General

1.1 Basic requirements

- 1.1.1 The systems are to be free from excessive torsional, axial, lateral and linear vibration, and are to be aligned in accordance with accepted tolerances and taking into account the requirements of 5.5.

- 1.1.2 System designs are to take account of the potential effects of engine and component malfunction and variability in characteristic values such as stiffness and damping of flexible couplings and dampers or engine misfire conditions.

- 1.1.3 Where torques, stresses or amplitudes are found to exceed the limits for continuous operation, restrictions in speed and/or power will be imposed.

- 1.1.4 Where significant changes are subsequently made to a dynamic system which has been approved, (e.g. by changing the original design parameters of the prime movers and/or propulsion shafting system or by fitting a propeller or flexible coupling of different design from the previous), revised calculations may require to be submitted for consideration. Details of all such changes are to be submitted.

Shaft Vibration and Alignment

Part 5, Chapter 8

Section 2

2.2.6 Where installations include electric motors, generators or non-integral pumps, drawings showing the principal dimensions of the shaft, together with manufacturer's estimates of mass moment of inertia for the rotating parts.

2.2.7 Details of vibration or performance monitoring proposals where required.

2.3 Scope of calculations

2.3.1 Calculations are to be carried out, by recognised techniques, for the full dynamic system formed by the oil engines, turbines, motors, generators, flexible couplings, gearing, shafting and propeller, where applicable, including all branches.

2.3.2 Calculations are to give due consideration to the potential deviation in values used to represent component characteristics due to manufacturing/service variability.

2.3.3 The calculations carried out on oil engine systems are to be based on the Enginebuilders' harmonic torque data (on request, Lloyd's Register (hereinafter referred to as 'LR') can provide a table of generalised harmonic torque components for use where appropriate). The calculations are to take account of the effects of engine malfunctions commonly experienced in service, such as a cylinder not firing (i.e. no injection but with compression) giving rise to the highest torsional vibration stresses in the shafting. Calculations are also to take account of a degree of imbalance between cylinders, which is characteristic of the normal operation of an engine under service conditions.

2.3.4 Whilst limits for torsional vibration stress in crankshafts are no longer stated explicitly, calculations are to include estimates of crankshaft stress at all designated operating/service speeds, as well as at any major critical speed.

2.3.5 Calculations are to take into account the possible effects of excitation from propeller rotation. Where the system shows some sensitivity to this phenomenon, propeller excitation data for the installation should be used as a basis for calculation, and submitted.

2.3.6 Where the torsional stiffness of flexible couplings varies with torque, frequency or speed, calculations should be representative of the appropriate range of effective dynamic stiffness.

2.4 Symbols and definitions

2.4.1 The symbols used in this Section are defined as follows:

- d = minimum diameter of shaft considered, in mm
- d_i = diameter of internal bore, in mm
- k = the factor used in determining minimum shaft diameter, defined in Ch 6,3.1.1 and 3.5.1
- r = ratio N/N_s or N_c/N_s whichever is applicable
- C_d = a size factor defined as $0,35 + 0,93d^{-0,2}$
- C_k = a factor for different shaft design features, see Table 8.2.1
- N = engine speed, in rev/min

- N_c = critical speed, in rev/min
- N_s = maximum continuous engine speed, in rev/min, or, in the case of constant speed generating sets, the full load speed, in rev/min
- Q_s = rated full load mean torque
- σ_u = specified minimum tensile strength of the shaft material, in N/mm²
- τ_c = permissible stress due to torsional vibrations for continuous operation, in N/mm²
- τ_t = permissible stress due to torsional vibrations for transient operation, in N/mm²
- e = slot width, in mm
- l = slot length, in mm.

Table 8.2.1 C_k factors

Intermediate shafts with	
Integral coupling flange and straight sections	1,0
Shrink fit coupling	1,0
Keyway, tapered connection	0,60
Keyway, cylindrical connection	0,45
Radial hole	0,50
Longitudinal slot	0,30 (see 2.4.4)
Thrust shafts external to engines	
On both sides of thrust collar	0,85
In way of axial bearing where a roller bearing is used as a thrust bearing	0,85
Propeller shafts	
Flange mounted or keyless taper fitted propellers	0,55
Key fitted propellers	0,55
Between forward end of aft most bearing and forward stern tube seal	0,80
NOTE	
The determination of C_k – factors for shafts other than shown in this Table will be specially considered by LR.	

2.4.2 Alternating torsional vibration stresses are to be based on half-range amplitudes of stress resulting from the alternating torque (which is superimposed on the mean torque) representing the synthesis of all harmonic orders present.

2.4.3 All vibration stress limits relate to the synthesis or measurement of total nominal torsional stress and are to be based on the plain section of the shafting neglecting stress raisers.

2.4.4 For a longitudinal slot $C_k = 0,3$ is applicable within the dimension limitations given in Pt 5 Ch 6,3.1.6. If the slot dimensions are outside these limitations, or if the use of another C_k is desired, the actual stress concentration factor (scf) is to be documented or determined from 2.4.5, in which case:

$$C_k = \frac{1,45}{scf}$$

Note that the scf is defined as the ratio between the maximum local principal stress and $\sqrt{3}$ times the nominal torsional stress (determined for the bored shaft without slots).

Shaft Vibration and Alignment

Part 5, Chapter 8

Section 2

2.4.5 Stress concentration factor of slots. The stress concentration factor (*scf*) at the ends of slots can be determined by means of the following empirical formulae:

$$scf = \alpha_{t(hole)} + 0,57 \frac{\frac{(l-e)}{d}}{\sqrt{\left(1 - \frac{d_i}{d}\right) \frac{e}{d}}}$$

This formula applies to:

- Slots at 120 or 180 or 360 degrees apart.
- Slots with semicircular ends. A multi-radii slot end can reduce the local stresses, but this is not included in this empirical formula.
- Slots with no edge rounding (except chamfering), as any edge rounding increases the *scf* slightly.

$\alpha_{t(hole)}$ represents the stress concentration of radial holes and can be determined as :

$$\alpha_{t(hole)} = 2,3 - 3 \frac{e}{d} + 15 \left(\frac{e}{d}\right)^2 + 10 \left(\frac{e}{d}\right)^2 \left(\frac{d_i}{d}\right)^2$$

where *e* = hole diameter, in mm

or simplified to $\alpha_{t(hole)} = 2,3$.

2.5 Limiting stress in propulsion shafting

2.5.1 The following stress limits apply to intermediate shafts, thrust shafts and to screwshafts fully protected from seawater. For screwshafts, the limits apply to the minimum sections of the portions of the screwshaft as defined in Ch 6,3.5.

2.5.2 In the case of unprotected screwshafts, special consideration will be given.

2.5.3 In no part of the propulsion shafting system may the alternating torsional vibration stresses exceed the values of τ_c for continuous operation, and τ_t for transient running, given by the following formulae:

$$\tau_c = \frac{\sigma_u + 160}{18} C_k C_d (3 - 2r^2) \text{ for } r < 0,9 \text{ N/mm}^2$$

$$\tau_c = \frac{\sigma_u + 160}{18} C_k C_d 1,38 \text{ for } 0,9 \leq r \leq 1,05 \text{ N/mm}^2$$

$$\tau_t = \pm 1,7 \tau_c \frac{1}{\sqrt{C_k}} \text{ for } r \leq 0,8 \text{ N/mm}^2$$

2.5.4 In general, the tensile strength of the steel used is to comply with the requirements of Ch 6,2. For the calculation of the permissible limits of stresses due to torsional vibration, σ_u is not to be taken as more than 800 N/mm² in the case of alloy steel intermediate shafts, or 600 N/mm² in the case of carbon and carbon-manganese steel intermediate thrust and propeller shafts.

2.5.5 Where the scantlings of coupling bolts and straight shafting differ from the minimum required by the Rules, special consideration will be given.

2.6 Generator sets

2.6.1 Natural frequencies of the complete set are to be sufficiently removed from the firing impulse frequency at the full load speed, particularly where flexible couplings are interposed between the engine and generator.

2.6.2 Within the speed limits of 0,95 N_s and 1,05 N_s the vibration stresses in the transmission shafting are not to exceed the values given by the following formula:

$$\tau_c = \pm (21 - 0,014d) \text{ N/mm}^2.$$

2.6.3 Vibration stresses in the transmission shafting due to critical speeds which have to be passed through in starting and stopping, are not to exceed the values given by the following formula:

$$\tau_t = 5,5 \tau_c.$$

2.6.4 The amplitudes of the total vibratory inertia torques imposed on the generator rotors are to be limited to $\pm 2,0Q_s$ in general, or to $\pm 2,5Q_s$ for close-coupled revolving field alternating current generators, over the speed range from 0,95 N_s to 1,05 N_s . Below 0,95 N_s the amplitudes are to be limited to $\pm 6,0Q_s$. Where two or more generators are driven from one engine, each generator is to be considered separately in relation to its own rated torque.

2.6.5 The rotor shaft and structure are to be designed to withstand these magnitudes of vibratory torque. Where it can be shown that they are capable of withstanding a higher vibratory torque, special consideration will be given.

2.6.6 In addition to withstanding the vibratory conditions over the speed range from 0,95 N_s to 1,05 N_s , flexible couplings, if fitted, are to be capable of withstanding the vibratory torques and twists arising from transient criticals and short-circuit currents.

2.6.7 In the case of alternating current generators, resultant vibratory amplitudes at the rotor are not to exceed $\pm 3,5$ electrical degrees under both full load working conditions and the malfunction condition mentioned in 2.3.3.

2.7 Other auxiliary machinery systems

2.7.1 The relevant requirements of 2.6.1, 2.6.2 and 2.6.3 are also applicable to other machinery installations such as pumps or compressors with the speed limits being taken as 0,95 N_s to 1,10 N_s .

2.8 Other machinery components

2.8.1 Torsional vibration dampers. The use of dampers or detuners to limit vibratory stress due to resonances which occur within the range between 0,85 N_s and 1,05 N_s are to be considered. If fitted, these should be of a type which makes adequate provision for dissipation of heat. Where necessary, performance monitoring may be required.

Shaft Vibration and Alignment

Part 5, Chapter 8

Section 2

2.8.2 Flexible couplings:

- (a) Flexible couplings included in an installation are to be capable of transmitting the mean and vibratory loads without exceeding the makers' recommended limits for angular amplitude or heat dissipation.
- (b) Where calculations indicate that the limits recommended by the manufacturer may be exceeded under misfiring conditions, a suitable means is to be provided for detecting and indicating misfiring. Under these circumstances power and/or speed restrictions may be required. Where machinery is non-essential, disconnection of the branch containing the coupling would be an acceptable action in the event of misfiring.

2.8.3 Gearing:

- (a) The torsional vibration characteristics are to comply with the requirements of 2.3. The sum of the mean and of the vibratory torque should not exceed four-thirds of the full transmission torque, at MCR, throughout the speed range. In cases where the proposed transmission torque loading on the gear teeth is less than the maximum allowable, special consideration will be given to the acceptance of additional vibratory loading on the gears.
- (b) Where calculations indicate the possibility of torque reversal, the operating speed range is to be determined on the basis of observations during sea trials.

2.9 Measurements

2.9.1 Where calculations indicate that the limits for torsional vibration within the range of working speeds are exceeded, measurements, using an appropriate technique, may be taken from the machinery installation for the purpose of approval of torsional vibration characteristics, or determining the need for restricted speed ranges, and the confirmation of their limits.

2.9.2 Where differences between calculated and measured levels of stress, torque or angular amplitude arise, the stress limits are to be applied to the stresses measured on the completed installation.

2.9.3 The method of measurement is to be appropriate to the machinery components and the parameters which are of concern. Where shaft stresses have been estimated from angular amplitude measurements, and are found to be close to limiting stresses as defined in 2.5, strain gauge techniques may be required. When measurements are required, detailed proposals are to be submitted.

2.10 Vibration monitoring

2.10.1 Where calculations and/or measurements have indicated the possibility of excessive vibratory stresses, torques or angular amplitudes in the event of a malfunction, vibration or performance monitoring, directly or indirectly, may be required.

2.11 Restricted speed and/or power ranges

2.11.1 Restricted speed and/or power ranges will be imposed to cover all speeds where the stresses exceed the limiting values, τ_c , for continuous running, including one-cylinder misfiring conditions if intended to be continuously operated under such conditions. For controllable pitch propellers with the possibility of individual pitch and speed control, both full and zero pitch conditions are to be considered. Similar restrictions will be imposed, or other protective measures required to be taken, where vibratory torques or amplitudes are considered to be excessive for particular machinery items. At each end of the restricted speed range the engine is to be stable in operation.

2.11.2 The restricted speed range is to take account of the tachometer speed tolerances at the barred speeds.

2.11.3 Critical responses which give rise to speed restrictions are to be arranged sufficiently removed from the maximum revolutions per minute to ensure that, in general, at $r = 0,8$ the stress due to the upper flank does not exceed τ_c .

2.11.4 Provided that the stress amplitudes due to a torsional critical response at the borders of the barred speed range are less than τ_c under normal and stable operating conditions the speed restriction derived from the following formula may be applied:

$$\frac{16}{18-r} N_c \text{ to } \frac{18-r}{16} N_c \text{ inclusive.}$$

2.11.5 Where calculated vibration stresses due to criticals below $0,8N_s$ marginally exceed τ_c or where the critical speeds are sharply tuned, the range of revolutions restricted for continuous operation may be reduced.

2.11.6 In cases where the resonance curve of a critical speed has been derived from measurements, the range of revolutions to be avoided for continuous running may be taken as that over which the measured vibration stresses are in excess of τ_c , having regard to the tachometer accuracy.

2.11.7 Where restricted speed ranges under normal operating conditions are imposed, notice boards are to be fitted at the control stations stating that the engine is not to be run continuously between the speed limits obtained as above, and the engine tachometers are to be marked accordingly.

2.11.8 Where vibration stresses approach the limiting value, τ_t , the range of revolutions restricted for continuous operation may be extended. The notice boards are to indicate that this range must be passed through rapidly.

2.11.9 For excessive vibratory torque, stress or amplitude in other components, based on 2.8.1 to 2.8.3, the limits of any speed/power restriction are to be such as to maintain acceptable levels during continuous operation.

2.11.10 Where the restrictions are imposed for the contingency of an engine malfunction or component failure, the limits are to be entered in the machinery Operating Manual.

Shaft Vibration and Alignment

Part 5, Chapter 8

Sections 2 & 3

2.11.11 Restricted speed ranges in one-cylinder misfiring conditions on ships with single engine propulsion are to enable safe navigation whereby sufficient propulsion power is available to maintain control of the ship.

2.11.12 There are to be no restricted speed ranges imposed above a speed ratio of $r = 0,8$ under normal operating conditions.

2.12 Tachometer accuracy

2.12.1 Where restricted speed ranges are imposed as a condition of approval, the tachometer accuracy is to be checked against the counter readings, or by equivalent means, in the presence of the Surveyors to verify that it reads correctly within ± 2 per cent in way of the restricted range of revolutions.

2.13 Governor control

2.13.1 Where there is a significant critical response above and close to the maximum service speed, consideration is to be given to the effect of temporary overspeed.

Section 3 Axial vibration

3.1 General

3.1.1 For all main propulsion shafting systems, the Shipbuilders are to ensure that axial vibration amplitudes are satisfactory throughout the speed range. Where natural frequency calculations indicate significant axial vibration responses, sufficiently wide restricted speed ranges will be imposed. Alternatively, measurements may be used to determine the speed ranges at which amplitudes are excessive for continuous running.

3.2 Particulars to be submitted

3.2.1 The results of calculations, together with recommendations for any speed restrictions found necessary.

3.2.2 Enginebuilder's recommendation for axial vibration amplitude limits at the non-driving end of the crankshaft or at the thrust collar.

3.2.3 Estimate of flexibility of the thrust bearing and its supporting structure.

3.2.4 The requirement for calculations to be submitted may be waived upon request provided evidence of satisfactory service experience of similar dynamic installations is submitted.

3.3 Calculations

3.3.1 Calculations of axial vibration natural frequency are to be carried out using appropriate techniques, taking into account the effects of flexibility of the thrust bearing, for shaft systems where the propeller is:

- (a) Driven directly by a reciprocating internal combustion engine.
- (b) Driven via gears, or directly by an electric motor, and where the total length of shaft between propeller and thrust bearing is in excess of 60 times the intermediate shaft diameter.

3.3.2 Where an axial vibration damper is fitted, the calculations are to consider the effect of a malfunction of the damper.

3.3.3 For those systems as defined in 3.3.1(b) the propeller speed at which the critical frequency occurs may be estimated using the following formula:

$$\frac{0,98}{N} \left(\frac{ab}{a+b} \right)^{1/2} \text{ rev/min}$$

where

$$a = \frac{E}{G l^2} (66,2 + 97,5A - 8,88A^2)^2 \text{ (c/min)}^2$$

$$b = 91,2 \frac{k}{M_e} \text{ (c/min)}^2$$

d = internal diameter of shaft, in mm

k = estimated stiffness at thrust block bearing, in N/m

l = length of shaft line between propeller and thrust bearing, in mm

m = mass of shaft line considered, in kg
 $= 0,785 (D^2 - d^2) G l$

$$A = \frac{m}{M}$$

D = outside diameter of shaft, taken as an average over length l , in mm

E = modulus of elasticity of shaft material, in N/mm²

G = density of shaft material, in kg/mm³

M = dry mass of propeller, in kg

$M_e = M (A + 2)$

N = number of propeller blades

Where the results of this method indicate the possibility of an axial vibration resonance in the vicinity of the maximum service speed, calculations using a more accurate method will be required.

3.4 Measurements

3.4.1 Where calculations indicate the possibility of excessive axial vibration amplitudes within the range of working speeds under normal or malfunction conditions, measurements are required to be taken from the shafting system for the purpose of determining the need for restricted speed ranges.

Shaft Vibration and Alignment

Part 5, Chapter 8

Sections 3, 4 & 5

3.5 Restricted speed ranges

3.5.1 The limits of any speed restriction are to be such as to maintain axial amplitudes within recommended levels during continuous operation.

3.5.2 Limits of a speed restriction, where required, may be determined by calculation or on the basis of measurement.

3.5.3 Where a speed restriction is imposed for the contingency of a damper malfunction, the speed limits are to be entered in the machinery Operating Manual and regular monitoring of the axial vibration amplitude is required. Details of proposals for monitoring are to be submitted.

3.6 Vibration monitoring

3.6.1 Where a vibration monitoring system is to be specified, details of proposals are to be submitted.

Section 4 Lateral vibration

4.1 General

4.1.1 For all main propulsion shafting systems, the Shipbuilders are to ensure that lateral vibration characteristics are satisfactory throughout the speed range.

4.2 Particulars to be submitted

4.2.1 Calculations of the lateral vibration characteristics of shafting systems having supports outboard of the hull or incorporating cardan shafts are to be submitted.

4.3 Calculations

4.3.1 The calculations in 4.2.1, taking account of bearing, oil-film (where applicable) and structural dynamic stiffnesses, are to investigate the excitation frequencies giving rise to all critical speeds which may result in significant amplitudes within the speed range, and are to indicate relative deflections and bending moments throughout the shafting system.

4.3.2 The calculated natural frequencies of the system are to be compared to both the shaft rotational orders and propeller blade passing frequencies. Where cardan shafts are fitted, the shaft second rotational orders are also to be considered.

4.3.3 Requirements for calculations may be waived upon request provided evidence of satisfactory service experience of similar dynamic installations is submitted.

4.4 Measurements

4.4.1 Where calculations indicate the possibility of significant lateral vibration responses within the range of ± 20 per cent of the M.C.R. speed, measurements using an appropriate recognised technique may be required to be taken from the shafting system for the purpose of determining the need for restricted speed ranges.

4.4.2 The method of measurement is to be appropriate to the machinery arrangement and the modes of vibration which are of concern. When measurements are required, detailed proposals are to be submitted in advance.

Section 5 Shaft alignment

5.1 General

5.1.1 Shaft alignment calculations are to be carried out for main propulsion shafting rotating at propeller speed, including the crankshaft of direct drive systems or the final reduction gear wheel on geared installations. The Builder is to make available shaft alignment procedures detailing the proposed alignment method and checks for these arrangements.

5.2 Particulars to be submitted for approval – shaft alignment calculations

5.2.1 Shaft alignment calculations are to be submitted to LR for approval for the following shafting systems:

- All geared installations, where the screwshaft has a diameter of 300 mm or greater in way of the aftmost bearing.
- All direct drive installations which incorporate 3 or less bearings supporting the intermediate and screwshaft aft of the prime mover.
- Where prime movers or shaftline bearings are installed on resilient mountings.
- All systems where the screwshaft has a diameter of 800 mm or greater in way of the aftmost bearing.

5.2.2 The shaft alignment calculations are to take into account the:

- thermal displacements of the bearings between cold static and hot dynamic machinery conditions;
- buoyancy effect of the propeller immersion due to the ship's operating draughts;
- effect of predicted hull deformations over the range of the ship's operating draughts, where known;
- effect of filling the aft peak ballast tank upon the bearing loads, where known;
- gear forces, where appropriate, due to prime-mover engagement on multiple-input single-output installations;
- propeller offset thrust effects;
- maximum allowed bearing wear, for water or grease-lubricated sterntube bearings, and its effect on the bearing loads.

Shaft Vibration and Alignment

Part 5, Chapter 8

Section 5

5.2.3 The shaft alignment calculations are to state the:

- (a) expected bearing loads at light and normal ballast, fully loaded and any other draughts deemed to be part of the ship's operating profile, for the machinery in cold and hot, static and dynamic conditions;
- (b) bearing influence coefficients and the deflection, slope, bending moment and shear force along the shaftline;
- (c) details of propeller offset thrust;
- (d) details of proposed slope-bore of the aftermost stern-tube bearing, where applicable;
- (e) manufacturer's specified limits for bending moment and shear force at the shaft couplings of the gearbox/prime movers;
- (f) estimated bearing wear-down rates for water or grease-lubricated stern-tube bearings;
- (g) expected hull deformation effects and their origin, viz. whether finite element calculations or measured results from sister or similar ships have been used;
- (h) anticipated thermal rise of prime movers and gearing units between cold static and hot running conditions; and
- (j) manufacturer's allowable bearing loads.

5.3 Shaft alignment procedures

5.3.1 A shaft alignment procedure is to be made available for review and for the information of the attending surveyors for all main propulsion installations detailing, as a minimum,

- (a) expected bearing loads at light and normal ballast, fully loaded and any other draughts deemed to be part of the ship's operating profile, for the machinery in cold and hot, static and dynamic conditions;
- (b) maximum permissible loads for the proposed bearing designs;
- (c) design bearing offsets from the straight line;
- (d) design gaps and sags;
- (e) location and loads for the temporary shaft supports;
- (f) expected relative slope of the shaft and the bearing in the aftermost stern-tube bearing;
- (g) details of slope-bore of the aftermost stern-tube bearing, where applied;
- (h) proposed bearing load measurement technique and its estimated accuracy;
- (j) jack correction factors for each bearing where the bearing load is measured using a specified jacking technique;
- (k) proposed shaft alignment acceptance criteria, including the tolerances; and
- (l) flexible coupling alignment criteria.

5.4 Design and installation criteria

5.4.1 For main propulsion installations, the shafting is to be aligned to give, in all conditions of ship loading and machinery operation, bearing load distribution satisfying the requirements of 5.4.2.

5.4.2 Design and installation of the shafting is to satisfy the following criteria:

- (a) The Builder is to position the bearings and construct the bearing seatings to minimise the effects of hull deflections under any of the ship's operating conditions with the aim of optimising the bearing load distribution.
- (b) Relative slope between the propeller shaft and the aftermost stern-tube bearing is, in general, not to exceed 3×10^{-4} rad in the static condition.
- (c) Stern-tube bearing loads are to satisfy the requirements of Ch 6,3.12.
- (d) Evidence is to be provided to LR demonstrating that bearings of synthetic material have been verified as being within the tolerance stated by the bearing manufacturer for diameter, ovality, and straightness after installation.
- (e) Bearings of synthetic material are to be verified as being within tolerance for ovality and straightness, circumferentially and longitudinally, after installation.
- (f) The stern-tube forward bearing static load is to be sufficient to prevent unloading in all static and dynamic operating conditions, including the transient conditions experienced during manoeuvring turns and during operation in heavy weather.
- (g) Intermediate shaft bearings' loads are not to exceed 80 per cent of the bearing manufacturer's allowable maximum load, for plain journal bearings, based on the bearing projected area.
- (h) Equipment manufacturer's bearing loads are to be within the manufacturer's specified limits, i.e. prime movers, gearing.
- (j) Resulting shear forces and bending moments are to meet the equipment manufacturer's specified coupling conditions.
- (k) The manufacturer's radial, axial and angular alignment limits for the flexible couplings are to be maintained.

5.5 Measurements

5.5.1 The system bearing load measurements are to be carried out to verify that the design loads have been achieved. In general the measurements will be carried out by the jack-up measurement technique using calibrated equipment.

5.5.2 For the first vessel of a new design an agreed programme of static shaft alignment measurements is to be carried out in order to verify that the shafting has been installed in accordance with the design assumptions and to verify the design assumptions in respect of the hull deflections and the effects of machinery temperature changes. The programme is to include static bearing load measurements in a number of selected conditions. Depending on the ship type and the operational loading conditions that are achievable prior to and during sea trials these should include, where practicable, combinations of light ballast cold, full ballast cold, full ballast hot and full draught hot with aft peak tank empty and full.

Shaft Vibration and Alignment

Part 5, Chapter 8

Section 5

5.5.3 For vessels of an existing design or similar to an existing design where evidence of satisfactory service experience is submitted for consideration and for subsequent ships in a series a reduced set of measurements may be accepted. In such cases the minimum set of measurements is to be sufficient to verify that the shafting has been installed in accordance with the design assumptions and are to include at least one cold and one hot representative condition.

5.5.4 Where calculations indicate that the system is sensitive to changes in alignment under different service conditions, the shaft alignment is to be verified by measurements during sea trials using an approved strain gauge technique.

5.6 Flexible couplings

5.6.1 Where the shafting system incorporates flexible couplings, the effects of such couplings on the various modes of vibration are to be considered, see Sections 2, 3 and 4.

■ Section 1 Scope

1.1 General

1.1.1 This Chapter applies to podded propulsion units where used for propulsion, dynamic positioning duty or as the sole means of steering.

1.1.2 For the purposes of these Rules, a podded propulsion unit is any propulsion or manoeuvring device that is external to the normal form of the ship's hull and houses a propeller powering device.

1.1.3 The requirements of this Chapter relate to podded propulsion units powered by electric propulsion motors. Podded propulsion units with other drive arrangements will be subject to individual consideration.

1.1.4 The structural requirements stated in 5.1, 5.2 and 5.3 relate to podded propulsion units having a pod body with single supporting strut with or without an integral slewing ring arrangement, see Fig. 9.1.1. Novel and unconventional arrangements will be subject to individual consideration. In such cases, the designers are advised to contact LR in the early stages of the design for advice on the manner and content of design information required for formal classification appraisal.

1.1.5 The aft end structures associated with podded installations are to be examined with respect to potential slamming, see Pt 4, Ch 2.

Fig. 9.1.1 Podded propulsion unit

1.1.6 It is the shipbuilder's responsibility to ensure that all installed equipment is suitable for operation in the location and under all anticipated environmental conditions associated with the design of the ship which is to include temperature, humidity, vibration and impulsive accelerations.

1.1.7 The design of a podded propulsor system is to take into account a range of operating conditions which are to include the following:

- All ahead seagoing conditions up to and including the maximum rated output of the podded propulsor while maintaining a steady course under foreseeable sea and wind conditions.
- The ability of the ship to change direction rapidly at the declared steering angles with the ship running at maximum ahead service speed.
- Executing a steady turning manoeuvre with a tactical diameter not greater than $5L$ and advance not greater than $4,5L$ whilst maintaining a power corresponding to the test speed, where L is the length measured between the aft and forward perpendiculars. Test speed is defined as a speed of at least 90 per cent of the ship's speed corresponding to 85 per cent of the maximum rated power of the podded propulsor.
- Changing heading, manoeuvring in and out of harbour both ahead and astern, at slow speeds, stationary and starting from rest in foreseeable current and wind conditions.
- Berthing manoeuvres in the case of azimuthing podded propulsion units.
- Rapid acceleration and deceleration manoeuvres where the ship's operating profile demands this capability.
- Holding stationary positions over-ground under different conditions.
- Stopping manoeuvre as required by Ch 1,5.2.
- Manoeuvring in ice where ice class is required.

Podded Propulsion Units

Part 5, Chapter 9

Section 2

Section 2

General requirements

2.1 Pod arrangement

2.1.1 In general, for a ship to be assigned an unrestricted service notation, a minimum of two podded propulsion units are to be provided where these form the sole means of propulsion. For vessels where a single podded propulsion unit is the sole means of propulsion, an evaluation of a detailed engineering and safety justification will be conducted by LR, see 2.2.2. This evaluation process will include the appraisal of a Failure Modes and Effects Analysis (FMEA) to verify that sufficient levels of redundancy and monitoring are incorporated in the podded propulsion unit's essential support systems and operating equipment.

2.2 Plans and information to be submitted

2.2.1 In addition to the plans required by Chapters 5, 6, 7, 8, 14 and 19, and Pt 6, Ch 1 and Ch 2, the following plans and information are required to be submitted for appraisal:

- Description of the ship's purpose/capabilities together with the pod's intended operational modes in support of these capabilities.
- Power transmitted at MCR condition (shaft power and rpm) and other maximum torque conditions, e.g. bollard pull.
- Maximum transient thrust, torque and other forces and moments experienced during all envisaged operating modes as permitted by the steering and propulsor drive control systems.
- Details of the electric propulsion motor short-circuit torque and motor air gap tolerance.
- Sectional assembly in the Z-X plane, see Fig. 9.2.1.
- Specifications of materials and NDE procedures for components essential for propulsion and steering operation to include propulsion shaft and slewing ring bearings, gearing and couplings, see 4.1.
- Details of intended manoeuvring capability of the ship in each operating condition. (To be declared by the shipyard, see also 3.1.1).
- Design loads for both the pod structure and propeller together with podded propulsion unit design operating modes, see 2.4.1, 6.3.7, 6.6.5 and 6.6.6.
- Supporting data and direct calculation reports. This is to include, where applicable, an assessment of anticipated global accelerations acting on the ship's machinery and equipment which may potentially affect the reliable operation of the propulsion system for all foreseeable seagoing and operating conditions. Typically, this may include response to slamming, extreme ship motions and pod interaction. See also 1.1.5.
- Structural component details including: strut, pod body, bearing supports, bearing end caps, ship's structure in way of podded propulsion unit integration and a welding Table showing a key to weld symbols used on the plans specifying weld size, type, preparation and heat treatment. The information should include the following:
 - Detailed drawings showing the structural arrangement, dimensions and scantlings.
 - Welding and structural details.

Fig. 9.2.1 Pod co-ordinate system

- Connections between structural components (bolting).
 - Casting's chemical and mechanical properties.
 - Forging's chemical and mechanical properties.
 - Material grades for plate and sections.
- Nozzle structure, its support arrangements, together with related calculations for all permitted operating conditions where the propeller operates in a nozzle (duct), see Pt 3, Ch 13.3.
 - Propeller shaft bearing mounting and housing arrangement details, see also 6.3.6.
 - Details of propeller shaft and steering bearings, where roller bearings are used supporting calculations are to be submitted, see 6.3.7 and 6.6.6.
 - Propeller shaft seal details.
 - Details of propeller shaft and pod steering securing/locking and means of aligning the securing/locking arrangements.
 - Cooling systems piping system schematic.
 - Details of any lubricating oil conditioning systems (filtering/cooling/heating) and control arrangements necessary to ensure the continuous availability of the required lubricating oil quality to the propeller shaft bearings.
 - Details of installed condition monitoring equipment.
 - Details of the derivation of any duty factor used in the design of the steering gears.
 - Identification of any potentially hazardous atmospheric conditions together with details of how the hazard will be countered, this should include a statement of the maximum anticipated air temperature within the pod during full power steady state operation, see 2.3.
 - Where provided, access and closing arrangements for pod unit inspection and maintenance.
 - Heat balance calculations for pods having an electric propulsion motor but no active cooling system, see 6.7.4.
 - Details of proposed testing and trials required by Section 9.
 - Details of emergency steering and pod securing arrangements. See 6.3.11.

Podded Propulsion Units

Part 5, Chapter 9

Section 2

2.2.2 Where an engineering and safety justification report is required, the following supporting information is to be submitted:

- A Failure Mode and Effects Analysis (FMEA), see 2.5.
- Design standards and assumptions.
- Limiting operating parameters.
- A statement and evidence in respect of the anticipated reliability of any non-duplicated components.

2.2.3 Recommended installation, inspection, maintenance and component replacement procedures (see also 5.1.2). This is to include any in-water/underwater engineering procedures where recommended by the pod manufacturer. See also 6.5.7 and Section 10.

2.3 Pod internal atmospheric conditions

2.3.1 Machinery and electrical equipment installed within the pod unit are to be suitable for operation, without degraded performance, at the maximum anticipated air temperature and humidity conditions within the pod unit with the pod operating at its maximum continuous rating in sea water of not less than 32°C after steady state operating conditions have been achieved.

2.3.2 Precautions are to be taken to prevent as far as reasonably practicable the possibility of danger to personnel and damage to equipment arising from the development of hazardous atmospheric conditions within the pod unit. Circumstances that may give rise to these conditions are to be identified and the counter measures taken are to be defined.

2.4 Global loads

2.4.1 The overall strength of the podded propulsion unit structure is to be based upon the maximum anticipated in-service loads, including the effects of ship manoeuvring and of ship motion (see Table 14.8.1 in Pt 3, Ch 14). This is to include the effects of any pod to pod and/or pod to ship hydrodynamic interference effects. The designer is to supply the following maximum load and moment values to which the unit may be subjected with a description of the operating condition at which they occur.

- F_x , Force in the longitudinal direction;
- F_y , Force in the transverse direction;
- F_z , self weight, in water, augmented by the ship's pitch and heave motion and flooded volume where applicable, see Pt 3, Ch 14;
- M_x , moment at the slewing ring about the pod unit's global longitudinal axis;
- M_y , moment at the slewing ring about the pod unit's global transverse axis;
- M_z , moment at the slewing ring about the pod unit's vertical axis (maximum dynamic duty steering torque on steerable pods).

The directions of the X, Y and Z axes, with the origin at the centre of the slewing ring, are shown in Fig. 9.2.1.

2.4.2 Where the maximum forces and moments defined in 2.4.1 cannot be accurately calculated, then, an estimate of these loadings is to be stated together with an assessment of the associated error tolerances for the sequences of permitted design manoeuvres, see 1.1.7. Typically this will include emergency astern manoeuvres, zig zag manoeuvres and pod interaction. Such estimates are to be defined on a load versus pod angle basis. In the case of pod to pod and/or pod to ship hydrodynamic interaction effects these, must be defined for the most severely affected propulsor.

2.4.3 Where control systems are installed to limit the operation of the podded drive to defined angles at defined ship speeds, this information may be taken into consideration when determining the pod unit loading.

2.4.4 Where pod units are fixed about their Z axis, then maximum global loads, to be used as the basis of the structural appraisal, are to be determined for inflows in 5 degree increments between the extremes of anticipated inflow angle during manoeuvring with ship at full speed and maximum propeller thrust.

2.4.5 The podded propulsor is to be capable of withstanding a blade root failure due to fatigue occurring at the maximum rated output of the podded propulsor without initiating a failure in other parts of the propulsor system.

2.5 Failure Modes and Effects Analysis (FMEA)

2.5.1 An FMEA is to be carried out where a single podded propulsion unit is the vessel's sole means of propulsion, see 2.1.1. The FMEA is to identify components where a single failure could cause loss of all propulsion and/or steering capability and the proposed arrangements for preventing and mitigating the effects of such a failure.

2.5.2 The FMEA is to be carried out using the format presented in Table 22.2.1 in Chapter 22 or an equivalent format that addresses the same reliability issues. Analyses in accordance with IEC 60812, *Analysis techniques for system reliability – Procedure for failure mode and effects analysis (FMEA)*, or IMO MSC Resolution 36(63) Annex 4 – *Procedures for Failure Mode and Effects Analysis*, would be acceptable.

2.5.3 The FMEA is to be organised in terms of equipment and function. The effects of item failures at a stated level and at higher levels are to be analysed to determine the effects on the system as a whole. Actions for mitigation of the effects of failure are to be determined, see 2.5.1.

2.5.4 The FMEA is to:

- identify the equipment or sub-system and mode of operation;
- identify potential failure modes and their causes;
- evaluate the effects on the system of each failure mode;
- identify measures for reducing the risks associated with each failure mode;
- identify measures for preventing failure; and
- identify trials and testing necessary to prove conclusions.

Podded Propulsion Units

Part 5, Chapter 9

Sections 2 to 5

2.5.5 At sub-system level it is acceptable, for the purpose of these Rules, to consider failure of equipment items and their functions, e.g. failure of a pump to produce flow or pressure head. It is not required that the failure of components within that pump be analysed. In addition, their failure need only be dealt with as a cause of failure of the pump.

2.5.6 Where FMEA is used for consideration of systems that depend on software-based functions for control or co-ordination, the analysis is to investigate failure of the functions rather than a specific analysis of the software code itself.

2.6 Ice Class requirements

2.6.1 Where an ice class notation is included in the class of a ship, additional requirements as detailed in Part 8 are to be complied with as applicable.

Section 3 Functional capability

3.1 General

3.1.1 The arrangement of podded propulsion units is to be such that the ship can be satisfactorily manoeuvred to a declared performance capability. The operating conditions covered are to include the following:

- (a) Maximum continuous shaft power/speed to the propeller in the ahead condition at the declared steering angles and sea conditions.
- (b) Manoeuvring speeds of the propeller shaft in the ahead and astern direction at the declared steering angles and sea conditions.
- (c) The stopping manoeuvre described in Ch 1,5.2.2(b).
- (d) All astern running conditions for the ship.
- (e) Manoeuvring in ice where ice class is required.

3.1.2 In general, the steering mechanism is to be capable of turning the pod between the declared steering angle limits at an average rotational speed of not less than 0,4 rev/min with the ship initially operating at its maximum ahead service speed.

3.1.3 The steering mechanism for podded units used for Dynamic Positioning applications with an associated class notation, is to be capable of a rotational speed of not less than 1,5 rev/min.

Section 4 Materials

4.1 General

4.1.1 The materials used for major structural and machinery components are to be manufactured and tested in accordance with the requirements of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials). These components include hull support structure, pod body, pod strut, shafting and propellers.

4.1.2 Components of novel design or components manufactured from materials not covered by the Rules for Materials are to be subject to evaluation and approval by Lloyd's Register (hereinafter referred to as 'LR') prior to manufacture.

4.1.3 Material specifications, see 2.2.1(f), for propulsion shaft and slewing ring bearings, gearing and couplings are to be approved by LR prior to manufacture. The specification is to include details of the grade of material, including the target range of chemical composition that is to be reported on the certificate, the required mechanical properties, heat treatment details including temperatures and hold times, details of necessary non-destructive examinations including acceptance levels. Additionally, any steel cleanliness or microstructure requirements are to be included. These components are to be manufactured under survey.

4.1.4 For propulsion shaft rolling element bearings, the amount of retained austenite is to be determined and is not to exceed 4 per cent for nominally bainitic structures.

4.1.5 Where load carrying threaded fasteners screw directly into structural castings, the integrity of the casting is to be such that there is no porosity or shrinkage in the area of the connection.

Section 5 Structure design and construction requirements

5.1 Pod structure

5.1.1 Podded unit struts and pod bodies may be of cast, forged or fabricated construction or a combination of these construction methods.

5.1.2 Means are to be provided to enable the shaft, bearings and seal arrangements to be examined in accordance with LR's requirements and the manufacturer's recommendations.

Podded Propulsion Units

Part 5, Chapter 9

Section 5

5.1.3 When high tensile steel fasteners are used as part of the structural arrangement and there is a risk that these fasteners may come into contact with sea-water, carbon-manganese and low alloy steels with a specified tensile strength of greater than 950 N/mm² are not to be used due to the risk of hydrogen embrittlement.

5.1.4 For steerable pod units, an integral slewing ring is to be arranged at the upper extremity of the strut to provide support for the slewing bearing.

5.1.5 The strut is to have a smooth transition from the upper mounting to the lower hydrodynamic sections.

5.1.6 For fabricated structures, vertical and horizontal plate diaphragms are to be arranged within the strut and, where necessary, secondary stiffening members are to be arranged.

5.1.7 Pod unit structure scantling requirements are shown in Table 9.5.1. Where the scantling requirements in Table 9.5.1 cannot be satisfied, direct calculations carried out in accordance with 5.3 may be considered.

5.1.8 The connection between the strut and the pod body should generally be effected through large radiused fillets in cast pod units or curved plates in fabricated pod units.

5.1.9 The structural response under the most onerous combination of loads is not to exceed the normal operational requirements of the propulsion or steering system components.

5.1.10 For cast pod structures, the elongation of the material on a gauge length of $5,65 \sqrt{S_0}$ is to be not less than 12 per cent where S_0 is the actual cross sectional area of the test piece.

5.1.11 In castings, sudden changes of section or possible constriction to the flow of metal during casting are to be avoided. All fillets are to have adequate radii, which should, in general, be not less than 75 mm.

5.1.12 Castings are to comply with the requirements of Chapters 4 or 7 of the Rules for Materials.

5.2 Hull support structure

5.2.1 For supporting the main slewing bearing outer races, a system of primary structural members is to be provided in order to transfer the maximum design loads and moments from the podded propulsion unit into the ship's hull without undue deflection. Due account is also to be taken of the loads induced by the maximum ship's motions in the vertical direction resulting from combined heave and pitch motion of the ship. Account is also to be taken of any manoeuvring conditions that are likely to give rise to high mean or vibratory loadings induced by the podded propulsion unit. See 2.2.1(c).

Table 9.5.1 Podded propulsion unit – fabricated structure requirements

Location	Requirement	Notes
Strut external shell plating	Thickness, in mm, is to be not less than: $t = 0,0063s f (h_7 k)^{0,5}$	The minimum thickness of plating diaphragms and primary webs within the strut is to be not less than the Rule requirement for the strut external plating. For internal diaphragms, panel stiffening is to be provided where the ratio of spacing to plate thickness (s/t) exceeds 100. Where there are no secondary members, s is to be replaced by S.
Strut primary framing	The section modulus in cm ³ is to be not less than: $z = 7,75h_7 l_e^2 S k$	This does not apply to full breadth plate diaphragms.
Strut secondary stiffening	The section in cm ³ is to be not less than: $z = 0,0056h_7 l_e^2 s k$	This does not apply to full breadth plate diaphragms.
Cylindrical pod body external shell plating	Thickness, in mm, is to be not less than: $t = 3,0R_g (h_7 k)^{0,5}$	Not to be less than the Rule basic shell end thickness from Table 3.2.1 in Pt 3, Ch 3,2
Symbols		
f = panel aspect ratio correction factor = $[1,1 - s/(2500S)]$ h_7 = $(T + C_w + 0.014V^2)$ k = local higher tensile steel factor, as in Pt 3, Ch 2 l_e = effective span of the member under consideration, in metres s = the frame spacing of secondary members, in mm C_w = design wave amplitude, in metres, as in Pt 4, Ch 1,1.5 R_g = mean radius of pod body tube, in metres S = the spacing of primary members, in metres T = the vessel scantling draft, in metres, as in Pt 3, Ch 1,6.1 V = ship service speed, in knots, as in Pt 3, Ch 1,6.1.		

5.2.2 The hull support structure in way of the slewing bearing should be sufficiently stiff that the bearing manufacturer's limits on seating flatness are not exceeded due to hull flexure as a consequence of the loads defined under 5.2.1.

5.2.3 Generally, the system of primary members is to comprise a pedestal girder directly supporting the slewing ring and bearing. The pedestal girder is to be integrated with the ship's structure by means of radial girders and transverse aligned at their outer ends with the ship's bottom girders and transverse, see Fig. 9.5.1. Proposals to use alternative arrangements that provide an equivalent degree of strength and rigidity may be submitted for appraisal.

5.2.4 The ship's support structure in way of the podded unit may be of double or single bottom construction. Generally, podded drives should be supported where practical within a double bottom structure; however final acceptance of the supporting arrangements will be dependent upon satisfying the stress criteria set out in Table 9.5.2, see also 5.3.5.

5.2.5 The shell envelope plating and tank top plating in way of the aperture for the podded drive (i.e. over the extent of the radial girders shown in Fig. 9.5.1) are to be increased by 50 per cent over the Rule minimum thickness to provide additional local stiffness and robustness. However the thickness of this plating is not to be less than the actual fitted thickness of the surrounding shell or tank top plating.

5.2.6 The scantlings of the primary support structure in way of the podded drive are to be based upon the limiting design stress criteria specified in Table 9.5.2, see also 5.3.5. Primary member scantlings are, however, not to be less than those required by Pt 3, Ch 6,5.

Fig. 9.5.1 Hull support structure

5.2.7 The pedestal girder is to have a thickness not less than the required shell envelope minimum Rule thickness in way. Where abutting plates are of dissimilar thickness then the taper requirements of Pt 3, Ch 10,2 are to be complied with.

5.2.8 In general, full penetration welds are to be applied at the pedestal girder boundaries and in way of the end connections between the radial girders and the pedestal girder. Elsewhere, for primary members, double continuous fillet welding is to be applied using a minimum weld factor of 0,34.

5.3 Direct calculations

5.3.1 Finite element or other direct calculation techniques may be employed in the verification of the structural design. The mesh density used is to be sufficient to accurately demonstrate the response characteristics of the structure and to provide adequate stress and deflection information. A refined mesh density is to be applied to geometry transition areas and those locations where high localised stress or stress gradients are anticipated.

Table 9.5.2 Direct calculation maximum permissible stresses for steel fabricated structures

Permissible stress values		
Location	Podded drive structure	Podded drive/hull interface
X-Y shear stress	0,26σ ₀	0,35σ ₀
Direct stress due to bending	0,33σ ₀	0,63σ ₀
Von Mises stress	0,40σ ₀	0,75σ ₀
Localised Von Mises peak stresses	σ ₀	σ ₀
Symbols		
σ ₀ = minimum yield strength of the material		
NOTES 1. The values stated above are intended to give an indication of the levels of stress in the pod and ship structure for the maximum loads which could be experienced during normal service. 2. If design is based on extreme or statistically low probability loads, then proposals to use alternative acceptance stress criteria may be considered.		

Podded Propulsion Units

Part 5, Chapter 9

Sections 5 & 6

5.3.2 Model boundary constraints are generally to be applied in way of the slewing ring/ship attachment only.

5.3.3 The loads applied to the mathematical model, see 2.4.1, are to include the self weight, dynamic acceleration due to ship motion, hydrodynamic loads, hydrostatic pressure, propeller forces and shaft bearing support forces. In situations where a pod can operate in the flooded conditions or where flooding of a pod adds significant mass to the pod, details are to be included.

5.3.4 Based on the most onerous combination of normal service loading conditions, the stress criteria shown in Table 9.5.2 are not to be exceeded. See also 2.2.1(c).

5.3.5 Where the structural design is based on a fatigue assessment and the stress criteria shown in Table 9.5.2 are not applicable, details of cumulative load history and stress range together with the proposed acceptance criteria are to be submitted for consideration.

5.3.6 For cast structures, the localised von Mises stress should not exceed 0,6 times the nominal 0,2 per cent proof or yield stress of the material for the most onerous design condition.

6.3.2 There is to be no significant lateral vibration response that may cause damage to the shaft seals within ± 20 per cent of the running speed range. For vibration analysis computations the influence of the slewing ring and shaft bearing stiffnesses together with the contribution from the seating stiffnesses are to be included in the calculation procedures.

6.3.3 As an alternative to the requirements of Chapter 6, a fatigue strength analysis of shafting components indicating a factor of safety of 1,5 at the design loads based on a suitable fatigue failure criterion may be submitted for consideration. The effects of stress concentrations, material properties and operating environment are to be taken into account.

6.3.4 With the exception of the propeller connection (requirements stated in Chapter 7) couplings relying on friction are to have a factor of safety of 2,5 against slippage at the maximum rated torque. In order to reduce the possibility of fretting, a grip stress of not less than 20 N/mm² is to be attained.

6.3.5 The effects of motor short-circuit torque on the shafting system should not prevent continued operation once the fault has been rectified.

6.3.6 The arrangement of shaft bearings is to take account of shaft thermal expansion, misalignment of bearings, shaft slope through the bearings and manufacturing tolerances. Additionally, the influence of the pod deflection on the shaft bearing alignment is to be considered under the most onerous mechanical and hydrodynamic loading conditions.

6.3.7 Propeller shaft roller bearing life calculations are to take account of the following loadings:

- Shaft, motor, propeller and other shaft appendages' weights;
- Forces due to ship's motion;
- The propeller-generated forces and moments about the three Cartesian axes related to the shaft; f_x , f_y , f_z , m_x , m_y , m_z , see Fig. 9.2.1.
- Variance of propeller-generated forces and moments with pod azimuth angle. This load variance should take account of the motor control characteristics;
- Forces due to pod rotation, including gyroscopic forces;
- A predicted azimuth service profile for the pod indicating the proportion of time spent at various azimuth angles;
- Loads due to hydrodynamic interaction between pods;
- Any additional loads experienced during operation in ice conditions (for Ice Class notations);
- Where validation of the above loadings is available, detailed calculations must demonstrate that the bearing life when operating at the normal duty profile will comfortably exceed the time between 5-yearly surveys. Parameters used to justify the bearing life, i.e. those related to oil cleanliness, viscosity limits and material quality are to be quoted.

Section 6

Machinery design and construction requirements

6.1 General

6.1.1 The requirements detailed in Chapter 1 are applicable.

6.1.2 Means are to be provided whereby normal operation of the podded propulsion system can be sustained or readily restored if one of the supporting auxiliaries becomes inoperative. See also 2.1.1. Consideration shall be given to the malfunctioning of:

- sources of lubricating oil pressure,
- sources of cooling,
- hydraulic, pneumatic or electrical means for control of the podded propulsor.

6.2 Gearing

6.2.1 If gearing is used in the propulsion system then the requirements of Chapter 5 are applicable.

6.3 Propulsion shafting

6.3.1 In addition to meeting the requirements of Chapters 6 and 8, the pod propulsion shafting supporting an electric motor is to be sufficiently stiff that both static and dynamic shaft flexure are within the motor manufacturer's limits for all envisaged operating conditions.

Podded Propulsion Units

Part 5, Chapter 9

Section 6

6.3.8 Where detailed validation of the loadings identified in 6.3.7. is not available, the calculations for roller bearings are to indicate a bearing life greater than 65,000 hours at the maximum continuous rating of the podded drive taking into account the azimuth angle duty cycle. Any parameters used to justify this life, i.e. those related to oil cleanliness, water contamination and viscosity limits are to be quoted. Proposals for the use of a shaft bearing of life less than 65,000 hours will be considered on application with details of alleviating factors and supporting documentation; however, this bearing life must exceed the time between surveys.

6.3.9 The design of the shaft line bearings is to take account of the maximum and minimum operating temperatures likely to be encountered during both a voyage cycle and, more widely, during the ship's operational life. Furthermore, any anticipated temperature distributions through the bearing components and structures are to be included in the design calculations.

6.3.10 Means are to be provided for detecting shaft bearing deterioration. Where rolling element shaft bearings are used in single pod applications or in pods where the motor power exceeds 6 MW, vibration monitoring of the shaft bearings is to be provided. The bearing monitoring system is to be suitable for the local bearing conditions and is to be able to differentiate from other vibration sources such as propeller cavitation or ship motions.

6.3.11 In multi-podded propulsor systems or ships having at least one pod in association with other propulsion devices and where the individual pod installed power is greater than 5 MW, means are to be provided to hold the propeller for an inoperable unit stationary whilst the other pod(s) propel the vessel at a manoeuvring speed of not less than 7 knots. Operating instructions displayed at the holding mechanism's operating position are to include a direction to inform the bridge of any limitation in ship's speed required as a result of the holding mechanism being activated.

6.3.12 Shaft seals for maintaining the watertight integrity of the pod are to be Type Approved to a standard acceptable to LR. The seals are to be designed to withstand the extremes of operation for which they are intended and this is to include extremes of temperature, vibration, pressure and shaft movement.

6.3.13 In single pod installations, the integrity of shaft seals is to be evaluated on the basis of a double failure. In such installations, seal duplication is to be used with indication of failure of one seal being provided.

6.4 Propeller

6.4.1 The requirements of Chapter 7 are to be complied with.

6.4.2 Where propeller scantlings have been determined by a detailed fatigue analysis, based on reliable wake survey data as described in Ch 7,3.1.7, a factor of safety of 1,5 against suitable fatigue failure criteria is to be demonstrated. The effects of fillet stress concentrations, residual stress, fluctuating loads and material properties are to be taken into account.

6.5 Bearing lubrication system

6.5.1 The bearing lubrication system is to be arranged to provide a sufficient quantity of lubricant of a quality, viscosity and temperature acceptable to the bearing manufacturer under all ship operating conditions.

6.5.2 In addition to the requirements detailed in this Section, the requirements of Chapter 14, sub-Sections 8.1, 8.5, 8.7 and 8.9 are to be complied with.

6.5.3 For systems employing forced lubrication, the sampling points required by Ch 14,8.9.6 are to be located such that the sample taken is representative of the oil present at the bearing.

6.5.4 For lubricating oil systems employing gravity feed, the arrangements are to be such as to permit oil sampling and oil changes in accordance with the manufacturer's instructions for the safe and reliable operation of the propulsion system.

6.5.5 Where continuous operation of the lubricating oil system is essential for the pod to operate at its maximum continuous rating, a standby pump in accordance with Ch 14,8.2.2 is to be provided. In such systems, provision is to be made for the efficient filtration of the oil. The filters are to be capable of being cleaned without stopping the pod.

6.5.6 Where bearings are grease lubricated, means are to be provided for collecting waste grease to enable analysis for particulates and water. The arrangements for collecting waste grease are to be in accordance with the pod manufacturer's recommendations. Alternative arrangements which demonstrate that bearings are satisfactorily lubricated will be considered.

6.5.7 Pipework conveying lubricating oil is to be sited such that any possible leakage from joints will not impinge on electrical equipment, hot surfaces or other sources of ignition, see also Ch 13,2.9.3.

6.5.8 The procedures for flushing the lubrication system are to be defined. This procedure is to embrace the following conditions:

- (a) Initial installation.
 - (b) Post maintenance situations.
 - (c) Major dry-docking refits.
- See Section 10.

6.6 Steering system

6.6.1 The requirements of Chapter 19, Sections 1, 2, 3, 6, 7 and 8 are to be complied with where applicable. See also 3.1.

6.6.2 For vessels where a single podded propulsion unit is the sole means of propulsion, the requirement for auxiliary steering gear in Ch 19,2 is to be achieved by means of two or more identical power units.

Podded Propulsion Units

Part 5, Chapter 9

Sections 6 & 7

6.6.3 Steering arrangements, other than of the hydraulic type, may be accepted provided that there are means of limiting the maximum torque to which the steering arrangement may be subjected.

6.6.4 The steering mechanism is to be provided with power that is sufficient for the maximum steering torques present during the declared functional capability identified in 3.1 and is to be demonstrated for the most onerous specified manoeuvring trial, see Section 9.

6.6.5 Geared arrangements employed for steering are to consider the following conditions:

- A design maximum dynamic duty steering torque, M_z , see 2.4.1;
- A static duty ($\leq 10^3$ load cycles) steering torque. The static duty steering torque should not be less than M_{WV} , the maximum torque which can be generated by the steering gear mechanism.

The minimum factors of safety, as derived using ISO 6336 Calculation of load capacity of spur and helical gears, or a recognised National Standard, are to be 1.5 on bending stress and 1.0 on Hertzian contact stress. The use of a duty factor in the dynamic duty strength calculations is acceptable but the derivation of such a factor, based on percentage of time spent at a percentage of the maximum working torque, should be submitted to LR for consideration and acceptance.

6.6.6 Slewing ring bearing capacity calculations are to take account of:

- Pod weight in water;
- Gyroscopic forces from the propeller and motor;
- Hydrodynamic loads on pod; and
- Forces due to ship's motions.

The calculations are to demonstrate that the factor of safety against the maximum combination of the above forces is not less than 2. The calculations are to be carried out in accordance with a suitable declared standard.

6.6.7 Means of allowing the condition of the slewing gears and bearings to be assessed are to be provided.

6.6.8 On multi podded ships, means are to be provided to secure each pod unit's slewing mechanism in its mid position in the event of a steering system failure. These arrangements are to be of sufficient strength to hold the pod in position at the ship's manoeuvring speed to be taken as not less than 7 knots, see also 6.3.9. Operating instructions displayed at the securing mechanism's operating position are to include a direction to inform the bridge of any limitation in ship's speed required as a result of the securing mechanism being activated.

6.7 Ventilation and cooling systems

6.7.1 Means are to be provided to ensure that air used for motor cooling purposes is of a suitable temperature and humidity as well as being free from harmful particles.

6.7.2 Cooling water supplies are to comply with Ch 14,7. See also Pt 6, Ch 2,8.6.

6.7.3 On single podded installations, a standby cooling arrangement of the same capacity as the main cooling system, is to be provided and available for immediate use.

6.7.4 For pods having an electric propulsion motor but no active cooling system, heat balance calculations as required by 2.2.1(w) are to demonstrate that the pod unit and associated systems are able to function satisfactorily over all operating conditions, see Ch 1,3.5.

6.8 Pod drainage requirements

6.8.1 Unless the electrical installation is suitable for operation in a flooded space, means are to be provided to ensure that leakage from shaft bearings or the propeller seal do not reach the motor windings, or other electrical components. Account is to be taken of cooling air flow circulating within the pod unit.

6.8.2 Where the design of a pod space has a requirement to be maintained in a dry condition, two independent means of drainage are to be provided so that liquid leakage may be removed from the pod unit at all design angles of heel and trim, see Ch 1,3.6.

6.8.3 Pipework conveying leakage from the pod is to be sited such that any leakage from joints will not impinge on electrical equipment, see also Ch 13,2.9.3.

6.9 Hydraulic actuating systems

6.9.1 Hydraulic actuating systems are to comply with Ch 14,9 and Ch 19,3 as applicable.

Section 7 Electrical equipment

7.1 General

7.1.1 The electrical installation is to be designed, constructed and installed in accordance with the requirements of Pt 6, Ch 2.

7.1.2 Means are to be provided to prevent electrical currents flowing across shaft bearings, which may cause their premature failure.

7.1.3 Steering gear electrical systems are to comply with Ch 19,5.

■ Section 8 Control engineering arrangements

8.1 General

8.1.1 Control engineering arrangements are to be in accordance with Pt 6, Ch 1.

8.1.2 Steering gear control, monitoring and alarm systems are to comply with Ch 19,4 and Ch 19,5.

8.1.3 Steering control is to be provided for podded drives from the navigating bridge, the main machinery control station and locally.

8.1.4 An indication of the angular position of the podded propulsion unit(s) and the magnitude of the thrust is to be provided at each station from which it is possible to control the direction of thrust. This indication is to be independent of the steering control system.

8.1.5 Means are to be provided at the remote control station(s), independent of the podded drive control system, to stop each podded drive in an emergency. *See also* Pt 6, Ch 2,15.3.7.

8.1.6 Where programmable electronic equipment is used to prevent loads exceeding those for which the system has been designed (see 2.4.3), then either:

- (a) A fully independent hard wired backup is to be provided; or
- (b) The software is to be certified in accordance with LR's Software Conformity Assessment System – Assessment Module GEN1 (1994) and have an independent solution showing redundancy with design diversity, etc., see Pt 6, Ch 1,2.12 of the Rules.

8.1.7 Where a propulsion system which includes a podded propulsor unit is controlled by a series of interactive and integrated programmable electronic systems, then these are to comply with the requirements of Pt 6, Ch 1,2.13 of the Rules.

8.1.8 For electronic control systems and electrical actuating systems, the quality plan for sourcing, design, installation and testing of components is to address the following issues:

- (a) Standard(s) applied.
- (b) Details of the quality control system applied during manufacture and testing.
- (c) Details of type approval, type testing or approved type status assigned to the equipment.
- (d) Details of installation and testing recommendations for the equipment.
- (e) Details of any local and/or remote diagnostic arrangements where assessment and alteration of control parameters can be made which can affect the operation of the podded propulsor unit.
- (f) Details of arrangements for software upgrades.

8.1.9 The system integration plan is required to identify the process for verification of the functional outputs from the electronic control systems with particular reference to system integrity, consistency, security against unauthorised changes to software and maintaining the outputs within acceptable tolerances of stated performance for safe and reliable operation of the podded propulsor unit.

8.1.10 For the permitted range of operating conditions, the control system is to be capable of protecting the podded propulsor from experiencing mechanical loads that may initiate damage while permitting the desired manoeuvres to take place.

8.2 Monitoring and alarms

8.2.1 The requirements for alarms and monitoring arrangements are to be in accordance with Ch 19,5.3 and Table 9.8.1.

8.2.2 Alarms specified in Table 9.8.1 are to be in accordance with the alarm system specified by Pt 6, Ch 1,2,3.

8.2.3 Sensors for control, monitoring and alarm systems required by the Rules and located within the pod are to be duplicated in order that a single sensor failure does not inhibit system functionality.

8.2.4 Pod unit dry space pumping arrangements are to function automatically in the event of a high liquid level being detected in the pod unit.

8.2.5 Spaces intended to be dry are to be provided with arrangements to indicate water ingress in accordance with 8.2.6 and Table 9.8.1.

8.2.6 The number and location of dry space level detectors are to be such that accumulation of liquids will be detected at all design angles of heel and trim.

8.2.7 Condition monitoring arrangements are not to interface with the operation of safety systems which may cause slow-down or shut-down of the propulsion system. *See also* Pt 6, Ch 1,2.6.9.

Podded Propulsion Units

Part 5, Chapter 9

Sections 8, 9 & 10

Table 9.8.1 Specific alarms for pod control systems

Item	Alarm	Note
Podded drive azimuth angle	—	Indicator, see 8.1.4
Propulsion motors	Overload, power failure	To be indicated on the navigating bridge
Hydraulic oil system pressure	Low	To be indicated on the navigating bridge
Bearing temperature	High	For grease lubricated bearings
Motor temperature	High	See Pt 6, Ch 15, 1.3
Lubricating oil supply pressure	Low	If separate forced lubrication for shaft bearings; to be indicated on the navigating bridge
Lubricating oil temperature	High	
Lubricating oil tank level for motor bearings	Low	
Water in lubricating oil for motor bearings	High	Required for single podded propulsion units only
Motor cooling air inlet temperature	High	
Motor cooling air outlet temperature	High	
Motor cooling air flow	Low	
Shaft bearing vibration monitoring	High	See 6.3.10. Monitoring is to allow bearing condition to be gauged using trend analysis
Dry space water pump operation	Abnormal	Alarm set to indicate a frequency or duration exceeding that which would normally be expected
Dry space water level	High	

Section 9 Testing and trials

9.1 General

9.1.1 The following requirements are to be complied with:

- Ch 1,5.2 for sea trials.
- Ch 19,7.2 for steering trials.

In addition, the functional capability specified in 3.1.1 is to be demonstrated to the Surveyor's satisfaction.

9.1.2 The actual values of steering torque are to be verified during sea trials to confirm that the design maximum dynamic duty torque has not been exceeded.

9.1.3 Electric motor cooling systems are to be verified, as far as possible, to ensure that they are capable of limiting the extremes of ambient temperature to those specified in 2.3.1.

9.1.4 Any trials and testing identified from the FMEA report, see 2.5.4(f), are also to be carried out.

Section 10 Installation, maintenance and replacement procedures

10.1 General

10.1.1 All podded propulsion units are to be supplied with a copy of the manufacturer's installation and maintenance manual that is pertinent to the actual equipment.

10.1.2 The manual required by 10.1.1 is to be placed on board and is to contain the following information:

- Description of the podded propulsion unit with details of function and design operating limits. This is also to include details of support systems such as lubrication, cooling and condition monitoring arrangements.
- Identification of all components together with details of any that have a defined maximum operating life.
- Instructions for installation of unit(s) on board ship with details of any required specialised equipment.
- Instructions for commissioning at initial installation and following maintenance.
- Maintenance and service instructions to include inspection/renewal of bearings, seals, motors, slip rings and other major components. This is also to include component fitting procedures, special environmental arrangements, clearance and push-up measurements and lubricating oil treatment where applicable.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 1

Section

- 1 **General requirements**
- 2 **Cylindrical shells and drums subject to internal pressure**
- 3 **Spherical shells subject to internal pressure**
- 4 **Dished ends subject to internal pressure**
- 5 **Conical ends subject to internal pressure**
- 6 **Standpipes and branches**
- 7 **Boiler tubes subject to internal pressure**
- 8 **Headers**
- 9 **Flat surfaces and flat tube plates**
- 10 **Flat plates and ends of vertical boilers**
- 11 **Furnaces subject to external pressure**
- 12 **Boiler tubes subject to external pressure**
- 13 **Tubes welded at both ends and bar stays for cylindrical boilers**
- 14 **Construction**
- 15 **Mountings and fittings for cylindrical and vertical boilers, steam generators, pressurised thermal liquid and pressurised hot water heaters**
- 16 **Mountings and fittings for water tube boilers**
- 17 **Hydraulic tests**

■ Section 1 General requirements

1.1 Application

1.1.1 The requirements of this Chapter are applicable to fusion welded pressure vessels and their mountings and fittings, for the following uses:

- (a) Production or storage of steam.
- (b) Heating of pressurised hot water above 120°C.
- (c) Heating of pressurised thermal liquid.

The formulae in this Chapter may be used for determining the thickness of seamless pressure vessels using a joint factor of 1.0. Seamless pressure vessels are to be manufactured and tested in accordance with the requirements of Chapter 5 of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

1.1.2 The scantlings of coil type heaters with pumped circulation, which are fired or heated by exhaust gas, are to comply with the appropriate requirements of this Chapter.

1.2 Definition of symbols

1.2.1 The symbols used in the various formulae in Sections 2 to 8, unless otherwise stated, are defined as follows and are applicable to the specific part of the pressure vessel under consideration:

- d = diameter of hole or opening, in mm
- p = design pressure, see 1.3, in bar
- r_i = inside knuckle radius, in mm
- r_o = outside knuckle radius, in mm
- s = pitch, in mm
- t = minimum thickness, in mm
- D_i = inside diameter, in mm
- D_o = outside diameter, in mm
- J = joint factor applicable to welded seams, see 1.9, or ligament efficiency between tube holes (expressed as a fraction, see 2.2)
- R_i = inside radius, in mm
- R_o = outside radius, in mm
- T = design temperature, in °C
- σ = allowable stress, see 1.8, in N/mm².

1.2.2 Where reference is made to calculated or actual plate thickness for the derivation of other values, these thicknesses are to be minus the standard Rule corrosion allowance of 0,75 mm, if not so stated.

1.3 Design pressure

1.3.1 The design pressure is the maximum permissible working pressure and is to be not less than the highest set pressure of any safety valve.

1.3.2 The calculations made to determine the scantlings of the pressure parts are to be based on the design pressure, adjusted where necessary to take account of pressure variations corresponding to the most severe operational conditions.

1.3.3 It is desirable that there should be a margin between the normal pressure at which the boiler or pressure vessel operates and the lowest pressure at which any safety valve is set to lift, to prevent unnecessary lifting of the safety valve.

1.4 Metal temperature

1.4.1 The metal temperature, T , used to evaluate the allowable stress, σ , is to be taken as the actual mean wall metal temperature expected under operating conditions for the pressure part concerned, and is to be stated by the manufacturer when plans of the pressure parts are submitted for consideration.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 1

1.4.2 The following values are to be regarded as the minimum:

- (a) For fired steam boilers, T , is to be taken as not less than 250°C.
- (b) For steam heated generators, secondary drums of double evaporation boilers, steam receivers and pressure parts of fired pressure vessels, not heated by hot gases and adequately protected by insulation, T , is to be taken as the maximum temperature of the internal fluid.
- (c) For pressure parts heated by hot gases, T , is to be taken as not less than 25°C in excess of the maximum temperature of the internal fluid.
- (d) For boiler, superheater, reheater and economiser tubes, T , is to be taken as indicated in 7.1.2.
- (e) For combustion chambers of the type used in horizontal wet-back boilers, T , is to be taken as not less than 50°C in excess of the maximum temperature of the internal fluid.
- (f) For furnaces, fireboxes, rear tube plates of dry-back boilers and pressure parts subject to similar rates of heat transfer, T , is to be taken as not less than 90°C in excess of the maximum temperature of the internal fluid.

1.4.3 In general any parts of boiler drums or headers not protected by tubes, and exposed to radiation from the fire or to the impact of hot gases, are to be protected by a shield of good refractory material or by other approved means.

1.4.4 Drums and headers of thickness greater than 35 mm are not to be exposed to combustion gases having an anticipated temperature in excess of 650°C unless they are efficiently cooled by closely arranged tubes.

1.5 Classification of fusion welded pressure vessels

1.5.1 For Rule purposes, pressure vessels with fusion welded seams are graded as Class 1 if they comply with the following conditions:

- (a) For pressure parts of fired steam boilers, fired thermal liquid heaters and exhaust gas heated shell type steam boilers where the design pressure exceeds 3,4 bar.
- (b) For pressure parts of steam heated steam generators and separate steam receivers where the design pressure exceeds 11,3 bar, or where the pressure, in bar, multiplied by the internal diameter of the shell, in mm, exceeds 14 420.

1.5.2 For Rule purposes, pressure vessels with fusion welded seams, used for the production or storage of steam, the heating of pressurised hot water above 120°C or the heating of pressurised thermal liquid not included in Class 1 are graded as Class 2/1 and 2/2.

1.5.3 Pressure vessels which are constructed in accordance with Class 2/1 or Class 2/2 standards (as indicated above) will, if manufactured in accordance with requirements of a superior class, be approved with the scantlings appropriate to that class.

1.5.4 Pressure vessels which have only circumferential fusion welded seams, will be considered as seamless with no class being assigned. Preliminary weld procedure tests and non-destructive examination for the circumferential seam welds should be carried out for the equivalent class as determined by 1.5.1 and 1.5.2.

1.5.5 In special circumstances relating to service conditions, materials, operating temperature, the carriage of dangerous gases and liquids, etc., it may be required that certain pressure vessels be manufactured in accordance with the requirements of a superior class.

1.5.6 Details of heat treatment, non-destructive examination and routine tests (where required) are given in Chapter 13 of the Rules for Materials.

1.5.7 Hydraulic testing is required for pressure vessels of Class 1, 2/1 and 2/2.

1.6 Plans

1.6.1 Plans of boilers, superheaters and economisers are to be submitted in triplicate for consideration. When plans of water tube boilers are submitted for approval, particulars of the safety valves and their disposition on boilers and superheaters, together with the estimated pressure drop through the superheaters, are to be stated. The pressures proposed for the settings of boiler and superheater safety valves are to be indicated on the boiler plan.

1.6.2 Plans, in triplicate, showing full constructional features of fusion welded pressure vessels and dimensional details of the weld preparation for longitudinal and circumferential seams and attachments, together with particulars of the welding consumables and of the mechanical properties of the materials, are to be submitted before construction is commenced.

1.6.3 Plans, in triplicate, showing details of the air flow through the combustion chamber, boiler furnace and boiler uptake spaces, including measures taken to assure effective purging in all of the spaces, are to be submitted for consideration. See also Pt 6, Ch 1,3.5 and 3.6.

1.6.4 Plans, in triplicate, showing all areas of refractory material in the combustion chamber and boiler furnace spaces, are to be submitted for consideration. See 1.12.1.

1.6.5 Calculations, in triplicate, showing that a minimum of 4 air changes of the combustion chamber, boiler furnace and boiler uptake spaces will be achieved during automatic purging operations, with details of the forced draft fans and arrangements of air flow from fan intake to flue outlet, are to be submitted for consideration, see 1.12.1.

1.6.6 Calculations, in triplicate, are to be submitted showing that the ventilation of machinery spaces containing boilers is adequate for the air consumers within the space with an unimpaired air supply, in accordance with the equipment manufacturer's recommendations, under operating conditions as defined in Ch 1,4.4.2.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 1

1.7 Materials

1.7.1 Materials used in the construction are to be manufactured and tested in accordance with the requirements of the Rules for Materials.

1.7.2 The specified minimum tensile strength of carbon and carbon-manganese steel plates, pipes, forgings and castings is to be within the following general limits:

- (a) For seamless, Class 1, Class 2/1 and Class 2/2 fusion welded pressure vessels:
340 to 520 N/mm².
- (b) For boiler furnaces, combustion chambers and flanged plates:
400 to 520 N/mm².

1.7.3 The specified minimum tensile strength of low alloy steel plates, pipes, forgings and castings is to be within the general limits of 400 to 500 N/mm² and pressure vessels made in these steels are to be either seamless or Class 1 fusion welded.

1.7.4 The specified minimum tensile strength of boiler and superheater tubes is to be within the following general limits:

- (a) Carbon and carbon-manganese steels:
320 to 460 N/mm².
- (b) Low alloy steels:
400 to 500 N/mm².

1.7.5 Where it is proposed to use materials other than those specified in the Rules for Materials, details of the chemical compositions, heat treatment and mechanical properties are to be submitted for approval. In such cases the values of the mechanical properties used for deriving the allowable stress are to be subject to agreement by Lloyd's Register (hereinafter referred to as 'LR').

1.7.6 Where a fusion welded pressure vessel is to be made of alloy steel, and approval of the scantlings is required on the basis of the high temperature properties of the material, particulars of the welding consumables to be used, including typical mechanical properties and chemical composition of the deposited weld metal, are to be submitted for approval.

1.8 Allowable stress

1.8.1 The term 'allowable stress', σ , is the stress to be used in the formulae for the calculation of scantlings of pressure parts.

1.8.2 The allowable stress, σ , is to be the lowest of the following values:

$$\sigma = \frac{E_t}{1,5} \quad \sigma = \frac{R_{20}}{2,7} \quad \sigma = \frac{S_R}{1,5}$$

where

E_t = specified minimum lower yield stress or 0,2 per cent proof stress at temperature, T

R_{20} = specified minimum tensile strength at room temperature

S_R = average stress to produce rupture in 100 000 hours at temperature, T

T = metal temperature, see 1.4.

1.8.3 The allowable stress for steel castings is to be taken as 80 per cent of the value determined by the method indicated in 1.8.2, using the appropriate values for cast steel.

1.8.4 Where steel castings, which have been tested in accordance with the Rules for Materials, are also subjected to non-destructive tests, consideration will be given to increasing the allowable stress using a factor up to 90 per cent in lieu of the 80 per cent referred to in 1.8.3. Particulars of the non-destructive test proposals are to be submitted for consideration.

1.9 Joint factors

1.9.1 The following joint factors are to be used in the equations in Sections 2 to 8, where applicable. Fusion welded pressure parts are to be made in accordance with Chapter 17.

Class of pressure vessel	Joint factor
Class 1	1,0
Class 2/1	0,85
Class 2/2	0,75

1.9.2 The longitudinal and circumferential joints for all classes of pressure vessels for the purposes of this Chapter are to be butt joints. For typical acceptable methods of attaching dished ends, see Fig. 10.14.1.

1.10 Pressure parts of irregular shape

1.10.1 Where pressure parts are of such irregular shape that it is impracticable to design their scantlings by the application of formulae in Sections 2 to 8, the suitability of their construction is to be determined by hydraulic proof test of a prototype or by agreed alternative method.

1.11 Adverse working conditions

1.11.1 Where working conditions are adverse, special consideration may be required to be given to increasing the scantlings derived from the formulae. In this connection, where necessary, account should also be taken of any excess of loading resulting from:

- (a) impact loads, including rapidly fluctuating pressures,
- (b) weight of the vessel and normal contents under operating and test conditions,
- (c) superimposed loads such as other pressure vessels, operating equipment, insulation, corrosion-resistant or erosion-resistant linings and piping,
- (d) reactions of supporting lugs, rings, saddles or other types of supports, or
- (e) the effect of temperature gradients on maximum stress.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Sections 1 & 2

1.12 Furnace explosion prevention

1.12.1 The design of combustion chamber and furnace arrangements is to incorporate measures to minimise the risk of explosion as far as practicable. Measures are to be taken to prevent the accumulation of flammable gases in spaces which may not effectively be reached by purging air. Measures are to be taken to minimise heat retaining surfaces e.g. refractory which can become sources of ignition in the furnace and uptakes.

Section 2 Cylindrical shells and drums subject to internal pressure

2.1 Minimum thickness

2.1.1 Minimum thickness, t , of a cylindrical shell is to be determined by the following formula:

$$t = \frac{p R_i}{10\sigma J - 0,5p} + 0,75 \text{ mm}$$

where

t , p , R_i and σ are defined in 1.2,

J = efficiency of ligaments between tube holes or other openings in the shell or the joint factor of the longitudinal joints (expressed as a fraction). See 1.9 or 2.2, whichever applies. In the case of seamless shells clear of tube holes or other openings, $J = 1,0$.

2.1.2 The formula in 2.1.1 is applicable only where the resulting thickness does not exceed half the internal radius, i.e. where R_o is not greater than $1,5R_i$.

2.1.3 Irrespective of the thickness determined by the above formula, t is to be not less than:

- 6,0 mm for cylindrical shell plates.
- For tube plates, such thickness as will give a minimum parallel seat of 9,5 mm, or such greater width as may be necessary to ensure tube tightness, see 14.6.

2.2 Efficiency of ligaments between tube holes

2.2.1 Where tube holes are drilled in a cylindrical shell in a line or lines parallel to its axis, the efficiency, J , of the ligaments is to be determined as in 2.2.2, 2.2.3 and 2.2.4.

2.2.2 **Regular drilling.** Where the distance between adjacent tube holes is constant, see Fig. 10.2.1,

$$J = \frac{s - d}{s}$$

where

d = the mean effective diameter of the tube holes, in mm, after allowing for any serrations, counter-boring or recessing, or the compensating effect of the tube stub. See 2.3 and 2.4.

s = pitch of tube holes, in mm.

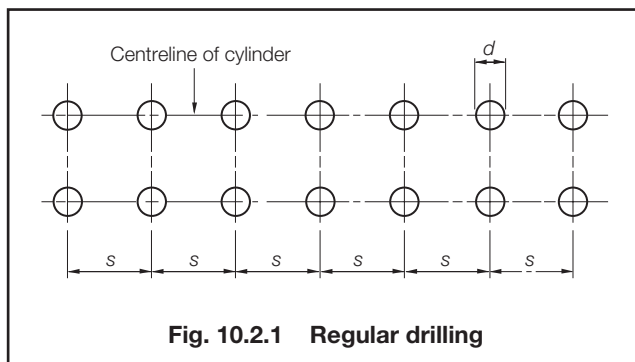

Fig. 10.2.1 Regular drilling

2.2.3 **Irregular drilling.** Where the distance between centres of adjacent tube holes is not constant, see Fig. 10.2.2:

$$J = \frac{s_1 + s_2 - 2d}{s_1 + s_2}$$

where d is as defined in 2.2.2

s_1 = the shorter of any two adjacent pitches, in mm

s_2 = the longer of any two adjacent pitches, in mm.

Fig. 10.2.2 Irregular drilling

2.2.4 When applying the formula in 2.2.3, the double pitch ($s_1 + s_2$) chosen is to be that which makes J , a minimum, and in no case is s_2 to be taken as greater than twice s_1 .

2.2.5 Where the circumferential pitch between tube holes measured on the mean of the external and internal drum or header diameters is such that the circumferential ligament efficiency determined by the formulae in 2.2.2 and 2.2.3 is less than one-half of the ligament efficiency on the longitudinal axis, J in 2.1 is to be taken as twice the circumferential efficiency.

2.2.6 Where tube holes are drilled in a cylindrical shell along a diagonal line with respect to the longitudinal axis, the efficiency, J , of the ligaments is to be determined as in 2.2.7 to 2.2.10.

2.2.7 For spacing of tube holes on a diagonal line as shown in Fig. 10.2.3, or in a regular saw-tooth pattern as shown in Fig. 10.2.4, J is to be determined from the formula in 2.2.8, where a and b , as shown in Figs. 10.2.3 and 10.2.4, are measured, in mm, on the median line of the plate, and d , is as defined in 2.2.2.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 2

Fig. 10.2.3 Spacing of holes on a diagonal line

Fig. 10.2.4 Regular saw-tooth pattern of holes

2.2.8 For tube holes on a diagonal line:

$$J = \frac{2}{A + B + \sqrt{(A - B)^2 + 4C^2}}$$

where

$$A = \frac{\cos^2 \alpha + 1}{2 \left(1 - \frac{d \cos \alpha}{a} \right)}$$

$$B = 0,5 \left(1 - \frac{d \cos \alpha}{a} \right) (\sin^2 \alpha + 1)$$

$$C = \frac{\sin \alpha \cos \alpha}{2 \left(1 - \frac{d \cos \alpha}{a} \right)}$$

$$\cos \alpha = \frac{1}{\sqrt{1 + \frac{b^2}{a^2}}}$$

$$\sin \alpha = \frac{1}{\sqrt{1 + \frac{a^2}{b^2}}}$$

α = angle between centreline of cylinder and centreline of diagonal holes.

2.2.9 For regularly staggered spacing of tube holes as shown in Fig. 10.2.5, the smallest value of the efficiency, J , of all ligaments (longitudinal, circumferential and diagonal) is obtained from Fig. 10.2.6, where a and b as shown in Fig. 10.2.5 are measured, in mm, on the median line of the plate, and d is as defined in 2.2.2.

Fig. 10.2.5 Regular staggering of holes

2.2.10 For irregularly spaced tube holes whose centres do not lie on a straight line, the formula in 2.2.3 is to apply, except that an equivalent longitudinal width of the diagonal ligament is to be used. An equivalent longitudinal width is that width which gives, using the formula in 2.2.2, the same efficiency as would be obtained using the formula in 2.2.8 for the diagonal ligament in question.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 2

2.3 Compensating effect of tube stubs

2.3.1 Where a drum or header is drilled for tube stubs fitted by strength welding, either in line or in staggered formation, the effective diameter of holes is to be taken as:

$$d_e = d_a - \frac{A}{t}$$

where

d_e = the equivalent diameter of the hole, in mm

d_a = the actual diameter of the hole, in mm

t = the thickness of the shell, in mm

A = the compensating area provided by each tube stub and its welding fillets, in mm².

2.3.2 The compensating area, A , is to be measured in a plane through the axis of the tube stub parallel to the longitudinal axis of the drum or header and is to be calculated as follows, see Figs. 10.2.7 and 10.2.8:

- The cross-sectional area of the stub, in excess of that required by 7.1 for the minimum tube thickness, from the interior surface of the shell up to a distance, b , from the outer surface of the shell;
- plus the cross-sectional area of the stub projecting inside the shell within a distance, b , from the inner surface of the shell;
- plus the cross-sectional area of the welding fillets inside and outside the shell;

where

$$b = \sqrt{d_a t_b}$$

t_b = actual thickness of tube stub, in mm.

2.3.3 Where the material of the tube stub has an allowable stress lower than that of the shell, the compensating cross-sectional area of the stub is to be multiplied by the ratio:

$$\frac{\text{allowable stress of stub at design metal temperature}}{\text{allowable stress of shell at design metal temperature}}$$

2.4 Unreinforced openings

2.4.1 Openings in a definite pattern, such as tube holes, may be designed in accordance with the Rules for ligaments in 2.2, provided that the diameter of the largest hole in the group does not exceed that permitted by 2.4.2.

2.4.2 The maximum diameter, d , of any unreinforced isolated openings is to be determined by the following formula:

$$d = 8,08 [D_o t (1 - K)]^{1/3} \text{ in mm}$$

The value of K to be used is calculated from the following formula:

$$K = \frac{p D_o}{18,2 \sigma t} \text{ but is not to be taken as greater than } 0,99$$

where

p , D_o and σ are as defined in 1.2

t = actual thickness of shell, in mm.

2.4.3 For elliptical or oval holes, d , for the purposes of 2.4.2, refers to the major axis when this lies longitudinally or to the mean of the major and minor axes when the minor axis lies longitudinally.

2.4.4 No unreinforced opening is to exceed 200 mm in diameter.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 2

2.4.5 Holes may be considered isolated if the centre distance between two holes on the longitudinal axis of a cylindrical shell is not less than:

$$d + 1,1\sqrt{Dt} \text{ with a minimum } 5d$$

d = diameter of openings in shell (mean diameter if dissimilarly sized holes involved)

D = mean diameter of shell

t = actual thickness of shell

Where the centre distance is less than so derived, the holes are to be fully compensated.

Where two holes are offset on a diagonal line, the diagonal efficiency from Fig. 10.2.6 may be used to derive an equivalent longitudinal centre distance for the purposes of this paragraph.

2.5 Reinforced openings

2.5.1 Openings larger than those permitted by 2.4 are to be compensated in accordance with Fig. 10.2.9(a) or (b). The following symbols are used in Fig. 10.2.9(a) and (b):

t_s = calculated thickness of a shell without joint or opening or corrosion allowance, in mm

t_d = thickness calculated in accordance with 7.1 without corrosion allowance, in mm

t_a = actual thickness of shell plate without corrosion allowance, in mm

t_b = actual thickness of standpipe without minus tolerances and corrosion allowance, in mm

t_r = thickness of added reinforcement, in mm

D_i = internal diameter of cylindrical shell, in mm

d_o = diameter of hole in shell, in mm

L = width of added reinforcement not exceeding D , in mm

$C = \sqrt{d_o t_b}$ in mm

$D = \sqrt{D_i t_a}$ and is not to exceed $0,5d_o$, in mm

σ = shell plate allowable stress, N/mm²

σ_p = standpipe allowable stress, N/mm²

σ_r = added reinforcement allowable stress, N/mm²

σ_w = weld metal allowable stress, N/mm²

NOTE

σ_p , σ_r and σ_w are not to be taken as greater than σ .

2.5.2 For elliptical or oval holes, the dimension on the meridian of the shell is to be used for d_o in 2.5.1.

2.5.3 Compensation is to be distributed equally on either side of the centreline of the opening.

2.5.4 The welds attaching standpipes and reinforcing plates to the shell are to be of sufficient size to transmit the full strength of the reinforcing areas and all other loadings to which they may be subjected.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Sections 3 & 4

■ Section 3

Spherical shells subject to internal pressure

3.1 Minimum thickness

3.1.1 The minimum thickness of a spherical shell is to be determined by the following formula:

$$t = \frac{p R_i}{20\sigma J - 0,5p} + 0,75 \text{ mm}$$

where t , p , R_i , σ and J are as defined in 1.2.

3.1.2 The formula in 3.1.1 is applicable only where the resulting thickness does not exceed half the internal radius.

3.1.3 Openings in spherical shells requiring compensation are to comply, in general, with 2.5, using the calculated and actual thicknesses of the spherical shell as applicable.

■ Section 4

Dished ends subject to internal pressure

4.1 Minimum thickness

4.1.1 The thickness, t , of semi-ellipsoidal and hemispherical unstayed ends, and the knuckle section of torispherical ends, dished from plate, having pressure on the concave side and satisfying the conditions listed below, is to be determined by the following formula:

$$t = \frac{p D_o K}{20\sigma J} + 0,75 \text{ mm}$$

where

t , p , D_o , σ and J are as defined in 1.2

K = a shape factor, see 4.2 and Fig. 10.4.1.

4.1.2 For semi-ellipsoidal ends:

the external height, $H \geq 0,18D_o$

where

D_o = the external diameter of the parallel portion of the end, in mm.

4.1.3 For torispherical ends:

the internal radius, $R_i \leq D_o$

the internal knuckle radius, $R_i \geq 0,1D_o$

the internal knuckle radius, $R_i \geq 3t$

the external height, $H \geq 0,18D_o$ and is determined as follows:

$$H = R_o - \sqrt{(R_o - 0,5D_o)(R_o + 0,5D_o - 2r_o)}$$

4.1.4 In addition to the formula in 4.1.1 the thickness, t , of a torispherical head, made from more than one plate, in the crown section is to be not less than that determined by the following formula:

$$t = \frac{p R_i}{20\sigma J - 0,5p} + 0,75 \text{ mm}$$

where

t , p , R_i , σ and J are as defined in 1.2.

4.1.5 The thickness required by 4.1.1 for the knuckle section of a torispherical head is to extend past the common tangent point of the knuckle and crown radii into the cross-section for a distance not less than $0,5 \sqrt{R_i t}$ mm, before reducing to the crown thickness permitted by 4.1.4, where

t = the required thickness from 4.1.1.

4.1.6 In all cases, H , is to be measured from the commencement of curvature, see Fig. 10.4.2.

4.1.7 The minimum thickness of the head, t , is to be not less than 6,0 mm.

4.1.8 For ends which are butt welded to the drum shell, see 1.8, the thickness of the edge of the flange for connection to the shell is to be not less than the thickness of an unpierced seamless or welded shell, whichever is applicable, of the same diameter and material and determined by 2.1.

4.2 Shape factors for dished ends

4.2.1 The shape factor, K , to be used in 4.1.1 is to be obtained from the curves in Fig. 10.4.1, and depends on the ratio of height to diameter $\frac{H}{D_o}$.

4.2.2 The lowest curve in the series provides the factor, K , for plain (i.e. unpierced) ends. For lower values of $\frac{H}{D_o}$,

K depends upon the ratio of thickness to diameter, $\frac{t}{D_o}$, as

well as on the ratio $\frac{H}{D_o}$, and a trial calculation may be necessary

to arrive at the correct value of K .

4.3 Dished ends with unreinforced openings

4.3.1 Openings in dished ends may be circular, obround or approximately elliptical.

4.3.2 The upper curves in Fig. 10.4.1 provide values of K , to be used in 4.1.1, for ends with unreinforced openings. The selection of the correct curve depends on the value

$\frac{d}{\sqrt{D_o t}}$ and trial calculation is necessary to select the correct

curve,

where

d = the diameter of the largest opening in the end plate, in mm (in the case of an elliptical opening, the larger axis of the ellipse)

t = minimum thickness, after dishing, in mm

D_o = outside diameter of dished end, in mm.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 4

4.3.3 The following requirements must in any case be satisfied:

$$\frac{t}{D_o} \leq 0,1$$

$$\frac{d}{D_o} \leq 0,7.$$

4.3.4 From Fig.10.4.1 for any selected ratio of $\frac{H}{D_o}$ the curve for unpierced ends gives a value for $\frac{d}{\sqrt{D_o t}}$ as well as for K. Openings giving a value of $\frac{d}{\sqrt{D_o t}}$ not greater than the value so obtained may thus be pierced through an end designed as unpierced without any increase in thickness.

4.4 Flanged openings in dished ends

4.4.1 The requirements in 4.3 apply equally to flanged openings and to unflanged openings cut in the plate of an end. No reduction may be made in end plate thickness on account of flanging.

4.4.2 Where openings are flanged, the radius, r_m of the flanging is to be not less than 25 mm, see Fig. 10.4.2(d). The thickness of the flanged portion may be less than the calculated thickness.

4.5 Location of unreinforced and flanged openings in dished ends

4.5.1 Unreinforced and flanged openings in dished ends are to be so arranged that the distance from the edge of the hole to the outside edge of the plate and the distance between openings are not less than those shown in Fig. 10.4.3.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 4

Fig. 10.4.3 Opening in dished ends

4.6 Dished ends with reinforced openings

4.6.1 Where it is desired to use a large opening in a dished end of less thickness than would be required by 4.3, the end is to be reinforced. This reinforcement may consist of a ring or standpipe welded into the hole, or of reinforcing plates welded to the outside and/or inside of the end in the vicinity of the hole, or a combination of both methods, see Fig. 10.4.4. Forged reinforcements may be used.

4.6.2 Reinforcing material with the following limits may be taken as effective reinforcement:

- The effective width, l_1 of reinforcement is not to exceed $\sqrt{2R_i t}$ or $0,5d_o$ whichever is the lesser.
- The effective length, l_2 of a reinforcing ring is not to exceed $\sqrt{d_o t_b}$

where

R_i = the internal radius of the spherical part of a torispherical end, in mm, or

R_i = internal radius of the meridian of the ellipse at the centre of the opening, of a semi-ellipsoidal end, in mm, and is given by the following formula:

$$\frac{[a^4 - x^2(a^2 - b^2)]^{3/2}}{a^4 b}$$

where

Fig. 10.4.4 Limits of reinforcement

a, b and x are shown in Fig. 10.4.2(c)

d_o = external diameter of ring or standpipe, in mm

l_1 and l_2 are shown in Fig. 10.4.4

t_b = actual thickness of ring or standpipe, in mm.

4.6.3 The shape factor, K , for a dished end having a reinforced opening can be read from Fig. 10.4.1 using the value obtained from:

$$\frac{d_o - \frac{A}{t}}{\sqrt{D_o t}} \text{ instead of from } \frac{d}{\sqrt{D_o t}}$$

where

A = the effective cross-sectional area of reinforcement and is to be twice the area shown shaded on Fig. 10.4.4.

As in 4.3, a trial calculation is necessary in order to select the correct curve.

4.6.4 The area shown in Fig. 10.4.4 is to be obtained as follows:

- Calculate the cross-sectional area of reinforcement both inside and outside the end plate within the length, l_1
- plus the full cross-sectional area of that part of the ring or standpipe which projects inside the end plate up to a distance, l_2
- plus the full cross-sectional area of that part of the ring or standpipe which projects outside the internal surface of the end plate up to a distance, l_2 and deduct the sectional area which the ring or standpipe would have if its thickness were as calculated in accordance with 7.1.

4.6.5 If the material of the ring or the reinforcing plates has an allowable stress value lower than that of the end plate, then the effective cross-sectional area, A , is to be multiplied by the ratio:

$$\frac{\text{allowable stress of reinforcing plate at design temperature}}{\text{allowable stress of end plate at design temperature}}$$

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Sections 4 & 5

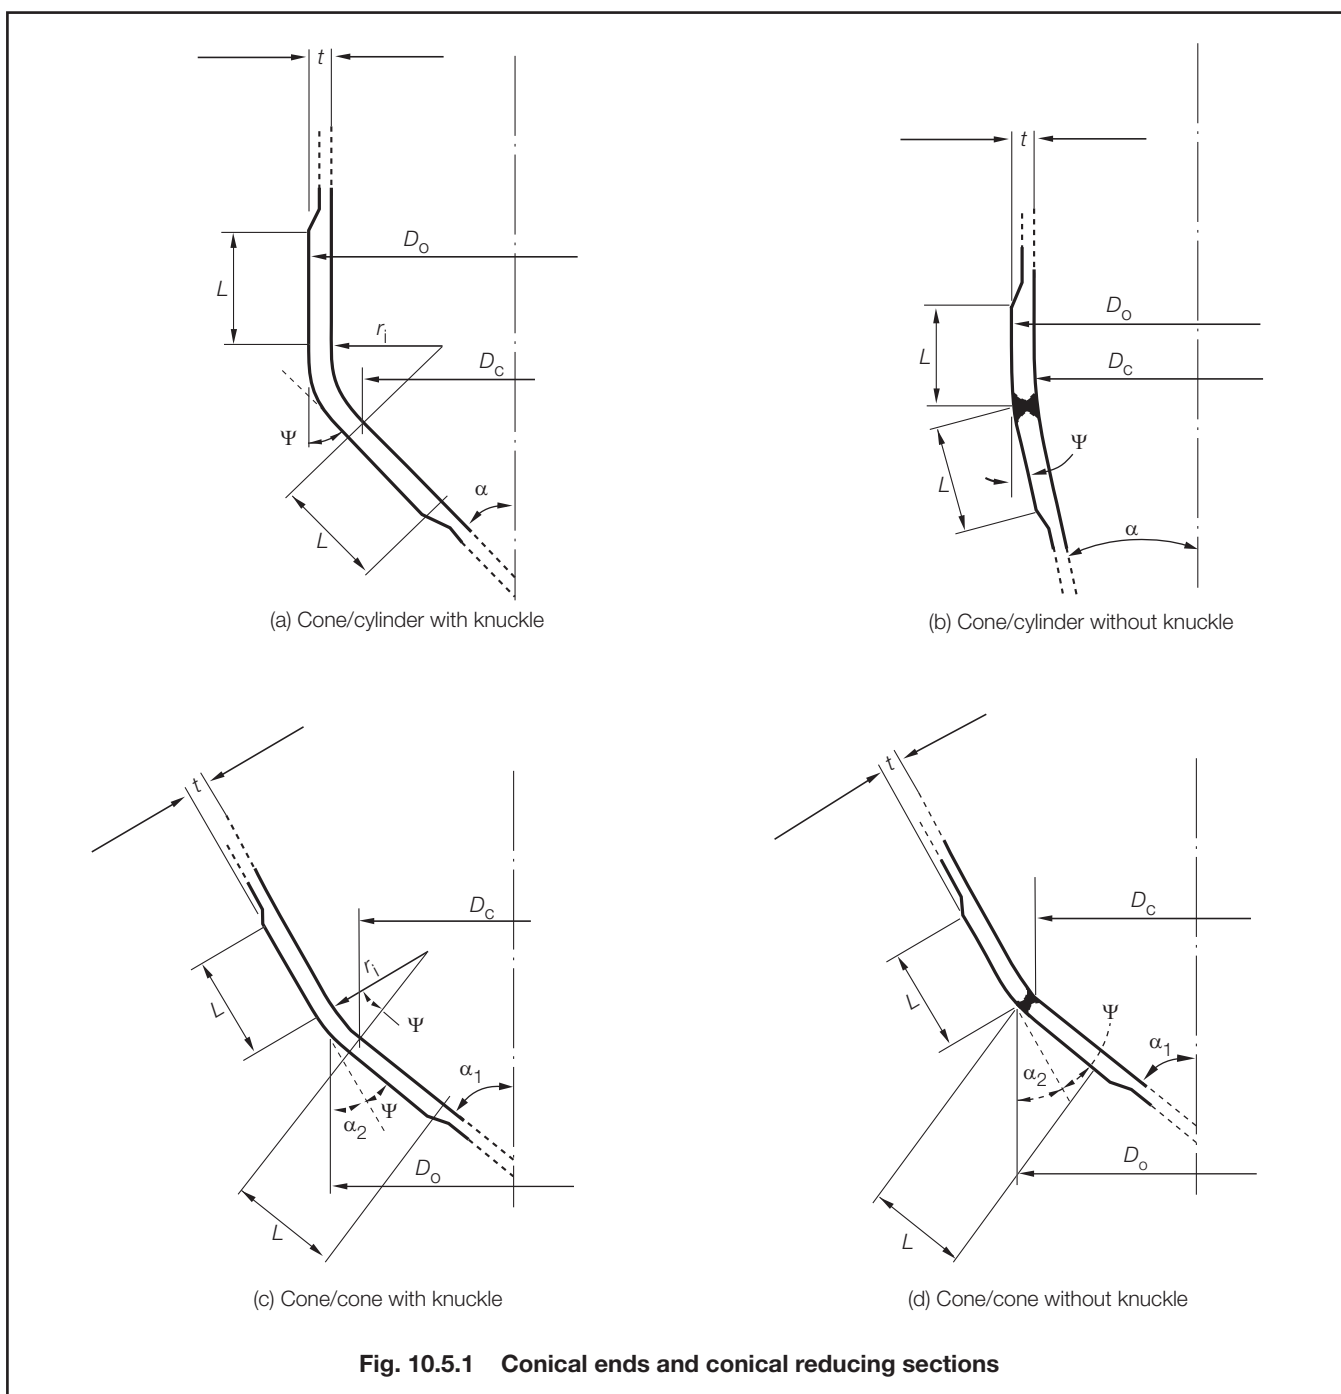

4.7 Torispherical dished ends with reinforced openings

4.7.1 If an opening and its reinforcement are positioned entirely within the crown section, the compensation requirements are to be as for a spherical shell, using the crown radius as the spherical shell radius. Otherwise the requirements of 4.6 are to be applied.

Section 5 Conical ends subject to internal pressure

5.1 General

5.1.1 Conical ends and conical reducing sections, as shown in Fig. 10.5.1, are to be designed in accordance with the equations given in 5.2.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Sections 5 & 6

Table 10.5.1 Values of K as a function of ψ and r_i/D_o

ψ	Values of K for r_i/D_o ratios of											
	0,01	0,02	0,03	0,04	0,06	0,08	0,10	0,15	0,20	0,30	0,40	0,50
10°	0,70	0,65	0,60	0,60	0,55	0,55	0,55	0,55	0,55	0,55	0,55	0,55
20°	1,00	0,90	0,85	0,80	0,70	0,65	0,60	0,55	0,55	0,55	0,55	0,55
30°	1,35	1,20	1,10	1,00	0,90	0,85	0,80	0,70	0,65	0,55	0,55	0,55
45°	2,05	1,85	1,65	1,50	1,30	1,20	1,10	0,95	0,90	0,70	0,55	0,55
60°	3,20	2,85	2,55	2,35	2,00	1,75	1,60	1,40	1,25	1,00	0,70	0,55
75°	6,80	5,85	5,35	4,75	3,85	3,50	3,15	2,70	2,40	1,55	1,00	0,55

5.1.2 Connections between cylindrical shell and conical sections and ends should preferably be by means of a knuckle transition radius. Typical permitted details are shown in Fig. 10.5.1. Alternatively, conical sections and ends may be butt welded to cylinders without a knuckle radius where the change in angle of slope, ψ , between the two sections under consideration does not exceed 30°.

5.1.3 Conical ends may be constructed of several ring sections of decreasing thickness, as determined by the corresponding decreasing diameter.

5.2 Minimum thickness

5.2.1 The minimum thickness, t , of cylinder, knuckle and conical section at the junction and within the distance, L , from the junction is to be determined by the following formula:

$$t = \frac{p D_o K}{20\sigma J} + 0,75 \text{ mm}$$

where

t, p, σ and J are as defined in 1.2

K = a factor, taking into account the stress in the knuckle, see Table 10.5.1.

D_o = outside diameter, in mm, of the conical section or end, see Fig. 10.5.1.

5.2.2 If the distance of a circumferential seam from the knuckle or junction is not to be less than L , then J is to be taken as 1,0; otherwise J is to be taken as the weld joint factor appropriate to the circumferential seam, where

L = distance, in mm, from the knuckle or junction within which meridional stresses determine the required thickness, see Fig. 10.5.1

$$= 0,5 \sqrt{\frac{D_o t}{\cos \psi}}$$

r_i = inside radius of transition knuckle, in mm, which is to be taken as $0,01D_o$ in the case of conical sections without knuckle transition.

ψ = difference between angle of slope of two adjoining conical sections, see Fig. 10.5.1.

5.2.3 The minimum thickness, t , of those parts of conical sections not less than a distance, L , from the junction with a cylinder or other conical section is to be determined by the following formula:

$$t = \frac{p D_c}{(20\sigma J - p)} \frac{1}{\cos \alpha} + 0,75 \text{ mm}$$

where

D_c = inside diameter, in mm of conical section or end at the position under consideration, see Fig. 10.5.1

$\alpha, \alpha_1, \alpha_2$ = angle of slope of conical section (at the point under consideration) to the vessel axis, see Fig. 10.5.1.

5.2.4 The greater of the two thicknesses determined by the formulae in 5.2.1 and 5.2.3 is to apply at the junction or knuckle and within the limits of reinforcement.

5.2.5 The thickness of conical sections having an angle of inclination to the vessel axis of more than 75° is to be determined as for a flat plate.

Section 6

Standpipes and branches

6.1 Minimum thickness

6.1.1 The minimum wall thickness of standpipes and branches is to be not less than that determined by 7.1 increased by the addition of a corrosion allowance of 0,75 mm, making such additions as may be necessary on account of bending, static loads and vibration. The wall thickness, however, is to be not less than:

$$t = 0,015D_o + 3,2 \text{ mm}$$

This thickness need only be maintained for a length, L , from the outside surface of the vessel, but need not extend past the first connection, butt weld or flange, where:

$$L = 3,5 \sqrt{D_o t} \text{ mm}$$

where t and D_o are as defined in 1.2.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Sections 6 & 7

6.1.2 For boilers having a working pressure exceeding 50 bar and safety valves of full lift or full bore type, the thickness of the branch pipe carrying the superheater or drum safety valves is to be not less than:

$$t = \frac{1}{\sigma} \left[1,7d + \frac{DWK}{1,3d^2} \right] \text{ mm}$$

where

t and σ are as defined in 1.2

d = inside diameter of branch, in mm

D = inside diameter of safety valve discharge, in mm

K = 2 for superheater safety valves

= 1 for drum safety valves

W = total valve throughput, in kg/h.

6.1.3 The offset from the centreline of the waste steam pipe to the centreline of the safety valve is not to exceed four times the outside diameter of the safety valve discharge pipe. The waste steam pipe system is to be supported and arrangements made for expansion such that no direct loading is imposed on the safety valve chests and the effects of vibration are to be minimised.

6.1.4 The pipe or header which carries the superheater safety valve is to be suitably thickened but is to be not less than the thickness required for the branch for a distance of $\sqrt{D_2 t}$ on either side of the opening

where

t = thickness required for the branch

D_2 = inside diameter of the pipe or header.

6.1.5 Except as required by 6.1.4, in no case need the wall thickness exceed the minimum shell thickness as required by 2.1, 3.1 or 4.1 as applicable.

6.1.6 Where a standpipe or branch is connected by screwing, the thickness is to be measured at the root of the thread.

6.1.7 For boiler, superheater or economiser tubes, the minimum thickness of the drum or the header connection or tube stub is to be calculated as part of the tube in accordance with 7.1.

NOTES

1. Provision must be made for minus tolerances where necessary and also in cases where abnormal corrosion or erosion is expected in service. For bending allowances, see 7.2.
2. Thickness is in no case to be less than the minimum shown in Table 10.7.1.

Table 10.7.1 Minimum thickness of tubes

Nominal outside diameter of tube, in mm	Minimum thickness, in mm
≤ 38	1,75
> 38 > 50	2,16
≤ 50 ≤ 70	2,40
> 70 ≤ 75	2,67
> 75 ≤ 95	3,05
> 95 ≤ 100	3,28
> 100 ≤ 125	3,50

7.1.2 The minimum thickness of boiler, superheater, reheater and economiser tubes is to be determined by using the design stress appropriate to the mean wall temperature, which will be considered to be the metal temperature. Unless it is otherwise agreed between the manufacturer and LR, the metal temperature used to decide the value of σ for these tubes is to be determined as follows:

- (a) The calculation temperature for boiler tubes is to be taken as not less than the saturated steam temperature, plus 25°C for tubes mainly subject to convection heat, or plus 50°C for tubes mainly subject to radiant heat.
- (b) The calculation temperature for superheater and reheater tubes is to be generally taken as not less than the steam temperature expected in the part being considered, plus 35°C for tubes mainly subject to convection heat. For tubes mainly subject to radiant heat the calculation temperature is generally to be taken as not less than the steam temperature expected in the part being considered, plus 50°C, but the actual metal temperature expected is to be stated when submitting plans.
- (c) The calculation temperature for economiser tubes is to be taken as not less than 35°C in excess of the maximum temperature of the internal fluid.

7.1.3 The minimum thickness of downcomer tubes and pipes which form an integral part of the boiler and which are not exposed to combustion gases is to comply with the requirements for steam pipes.

Section 7

Boiler tubes subject to internal pressure

7.1 Minimum thickness

7.1.1 The minimum wall thickness of straight tubes subject to internal pressure is to be determined by the following formula:

$$t = \frac{p D_o}{20\sigma + p} \text{ mm}$$

where t , p , D_o and σ are as defined in 1.2.

7.2 Tube bending

7.2.1 Where boiler, superheater, reheater and economiser tubes are bent, the resulting thickness of the tubes at the thinnest part is to be not less than that required for straight tubes, unless it can be demonstrated that the method of forming the bend results in no decrease in strength at the bend. The manufacturer is to demonstrate in connection with any new method of tube bending that this condition is satisfied.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Sections 7 & 8

7.2.2 Tube bending, and subsequent heat treatment, where necessary, is to be carried out as to ensure that residual stresses do not adversely affect the strength of the tube for the design purpose intended.

Cross-references

For details of manholes, sight holes and doors, see 14.1.
For details of tube holes and fitting of tubes, see 14.6.

Section 8 Headers

8.1 Circular section headers

8.1.1 The minimum thickness of circular section headers is to be calculated in accordance with the formula for cylindrical shells in 2.1.

8.2 Rectangular section headers

8.2.1 The thickness of the flat walls of rectangular section headers is to be determined at the centre of the sides, at all the lines of holes and at the corners. The minimum required is to be the greatest thickness determined by the following formula:

$$t = \frac{pn}{20\sigma J} + \sqrt{\frac{0,4Yp}{\sigma J_1}} + 0,75 \text{ mm}$$

where

t, p and σ are as defined in 1.2

n = one half of the internal width of the wall perpendicular to that under consideration, in mm, see Fig. 10.8.1(b)

J = ligament efficiency for membrane stresses determined in accordance with 8.2.3

J_1 = ligament efficiency for bending stresses determined in accordance with 8.2.3.

Y = a coefficient determined in accordance with 8.2.2. In all cases if the value of Y is negative, the sign is to be ignored.

8.2.2 The coefficient Y for use in 8.2.1 is to be determined as follows:

(a) at the centre of the side with internal width, $2m$:

$$Y = \frac{1}{3} \left(\frac{m^3 + n^3}{m + n} \right) - \frac{1}{2} m^2$$

where

m = one half of the internal width of the wall under consideration, in mm, see Fig. 10.8.1(b)

(b) at a line of holes parallel to the longitudinal axis of the header on the wall of width, $2m$:

$$Y = \frac{1}{3} \left(\frac{m^3 + n^3}{m + n} \right) - \frac{m^2 - b^2}{2}$$

where

(a)

(b)

5610/01

Fig. 10.8.1 Rectangular section headers

b = distance from the centre of the holes to the centre-line of the wall, in mm, see Fig. 10.8.1(a)

(c) to check the effect of the off-set on a staggered hole arrangement where the holes are positioned equidistant from the centreline of the wall:

$$Y = \cos \alpha \left\{ \frac{1}{3} \left(\frac{m^3 + n^3}{m + n} \right) - \frac{m^2}{2} \right\}$$

where

α = the angle subtended by the diagonal ligament on the longitudinal ligament, see Fig.10.8.1(a)

(d) at the corners:

$$Y = \frac{1}{3} \left(\frac{m^3 + n^3}{m + n} \right)$$

8.2.3 The ligament efficiencies J and J_1 are to be determined as follows:

(a) for a line of holes parallel to the longitudinal axis of the header:

$$J = \frac{s - d}{s}$$

Symbols are as defined in 8.2.4.

(b) for the diagonals:

$$J = \frac{s_1 - d}{s_1}$$

Symbols are as defined in 8.2.4.

(c) for a line of holes parallel to the longitudinal axis of the header:

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 8

$$J_1 = \frac{s-d}{s} \text{ when } d < 0,6m$$

or

$$J_1 = \frac{s-0,6m}{s} \text{ when } d \geq 0,6m$$

Symbols are as defined in 8.2.4.

(d) for the diagonals:

$$J_1 = \frac{s_1-d}{s_1} \text{ when } d < 0,6m$$

or

$$J_1 = \frac{s_1-0,6m}{s_1} \text{ when } d \geq 0,6m$$

Symbols are as defined in 8.2.4.

8.2.4 Symbols, as used in 8.2.3, are defined as follows:

d = diameter of the hole in the header, in mm
 m , s and s_1 , in mm, are as shown in Fig. 10.8.1.

8.2.5 In the case of elliptical holes the value of d to be used in the equations for J and J_1 is to be the inside dimension of the hole measured parallel to the longitudinal axis of the header. For evaluating the two limiting values of d in the equations for J_1 , the value of d is to be the inside dimension of the hole measured perpendicular to the longitudinal axis of the header.

8.2.6 The internal corner radius, r , is to be not less than one third of the mean of the nominal thicknesses of the two sides, but in no case to be less than 6,5 mm.

8.3 Toroidal furnace headers

8.3.1 The minimum thickness of a toroidal header forming the lower end of a waterwall furnace, and supporting the weight of the boiler and water, is to be determined by the following formula:

$$t = A + \sqrt{A^2 + \frac{4M}{JS\sigma}} + 0,75 \text{ mm}$$

where

$$A = \frac{pr}{30J\sigma} \text{ mm}$$

t , p and σ are as defined in 1.2

d_e = equivalent diameter of the tube hole in accordance with 2.3

r = inside radius of toroid circular cross-section, in mm, see Fig. 10.8.3

J = ligament efficiency of tube holes around toroid

$$= \frac{S-d_e}{S}$$

S = pitch of tubes around the toroid, in mm

$$M = \frac{Wr}{3} - \frac{pd^2r}{40} \text{ Nmm}$$

where

W = imposed loading on each water wall tube due to the weight of the boiler and water, in N

d = minimum diameter of the tube hole in the toroid, in mm

The calculation is to be performed at design pressure using the allowable stress at saturation temperature, and also at zero pressure using the allowable stress at 100°C.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Sections 8 & 9

Fig. 10.8.3 Toroidal furnace headers

8.4 Header ends

8.4.1 The shape and thickness of ends forged integrally with the bodies of headers are to be the subject of special consideration.

8.4.2 Where sufficient experience of previous satisfactory service of headers with integrally forged ends cannot be shown, the suitability of a proposed form of end is to be proved in accordance with the provisions of 1.10.

8.4.3 Ends attached by welding are to be designed as follows:

- Dished ends: these are to be in accordance with 4.1.
- Flat ends: the minimum thickness of flat end plates is to be determined by the following formula:

$$t = d_i \sqrt{\frac{pC}{\sigma}} + 0,75 \text{ mm}$$

where

p and σ are as defined in 1.2.

t = minimum thickness of end plate, in mm

d_i = internal diameter of circular header or least width between walls of rectangular header, in mm

C = a constant depending on method of end attachment, see Fig. 10.8.2.

- For end plates welded as shown in Fig. 10.8.2(a):
 $C = 0,019$ for circular headers
 $= 0,032$ for rectangular headers.
- For end plates welded as shown in Figs. 10.8.2(b) and (c):
 $C = 0,028$ circular headers
 $= 0,040$ for rectangular headers.

8.4.4 Where flat end plates are bolted to flanges attached to the ends of headers, the flanges and end plates are to be in accordance with recognised pipe flange standards.

8.4.5 Openings in flat plates are to be compensated in accordance with Fig. 10.2.9 (a) or (b), with the value of A_1 the compensation required, calculated as follows:

$$A_1 = \frac{d_o}{2,4} t_f \text{ mm}$$

where

d_o = diameter of hole in flat plate, in mm

t_f = required thickness of the flat plate in the area under consideration, in mm, calculated in accordance with 8.4.3, 8.3.3 or 9.1.6, as applicable, without corrosion allowance

Limit $D = 0,5d_o$.

Section 9

Flat surfaces and flat tube plates

9.1 Stayed flat surfaces

9.1.1 Where flat end plates are flanged for connection to the shell, the inside radius of flanging is to be not less than 1,75 times the thickness of the plate, with a minimum of 38 mm.

9.1.2 Where combustion chamber or firebox plates are flanged for connection to the wrapper plate, the inside radius of flanging is to be equal to the thickness of the plate, with a minimum of 25 mm.

9.1.3 Where unflanged flat plates are connected to the shell by welding, typical methods of attachment are shown in Fig. 10.9.1. Similar forms of attachment may be used where unflanged combustion chamber or firebox plates are connected to the wrapper plate by welding.

9.1.4 Where the flange curvature is a point of support, this is to be taken at the commencement of curvature, or at a line distant 3,5 times the thickness of the plate from the outside of the plate, whichever is nearer to the flange.

9.1.5 Where a flat plate is welded directly to a shell or wrapper plate, the point of support is to be taken at the inside of the shell or wrapper plate.

9.1.6 The thickness, t , of those portions of flat plates supported by stays and around tube nests is to be determined by the following formula:

$$t = Cd \sqrt{\frac{p}{\sigma}} + 0,75 \text{ mm}$$

where

t , p and σ are as defined in 1.2

d = diameter of the largest circle which can be drawn through at least three points of support. At least one point of support must lie on one side of any diameter of the circle

C = a constant, dependent on the method of support as detailed in 9.1.7. Where various forms of support are used, C is to be the mean of the values for the respective methods adopted.

9.1.7 The value of C in the formula in 9.1.6 is to be as follows:

(a) Where plain bar stays are strength welded into the plates as shown in Fig. 10.9.2

$C = 0,134$

(b) Where plain bar stays pass through holes in the plates and are fitted on the outside with washers as shown in Fig. 10.9.3

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 9

$C = 0,12$ where the diameter of the washer is 3,5 times the diameter of the stay

$C = 0,113$ where the diameter of the washer is 0,67 times the pitch of the stays.

- (c) Where the flat plate is flanged for attachment to the shell, flue, furnace or wrapper or, alternatively, is welded directly to shell, flue, furnace or wrapper, see 9.1.4 and 9.1.5:

$C = 0,113$

- (d) Where the support is a gusset stay

$C = 0,134$

- (e) Where the support is a tube secured as shown in Fig. 10.9.4

$C = 0,144$.

9.1.8 Where tubes are fixed by expanding only, sufficient tubes welded at both ends in accordance with Fig. 10.9.4 are to be provided within the tube nest to comply with 9.1.6, to carry the flat plate loading within the tube nest. Tubes welded in accordance with Fig. 10.9.4 are also to be provided in the boundary rows in sufficient numbers to carry the flat plate loading outside the tube areas.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 9

Fig. 10.9.4 Detail of weld for tube

9.1.9 In the case of small boilers with a single tube nest of expanded tubes which does not exceed an area of 0,65 m², welded tubes need not be fitted provided the tubes are beaded at the inlet end. In this instance the support afforded by the expanded tubes is not to be taken to extend beyond the line enclosing the outer surfaces of the tubes except that, between the outside of the nest and the attachment of the end plate to shell, there may be an unsupported width equal to the flat plate margin, as given by the formula in 9.4.1. The required tube plate thickness within such a tube nest is to be determined using the formula in 9.1.6, where:

$$C = 0,154$$

$$d = \text{four times the mean pitch, in mm, of the expanded tubes in the nest.}$$

9.1.10 The thickness, t , of any tube plate in the tube area is to be not less than that required for the surrounding plate determined by 9.1.6 and in no case less than:

- 12,5 mm where the diameter of the tube hole does not exceed 50 mm, or
- 14 mm where the diameter of the tube hole is greater than 50 mm.

9.1.11 Alternative methods of support will be specially considered.

9.1.12 The spacing of tube holes is to be such that the minimum width, b , in mm of any ligament between tube holes is not less than:

for expanded tubes:

$$b = 0,125d + 12,5 \text{ mm}$$

for welded tubes:

$$b = 0,125d + 8 \text{ mm}$$

where

$$d = \text{diameter of the hole drilled in the plate, in mm.}$$

9.1.13 Where a flat plate has a manhole or sight hole and the opening is strengthened by flanging, the total depth, H , of the flange, measured from the outer surface of the plate, is to be not less than:

$$H = \sqrt{tW}$$

where

t = thickness of plate, in mm

H = depth of flange, in mm

W = minor axis of manhole or sight hole, in mm.

9.1.14 Where the flat top plates of combustion chambers are supported by welded-on girders, the equation in 9.1.6 is to apply as follows:

- (a) In the case of welded-on girders provided with waterways

$$C = 0,144$$

$$d = \sqrt{X^2 + Y^2}$$

where

X = width of waterway in the girder plus the thickness of the girder, in mm

Y = pitch of girders, in mm.

- (b) In the case of continuously welded-on girders

$$C = 0,175$$

$$d = D$$

where

D = distance between inside faces of girders, in mm.

9.2 Combustion chamber tube plates under compression

9.2.1 The thickness of combustion chamber tube plates under compression due to the pressure on the top plate, based on a compressive stress not exceeding 96 N/mm² is to be determined by the following formula:

$$t = \frac{pWs}{1930(s-d)} \text{ mm}$$

where

t and p are as defined in 1.2

d = internal diameter of the plain tubes, in mm

s = pitch of tubes, in mm, measured horizontally where tubes are chain pitched, or diagonally where the tubes are staggered pitched and the diagonal pitch is less than the horizontal pitch

W = internal width of the combustion chamber, in mm, measured from tube plate to back chamber plate.

9.3 Girders for combustion chamber top plates

9.3.1 The formula in 9.3.2 is applicable to plate girders welded to the top combustion chamber plate by means of a full penetration weld.

9.3.2 The thickness of steel plate girders supporting the tops of combustion chambers is to be determined by the following formula:

$$t = \frac{0,32p l^2 s}{d^2 R_{20}} \text{ mm}$$

where

t and p are as defined in 1.2

d = effective depth of girder, in mm

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Sections 9 & 10

- l = length of girder measured internally from tube plate to back chamber plate, in mm
 s = pitch of the girders, in mm
 R_{20} = specified minimum tensile strength of the girder plate, in N/mm².

9.4 Flat plate margins

9.4.1 The width of margin, b , of a flat plate which may be regarded as being supported by the shell, furnaces or flues to which the flat plate is attached is not to exceed that determined by the following formula:

$$b = C(t - 0,75) \sqrt{\frac{\sigma}{\rho}} \text{ mm}$$

where

- ρ and σ are as defined in 1.2
 t = thickness of the flat plate, in mm
 b = width of margin, in mm
 C = 3,12.

9.4.2 Where an unflanged flat plate is welded directly to the shell, furnaces or flues and it is not practicable to effect the full penetration weld from both sides of the flat plate, the constant C used in the formula in 9.4.1 is to be:

$$C = 2,38.$$

9.4.3 In the case of plates which are flanged, the margin is to be measured from the commencement of curvature of flanging, or from a line 3,5 times the thickness of the plate measured from the outside of the plate, whichever is nearer to the flange.

9.4.4 Where the flat plate is not flanged for attachment to the shell, furnaces or flues, the margin is to be measured from inside of the shell or the outside of the furnaces or flues, whichever is applicable.

9.4.5 In no case is the diameter D , in mm, of the circle forming the boundary of the margin supported by the uptake of a vertical boiler to be greater than determined by the following formula:

$$D = \sqrt{\frac{345A}{\rho} + d^2}$$

where

- ρ is as defined in 1.2
 d = external diameter of uptake, in mm
 d_i = internal diameter of uptake, in mm
 A = cross-sectional area of the uptake tube material,
 i.e. $\frac{\pi}{4} (d^2 - d_i^2)$ mm².

Section 10 Flat plates and ends of vertical boilers

10.1 Tube plates of vertical boilers

10.1.1 Where vertical boilers have a nest or nests of horizontal tubes, so that there is direct tension on the tube plates due to the vertical load on the boiler ends or to their acting as horizontal ties across the shell, the thickness of the tube plates in way of the outer rows of tubes is to be determined by the following formula:

$$t = \frac{\rho D}{5J R_{20}} + 0,75 \text{ mm}$$

where

- t and ρ are as defined in 1.2
 D = twice the radial distance of the centre of the outer row of tube holes from the axis of the shell, in mm
 J = efficiency of ligaments between tube holes in the outer vertical rows (expressed as a fraction)
 $= \frac{s - d}{s}$
 R_{20} = specified minimum tensile strength of tube plate, in N/mm²

where

- d = diameter of tube holes, in mm
 s = vertical pitch of tubes, in mm.

10.1.2 Each alternate tube in the outer vertical rows of tubes is to be a tube welded at both ends as shown in Fig. 10.9.4. Further, the arrangement of tubes in the nests is to be such that the thickness of the tube plates meets the requirements of 9.1.

10.1.3 Where the vertical height of the tube plates between the top and bottom shelves exceeds 0,65 times the internal diameter of the boiler, the staying of the tube plates, and the scantlings of the tube plates and shell plates to which the sides of the tube plates are connected, will require to be specially considered. It is recommended, however, that for this type of boiler the vertical height of the tube plates between the top and bottom shelves should not exceed 1,25 times the internal diameter of the boiler.

10.2 Horizontal shelves of tube plates forming part of the shell

10.2.1 For vertical boilers of the type referred to in 10.1, in order to withstand vertical load due to pressure on the boiler ends, the horizontal shelves of the tube plates are to be supported by gussets in accordance with the following formula:

$$C = \frac{AD_i \rho}{t}$$

where

- ρ = design pressure, in bar
 t = thickness of the tube plate, in mm
 A = maximum horizontal dimension of the shelf from the inside of the shell plate to the outside of the tube plate, in mm
 D_i = inside diameter of the boiler, in mm.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Sections 10 & 11

10.2.2 For the combustion chamber tube plate the minimum number of gussets is to be:

- 1 gusset, where C exceeds 255 000
- 2 gussets, where C exceeds 350 000
- 3 gussets where C exceeds 420 000.

10.2.3 For the smokebox tube plate the minimum number of gussets is to be:

- 1 gusset where C exceeds 255 000
- 2 gussets where C exceeds 470 000.

10.2.4 The shell plates to which the sides of the tube plates are connected are to be not less than 1,6 mm thicker than is required by the formula applicable to shell plates with continuous circularity, and where gussets or other stays are not fitted to the shelves, the strength of the parts of the circumferential seams at the top and bottom of these plates from the outside of one tube plate to the outside of the other, is to be sufficient to withstand the whole load on the boiler end with a factor of safety of not less than 4,5 related to R_{20} (where R_{20} is the specified minimum tensile strength of the shell plates, in N/mm²).

10.3 Dished and flanged ends for vertical boilers

10.3.1 The minimum thickness, t , of dished and flanged ends for vertical boilers which are subject to pressure on the concave side and are supported by central uptakes is to be determined by the following formula:

$$t = \frac{pR_i}{13\sigma} + 0,75 \text{ mm}$$

where t , p , R_i and σ are as defined in 1,2.

10.3.2 The inside radius of curvature, R_i , of the end plate is to be not greater than the external diameter of the cylinder to which it is attached.

10.3.3 The inside knuckle radius, r_i , see Fig. 10.4.2(a), of the arc joining the cylindrical flange to the spherical surface of the end is to be not less than four times the thickness of the end plate, and in no case less than 65 mm.

10.3.4 The inside radius of curvature of flange to uptake is to be not less than twice the thickness of the end plate, and in no case less than 25 mm.

10.3.5 If the dished end has a manhole, the opening is to be strengthened by flanging. The total depth, H , of the flange, measured from the outer surface of the plate on the minor axis, is to be not less than:

$$H = \sqrt{tW}$$

where

- t = thickness of the flange, in mm
- H = depth of flange, in mm
- W = minor axis of the manhole, in mm.

10.4 Flat crowns of vertical boilers

10.4.1 The minimum thickness of flat crown plates of vertical boilers is to be determined as in 9,1; d and C are defined as follows:

- Where the crown is supported by an uptake only,
 d = diameter, in mm, of the largest circle which can be drawn between the connections to the shell or firebox and uptake, see 9.1.1 to 9.1.5
 C = 0,161
- Where bar stays are fitted in accordance with 9.1.6 and 9.1.7:
 d = diameter of the largest circle which can be drawn through at least three points of support, in mm
 C = the mean of the values for the respective points of support through which the circle passes.

Section 11 Furnaces subject to external pressure

11.1 Maximum thickness

11.1.1 Furnaces, plain or corrugated, are not to exceed 22,5 mm in thickness.

11.2 Corrugated furnaces

11.2.1 The minimum thickness, t , of corrugated furnaces is to be determined by the following formula:

$$t = \frac{pD_o}{C} + 0,75 \text{ mm}$$

where p is as defined in 1.2

t = thickness of the furnace plate measured at the bottom of the corrugations, in mm

C = 1060 for Fox, Morison and Deighton corrugations
 = 1130 for Suspension Bulb corrugations

D_o = external diameter of the furnace measured at the bottom of the corrugations, in mm.

11.3 Plain furnaces, flue sections and combustion chamber bottoms

11.3.1 The minimum thickness, t , between points of substantial support, of plain furnaces or furnaces strengthened by stiffening rings, of flue sections and of the cylindrical bottoms of combustion chambers is to be determined by the following formulae, the greater of the two thicknesses obtained being taken:

$$t = \sqrt{\frac{pD_o(L + 610)}{102\,400}} + 0,75 \text{ mm}$$

$$t = \frac{CpD_o}{1100} + \frac{L}{320} + 0,75 \text{ mm}$$

where

t and p are as defined in 1.2

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 11

$$C = \frac{2x}{x + \sigma} \text{ or } 0,85 \text{ whichever is the greater}$$

D_o = external diameter of the furnace, flue or combustion chamber, in mm

L = length of section between the centres of points of substantial support, in mm

x and σ are as defined in 11.7.1.

11.3.2 Where stiffeners are used for strengthening plain cylindrical furnaces, or combustion chambers, the second moment of area, I , of the stiffener is to be determined by the following formula:

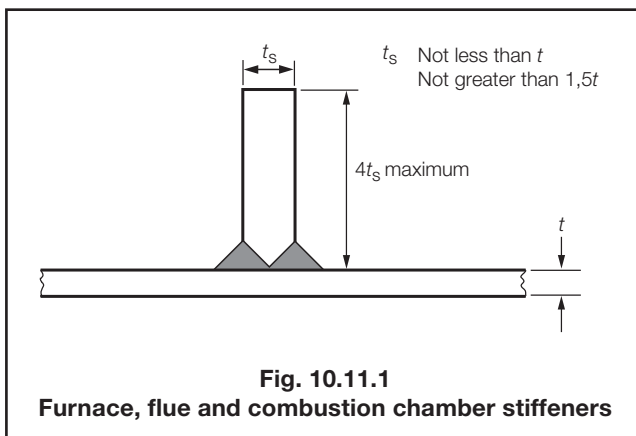

$$I = \frac{\rho D_o^3 L}{13,3 \times 10^6} \text{ mm}^4$$

where ρ is as defined in 1.2

D_o = external diameter of the furnace flue or combustion chamber, in mm

L = length of section between the centres of points of substantial support, in mm

For proportion of stiffening rings, see Fig 10.11.1.

11.4 Plain furnaces of vertical boilers

11.4.1 The thickness of plain furnaces not exceeding 2000 mm in external diameter is to be determined by the formulae given in 11.3.1, the greater of the two thicknesses being taken:

where

D_o = external diameter of the furnace, in mm. Where the furnace is tapered, the diameter to be taken for calculation purposes is to be the mean of that at the top and that at the bottom where it meets the substantial support from flange, ring or row of stays

L = effective length, in mm, of the furnace between the points of substantial support as indicated in Fig. 10.11.2.

11.4.2 For furnaces under 760 mm in external diameter, the thickness is to be not less than 8 mm, and for furnaces 760 mm in external diameter and over, the thickness is to be not less than 9,5 mm.

11.4.3 A circumferential row of stays connecting the furnace to the shell will be considered to provide substantial support to the furnace, provided that:

- The diameter of the stay is not less 22,5 mm or twice the thickness of the furnace, whichever is the greater.
- The pitch of the stays at the furnace does not exceed 14 times the thickness of the furnace.

11.5 Hemispherical furnaces

11.5.1 The minimum thickness, t , of unsupported hemispherical furnaces subject to pressure on the convex surface is to be determined by the following formula:

$$t = \frac{C p R_o}{608} + 0,75 \text{ mm}$$

where t and p are as defined in 1.2
 x and σ are as defined in 11.7.1

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Sections 11 & 12

$$C = \frac{2x}{x + \sigma} \text{ or } 0,85 \text{ whichever is the greater}$$

R_o = outer radius of curvature of the furnace, in mm.

11.5.2 In no case is the maximum thickness to exceed

22,5 mm, or the ratio $\frac{R_o}{t - 0,75}$ to exceed 100.

11.6 Dished and flanged ends for supported vertical boiler furnaces

11.6.1 The minimum thickness, t , of dished and flanged ends for vertical boiler furnaces that are subject to pressure on the convex side and are supported by central uptakes, is to be determined by the following formula:

$$t = \frac{p R_o}{10\sigma} + 0,75 \text{ mm}$$

where t , p , R_o and σ are as defined in 1.2.

11.6.2 The inside radius of dishing and flanging are to be as required by 10.3.

11.7 Dished and flanged ends for unsupported vertical boiler furnaces

11.7.1 The minimum thickness, t , of dished and flanged ends for vertical boiler furnaces that are subject to pressure on the convex side and are without support from stays of any kind, is to be determined by the following formula, but is in no case to be less than the thickness of the firebox:

$$t = \frac{C p R_o}{660} + 0,75 \text{ mm}$$

where

t and p are as defined in 1.2.

x = specified minimum lower yield stress or 0,2 per cent proof stress in N/mm² at a temperature 90°C above the saturated steam temperature corresponding to the design pressure for carbon and carbon manganese steel with a specified minimum tensile strength of 400 N/mm²

$$C = \frac{2x}{x + \sigma} \text{ or } 0,85 \text{ whichever is the greater}$$

R_o = outside radius of the crown plate, in mm

(in no case is $\frac{R_o}{t}$ to exceed 88)

σ = specified minimum lower yield stress or 0,2 per cent proof stress in N/mm² at a temperature 90°C above the saturated steam temperature corresponding to the design pressure for the steel actually used

11.7.2 The inside radius of curvature, R_i , of the end plate is to be not greater than the external diameter of the cylinder to which it is attached.

11.7.3 The inside knuckle radius, r_i , see Fig.10.4.2(a), of the arc joining the cylindrical flange to the spherical surface of the end is to be not less than four times the thickness of the end plate and in no case less than 65 mm.

11.8 Ogee rings

11.8.1 The minimum thickness, t , of the ogee ring which connects the bottom of the furnace to the shell of a vertical boiler and sustains the whole vertical load on the furnace is to be determined by the following formula:

$$t = \sqrt{\frac{p D_i (D_i - D_o)}{9\ 900}} + 0,75 \text{ mm}$$

where

t and p are as defined in 1.2

D_i = inside diameter of boiler shell, in mm

D_o = outside diameter of the lower part of the furnace where it joins the ogee ring, in mm.

11.8.2 Proposals to use a flat plate annular ring which connects the bottom of the furnace to the shell of a vertical boiler and sustains any unbalanced vertical load on the furnace will be the subject of special consideration.

11.9 Uptakes of vertical boilers

11.9.1 The minimum thickness, t , of internal uptakes of vertical boilers is to be determined by the following formulae, the greater of the two thicknesses obtained being taken:

$$t = \sqrt{\frac{p D_o (L + 610)}{102\ 400}} + 4 \text{ mm}$$

$$t = \frac{p D_o}{1100} + \frac{L}{320} + 4 \text{ mm}$$

where

t and p are as defined in 1.2

D_o = external diameter of uptake, in mm

L = length of uptake between the centres of points of substantial support, in mm.

Section 12

Boiler tubes subject to external pressure

12.1 Tubes

12.1.1 The thickness of tubes is to be in accordance with Table 10.12.1 for the appropriate outside diameter and design pressure.

12.1.2 Tubes may be welded at both ends, welded at the inlet end and expanded at the outlet end, or expanded at both ends. In addition to expanding, tubes may be bell mouthed or beaded at the inlet end. Where tubes are welded, the weld detail is to be as shown in Fig. 10.9.4 and the tubes are to be expanded into the tube plates in addition to welding, except as permitted by 12.1.3.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Sections 12, 13 & 14

Table 10.12.1 Thickness of plain tubes under external pressure

12.1.3 For tubes of thickness greater than 6,0 mm, expanding in addition to welding is not required if a recessed weld of depth not less than the tube thickness is provided.

Section 13 Tubes welded at both ends and bar stays for cylindrical boilers

13.1 Loads on tubes welded at both ends and bar stays

13.1.1 Each tube or bar stay is to be designed to carry its due proportion of the load on the plates which it supports.

13.1.2 For a tube or bar stay, the net area to be supported is to be the area, in mm², enclosed by the lines bisecting at right angles the lines joining the stay and the adjacent points of support, less the area of any tubes or stays enclosed. In the case of a tube or bar stay in the boundary rows, the support afforded by the flat plate margin, where applicable, should be taken into account. Where flat margins overlap stays are not required.

13.1.3 The thickness of tubes welded at both ends to tube plates is to be such that the longitudinal stress due to the flat plate loading does not exceed 70 N/mm².

13.1.4 Tubes may be welded into the boiler after post-weld heat treatment has been carried out.

13.1.5 The permissible longitudinal stress in combustion chamber bar stays or similar stays where an end is heated by flame, is not to exceed 70 N/mm², and the diameter of this type of bar stay is not to be less than 19 mm.

13.1.6 The permissible longitudinal stress in longitudinal bar stays not subject to heating, is not to exceed 20 per cent of the minimum specified tensile strength, in N/mm², and the diameter of this type of bar stay is not to be less than 25 mm.

Section 14 Construction

14.1 Access arrangements

14.1.1 In watertube boilers, manholes are to be provided in all drums of sufficient size to allow access for internal examination and cleaning, and for fitting and expanding the tubes. In the case of headers for water walls, superheaters or economisers, and of drums which are too small to permit entry, sight holes or mudholes sufficiently large and numerous for these purposes are to be provided.

14.1.2 Cylindrical boilers are to be provided, where possible with means for ingress to permit examination and cleaning of the inner surfaces of plates and tubes exposed to flame. Where the boilers are too small to permit this, there are to be sight holes and mudholes sufficiently large and numerous to allow the inside to be satisfactorily cleaned.

14.1.3 Where the cross tubes of vertical boilers are large, there is to be a sight hole in the shell opposite to one end of each tube sufficiently large to allow the tube to be examined and cleaned. These sight holes are to be in positions accessible for that purpose.

14.1.4 Manholes in cylindrical shells should preferably have their shorter axes arranged longitudinally.

14.1.5 Doors for manholes, mudholes and sight holes are to be formed from steel plate or other approved construction, and all jointing surfaces are to be machined.

14.1.6 Doors of the internal type are to be provided with spigots which have a clearance of not more than 1,5 mm all round, i.e. the axes of the opening are not to exceed those of the door by more than 3 mm. The width of the manhole gasket seat is to be not less than 16 mm.

14.1.7 Doors of the internal type for openings not larger than 230 mm x 180 mm need be fitted with one stud only, which may be forged integral with the door. Doors for openings larger than 230 mm x 180 mm are to be fitted with two studs or bolts. The strength of the attachment to the door is to be not less than the strength of the stud or bolt.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 14

14.1.8 The crossbars or dogs for doors are to be of steel.

14.1.9 For smaller circular openings in headers and similar fittings, an approved type of plug may be used.

14.1.10 Circular flat cover plates may be fitted to raised circular manhole frames not exceeding 400 mm diameter, and for an approved design pressure not exceeding 18 bar.

14.1.11 External circular flat cover plates are to be in accordance with a recognised National Standard.

14.2 Torispherical and semi-ellipsoidal ends

14.2.1 For typical acceptable types of attachment for dished ends to cylindrical shells, see Fig. 10.14.1.

14.2.2 Where the difference in thickness is the same throughout the circumference, the thicker plate is to be reduced in thickness by machining to a taper for a distance not less than four times the offset, so that the two plates are of equal thickness at the position of the circumferential weld. A parallel portion may be provided between the end of the taper and weld edge preparation; alternatively, if so desired, the width of the weld may be included as part of the smooth taper of the thicker plate.

14.2.3 The thickness of the plates at the position of the circumferential weld is to be not less than that of an unpierced cylindrical shell of seamless or welded construction, whichever is applicable, of the same diameter and material, see 4.1.

14.3 Hemispherical ends

14.3.1 Where hemispherical ends are butt welded to cylindrical shells, the thickness of the shell is to be reduced by taper to that of the end, and the centre of the hemisphere is to be so located that the entire tapered portion of the shell and the butt weld are within the hemisphere, see Fig. 10.14.2.

14.3.2 If the hemispherical end is provided with a parallel portion, the thickness of this portion is to be not less than that of a seamless or welded shell, whichever is applicable, of the same diameter and material.

14.4 Welded-on flanges, butt welded joints and fabricated branch pieces

14.4.1 Flanges may be cut from plates or may be forged or cast. Hubbed flanges are not to be machined from plate. Flanges are to be attached to branches by welding. Alternative methods of flange attachment will be subject to special consideration.

14.4.2 The types of welded-on flanges are to be suitable for the pressure, temperature and service for which the branches are intended.

14.4.3 Flange attachments and pressure-temperature ratings in accordance with materials and design of recognised Standards will be accepted.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 14

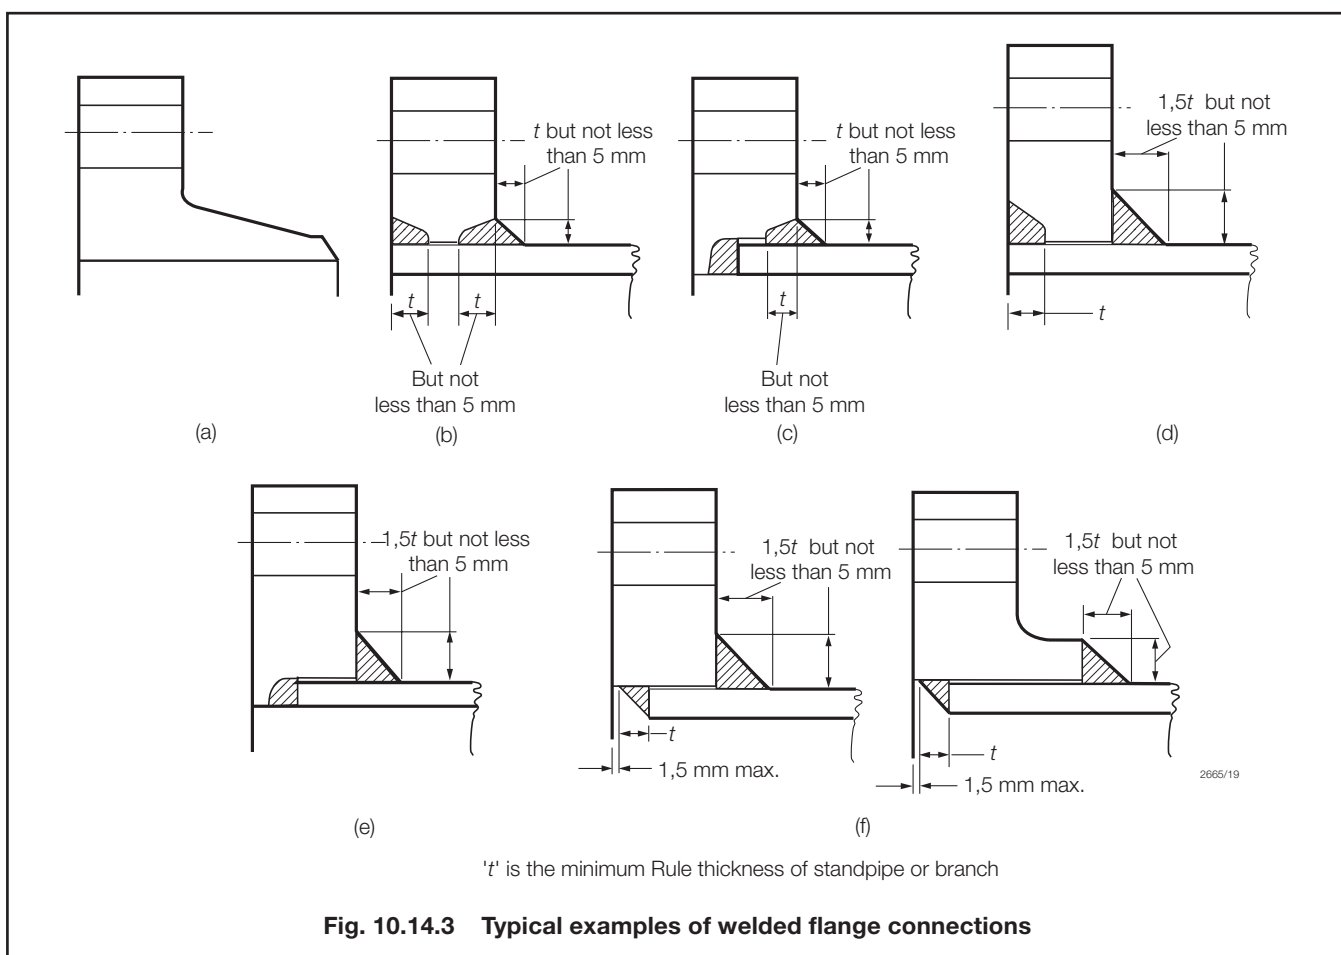

14.4.4 Typical examples of welded-on flange connections are shown in Fig. 10.14.3(a) to (f), and limiting design conditions for the flange types are shown in Table 10.14.1. In Fig. 10.14.3 t is the minimum Rule thickness of the standpipe or branch.

14.4.5 Welded-on flanges are not to be a tight fit on the branch. The maximum clearance between the bore of the flange and the outside diameter of the branch is to be 3 mm at any point, and the sum of the clearances diametrically opposite is not to exceed 5 mm.

14.4.6 Where butt welds are employed in the attachment of flange type (a), or in the construction of standpipes or branch pieces, the adjacent pieces are to be matched at the bores. This may be effected by drifting, roller expanding or machining, provided the pipe wall is not reduced below the designed thickness. If the parts to be joined differ in wall thickness, the thicker wall is to be gradually tapered to that of the thinner at the butt joint.

14.4.7 Welding may be carried out by means of the shielded metal arc, inert gas metal arc, oxy-acetylene or other approved process, but in general, oxy-acetylene welding is suitable only for flange type (a) and is not to be applied to branches exceeding 100 mm diameter or 9,5 mm thick. The welding is to be carried out in accordance with the appropriate paragraphs of Chapter 17.

14.4.8 Threaded sleeve joints complying with Ch 12.2.8.1 may be used on the steam and water piping of small oil fired package boilers of the once through coil type, used for auxiliary or domestic purposes, where the feed pump capacity limits the output.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 14

Table 10.14.1 Limiting design conditions for flanges

Flange type	Maximum pressure	Maximum temperature °C	Maximum pipe o.d. mm	Minimum pipe bore mm
(a)	Pressure-temperature ratings to be in accordance with a recognized standard	No restriction	No restriction	No restriction
(b)		No restriction	168,3 for alloy steels*	No restriction
(c)		No restriction	168,3 for alloy steels*	75
(d)		425	No restriction	No restriction
(e)		425	No restriction	75
(f)		425	No restriction	No restriction

* No restriction for carbon steels

14.4.9 Socket weld joints are not to be used where fatigue, severe erosion, crevice corrosion or stress corrosion is expected to occur, for example, blow down, drain, scum and chemical dosing connections.

14.5 Welded attachments to pressure vessels

14.5.1 Unless the actual thickness of the shell or end is at least twice that required by calculation for a seamless shell or end, whichever is applicable, doubling plates with well rounded corners are to be fitted in way of attachments such as lifting lugs, supporting brackets and feet, to minimise load concentrations on pressure shells and ends. Compensating plates, pads, brackets and supporting feet are to be bedded closely to the surface before being welded, and are to be provided with a 'tell-tale' hole not greater than 9,5 mm in diameter, open to the atmosphere to provide for the release of entrapped air during heat treatment of the vessel, or as a means of indicating any leakage during hydraulic testing and in service, see Chapter 17.

14.5.2 For acceptable methods of attaching standpipes, branches, compensating plates and pads, see Fig. 10.14.4. Alternative methods of attachment may be accepted provided details are submitted for consideration.

14.5.3 Where fillet welds are used to attach standpipes or set-in pads, there are to be equal sized welds both inside and outside the vessel, see Fig 10.14.4(a) and (l). The leg length of each of the fillet welds is to be not less than 1,4 times the actual thickness of the thinner of the parts being joined.

14.6 Fitting of tubes in water tube boilers

14.6.1 The tube holes in drums or headers are to be formed in such a way that the tubes can be effectively tightened in them. Where the tube ends are not normal to the tube plates, there is to be a neck or belt of parallel seating of at least 13 mm in depth, measured in a plane through the axis of the tube at the holes. Where the tubes are practically normal to their plates, this parallel seating is to be not less than 9,5 mm in depth.

Fig. 10.14.4
Typical acceptable methods of attaching branches and pads

14.6.2 Tubes are to be carefully fitted in the tube holes and secured by means of welding, expanding and belling or by other approved methods. Tubes are to project through the neck or belt of parallel seating by at least 6 mm and where they are secured from drawing out by means of bellmouthing only, the included angle of belling is to be not less than 30°.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 15

■ Section 15 Mountings and fittings for cylindrical and vertical boilers, steam generators, pressurised thermal liquid and pressurised hot water heaters

15.1 General

15.1.1 Valves over 38 mm diameter are to be fitted with outside screws, and the covers are to be secured by bolts or studs. All valves are to be arranged to shut with a right-hand (clockwise) motion of the wheels.

15.1.2 All valves and cocks connected to the boiler are to be such that it is seen without difficulty whether they are open or shut. Where boiler mountings are secured by studs, the studs are to have a full thread holding in the plate for a length of at least one diameter.

15.1.3 Where a superheater is fitted which can be shut-off from the boiler, it is to be provided with a separate safety valve fitted with easing gear. The valve as regards construction is to comply with the regulations for ordinary safety valves, but the easing gear may be fitted to be workable from the stokehold only. The superheater is also to be fitted with a drain valve or cock to free it from water when necessary.

15.1.4 Safety valve chests and other boiler and superheater mountings subjected to pressures exceeding 13,0 bar or to steam temperatures exceeding 220°C, and boiler blow-down fittings, are to be made of steel or other approved material.

15.2 Safety valves

15.2.1 Boilers and steam generators are to be fitted with not less than two safety valves, each having a minimum internal diameter of 25 mm, but those having a total heating surface of less than 50 m² may have one valve not less than 50 mm diameter. Small oil fired package boilers of the once through coil type used for auxiliary or domestic purposes, where the feed pump capacity limits the output, may have one safety valve not less than 19 mm internal diameter, or two safety valves with internal diameters not less than 16 mm, provided the capacity is in accordance with 15.2.13.

15.2.2 The valves, spindles, springs and compression screws are to be so encased and locked or sealed that the safety valves and pilot valves, after setting to the working pressure, cannot be tampered with or overloaded in service.

15.2.3 Valves are to be so designed that in the event of fracture of springs they cannot lift out of their seats.

15.2.4 Easing gear is to be provided for lifting the safety valves and is to be operable by mechanical means at a safe position from the boiler or engine room platforms.

15.2.5 Safety valves are to be made with working parts having adequate clearances to ensure complete freedom of movement.

15.2.6 Valve seats are to be effectively secured in position. Any adjusting devices which control discharge capacity are to be positively secured so that the adjustment will not be affected when the safety valves are dismantled at surveys.

15.2.7 All the safety valves of each boiler and steam generator may be fitted in one chest, which is to be separate from any other valve chest and is to be connected directly to the shell by a strong and stiff neck, the passage through which is to be of cross-sectional area not less than the aggregate area of the safety valves in the chest in the case of full lift valves, and one-half of that area in the case of other valves. For the meaning of aggregate area, see 15.2.13.

15.2.8 Each safety valve chest is to be drained by a pipe fitted to the lowest part and led with a continuous fall to the bilge or to a tank, clear of the boilers. No valves or cocks are to be fitted to these drain pipes. It is recommended that the bore of the drain pipes be not less than 19 mm.

15.2.9 Safety valves for shell type exhaust gas steaming economisers are to incorporate fail safe features which will ensure operation of the valve even with solid matter deposits on the valve and guide, or features that will prevent the accumulation of solid matter in way of the valve and in the clearance between the valve spindle and guide. Alternatively, if the fitted valves do not incorporate the features described then a bursting disc discharging to a suitable waste steam pipe is to be fitted in addition to the valves. These bursting discs are to function at a pressure not exceeding 1,25 times the economiser approved design pressure and are to have sufficient capacity to prevent damage to the economiser when operating at its design heat input level.

15.2.10 To avoid the accumulation of solid matter deposits on the outlet side of safety valves and bursting discs, the discharge pipes and safety valve/bursting disc housings are to be fitted with drainage arrangements from the lowest part, directed with continuous fall to a position clear of the economiser where it will not pose a threat to either personnel or machinery. No valves or cocks are to be fitted in the drainage arrangements.

15.2.11 Full particulars of the proposed arrangements are to be submitted for consideration.

15.2.12 Where the receiver is fitted with safety valves to relieve the steam output of the economiser and the economiser cannot be isolated from the receiver the requirements of 15.2.9 may be waived.

15.2.13 The designed discharge capacities of the safety valves on each boiler and steam generator are to be found from the following formulae:

Saturated steam safety valves:

$$E = \frac{AC(p + 1,03)}{98,1}$$

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 15

Superheated steam safety valves:

$$E = \frac{AC(p + 1,03)}{98,1} \sqrt{\frac{V_S}{V_H}}$$

where

- p = set pressure, in bar gauge
- A = for ordinary, high lift or improved high lift safety valves, the aggregate area, in mm², of the orifices through the seatings of the valves, neglecting the area of guides and other obstructions
- = for full lift safety valves, the net aggregate area, in mm², through the seats after deducting the area of the guides or other obstructions when the valves are fully lifted
- C = 4,8 for valves of ordinary type having a minimum lift of $\frac{D}{24}$
- = 7,2 for valves of high lift type, having a minimum lift of $\frac{D}{16}$
- = 9,6 for valves of improved high lift type having a minimum lift of $\frac{D}{12}$
- = 19,2 for valves of full lift type having a minimum lift of $\frac{D}{4}$
- D = bore of valve seat, in mm
- E = the maker's specified peak load evaporation, in kg/hour (including all evaporation from water walls, integral, or steaming economisers and other heating surfaces in direct communication with the boiler)
- V_H = specific volume of superheated steam (m³/kg)
- V_S = specific volume of saturated steam (m³/kg).

15.2.14 When the discharge capacity of a safety valve of approved design has been established by type tests, carried out in the presence of the Surveyors or by an independent authority recognised by LR, on valves representative of the range of sizes and pressures intended for marine application, consideration will be given to the use of a constant higher than $C = 19,2$, based on 90 per cent of the measured capacity up to a maximum of $C = 45$ for full lift safety valves.

15.2.15 Pressurised thermal liquid and pressurised hot water heaters are to be provided with a safety relief device.

15.3 Waste steam pipes

15.3.1 For ordinary, high lift and improved high lift type valves, the cross-sectional area of the waste steam pipe and passages leading to it is to be at least 10 per cent greater than the aggregate area of the safety valves as used in the formulae in 15.2.13. For full lift and other approved valves of high discharge capacity, the cross-sectional area of the waste steam pipe and passages is to be not less than 0,1C times the aggregate valve area.

15.3.2 The cross-sectional area of the main waste steam pipe is to be not less than the combined cross-sectional areas of the branch waste steam pipes leading thereto from the boiler safety valves.

15.3.3 Waste steam pipes are to be led to the atmosphere and are to be adequately supported and provided with suitable expansion joints, bends or other means to relieve the safety valve chests of undue loading.

15.3.4 The scantlings of waste steam pipes and silencers are to be suitable for the maximum pressure to which the pipes may be subjected in service, and in any case not less than 10 bar.

15.3.5 Silencers fitted to waste steam pipes are to be so designed that the clear area through the baffle plates is not less than that required for the pipes.

15.3.6 The safety valves of each exhaust gas heated economiser and exhaust gas heated boiler which may be used as an economiser are to be provided with entirely separate waste steam pipes.

15.3.7 External drains and exhaust steam vents to atmosphere are not to be led to waste steam pipes.

15.3.8 It is recommended that a scale trap and means for cleaning be provided at the base of each waste steam pipe.

15.4 Adjustment and accumulation tests

15.4.1 All safety valves are to be set under steam to a pressure not greater than the approved pressure of the boiler. As a working tolerance the setting is acceptable provided the valves lift at not more than 103 per cent of the approved design pressure. During a test of 15 minutes with the stop valves closed and under full firing conditions the accumulation of pressure is not to exceed 10 per cent of the design pressure. During this test no more feed water is to be supplied than is necessary to maintain a safe working water level.

15.5 Stop valves

15.5.1 One main stop valve is to be fitted to each boiler and secured directly to the shell. There are to be as few auxiliary stop valves as possible so as to avoid piercing the boiler shell more than is absolutely necessary.

15.5.2 Where two or more boilers are connected together:

- Stop valves of self-closing or non-return type are to be fitted.
- Essential services are to be capable of being supplied from at least two boilers.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 15

15.6 Water level indicators

15.6.1 Every boiler designed to contain water at a specified level is to be fitted with at least two means for indicating its water level, at least one of which is to be a direct reading gauge glass. The other means is to be either an additional gauge glass or an approved equivalent device. The required water level indicators are to be independent of each other.

15.6.2 Where a pair of gauge glasses are set at different levels to provide an extended range of water level indication they will only be considered as one water level indicator.

15.6.3 An approved equivalent device for level indication may derive its level input signal from one of the low water level detection systems required by 15.7.1 provided that in the event of a power supply failure to that system an alarm is initiated and the oil fuel supply to the burners, or any other fuel used to fire the boiler, is automatically shut-off. The fuel supply shut-off will only be required if the power supply failure results in the direct reading gauge glass being the only functioning water level indicator.

15.6.4 The water gauges are to be readily accessible and placed so that the water level is clearly visible. The lowest visible parts of water gauges are to be situated at the lowest safe working level.

15.6.5 The level of the highest part of the effective heating surfaces, e.g. combustion chamber top of a horizontal boiler and the furnace crown of a vertical boiler, is to be clearly marked in a position adjacent to the glass water gauge.

15.6.6 The cocks of all water gauges are to be operable from positions free from danger in the event of the glass breaking.

15.7 Low water level fuel shut-off and alarm

15.7.1 Every fired boiler designed to contain water at a specified level is to be fitted with two systems of water level detection which are to be independent of each other, and which will operate an alarm and shut-off automatically the fuel supply to the burners, or any other fuel used to fire the boiler, when the water level falls to a predetermined low level. These level detectors, in addition, may be used for other functions, e.g. high level alarm, feed pump control, etc.

15.8 Feed check valves

15.8.1 Two feed check and stop valves, connected to separate feed lines, are to be provided for all main and auxiliary boilers which are required for essential services. The feed check and stop valves may be connected to a single standpipe at the shell. In the case of steam/steam generators one feed check valve is acceptable provided steam for essential services is simultaneously available from another source.

15.9 Pressure gauges

15.9.1 Each boiler is to be provided with a separate steam pressure gauge.

15.9.2 The gauges are to be placed where they are easily read.

15.10 Blow-down and scum valves

15.10.1 Each boiler is to be fitted with at least one blow-down valve.

15.10.2 The blow-down valve is to be attached, wherever practicable, direct to the lower part of the boiler. Where it is not practicable to attach the blow-down valve directly, a steel pipe supported from the boiler may be fitted between the boiler and valve.

15.10.3 The blow-down valve and its connections to the sea need not be more than 38 mm, and is to be not less than 19 mm internal diameter. For cylindrical boilers the size of the valve may be generally 0,0085 times the diameter of the boiler.

15.10.4 Blow-down valves and scum valves (where the latter are fitted) of two or more boilers may be connected to one common discharge, but where thus arranged there are to be screw-down non-return valves fitted for each boiler to prevent the possibility of the contents of one boiler passing to another.

15.10.5 For blow-down valves or cocks on the ship's side and attachments, see Ch 13,2.

15.11 Salinometer valve or cock

15.11.1 Each boiler is to be provided with a salinometer valve or cock secured direct to the boiler in a convenient position. The valve or cock is not to be on the water gauge standpipe.

15.12 Additional requirements for shell type exhaust gas steaming economisers

15.12.1 The design and construction of shell type economisers are to pay particular attention to the welding, heat treatment and inspection arrangements at the tube plate connection to the shell.

15.12.2 Every shell type economiser is to be provided with removable lagging at the circumference of the tube end plates to enable ultrasonic examination of the tube plate to shell connection.

15.12.3 Every economiser is to be provided with arrangements for pre-heating and de-aeration, and addition of water treatment or combination thereof, to control the quality of feed water to within the manufacturer's recommendations.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Sections 15 & 16

15.12.4 The manufacturer is to provide operating instructions for each economiser which is to include reference to:

- Feed water treatment and sampling arrangements.
- Operating temperatures – exhaust gas and feed water temperatures.
- Operating pressure.
- Inspection and cleaning procedures.
- Records of maintenance and inspection.
- The need to maintain adequate water flow through the economiser under all operating conditions.
- Periodical operational checks of the safety devices to be carried out by the operating personnel and to be documented accordingly.
- Procedures for using the exhaust gas economiser in the dry condition.
- Procedures for maintenance and overhaul of safety valves.
- Emergency operating procedures.

Section 16 Mountings and fittings for water tube boilers

16.1 General

16.1.1 Mountings and fittings not mentioned in this Section are to be in accordance with the requirements in Section 15.

16.2 Safety valves

16.2.1 Water tube boilers are to be fitted with not less than two safety valves of area and design in general accordance with the requirements of 15.2.

16.2.2 Each saturated steam drum and each superheater are to be provided with at least one safety valve.

16.2.3 Where the superheater forms an integral part of the boiler, the relieving capacity of the superheater safety valve(s), based on the reduced pressure at the superheater outlet, may be included as part of the total relieving capacity required for the boiler. As some National Authorities limit the proportion of the superheater safety valve relieving capacity which may be credited towards the total capacity for the boiler, builders should give attention to any relevant Statutory Requirements of the National Authority of the country in which the ship is to be registered.

16.2.4 The boiler and superheater valves are to be so disposed and proportioned between saturated steam drum and superheater outlet that the superheater will be protected from overheating under all service conditions, including an emergency stop of the ship at full power.

16.2.5 Where it is proposed to fit full bore safety valves operated by independent pilot valves, the arrangements are to be submitted for consideration. The pipes connecting pilot valves and main valves are to be of ample bore and wall thickness to minimise the possibility of obstruction and damage.

16.2.6 Where it is impracticable to attach safety valves directly to the superheater, the valves are to be located as near as possible thereto and fitted to a branch piece connected to the superheater outlet pipe.

16.2.7 In high temperature installations the drains from safety valves are to be led to a tank or other place where high temperature steam can be safely discharged.

16.3 Safety valve settings

16.3.1 All boiler and superheater safety valves are to be set under steam to their respective working pressures, which are not to be greater than the approved design pressure of the boiler. As a working tolerance the setting is acceptable provided the valves lift at not more than 103 per cent of the approved pressure.

16.3.2 In the setting of superheater safety valves, allowance is to be made for the pressure drop through the superheater so that under discharge conditions the pressure in the boiler will not exceed the approved boiler pressure.

16.3.3 In no case is the superheater safety valve setting to exceed by more than three per cent the pressure for which the steam piping is approved.

16.4 Waste steam pipes

16.4.1 The waste steam pipe and passages leading to it from the safety valves are to be in general accordance with the requirements of 15.3.

16.4.2 In installations operating with a high degree of superheat, consideration is to be given to the high temperatures which waste steam pipes, silencers and surrounding spaces will attain when the superheater safety valves are blowing during accumulation tests and in service, adequate protection against heat effects is to be provided to the Surveyor's satisfaction.

16.4.3 Waste steam pipes are to be led well clear of electric cables and any parts or structures sensitive to heat or likely to distort; the pipes are to be insulated where necessary. In these installations each boiler should have a separate waste steam pipe system to atmosphere, with supporting and expansion arrangements such that no direct loading is imposed on the safety valve chests.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 16

16.5 Accumulation tests

16.5.1 Tests for accumulation of pressure are to be carried out with the stop valve closed and under full firing conditions for a period not exceeding seven minutes. The accumulation is not to exceed 10 per cent of the design pressure.

16.5.2 Where accumulation tests might endanger the superheaters, consideration will be given in cases of fired boilers to the omission of these tests, provided that application is made when the boiler plan and sizes of safety valves are submitted for approval, and that the safety valves are of an approved type for which the capacity has been established by test in the presence of the Surveyors or an approved independent authority, or for which LR is satisfied, by long experience of accumulation tests, that the capacity is adequate. When it is agreed to waive accumulation tests, it will be required that the valve makers provide a certificate for each safety valve, stating its rated capacity at the approved working conditions of the boilers and that the boiler makers provide a certificate for each boiler stating its maximum evaporation.

16.5.3 The safety valves are to be found satisfactory in operation under working conditions during the trials of the machinery on board ship.

16.6 Water level indicators

16.6.1 Every boiler designed to contain water at a specified level is to be fitted with at least two means for indicating its water level, at least one of which is to be a direct reading gauge glass. The other means is to be either an additional gauge glass or an approved equivalent device. The required water level indicators are to be independent of each other.

16.6.2 Where a pair of gauge glasses are set at different levels to provide an extended range of water level indication they will only be considered as one water level indicator.

16.6.3 An approved equivalent device for level indication may derive its level input signal from one of the low water level detection systems required by 16.7.1 provided that, in the event of a power supply failure to that system, an alarm is initiated and the oil fuel supply to the burners, or any other fuel used to fire the boiler, is automatically shut-off. The fuel supply shut-off will only be required if the power supply failure results in the direct reading gauge glass being the only functioning water level indicator.

16.6.4 Where a steam and water drum exceeding 4 m in length is fitted athwartships, two glass water gauges are to be fitted in suitable positions, one near each end of the drum.

16.6.5 The position of the glass water gauge of boilers in which the tubes are entirely drowned when cold is to be such that water is just showing in the glass when the water level in the steam drum is just above the top of the uppermost tubes when the boiler is cold.

16.6.6 In boilers, the tubes of which are not entirely drowned when cold, the glass water gauges are to be placed, to the Surveyor's satisfaction, in the positions which have been found by experience to indicate satisfactorily that the water content is sufficient for safety when the boiler is worked under all service conditions.

16.7 Low water level fuel shut-off and alarm

16.7.1 Every fired boiler designed to contain water at a specified level is to be fitted with two systems of water level detection which are to be independent of each other, and which will operate an alarm and shut-off automatically the fuel supply to the burners when the water level falls to a pre-determined low level. These level detectors may be used for other functions, e.g. high level alarm, feed pump control, etc.

16.7.2 Any proposals to depart from these requirements in the case of small auxiliary boilers will be the subject of special consideration.

16.7.3 See Pt 6, Ch 1 for requirements for control, alarm and safety systems, and additional requirements for unattended operation.

16.8 Feed check valves and water level regulators

16.8.1 Two feed check and stop valves, connected to separate feed lines, are to be provided for each boiler and are to be attached, wherever practicable, direct to the boiler or to an economiser which forms an integral part of the boiler.

16.8.2 Where the arrangements necessitate the use of a common inlet pipe on the economiser for both main and auxiliary feed systems, this pipe is to be as short as practicable, and the arrangements of check valves are to be such that either feed line can be effectively isolated without interruption of the feed water supply to the boiler.

16.8.3 At least one of the feed water systems is to be fitted with an approved feed water regulator whereby the water level in the boilers is controlled automatically. See Ch 14,6 for arrangements and details of boiler feed systems.

16.8.4 The feed check valves are to be fitted with efficient gearing, whereby they can be satisfactorily worked from the stokehold floor, or other convenient position.

16.8.5 Standpipes on boilers, for feed inlets, are to be designed with an internal pipe to prevent direct contact between the feed pipe and the boiler shell or end plates with the object of minimising thermal stresses in these plates. Similar arrangements are to be provided for desuperheater and other connections where significant temperature differences occur in service.

Steam Raising Plant and Associated Pressure Vessels

Part 5, Chapter 10

Section 17

■ Section 17 Hydraulic tests

17.1 General

17.1.1 Boilers and pressure vessels, together with their components are to withstand the following hydraulic tests without any sign of weakness or defect.

17.1.2 Having regard to the variation in the types and design of boilers, the hydraulic test may be carried out by either of the methods indicated below:

- (a) boilers are to be tested on completion to a pressure 1,5 times the approved design pressure, or
- (b) where construction permits, all components of the boiler are to be tested on completion of the work including heat treatment to 1,5 times the design pressure. In the case of components such as drums or headers, which are to be drilled for tube holes, the test may be before drilling the tube holes, but is to be after the attachment of standpipes, stubs and similar fittings and also after heat treatment has been carried out. Where all the components have been tested as above, each completed boiler after assembly is to be tested to 1,25 times the design pressure.

17.2 Mountings

17.2.1 All boiler mountings are to be subjected to a hydraulic test of twice the approved design pressure with the exception of feed check valves and other mountings connected to the main feed system which are to be tested to 2,5 times the approved boiler design pressure, or twice the maximum pressure which can be developed in the feed line in normal service, whichever is greater.

■ Section 1 General requirements

1.1 Application

1.1.1 The requirements of this Chapter are applicable to fusion welded pressure vessels and plate heat exchangers, intended for marine purposes but not included in Chapter 10. The equations in this Chapter may be used for determining the thickness of seamless pressure vessels using a joint factor of 1,0. Seamless pressure vessels are to be manufactured and tested in accordance with the requirements of Chapter 5 of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials). For the construction and design of pressure vessels and plate heat exchangers for liquefied gas or chemical cargo applications, see the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk* (hereinafter referred to as the Rules for Ships for Liquefied Gases) or the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk* (hereinafter referred to as the Rules for Ships for Liquid Chemicals) as applicable.

1.1.2 Where the required design criteria for pressure vessels are not indicated within this Chapter, the relevant Sections of Chapter 10 are applicable.

1.1.3 Seamless pressure vessels are to be manufactured in accordance with the requirements of the Rules for Materials where applicable.

1.2 Definition of symbols

1.2.1 The symbols used in the various formulae in Sections 2 to 7 inclusive, unless otherwise stated, are defined as follows, and are applicable to the specific part of the pressure vessel under consideration:

- d = diameter of hole, or opening, in mm
- p = design pressure, see 1.3, in bar
- r_i = inside knuckle radius, in mm
- r_o = outside knuckle radius, in mm
- s = pitch, in mm
- t = minimum thickness, in mm
- D_i = inside diameter, in mm
- D_o = outside diameter, in mm
- J = joint factor applicable to welded seams, see 1.9, or ligament efficiency between tube holes (expressed as a fraction, see Ch 10,2.2)
- R_i = inside radius, in mm
- R_o = outside radius, in mm
- T = design temperature, in °C
- σ = allowable stress, see 1.8, in N/mm².

1.2.2 Where reference is made to calculated or actual plate thickness for the derivation of other values, these thicknesses are to be minus the standard Rule corrosion allowance of 0,75 mm, if not so stated.

1.3 Design pressure

1.3.1 The design pressure is the maximum permissible working pressure, and is to be not less than the highest set pressure of any relief valve.

1.3.2 Calculations made to determine the scantlings of the pressure parts are to be based on the design pressure, adjusted where necessary to take account of pressure variations corresponding to the most severe operational conditions.

1.3.3 It is desirable that there should be a margin between the normal pressure at which the pressure vessel operates and the lowest pressure at which any relief valve is set to lift, to prevent unnecessary lifting of the relief valve.

1.4 Metal temperature

1.4.1 The metal temperature, T , used to evaluate the allowable stress, σ , is to be taken as the actual metal temperature expected under operating conditions for the pressure part concerned, and is to be stated by the manufacturer when plans of the pressure parts are submitted for consideration.

1.4.2 The design temperature, T , for calculation purposes is to be not less than 50°C.

1.5 Classification of fusion welded pressure vessels

1.5.1 For Rule purposes, pressure vessels are graded as Class 1 where the shell thickness exceeds 38 mm.

Other Pressure Vessels

Part 5, Chapter 11

Section 1

1.5.2 For Rule purposes, pressure vessels are graded as Class 2/1 and Class 2/2 if they comply with the following conditions:

- (a) where the design pressure exceeds 17,2 bar, or
- (b) where the metal temperature exceeds 150°C, or
- (c) where the design pressure, in bar, multiplied by the actual thickness of the shell, in mm, exceeds 157, or
- (d) where the shell thickness does not exceed 38 mm.

1.5.3 For Rule purposes, Class 3 pressure vessels are to have a maximum shell thickness of 16 mm, and are pressure vessels not included in Classes 1, 2/1 or 2/2.

1.5.4 Pressure vessels which are constructed in accordance with Classes 2/1, 2/2 or 3 standards (as indicated above) will, if manufactured in accordance with the requirements of superior Class, be approved with the scantlings appropriate to that Class.

1.5.5 Pressure vessels which only have circumferential fusion welded seams, will be considered as seamless with no Class being assigned. Preliminary weld procedure tests and non-destructive examination for the circumferential seam welds should be carried out for the equivalent Class as determined by 1.5.1, 1.5.2 and 1.5.3.

1.5.6 In special circumstances relating to service conditions, materials, operating temperature, the carriage of dangerous gases and liquids, etc., it may be required that certain pressure vessels be manufactured in accordance with the requirements of a superior Class.

1.5.7 Details of heat treatment, non-destructive examination and routine tests (where required) are given in Chapter 13 of the Rules for Materials.

1.5.8 Hydraulic testing is required for all Classes of pressure vessels.

1.5.9 For a full definition of Classes of pressure vessels relating to boilers and associated pressure vessels, see Ch 10.1.

1.6 Plans

1.6.1 Plans of pressure vessels are to be submitted in triplicate for consideration where all the conditions in (a) or (b) are satisfied:

- (a) The vessel contains vapours or gases, e.g. air receivers, hydrophore or similar vessels and gaseous CO₂ vessels for fire-fighting, and
 - $pV > 600$
 - $p > 1$
 - $V > 100$
 - V = volume (litres) of gas or vapour space
- (b) The vessel contains liquefied gases, for fire-fighting or flammable liquids, and
 - $p > 7$
 - $V > 100$
 - V = volume (litres)
 - p is as defined in 1.2.1.

1.6.2 Plans of full constructional features of the vessel and dimensional details of the weld preparations for longitudinal and circumferential seams and attachments, together with particulars of the welding consumables and of the mechanical properties of the materials, are to be submitted before construction is commenced.

1.7 Materials

1.7.1 Materials used in the construction of Class 1, 2/1 and 2/2 pressure vessels are to be manufactured, tested and certified in accordance with the requirements of the Rules for Materials. Materials used in the construction of Class 3 pressure vessels may be in accordance with the requirements of an acceptable national or international specification. The manufacturer's certificate will be accepted in lieu of Lloyd's Register's (hereinafter referred to as LR) material certificate for such materials.

1.7.2 The specified minimum tensile strength of carbon and carbon-manganese steel plates, pipes, forgings and castings is to be within the general limits of 340 to 520 N/mm².

1.7.3 The specified minimum tensile strength of low alloy steel plates, pipes, forgings and castings is to be within the general limits of 400 to 500 N/mm², and pressure vessels made in these steels are to be either seamless or Class 1 fusion welded.

1.7.4 Where it is proposed to use materials other than those specified in the Rules for Materials, details of the chemical compositions, heat treatment and mechanical properties are to be submitted for approval. In such cases, the values of the mechanical properties used for deriving the allowable stress are to be subject to agreement by LR.

1.8 Allowable stress

1.8.1 The term 'allowable stress', σ , is the stress to be used in the formulae for the calculation of scantlings of pressure parts.

1.8.2 The allowable stress, σ , is to be the lowest of the following values:

$$\sigma = \frac{E_t}{1,5} \quad \sigma = \frac{R_{20}}{2,7} \quad \sigma = \frac{S_R}{1,5}$$

where

E_t = specified minimum lower yield stress or 0,2 per cent proof stress at temperature, T , for carbon and carbon-manganese steels. In the case of austenitic steels, the 1,0 per cent proof stress at temperature, T , is to be used

R_{20} = specified minimum tensile strength at room temperature

S_R = average stress to produce rupture in 100 000 hours at temperature, T

T = metal temperature, see 1.4.

1.8.3 The allowable stress for steel castings is to be taken as 80 per cent of the value determined by the method indicated in 1.8.2 using the appropriate values for cast steel.

1.8.4 Where steel castings, which have been tested in accordance with the Rules for Materials are also subjected to non-destructive tests, consideration will be given to increasing the allowable stress using a factor up to 90 per cent in lieu of the 80 per cent referred to in 1.8.3. Particulars of the non-destructive test proposals are to be submitted for consideration.

1.9 Joint factors

1.9.1 The following joint factors are to be used in the equations in Sections 2 to 6, where applicable. Fusion welded pressure parts are to be made in accordance with Chapter 17.

Class of pressure vessel	Joint factor
Class 1	1,0
Class 2/1	0,85
Class 2/2	0,75
Class 3	0,60

1.9.2 The longitudinal joints for all Classes of vessels are to be butt joints. Circumferential joints for Class 1 vessels are also to be butt welds. Circumferential joints for Classes 2/1, 2/2 and 3 vessels should also be butt joints with the following exceptions:

- (a) Circumferential joints for Classes 2/1, 2/2 and 3 vessels may be of the joggle type provided neither plate at the joints exceeds 16 mm thickness.
- (b) Circumferential joints for Class 3 vessels may be of the lap type provided neither plate at the joint exceeds 16 mm thickness nor the internal diameter of the vessel exceeds 610 mm.

For typical acceptable methods of attaching flat ends, see Fig. 10.8.2 and Fig. 10.9.1 in Chapter 10.

For typical acceptable methods of attaching dished ends, see Fig 11.8.1.

1.9.3 Where a pressure vessel is to be made of alloy steel, particulars of the welding consumables to be used, including typical mechanical properties and chemical composition of the deposited weld metal, are to be submitted for approval.

1.10 Pressure parts of irregular shape

1.10.1 Where pressure parts are of such irregular shape that it is impracticable to design their scantlings by the application of the formulae in Sections 2 to 7, the suitability of their construction is to be determined by hydraulic proof test of a prototype or by an agreed alternative method.

1.11 Adverse working conditions

1.11.1 Where working conditions are adverse, special consideration may require to be given to increasing the scantlings derived from the formulae. In this connection, where necessary, account should also be taken of any excess of loading resulting from:

- (a) impact loads, including rapidly fluctuating pressures,
- (b) weight of the vessel and normal contents under operating and test conditions,
- (c) superimposed loads, such as other pressure vessels, operating equipment, insulation, corrosion-resistant or erosion-resistant linings and piping,
- (d) reactions of supporting lugs, rings, saddles or other types of supports, or
- (e) the effect of temperature gradients on maximum stress.

Section 2 Cylindrical shells and drums subject to internal pressure

2.1 Minimum thickness

2.1.1 The minimum thickness, t , of a cylindrical shell is to be determined by the following formula:

$$t = \frac{p R_i}{10\sigma J - 0,5p} + 0,75 \text{ mm}$$

where

t , p , R_i and σ are as defined in 1.2

J = the joint factor of the longitudinal joints (expressed as a fraction). See 1.9 in the case of seamless shells clear of openings $J = 1,0$.

2.1.2 The formula in 2.1.1 is applicable only where the resulting thickness does not exceed half the internal radius, i.e. where R_o is not greater than $1,5R_i$.

2.1.3 Irrespective of the thickness determined by the formula in 2.1.1, t is to be not less than $3 + \frac{D_i}{1500}$ mm, where

D_i is as defined in 1.2. The minimum thickness permitted for vessels manufactured in corrosion resistant steels will be the subject of special consideration.

Cross-references

For efficiency of ligaments between tube holes, see Ch 10,2.2.

For compensating effect of tube stubs, see Ch 10,2.3.

For unreinforced openings, see Ch 10,2.4.

For reinforced openings, see Ch 10,2.5.

Other Pressure Vessels

Part 5, Chapter 11

Sections 3 & 4

Section 3 Spherical shells subject to internal pressure

3.1 Minimum thickness

3.1.1 The minimum thickness, t , of a spherical shell is to be determined by the following formula:

$$t = \frac{p R_i}{20\sigma J - 0,5p} + 0,75 \text{ mm}$$

where

t , p , R_i , σ and J are as defined in 1.2.

3.1.2 The formula in 3.1.1 is applicable only where the resulting thickness does not exceed half the internal radius.

3.1.3 Irrespective of the thickness determined by the formula in 3.1.1, t is to be not less than $3 + \frac{D_i}{1500}$ mm, where

D_i is as defined in 1.2. The minimum thickness permitted for vessels manufactured in corrosion resistant steels will be the subject of special consideration.

3.1.4 Openings in spherical shells requiring compensation are to comply, in general, with Ch 10,2.5, using the calculated and actual thickness of the spherical shell as applicable.

Section 4 Dished ends subject to internal pressure

4.1 Minimum thickness

4.1.1 The thickness, t , of semi-ellipsoidal and hemispherical unstayed ends and the knuckle section of torispherical ends, dished from plate, having pressure on the concave side and satisfying the conditions listed below, is to be determined by the following formula:

$$t = \frac{p D_o K}{20\sigma J} + 0,75 \text{ mm}$$

where

t , p , D_o , σ and J are as defined in 1.2

K = a shape factor, see Ch 10,4.2 and Fig. 10.4.1.

4.1.2 For semi-ellipsoidal ends:

the external height, $H \geq 0,18D_o$

where

D_o = the external diameter of the parallel portion of the end, in mm.

4.1.3 For torispherical ends:

the internal radius, $R_i \leq D_o$

the internal knuckle radius, $r_i \geq 0,1D_o$

the internal knuckle radius, $r_i \geq 3t$

the external height, $H \geq 0,18D_o$, and is determined as follows:

$$H = R_o - \sqrt{(R_o - 0,5D_o)(R_o + 0,5D_o - 2r_o)}$$

4.1.4 In addition to the formula in 4.1.1 the thickness, t , of a torispherical head, made from more than one plate, in the crown section, is to be not less than that determined by the following formula:

$$t = \frac{p R_i}{20\sigma J - 0,5p} + 0,75 \text{ mm}$$

where

t , p , R_i , σ , and J are as defined in 1.2.

4.1.5 The thickness required by 4.1.1 for the knuckle section of a torispherical head is to extend past the common tangent point of the knuckle and crown radii into the crown section for a distance not less than $0,5 \sqrt{R_i t}$ mm, before reducing to the crown thickness permitted by 4.1.4 where

t = the required thickness from 4.1.1.

4.1.6 In all cases, H is to be measured from the commencement of curvature, shown in Fig. 10.4.2, in Chapter 10.

4.1.7 The minimum thickness of the head, t , is in no case to be less than $3 + \frac{D_i}{1500}$ mm, where D_i is as defined in

1.2. The minimum thickness permitted for vessels manufactured in corrosion resistant steels will be the subject of special consideration.

4.1.8 For ends which are butt welded to the drum shell, see 1.9, the thickness of the edge of the flange for connection to the shell is to be not less than the thickness of an unpierced seamless or welded shell, whichever is applicable, of the same diameter and material and determined by 2.1.

Cross-references

For shape factors for dished ends, see Ch 10,4.2.

For dished ends with unreinforced openings, see Ch 10,4.3.

For flanged openings in dished ends, see Ch 10,4.4.

For location of unreinforced and flanged openings in dished ends, see Ch 10,4.5.

For dished ends with reinforced openings, see Ch 10,4.6 and 4.7.

Section 5

Dished ends for Class 3 pressure vessels

5.1 Minimum thickness

5.1.1 As an alternative to the formula in 4.1.1, for Class 3 vessels only, the minimum thickness, t , of a torispherical unstayed end dished from plate and having pressure on the concave or convex side is to be determined by the following formula:

$$t = \frac{p R_i}{CS}$$

where

t , p , and R_i are as defined in 1.2

$C = 2,57$ for ends concave to pressure

$= 1,65$ for ends convex to pressure

$S =$ specified minimum tensile strength of plate, in N/mm², which should be not less than 410 N/mm².

5.1.2 The inside radius of curvature, R_i , of the end plate is to be not greater than the external diameter of the cylinder to which it is attached.

5.1.3 The inside knuckle radius, r_i , of the arc joining the cylindrical flange to the spherical surface of the end is to be not less than four times the thickness of the end plate, and in no case less than 65 mm.

5.1.4 Ends convex to pressure are not to be used for vessels exceeding 610 mm internal diameter.

5.1.5 Where the end is provided with a flanged manhole, the thickness of the end, in mm, determined by 5.1.1, is to be increased by 3 mm, and the total depth, H , of the manhole flange, measured from the outer surface of the plate on the minor axis, is to be not less than:

$$H = \sqrt{t_1 W}$$

where

$t_1 =$ required thickness of the plate, in mm

$H =$ depth of flange, in mm

$W =$ minor axis of the manhole, in mm.

Section 6

Conical ends subject to internal pressure

6.1 General

6.1.1 Conical ends and conical reducing sections, as shown in Fig. 10.5.1 in Chapter 10, are to be designed in accordance with the equations given in 6.2.

6.1.2 Connections between cylindrical shell and conical sections and ends should preferably be by means of a knuckle transition radius. Typical permitted details are shown in Fig. 10.5.1 in Chapter 10. Alternatively, conical sections and ends may be butt welded to cylinders without a knuckle radius when the change in angle of slope, ψ , between the two sections under consideration does not exceed 30°.

6.1.3 Conical ends may be constructed of several ring sections of decreasing thickness as determined by the corresponding decreasing diameter.

6.2 Minimum thickness

6.2.1 The minimum thickness, t , of the cylinder, knuckle and conical section at the junction and within the distance L from the junction is to be determined by the following formula:

$$t = \frac{p D_o K}{20 \sigma J} + 0,75 \text{ mm}$$

where

t , p , σ and J are as defined in 1.2

$D_o =$ outside diameter, in mm of the conical section or end, see Fig. 10.5.1 in Chapter 10

$K =$ a factor, taking into account the stress in the knuckle, see Table 10.5.1 in Chapter 10.

6.2.2 If the distance of a circumferential seam from the knuckle or junction is not less than L , then J is to be taken as 1,0; otherwise J is to be taken as the weld joint factor appropriate to the circumferential seam, where

$r_i =$ inside radius of transition knuckle, in mm, which is to be taken as $0,01 D_o$ in the case of conical sections without knuckle transition

$L =$ distance, in mm, from knuckle or junction within which meridional stresses determine the required thickness, see Fig. 10.5.1 in Chapter 10

$$= 0,5 \sqrt{\frac{D_o t}{\cos \psi}}$$

$\psi =$ difference between angle of slope of two adjoining conical sections, see Fig. 10.5.1 in Chapter 10.

6.2.3 The minimum thickness, t , of those parts of conical sections not less than a distance L from the junction with a cylinder or other conical section, is to be determined by the following formula:

$$t = \frac{p D_c}{20 \sigma J - p} \frac{1}{\cos \alpha} + 0,75 \text{ mm}$$

where

$D_c =$ inside diameter, in mm, of conical section or end at the position under consideration, see Fig. 10.5.1 in Chapter 10

$\alpha, \alpha_1, \alpha_2 =$ angle of slope of conical section (at the point under consideration) to the vessel axis, see Fig. 10.5.1 in Chapter 10.

6.2.4 The thickness of conical sections having an angle of inclination to the vessel axis of more than 75° is to be determined as for a flat plate.

Section 7 Standpipes and branches

7.1 Minimum thickness

7.1.1 The minimum wall thickness, t , of standpipes and branches is to be not less than the greater of the two values determined by the following formulae, making such additions as may be necessary on account of bending, static loads and vibrations:

$$t = \frac{p D_o}{20\sigma + p} + 0,75 \text{ mm, or}$$

$$t = 0,015D_o + 3,2 \text{ mm}$$

where

t , p , D_o and σ are defined in 1.2.

If the second formula applies, the thickness need only be maintained for a length, L , from the outside surface of the vessel, but need not extend past the first connection, butt weld or flange, where:

$$L = 3,5 \sqrt{D_o t} \text{ mm}$$

7.1.2 In no case need the wall thickness exceed the minimum shell thickness as required by 2.1, 3.1 or 4.1 as applicable.

Section 8 Construction

8.1 Access arrangements

8.1.1 Pressure vessels are to be so made that the internal surfaces may be examined. Wherever practicable, the openings for this purpose are to be sufficiently large for access and for cleaning the inner surfaces.

8.1.2 Manholes in cylindrical shells should preferably have their shorter axes arranged longitudinally.

8.1.3 Doors for manholes and sightholes are to be formed from steel plate or of other approved construction, and all jointing surfaces are to be machined.

8.1.4 Doors of the internal type are to be provided with spigots which have a clearance of not more than 1,5 mm all round, i.e. the axes of the opening are not to exceed those of the door by more than 3 mm. The width of the manhole gasket seat is not to be less than 16 mm.

8.1.5 Doors of the internal type for openings not larger than 230 x 180 mm need be fitted with only one stud, which may be forged integral with the door. Doors for openings larger than 230 mm x 180 mm are to be fitted with two studs or bolts. The strength of the attachment to the door is not to be less than the strength of the stud or bolt.

8.1.6 The crossbars or dogs for doors are to be of steel.

8.1.7 External circular flat cover plates are to be in accordance with a Recognised Standard.

8.2 Torispherical and semi-ellipsoidal ends

8.2.1 For typical acceptance types of attachment for dished ends to cylindrical shells, see Fig. 11.8.1. Types (d) and (e) are to be made a tight fit in the cylindrical shell.

8.2.2 Where the difference in thickness is the same throughout the circumference, the thicker plate is to be reduced in thickness by machining to a taper for a distance not less than four times the offset, so that the two plates are of equal thickness at the position of the circumferential weld. A parallel portion may be provided between the end of the taper and the weld edge preparation; alternatively, if so desired, the width of the weld may be included as part of the smooth taper of the thicker plate.

8.2.3 The thickness of the plates at the position of the circumferential weld is to be not less than that of an unpierced cylindrical shell of seamless or welded construction, whichever is applicable, of the same diameter and material, see 2.1.

Cross-references

For hemispherical ends, see Ch 10,14.3.

For openings in flat ends, see Ch 10,8.4.

For unstayed circular flat end plates, see Ch 10,8.4.

For welded-on flanges, butt joints and fabricated branch pieces, see Ch 10,14.4.

For welded attachments to pressure vessels, see Ch 10,14.5.

Section 9 Mountings and fittings

9.1 General

9.1.1 Each pressure vessel or system is to be fitted with a stop valve situated as close as possible to the shell.

9.1.2 Adequate arrangements are to be provided to prevent over-pressure of any part of a pressure vessel which can be isolated. Pressure gauges are to be fitted in positions where they can be easily read.

9.1.3 Adequate arrangements are to be provided for draining and venting the separate parts of each pressure vessel.

9.2 Receivers containing pressurised gases

9.2.1 Each air receiver is to be fitted with a drain arrangement at its lowest part, permitting oil and water to be blown out.

9.2.2 Each receiver which can be isolated from a relief valve is to be provided with a suitable fusible plug to discharge the contents in case of fire. The melting point of the fusible plug is to be approximately 150°C, see also 9.2.3 and 9.2.4.

9.2.3 Where a fixed system utilising fire-extinguishing gas is fitted, to protect a machinery space containing an air receiver(s), fitted with a fusible plug, it is recommended that the discharge from the fusible plug be piped to the open deck.

9.2.4 Receivers used for the storage of air for the control of remotely operated valves are to be fitted with relief valves and not fusible plugs.

Cross-references

For starting air pipe systems and safety fittings, see Ch 2,7.
For mountings for liquefied gas vessels, see the Rules for Ships for Liquefied Gases.

Other Pressure Vessels

Part 5, Chapter 11

Sections 10 & 11

■ Section 10 Hydraulic tests

10.1 General

10.1.1 Pressure vessels covered by this Chapter are to be tested on completion to a pressure, p_T , determined by the following formula, without showing signs of weakness or defect:

$$p_T = 1,3 \frac{\sigma_{50}}{\sigma_T} \frac{t}{(t - 0,75)} p$$

but in no case is to exceed

$$= 1,5 \frac{t}{(t - 0,75)} p$$

where

- p = design pressure, in bar
- p_T = test pressure, in bar
- t = nominal thickness of shell as indicated on the plan, in mm
- σ_T = allowable stress at design temperature, in N/mm²
- σ_{50} = allowable stress at 50°C, in N/mm².

10.2 Mountings

10.2.1 Mountings are to be subjected to a hydraulic test of twice the approved design pressure.

■ Section 11 Plate heat exchangers

11.1 General

11.1.1 Plate heat exchangers are to be classed as follows. Class 2 where either of the following conditions apply:

- (a) the maximum metal design temperature is 150°C or greater, or
 - (b) design pressure is 17,2 bar or greater.
- Class 3 in all other cases.

11.1.2 Where the design temperature is equal to or lower than minus 10°C, a higher class is to apply.

- 8 **Hydraulic tests on pipes and fittings**
- 9 **Piping for LPG/LNG carriers, gas fuelled ships and classed refrigeration systems**

Appendix

- 10 **Guidance notes on metal pipes for water services**

- t = the minimum thickness of a straight pipe, in mm, including corrosion allowance and negative tolerance, where applicable
- t_b = the minimum thickness of a straight pipe to be used for a pipe bend, in mm, including bending allowance, corrosion allowance and negative tolerance, where applicable
- D = outside diameter of pipe, in mm, see 1.2.2
- R = radius of curvature of a pipe bend at the centreline of the pipe, in mm
- T = design temperature, in °C, see 1.4
- σ = maximum permissible design stress, in N/mm² (kgf/cm²).

1.2.2 The outside diameter, D , is subject to manufacturing tolerances, but these are not to be used in the evaluation of formulae.

1.2.3 The inside diameter, d , is not to be confused with nominal size, which is an accepted designation associated with outside diameters of standard rolling sizes.

1.2.4 The weld efficiency factor, e , is to be taken as 1 for seamless and electric resistance and induction welded steel pipes. Where other methods of pipe manufacture are proposed, the value of e will be specially considered.

■ Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter apply to the design and construction of piping systems, including pipe fittings forming parts of such systems.

1.1.2 The materials used for pipes, valves and fittings are to be suitable for the medium and the service for which the piping is intended.

1.1.3 The piping systems for LPG and LNG carriers, gas fuelled ships and classed refrigeration systems are to comply with the relevant Sections of this Chapter where applicable and the additional requirements in Section 9 as well as the requirements contained in the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk* (hereinafter referred to as the Rules for Ships for Liquefied Gases).

1.2 Design symbols

1.2.1 The symbols used in this Chapter are defined as follows:

- a = percentage negative manufacturing tolerance on thickness
- c = corrosion allowance, in mm
- d = inside diameter of pipe, in mm, see 1.2.3
- e = weld efficiency factor, see 1.2.4
- p = design pressure, in bar (kgf/cm²), see 1.3
- p_t = hydraulic test pressure, in bar (kgf/cm²)

1.3 Design pressure

1.3.1 The design pressure, p , is the maximum permissible working pressure and is to be not less than the highest set pressure of the safety valve or relief valve.

1.3.2 In water tube boiler installations, the design pressure for steam piping between the boiler and integral superheater outlet is to be taken as the design pressure of the boiler, i.e. not less than the highest set pressure of any safety valve on the boiler drum. For piping leading from the superheater outlet, the design pressure is to be taken as the highest set pressure of the superheater safety valves.

1.3.3 The design pressure of feed piping and other piping on the discharge from pumps is to be taken as the pump pressure at full rated speed against a shut valve. Where a safety valve or other protective device is fitted to restrict the pressure to a lower value than the shut valve load, the design pressure is to be the highest set pressure of the device.

1.3.4 For design pressure of steering gear components and piping, see Ch 19,3.1.5.

1.4 Design temperature

1.4.1 The design temperature is to be taken as the maximum temperature of the internal fluid, but in no case is it to be less than 50°C.

Piping Design Requirements

Part 5, Chapter 12

Section 1

1.4.2 In the case of pipes for superheated steam, the temperature is to be taken as the designed operating steam temperature for the pipeline, provided that the temperature at the superheater outlet is closely controlled. Where temperature fluctuations exceeding 15°C above the designed temperature are to be expected in normal service, the steam temperature to be used for determining the allowable stress is to be increased by the amount of this excess.

1.5 Classes of pipes

1.5.1 Pressure piping systems are divided into three classes for the purpose of assigning appropriate testing requirements, types of joints to be adopted, heat treatment and weld procedure.

1.5.2 Dependent on the service for which they are intended, Class II and III pipes are not to be used for design pressure or temperature conditions in excess of those shown in Table 12.1.1. Where either the maximum design pressure or temperature exceeds that applicable to Class II pipes, Class I pipes are to be used. To illustrate this, see Fig. 12.1.1.

Table 12.1.1 Maximum pressure and temperature conditions for Class II and III piping systems

Piping system	Class II		Class III	
	p	T	p	T
	bar	°C	bar	°C
Steam	16,0	300	7,0	170
Thermal oil	16,0	300	7,0	150
Flammable Liquids, see Note 1	16,0	150	7,0	60
Other media	40,0	300	16,0	200
Cargo oil	40,0	300	16,0	200
NOTE 1. Flammable liquids include: oil fuel, lubricating oil and flammable hydraulic oil. 2. For grey cast iron, see also 4.2.2.				

1.5.3 In addition to the pressure piping systems in Table 12.1.1, Class III pipes may be used for open ended piping, e.g. overflows, vents, boiler waste steam pipes, open ended drains, etc.

1.6 Materials

1.6.1 Materials for ferrous castings and forgings of Class I and Class II piping systems are to be produced at a works approved by Lloyd's Register (hereinafter referred to as 'LR') and are in general to be tested in accordance with the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

1.6.2 The manufacturer's test certificate for materials for pipes, valves and fittings of Class I and Class II piping systems will be accepted in lieu of LR's materials certificate where the maximum conditions are less than shown in Table 12.1.2.

Table 12.1.2 Maximum conditions for pipes, valves and fittings for which manufacturer's materials test certificate is acceptable

Material	Working temperature °C	DN = nominal diameter, mm p_w = working pressure, bar
Carbon and low alloy steel Spheroidal or nodular cast iron	< 300	$DN < 50$ or $p_w \times DN < 2500$
Copper alloy	< 200	$DN < 50$ or $p_w \times DN < 1500$

1.6.3 The manufacturer's test certificate for materials for ship-side valves and fittings and valves on the collision bulk-head equal to or less than 500 mm nominal diameter will be accepted in lieu of LR's materials certificate where the valves and fittings are in accordance with a recognised National Standard applicable to the intended application and are manufactured and tested in accordance with the appropriate requirements of the Rules for Materials.

Piping Design Requirements

Part 5, Chapter 12

Section 2

Section 2

Carbon and low alloy steels

2.1 Carbon and low alloy steel pipes, valves and fittings

2.1.1 Materials for Class I and Class II piping systems, also for ship-side valves and fittings and valves on the collision bulkhead, are to be manufactured and tested in accordance with the appropriate requirements of the Rules for Materials, see also 1.6.

2.1.2 Materials for Class III piping systems are to be manufactured and tested in accordance with the requirements of acceptable national specifications. Pipes having forge butt welded longitudinal seams are not to be used for oil fuel systems, for heating coils in oil tanks, or for pressures exceeding 4,0 bar (4,1 kgf/cm²). The manufacturer's test certificate will be acceptable and is to be provided for each consignment of material.

2.1.3 Steel pipes, valves and fittings may be used within the temperature limits indicated in Tables 12.2.1 and 12.2.2. Where rimming steel is used for pipes manufactured by electric resistance or induction welding processes, the design temperature is limited to 400°C, see Ch 6,3 of the Rules for Materials.

2.2 Wrought steel pipes and bends

2.2.1 The maximum permissible design stress, σ , is to be taken as the lowest of the following values:

$$\sigma = \frac{E_t}{1,6} \quad \sigma = \frac{R_{20}}{2,7} \quad \sigma = \frac{S_R}{1,6}$$

where

E_t = specified minimum lower yield or 0,2 per cent proof stress at the design temperature

R_{20} = specified minimum tensile strength at ambient temperature

S_R = average stress to produce rupture in 100 000 hours at the design temperature

Values of the maximum permissible design stress, σ , obtained from the properties of the steels specified in Chapter 6 of the Rules for Materials are shown in Tables 12.2.1 and 12.2.2. For intermediate values of specified minimum strengths and temperatures, values of the permissible design stress may be obtained by interpolation.

2.2.2 Where it is proposed to use, for high temperature service, alloy steels other than those detailed in Table 12.2.2 particulars of the tube sizes, design conditions and appropriate national or proprietary material specifications are to be submitted for consideration.

2.2.3 The minimum thickness, t , of straight steel pipes is to be determined by the following formula:

$$t = \left(\frac{pD}{20\sigma e + p} + c \right) \frac{100}{100 - a} \text{ mm}$$

$$\left(t = \left(\frac{pD}{2\sigma e + p} + c \right) \frac{100}{100 - a} \text{ mm} \right)$$

where

p, D, e and a are as defined in 1.2.1

c is obtained from Table 12.2.3

σ is defined in 2.2.1 and obtained from Table 12.2.1 or Table 12.2.2

For pipes passing through tanks, an additional corrosion allowance is to be added to take account of external corrosion; the addition will depend on the external medium and the value is to be in accordance with Table 12.2.3. Where the pipes are efficiently protected, the corrosion allowance may be reduced by not more than 50 per cent.

Table 12.2.1 Carbon and carbon-manganese steel pipes

Specified minimum tensile strength, N/mm ² (kgf/mm ²)	Maximum permissible stress, N/mm ² (kgf/cm ²)

NOTES

- Maximum permissible stress values applicable when the tempering temperature does not exceed 750°C.
- Maximum permissible stress values applicable when the tempering temperature exceeds 750°C.

Table 12.2.3 Values of c for steel pipes

Piping service	c mm
Superheated steam systems	0,3
Saturated steam systems	0,8
Steam coil systems in cargo tanks	2,0
Feed water for boilers in open circuit systems	1,5
Feed water for boilers in closed circuit systems	0,5
Blow down (for boilers) systems	1,5
Compressed air systems	1,0
Hydraulic oil systems	0,3
Lubricating oil systems	0,3
Oil fuel systems	1,0
Cargo oil systems	2,0
Refrigerating plants	0,3
Fresh water systems	0,8
Sea-water systems in general	3,0

2.2.4 The minimum thickness, t_b , of a straight steel pipe to be used for a pipe bend is to be determined by the following formula, except where it can be demonstrated that the use of a thickness less than t_b would not reduce the thickness below t at any point after bending:

$$t_b = \left[\left(\frac{\rho D}{20\sigma e + \rho} \right) \left(1 + \frac{D}{2,5R} \right) + c \right] \frac{100}{100 - a} \text{ mm}$$

$$\left(t_b = \left[\left(\frac{\rho D}{2\sigma e + \rho} \right) \left(1 + \frac{D}{2,5R} \right) + c \right] \frac{100}{100 - a} \text{ mm} \right)$$

where

ρ , D , R , e and a are as defined in 1.2.1

σ and c are as defined in 2.2.3. In general, R is to be not less than $3D$.

Piping Design Requirements

Part 5, Chapter 12

Section 2

2.2.5 Where the minimum thickness calculated by 2.2.3 or 2.2.4 is less than that shown in Table 12.2.4, the minimum nominal thickness for the appropriate standard pipe size shown in the Table is to be used. No allowance is required for negative tolerance, or reduction in thickness due to bending on this nominal thickness. For larger diameters, the minimum thickness will be specially considered. For threaded pipes, where permitted, the minimum thickness is to be measured at the bottom of the thread.

2.2.6 For sounding pipes, except those for cargo tanks with cargo having a flash point of less than 60°C, the minimum thickness is intended to apply to the part outside the tank.

2.2.7 For air, bilge, ballast, fuel, overflow, sounding and venting pipes as listed in Table 12.2.4, where the pipes are efficiently protected against corrosion, the thickness may be reduced by not more than 1 mm.

2.2.8 The internal diameter for bilge, venting and overflow pipes listed in Table 12.2.4 is to be not less than 50 mm. The internal diameter for sounding pipes is to be not less than 32 mm.

2.3 Pipe joints – General

2.3.1 Joints in pressure pipelines may be made by:

- Screwed-on or welded-on bolted flanges, see 2.5 and 2.6.
- Butt welds between pipes or between pipes and valve chests or other fittings, see 2.6.

- Socket weld joints, see 2.8.
- Welded sleeve joints, see 2.9.
- Threaded sleeve joints, see 2.10.
- Special types of approved joints that have been shown to be suitable for the design conditions. Details are to be submitted for consideration.

2.3.2 The dimensions and materials of flanges, gaskets and bolting, and the pressure – temperature rating of bolted flanges in pressure pipelines, are to be in accordance with National or other established Standards.

2.3.3 With the welded pressure piping systems referred to in 2.3.1 it is desirable that a few flanged joints be provided at suitable positions to facilitate installation, cold 'pull up' and inspection at Periodical Surveys.

2.3.4 Piping with joints is to be adequately adjusted, aligned and supported. Supports or hangers are not to be used to force alignment of piping at the point of connection.

2.3.5 Pipes passing through, or connected to, watertight decks are to be continuous or provided with an approved bolted or welded connection to the deck or bulkhead.

2.3.6 Consideration will be given to accepting joints in accordance with a recognised National Standard which is applicable to the intended service and media conveyed.

Table 12.2.4 Minimum thickness for steel pipes

External diameter, <i>D</i> , in mm	Pipes in general, in mm	Venting, overflow and sounding pipes for structural tanks, in mm	Bilge, ballast and general sea-water pipes, in mm	Bilge, air, overflow and sounding pipes through ballast and fuel tanks, ballast lines through fuel tanks and fuel lines through ballast tanks, in mm

177,8	4,5	5,0	5,0	8,8
193,7	4,5	5,4	5,4	8,8
219,1	4,5	5,9	5,9	8,8
244,5–273	5,0	6,3	6,3	8,8
298,5–368	5,6	6,3	6,3	8,8
406,4–457,2	6,3	6,3	6,3	8,8

NOTE
The pipe diameters and wall thicknesses given in the Table are based on common International Standards. Diameter and thickness according to other National or International Standards will be considered.

Piping Design Requirements

Part 5, Chapter 12

Section 2

2.4 Steel pipe flanges

2.4.1 Flanges may be cut from plates or may be forged or cast. The material is to be suitable for the design temperature. Flanges may be attached to the pipes by screwing and expanding or by welding. Alternative methods of flange attachment may be accepted provided details are submitted for consideration.

2.4.2 Flange attachments to pipes and pressure – temperature ratings in accordance with National or other approved Standards will be accepted.

2.5 Screwed-on flanges

2.5.1 Where flanges are secured by screwing, as indicated in Fig. 12.2.1, the pipe and flange are to be screwed with a vanishing thread and the diameter of the screwed portion of the pipe over the thread is not to be appreciably less than the outside diameter of the unscrewed pipe. After the flange has been screwed hard home the pipe is to be expanded into the flange.

Fig. 12.2.1 Screwed-on flange

2.5.2 The vanishing thread on a pipe is to be not less than three pitches in length, and the diameter at the root of the thread is to increase uniformly from the standard root diameter to the diameter at the top of the thread. This may be produced by suitably grinding the dies, and the flange should be tapered out to the same formation.

2.5.3 Such screwed and expanded flanges may be used for steam for a maximum design pressure of 30,0 bar (30,5 kgf/cm²) and a maximum design temperature of 370°C and for feed for a maximum design pressure of 50 bar (51 kgf/cm²).

2.6 Welded-on flanges, butt welded joints and fabricated branch pieces

2.6.1 The types of welded-on flanges are to be suitable for the pressure, temperature and service for which the pipes are intended.

2.6.2 Typical examples of welded-on flange attachments are shown in Fig. 12.2.2, and limiting design conditions for flange types (a) to (f) are shown in Table 12.2.5.

Fig. 12.2.2 Typical welded-on flanges

2.6.3 Butt welded joints are generally to be of the full penetration type and are to meet the requirements of Chapter 13 of the Rules for Materials.

Piping Design Requirements

Part 5, Chapter 12

Section 2

Table 12.2.5 Limiting design conditions for flange types

Flange type	Maximum pressure	Maximum temperature, in °C	Maximum pipe o.d., in mm	Minimum pipe bore, in mm
(a)	Pressure-temperature ratings to be in accordance with a Recognised Standard	No restriction	No restriction	No restriction
(b)		No restriction	168,3 for alloy steels*	No restriction
(c)		No restriction	168,3 for alloy steels*	75
(d)		425	No restriction	No restriction
(e)		425	No restriction	75
(f)		425	No restriction	No restriction
* No restriction for carbon steels				

2.6.4 Welded-on flanges are not to be a tight fit on the pipes. The maximum clearance between the bore of the flange and the outside diameter of the pipe is to be 3 mm at any point, and the sum of the clearances diametrically opposite is not to exceed 5 mm.

2.6.5 Where butt welds are employed in the attachment of flange type (a), in pipe-to-pipe joints or in the construction of branch pieces, the adjacent pieces are to be matched at the bores. This may be effected by drifting, roller expanding or machining, provided that the pipe wall is not reduced below the designed thickness. If the parts to be joined differ in wall thickness, the thicker wall is to be gradually tapered to the thickness of the thinner at the butt joint. The welding necks of valve chests are to be sufficiently long to ensure that the valves are not distorted as the result of welding and subsequent heat treatment of the joints.

2.6.6 Where backing rings are used with flange type (a) they are to fit closely to the bore of the pipe and should be removed after welding. The rings are to be made of the same material as the pipes or of mild steel having a sulphur content not greater than 0,05 per cent.

2.6.7 Branches may be attached to pressure pipes by means of welding provided that the pipe is reinforced at the branch by a compensating plate or collar or other approved means, or, alternatively, that the thickness of pipe and branch is increased to maintain the strength of the pipe. These requirements also apply to fabricated branch pieces.

2.6.8 Welding may be carried out by means of the shielded metal arc, inert gas metal arc, oxy-acetylene or other approved process, but in general oxy-acetylene welding is suitable only for flange type (a) and is not to be applied to pipes exceeding 100 mm diameter or 9,5 mm thick. The welding is to be carried out in accordance with the appropriate paragraphs of Chapter 17.

2.7 Loose flanges

2.7.1 Loose flange designs as shown in Fig. 12.2.3 may be used provided they are in accordance with a recognised National or International Standard.

**Fig. 12.2.3 Loose flange arrangements**

2.7.2 Loose flange designs where the pipe end is flared as shown in Fig 12.2.3(b) are only to be used for water pipes and on open ended lines.

2.8 Socket weld joints

2.8.1 Socket weld joints may be used in Class III systems with carbon steel pipes of any outside diameter. Socket weld fittings are to be of forged steel and the material is to be compatible with the associated piping. In particular cases, socket welded joints may be permitted for piping systems of Class I and II having outside diameter not exceeding 88,9 mm. Such joints are not to be used where fatigue, severe erosion or crevice corrosion is expected to occur or where toxic media are conveyed. See also Ch 10,14.4.9.

2.8.2 The thickness of the socket weld fittings is to meet the requirements of 2.2.3 but is to be not less than 1,25 times the nominal thickness of the pipe or tube. The diametrical clearance between the outside diameter of the pipe and the bore of the fitting is not to exceed 0,8 mm, and a gap of approximately 1,5 mm is to be provided between the end of the pipe and the bottom of the socket. See also Ch 13,5.2.9 of the Rules for Materials.

2.8.3 The leg lengths of the fillet weld connecting the pipe to the socket weld fitting are to be such that the throat dimension of the weld is not less than the nominal thickness of the pipe or tube.

Piping Design Requirements

Part 5, Chapter 12

Section 2

2.9 Welded sleeve joints

2.9.1 Welded sleeve joints may be used in Class III systems with carbon steel pipes of any outside diameter. In particular cases, welded sleeve joints may be permitted for piping systems of Class I and II having outside diameter not exceeding 88,9 mm. Such joints are not to be used where fatigue, severe erosion or crevice corrosion is expected to occur or where toxic media are conveyed.

2.9.2 Welded sleeve joints are not to be used in the following locations:

- Bilge pipes in way of deep tanks.
- Cargo oil piping outside of the cargo area for bow or stern loading/discharge.
- Air and sounding pipes passing through cargo tanks.

2.9.3 Welded sleeve joints may be used in piping systems for the storage, distribution and utilisation of oil fuel, lubricating or other flammable oil systems in machinery spaces provided they are located in readily visible and accessible positions. See also Ch 14,2.9.2.

2.9.4 Welded sleeve joints are not to be used at deck/bulkhead penetrations that require continuous pipe lengths.

2.9.5 The thickness of the sleeve is to satisfy the requirements of 2.2.3 and Table 12.2.4 but is to be not less than 1,42 times the nominal thickness of the pipe in order to satisfy the throat thickness requirement in 2.9.6. The radial clearance between the outside diameter of the pipe and the internal diameter of the sleeve is not to exceed 1 mm for pipes up to a nominal diameter of 50 mm, 2 mm on diameters up to 200 mm nominal size and 3 mm for larger size pipes. The pipe ends are to be separated by a clearance of approximately 2 mm at the centre of the sleeve.

2.9.6 The sleeve material is to be compatible with the associated piping and the leg lengths of the fillet weld connecting the pipe to the sleeve are to be such that the throat dimension of the weld is not less than the nominal thickness of the pipe or tube.

2.9.7 The minimum length of the sleeve is to conform to the following formula:

$$L_{si} = 0,14D + 36 \text{ mm}$$

where

L_{si} is the length of the sleeve

D is defined in 1.2.1.

2.10 Threaded sleeve joints

2.10.1 Threaded sleeve joints, in accordance with National or other established Standards, may be used with carbon steel pipes within the limits given in Table 12.2.6. Such joints are not to be used where fatigue, severe erosion or crevice corrosion is expected to occur or where flammable or toxic media is conveyed.

Table 12.2.6 Limiting design conditions for threaded sleeve joints

Thread type	Outside pipe diameter, in mm		
	Class I	Class II	Class III
Tapered thread	<33,7	<60,3	<60,3
Parallel thread	–	–	<60,3

2.11 Screwed fittings

2.11.1 Screwed fittings, including compression fittings, of an approved type may be used in piping systems for pipes not exceeding 51 mm outside diameter. Where the fittings are not in accordance with an acceptable standard then LR may require the fittings to be subjected to special tests to demonstrate their suitability for the intended service and working conditions.

2.12 Other mechanical couplings

2.12.1 Pipe unions, compression couplings, or slip-on joints, as shown in Fig. 12.2.4, may be used if Type Approved for the service conditions and the intended application. The Type Approval is to be based on the results of testing of the actual joints. The acceptable use for each service is indicated in Table 12.2.7 and dependence upon the Class of piping, with limiting pipe dimensions, is indicated in Table 12.2.8.

2.12.2 Where the application of mechanical joints results in a reduction in pipe wall thickness due to the use of bite type rings or other structural elements, this is to be taken into account in determining the minimum wall thickness of the pipe to withstand the design pressure.

2.12.3 Construction of mechanical joints is to prevent the possibility of tightness failure affected by pressure pulsation, piping vibration, temperature variation and other similar adverse effects occurring during operation on board.

2.12.4 Materials of mechanical joints are to be compatible with the piping material and internal and external media.

2.12.5 Mechanical joints for pressure pipes are to be tested to a burst pressure of 4 times the design pressure. For design pressures above 200 bar the required burst pressure will be specially considered.

2.12.6 In general, mechanical joints are to be of fire resistant type where required by Table 12.2.7.

2.12.7 Mechanical joints, which in the event of damage could cause fire or flooding, are not to be used in piping sections directly connected to the sea openings or tanks containing flammable fluids.

2.12.8 The mechanical joints are to be designed to withstand internal and external pressure as applicable and where used in suction lines are to be capable of operating under vacuum.

**Fig. 12.2.4 Examples of mechanical joints** (see continuation)

2.12.9 Generally, slip-on joints are not to be used in pipelines in cargo holds, tanks, and other spaces which are not easily accessible. Application of these joints inside tanks may only be accepted where the medium conveyed is the same as that in the tanks.

2.12.10 Unrestrained slip-on joints are only to be used in cases where compensation of lateral pipe deformation is necessary. Usage of these joints as the main means of pipe connection is not permitted.

2.12.11 Restrained slip-on joints are permitted in steam pipes with a design pressure of 10 bar or less on the weather decks of oil and chemical tankers to accommodate axial pipe movement, see Ch 13,2.7.

2.13 Non-destructive testing

2.13.1 For details of non-destructive tests on piping systems, other than hydraulic tests, see Chapter 13 of the Rules for Materials.

KEY + Application is allowed — Application is not allowed			
NOTES 1. Inside machinery spaces of Category A – only approved fire resistant types. 2. Not inside machinery spaces of Category A or accommodation spaces. May be accepted in other machinery spaces provided the joints are located in easily visible and accessible positions. 3. Approved fire resistant types. Fire resistant type is a type of connection which, when installed in the system and in the event of failure caused by fire, the failure would not result in fire spread, flooding or the loss of an essential service. 4. Above freeboard deck only. 5. In pump rooms and open decks – only approved fire resistant types. 6. If compression couplings include any components which are sensitive to heat, they are to be of approved fire resistant type as required for slip-on joints. 7. See 2.12.11.

Section 3 Copper and copper alloys

3.1 Copper and copper alloy pipes, valves and fittings

3.1.1 Materials for Class I and Class II piping systems, also for ship-side valves and fittings and valves on the collision bulkhead, are to be manufactured and tested in accordance with the requirements of Chapter 9 of the Rules for Materials, see also 1.6.

3.1.2 Materials for Class III piping systems are to be manufactured and tested in accordance with the requirements of acceptable National Specifications. The manufacturer's test certificate will be acceptable and is to be provided for each consignment of material.

3.1.3 Pipes are to be seamless, and branches are to be provided by cast or stamped fittings, pipe pressings or other approved fabrications.

3.1.4 Brazing and welding materials are to be suitable for the operating temperature and for the medium being carried. All brazing and welding are to be carried out to the satisfaction of the Surveyors.

3.1.5 In general, the maximum permissible service temperature of copper and copper alloy pipes, valves and fittings is not to exceed 200°C for copper and aluminium brass, and 300°C for copper-nickel. Cast bronze valves and fittings complying with the requirements of Chapter 9 of the Rules for Materials may be accepted up to 260°C.

3.1.6 The minimum thickness, t , of straight copper and copper alloy pipes is to be determined by the following formula:

$$t = \left(\frac{pD}{20\sigma + p} + c \right) \frac{100}{100 - a} \text{ mm}$$

$$\left(t = \left(\frac{pD}{2\sigma + p} + c \right) \frac{100}{100 - a} \text{ mm} \right)$$

where

p , D and a are as defined in 1.2.1

- c = corrosion allowance
 - = 0,8 mm for copper, aluminium brass, and copper-nickel alloys where the nickel content is less than 10 per cent
 - = 0,5 mm for copper-nickel alloys where the nickel content is 10 per cent or greater
 - = 0 where the media are non-corrosive relative to the pipe material
- σ = maximum permissible design stress, in N/mm² (kgf/cm²), from Table 12.3.1. Intermediate values of stresses may be obtained by linear interpolation.

3.1.7 The minimum thickness, t_b , of a straight seamless copper or copper alloy pipe to be used for a pipe bend is to be determined by the formula below, except where it can be demonstrated that the use of a thickness less than t_b would not reduce the thickness below t at any point after bending:

$$t_b = \left[\left(\frac{pD}{20\sigma + p} \right) \left(1 + \frac{D}{2,5R} \right) + c \right] \frac{100}{100 - a} \text{ mm}$$

$$\left(t_b = \left[\left(\frac{pD}{2\sigma + p} \right) \left(1 + \frac{D}{2,5R} \right) + c \right] \frac{100}{100 - a} \text{ mm} \right)$$

where

p , D , R and a are as defined in 1.2.1

σ and c are as defined in 3.1.6. In general, R is to be not less than $3D$.

Piping Design Requirements

Part 5, Chapter 12

Sections 3 & 4

Table 12.3.1 Copper and copper alloy pipes

Pipe material	Condition of supply	Specified minimum tensile strength, N/mm ² (kgf/mm ²)	Permissible stress, N/mm ² (kgf/cm ²)										
			Maximum design temperature, °C										
			50	75	100	125	150	175	200	225	250	275	300
Copper	Annealed	220 (22)	41,2 (420)	41,2 (420)	40,2 (410)	40,2 (410)	34,3 (350)	27,5 (280)	18,6 (190)	–	–	–	–
Aluminium brass	Annealed	320 (33)	78,5 (800)	78,5 (800)	78,5 (800)	78,5 (800)	78,5 (800)	51,0 (520)	24,5 (250)	–	–	–	–
90/10 Copper-nickel-iron	Annealed	270 (28)	68,6 (700)	68,6 (700)	67,7 (690)	65,7 (670)	63,7 (650)	61,8 (630)	58,8 (600)	55,9 (570)	52,0 (530)	48,1 (490)	44,1 (450)
70/30 Copper-nickel	Annealed	360 (37)	81,4 (830)	79,4 (810)	77,5 (790)	75,5 (770)	73,5 (750)	71,6 (730)	69,6 (710)	67,7 (690)	65,7 (670)	63,7 (650)	61,8 (630)

3.1.8 Where the minimum thickness calculated by 3.1.6 or 3.1.7 is less than shown in Table 12.3.2, the minimum nominal thickness for the appropriate standard pipe size shown in the Table is to be used. No allowance is required for negative tolerance or reduction in thickness due to bending on this nominal thickness. For threaded pipes, where permitted, the minimum thickness is to be measured at the bottom of the thread.

Table 12.3.2 Minimum thickness for copper and copper alloy pipes

Standard pipe sizes (outside diameter), in mm			Minimum overriding nominal thickness, in mm	
			Copper	Copper alloy
8	to	10	1,0	0,8
12	to	20	1,2	1,0
25	to	44,5	1,5	1,2
50	to	76,1	2,0	1,5
88,9	to	108	2,5	2,0
133	to	159	3,0	2,5
193,7	to	267	3,5	3,0
273	to	457,2	4,0	3,5
		508	4,5	4,0

3.2 Heat treatment

3.2.1 Pipes which have been hardened by cold bending are to be suitably heat treated on completion of fabrication and prior to being tested by hydraulic pressure. Copper pipes are to be annealed and copper alloy pipes are to be either annealed or stress relief heat treated.

4.1.2 Spheroidal or nodular graphite iron castings for pipes, valves and fittings in Class II and Class III piping systems are to be made in a grade having a specified minimum elongation not less than 12 per cent on a gauge length of $5,65 \sqrt{S_0}$, where S_0 is the actual cross-sectional area of the test piece.

4.1.3 Castings for Class II systems, also for ship-side valves and fittings and valves on the collision bulkhead, are to be manufactured and tested in accordance with the requirements of Chapter 7 of the Rules for Materials. Castings for Class III systems are to comply with the requirements of acceptable national specifications. A manufacturer's test certificate will be accepted and is to be provided for each consignment of material for Class III systems, see also 1.6.

4.1.4 Proposals for the use of this material in Class I piping systems will be specially considered, but in no case is the material to be used in systems where the design temperature exceeds 350°C.

4.1.5 Where the elongation is less than the minimum required by 4.1.1, the material is, in general, to be subject to the same limitations as grey cast iron.

4.2 Grey cast iron

4.2.1 Grey cast iron pipes, valves and fittings will, in general, be accepted in Class III piping systems except as stated in 4.2.3.

4.2.2 Grey cast iron is not to be used for pipes, valves and other fittings handling media having temperatures above 220°C or for piping subject to pressure shock, excessive strains or vibrations.

Section 4 Cast iron

4.1 Spheroidal or nodular graphite cast iron

4.1.1 Spheroidal or nodular graphite iron may be accepted for bilge, ballast and cargo oil piping.

Piping Design Requirements

Part 5, Chapter 12

Sections 4 & 5

4.2.3 Grey cast iron is not to be used for the following:

- Pipes for steam systems and fire extinguishing systems.
- Pipes, valves and fittings for boiler blow-down systems and other piping systems subject to shock or vibration.
- Ship-side valves and fittings, see Ch 13,2.5.
- Valves fitted on the collision bulkhead, see Ch 13,3.5.
- Bilge lines in tanks.
- Pipes and fittings in flammable oil systems where the design pressure exceeds 7 bar or the design operating temperature is greater than 60°C.
- Valves fitted to tanks containing flammable oil under static pressure.
- Valve chests and fittings for starting air systems, see Ch 2,7.4.3.

4.2.4 Castings for Class III piping systems are to comply with acceptable National Specifications.

Section 5 Plastics pipes

5.1 General

5.1.1 Proposals to use plastics pipes in shipboard piping systems will be considered in relation to the properties of the materials, the operating conditions, the intended service and location. Details are to be submitted for approval. Special consideration will be given to any proposed service for plastics pipes not mentioned in these Rules.

5.1.2 Attention is also to be given to the *Guidelines for the Application of Plastic Pipes on Ships* contained in IMO Resolution A.753(18).

5.1.3 Plastics pipes and fittings will, in general, be accepted in Class III piping systems. Proposals for the use of plastics in Class I and Class II piping systems will be specially considered.

5.1.4 For Class I, Class II and any Class III piping systems for which there are Rule requirements, the pipes are to be of a type which has been approved by LR.

5.1.5 For domestic and similar services where there are no Rule requirements, the pipes need not be of a type which has been approved by LR. However, the fire safety aspects as referenced in 5.4, are to be considered.

5.1.6 The use of plastics pipes may be restricted by statutory requirements of the National Authority of the country in which the ship is to be registered.

5.2 Design and performance criteria

5.2.1 Pipes and fittings are to be of robust construction and are to comply with a National or other established Standard, consistent with the intended use. Particulars of pipes, fittings and joints are to be submitted for consideration.

5.2.2 The design and performance criteria of all piping systems, independent of service or location, are to meet the requirements of 5.3.

5.2.3 Depending on the service and location, the fire safety aspects are to meet the requirements of 5.4.

5.2.4 Plastics piping is to be electrically conductive when:
(a) carrying fluids capable of generating electrostatic charges.
(b) passing through dangerous zones and spaces, regardless of the fluid being conveyed.

Suitable precautions against the build up of electrostatic charges are to be provided in accordance with the requirements of 5.5, see also Pt 6, Ch 2,1.12.

5.3 Design strength

5.3.1 The strength of pipes is to be determined by hydrostatic pressure tests to failure on representative sizes of pipe. The strength of fittings is to be not less than the strength of the pipes.

5.3.2 The nominal internal pressure, pN_i , of the pipe is to be determined by the lesser of the following:

$$pN_i \leq \frac{p_{st}}{4}$$

$$pN_i \leq \frac{p_{lt}}{2,5}$$

where

p_{st} = short term hydrostatic test failure pressure, in bar

p_{lt} = long term hydrostatic test failure pressure (100 000 hours), in bar

Testing may be carried out over a reduced period of time using suitable Standards, such as ASTM D2837 and D1598.

5.3.3 The nominal external pressure, pN_e , of the pipe, defined as the maximum total of internal vacuum and external static pressure head to which the pipe may be subjected, is to be determined by the following:

$$pN_e \leq \frac{p_{col}}{3}$$

where

p_{col} = pipe collapse pressure, in bar

The pipe collapse pressure is not to be less than 3 bar.

5.3.4 Piping is to meet these design requirements over the range of service temperature it will experience.

5.3.5 High temperature limits and pressure reductions relative to nominal pressures are to be according to a recognised standard, but in each case the maximum working temperature is to be at least 20°C lower than the minimum temperature of deflection under load of the resin or plastics material without reinforcement. The minimum heat distortion temperature is not to be less than 80°C, see also Ch 14,4 of the Rules for Materials.

5.3.6 Where it is proposed to use plastics piping in low temperature services, design strength testing is to be made at a temperature 10°C lower than the minimum working temperature.

Piping Design Requirements

Part 5, Chapter 12

Section 5

Table 12.5.1 Typical temperature and pressure limits for thermoplastic pipes

Material	Nominal pressure, bar	Maximum permissible working pressure, bar						
		–20 to 0°C	30°C	40°C	50°C	60°C	70°C	80°C
PVC	10 16		7,5 12	6 9	6

HDPE	10 16	7,5 12	6 9,5	6				
Abbreviations PVC Polyvinyl chloride ABS Acrylonitrile – butadiene – styrene HDPE High density polyethylene								

Table 12.5.2 Typical temperature and pressure limits for glassfibre reinforced epoxy (GRE) and polyester (GRP) pipes

Minimum heat distortion temperature of resin	Nominal pressure, bar	Maximum permissible working pressure, bar							
		–50 to 30°C	40°C	50°C	60°C	70°C	80°C	90°C	95°C
80°C	10	10	9	7,5	6				
	16	16	14	12	9,5				
	25	16	16	16	15				
100°C	10	10	10	9,5	8,5	7	6		
	16	16	16	15	13,5	11	9,5		
	25	16	16	16	16	16	15		
135°C	10	10	10	10	10	9,5	8,5	7	6
	16	16	16	16	16	15	13,5	11	9,5
	25	16	16	16	16	16	16	16	15

5.3.7 For guidance, typical temperature and pressure limits are indicated in Tables 12.5.1 and 12.5.2. The Tables are related to water service only. Transport of chemicals or other media is to be considered on a case by case basis.

5.3.8 The selection of plastics materials for piping is to take account of other factors such as impact resistance, ageing, fatigue, erosion resistance, fluid absorption and material compatibility such that the design strength of the piping is not reduced below that required by these Rules.

5.3.9 Design strength values may be verified experimentally or by a combination of testing and calculation methods.

5.4 Fire performance criteria

5.4.1 Where plastics pipes are used in systems essential to the safe operation of the ship, or for containing combustible liquids or sea-water where leakage or failure could result in fire or in the flooding of watertight compartments, the pipes and fittings are to be of a type which have been fire endurance tested in accordance with the requirements of Table 12.5.3.

5.4.2 Where a fire protective coating of pipes and fittings is necessary for achieving the fire endurance standards required, the coating is to be resistant to products likely to come into contact with the piping and be suitable for the intended application.

5.5 Electrical conductivity

5.5.1 Where a piping system is required to be electrically conductive for the control of static electricity, the resistance per unit length of the pipe, bends, elbows, fabricated branch pieces, etc., is not to exceed 0,1 MΩ/m, see also 5.2.4.

5.5.2 Electrical continuity is to be maintained across the joints and fittings and the system is to be earthed, see also Pt 6, Ch 2, 1.12. The resistance to earth from any point in the piping system is not to exceed 1 MΩ.

5.6 Manufacture and quality control

5.6.1 All materials for plastics pipes and fittings are to be approved by LR, and are in general to be tested in accordance with Ch 14,4 of the Rules for Materials.

LOCATION DEFINITIONS											
Location		Definition									
A	Machinery spaces of Category A		Machinery spaces of Category A as defined in SOLAS* regulation II-2/3.19.								
B	Other machinery spaces and pump rooms		Spaces, other than Category A machinery spaces and cargo pump rooms, containing propulsion machinery, boilers, steam and internal combustion engines, generators and major electrical machinery, pumps, oil filling stations, refrigerating, stabilising, ventilation and air-conditioning machinery, and similar spaces, and trunks to such spaces.								
C	Cargo pump rooms		Spaces containing cargo pumps and entrances and trunks to such spaces.								
D	Ro-Ro cargo holds		Ro-Ro cargo holds are Ro-Ro cargo spaces and special category spaces as defined in SOLAS* regulation II-2/3.14 and 3.18.								
E	Other dry cargo holds		All spaces other than Ro-Ro cargo holds used for non-liquid cargo and trunks to such spaces.								
F	Cargo tanks		All spaces used for liquid cargo and trunks to such spaces.								
G	Fuel oil tanks		All spaces used for oil fuel (excluding cargo tanks) and trunks to such spaces.								
H	Ballast water tanks		All spaces used for ballast water and trunks to such spaces.								
I	Cofferdams, voids, etc.		Cofferdams and voids are those empty spaces between two bulkheads separating two adjacent compartments.								
J	Accommodation, service		Accommodation spaces, service spaces and control stations as defined in SOLAS* regulation II-2/3.10, 3.12, 3.22.								
K	Open decks		Open deck spaces, as defined in SOLAS* regulation II-2/26.2.2(5).								
*	SOLAS 74 as amended by the 1978 SOLAS Protocol and the 1981 and 1983 amendments (consolidated text).										
ABBREVIATIONS											
L1	Fire endurance test in dry conditions, 60 minutes, IMO Resolution A.753(18) Appendix 1.

Piping Design Requirements

Part 5, Chapter 12

Section 5

Table 12.5.3 Fire endurance requirements (conclusion)

NOTES	
1.	Where non-metallic piping is used, remotely controlled valves to be provided at ship's side (valve is to be controlled from outside space).
2.	Remote closing valves to be provided at the cargo tanks.
3.	When cargo tanks contain flammable liquids with f.p. > 60°C, 'O' may replace 'N/A' or 'X'.
4.	For drains serving only the space concerned, 'O' may replace 'L1'.
5.	When controlling functions are not required by the Rules or statutory requirements, 'O' may replace 'L1'.
6.	For pipe between machinery space and deck water seal, 'O' may replace 'L1'.
7.	For passenger vessels, 'X' is to replace 'L1'.
8.	Scuppers serving open decks in positions 1 and 2, as defined in regulation 13 of the <i>International Convention on Load Lines, 1966</i> , should be 'X' throughout unless fitted at the upper end with the means of closing capable of being operated from a position above the freeboard deck in order to prevent downflooding.
9.	For essential services, such as oil fuel tank heating and ship's whistle, 'X' is to replace 'O'.
10.	For tankers where compliance with MARPOL Annex I, Regulation 19.3.6 is required, 'N/A' is to replace 'O'.
11.	Air and sounding pipes on open deck are to be of substantial construction, see Ch 13,10.2.2.

5.6.2 The material manufacturer's test certificate, based on actual tested data, is to be provided for each batch of material.

5.6.3 Plastics pipes and fittings are to be manufactured at a works approved by LR in accordance with agreed quality control procedures which shall be capable of detecting at any stage (e.g. incoming material, production, finished article, etc.) deviations in the material, product or process.

5.6.4 Plastics pipes are to be manufactured and tested in accordance with Ch 14,4 of the Rules for Materials. For Class III piping systems the pipe manufacturer's test certificate may be accepted in lieu of an LR Certificate and is to be provided for each consignment of pipe.

5.7 Installation and construction

5.7.1 All pipes are to be adequately but freely supported. Suitable provision is to be made for expansion and contraction to take place without unduly straining the pipes.

5.7.2 Pipes may be joined by mechanical couplings or by bonding methods such as welding and laminating.

5.7.3 Where bonding systems are used, the manufacturer or installer shall provide a written procedure covering all aspects of installation, including temperature and humidity conditions. The bonding procedure is to be approved by LR.

5.7.4 The person carrying out the bonding is to be qualified. Records are to be available to the Surveyor for each qualified person showing the bonding procedure and performance qualification, together with dates and results of the qualification testing.

5.7.5 In the case of pipes intended for essential services each qualified person is, at the place of construction, to make at least one test joint, representative of each type of joint to be used. The joined pipe section is to be tested to an internal hydrostatic pressure of four times the design pressure of the pipe system and the pressure held for not less than one hour, with no leakage or separation of joints. The bonding procedure test is to be witnessed by the Surveyor.

5.7.6 Conditions during installation, such as temperature and humidity, which may affect the strength of the finished joints, are to be in accordance with the agreed bonding procedure.

5.7.7 The required fire endurance level of the pipe is to be maintained in way of pipe supports, joints and fittings, including those between plastics and metallic pipes.

5.7.8 Where piping systems are arranged to pass through watertight bulkheads or decks, provision is to be made for maintaining the integrity of the bulkhead or deck by means of metallic bulkhead, or deck, pieces. The bulkhead pieces are to be protected against corrosion, and so constructed to be of a strength equivalent to the intact bulkhead; attention is drawn to 5.7.1, see also Ch 13,2.4.1. Details of the arrangements are to be submitted for approval.

Piping Design Requirements

Part 5, Chapter 12

Sections 5, 6 & 7

5.7.9 Where a piping system is required to be electrically conductive, for the control of static electricity, continuity is to be maintained across the joints and fittings, and the system is to be earthed, see *also* Pt 6, Ch 2, 1.12.

5.8 Testing

5.8.1 The hydraulic testing of pipes and fittings is to be in accordance with Section 8.

5.8.2 Where a piping system is required to be electrically conductive, tests are to be carried out to verify that the resistance to earth from any point in the system does not exceed 1 MΩ, see *also* Pt 6, Ch 2, 20.2.3.

Section 6 Valves

6.1 Design requirements

6.1.1 The design, construction and operational capability of valves is to be in accordance with an acceptable National or International Standard appropriate to the piping system. Where valves are not in accordance with an acceptable standard, details are to be submitted for consideration. Where valves are fitted, the requirements of 6.1.2 to 6.1.8 are to be satisfied.

6.1.2 Valves are to be made of steel, cast iron, copper alloy, or other approved material suitable for the intended purpose.

6.1.3 Valves having isolation or sealing components sensitive to heat are not to be used in spaces where leakage or failure caused by fire could result in fire spread, flooding or the loss of an essential service.

6.1.4 Where valves are required to be capable of being closed remotely in the event of fire, the valves, including their control gear, are to be of steel construction or of an acceptable fire tested design.

6.1.5 Valves are to be arranged for clockwise closing and are to be provided with indicators showing whether they are open or shut unless this is readily obvious. Legible nameplates are to be fitted.

6.1.6 Valves are to be so constructed as to prevent the possibility of valve covers or glands being slackened back or loosened when the valves are operated.

6.1.7 Valves are to be used within their specified pressure and temperature rating for all normal operating conditions, and are to be suitable for the intended purpose.

6.1.8 Valves intended for submerged installation are to be suitable for both internal and external media. Spindle sealing is to prevent ingress of external media at the maximum external pressure head expected in service.

Section 7 Flexible hoses

7.1 General

7.1.1 A flexible hose assembly is a short length of metallic or non-metallic hose normally with prefabricated end fittings ready for installation.

7.1.2 For the purpose of approval for the applications in 7.2, details of the materials and construction of the hoses, and the method of attaching the end fittings together with evidence of satisfactory prototype testing, are to be submitted for consideration.

7.1.3 The use of hose clamps and similar types of end attachments are not to be used for flexible hoses in piping systems for steam, flammable media, starting air systems or for sea-water systems where failure may result in flooding. In other piping systems, the use of hose clamps may be accepted where the working pressure is less than 5 bar and provided that there are two clamps at each end connection.

7.1.4 Flexible hoses are to be limited to a length necessary to provide for relative movement between fixed and flexibly mounted items of machinery/equipment or systems.

7.1.5 Flexible hoses are not to be used to compensate for misalignment between sections of piping.

7.1.6 Flexible hose assemblies are not to be installed where they may be subjected to torsional deformation (twisting) under normal operating conditions.

7.1.7 The number of flexible hoses in piping systems mentioned in this Section is to be kept to a minimum and to be limited for the purpose stated in 7.2.1.

7.1.8 Where flexible hoses are intended for conveying flammable fluids in piping systems that are in close proximity to hot surfaces, electrical installation or other sources of ignition, the risk of ignition due to failure of the hose assembly and subsequent release of fluids is to be mitigated as far as practicable by the use of screens or other suitable protection.

7.1.9 Flexible hoses are to be installed in clearly visible and readily accessible locations.

7.1.10 The installation of flexible hose assemblies is to be in accordance with the manufacturer's instructions and use limitations with particular attention to the following:

- Orientation.
- End connection support (where necessary).
- Avoidance of hose contact that could cause rubbing and abrasion.
- Minimum bend radii.

Piping Design Requirements

Part 5, Chapter 12

Section 7

7.1.11 Flexible hoses are to be permanently marked by the manufacturer with the following details:

- (a) Hose manufacturer's name or trademark.
- (b) Date of manufacture (month/year).
- (c) Designation type reference.
- (d) Nominal diameter.
- (e) Pressure rating
- (f) Temperature rating.

Where a flexible hose assembly is made up of items from different manufacturers, the components are to be clearly identified and traceable to evidence of prototype testing.

7.2 Applications

7.2.1 Short joining lengths of flexible hoses complying with the requirements of this Section may be used, where necessary, to accommodate relative movement between various items of machinery connected to permanent piping systems. The requirements of this Section may also be applied to temporarily-connected flexible hoses or hoses of portable equipment.

7.2.2 Rubber or plastics hoses, with integral cotton or similar braid reinforcement, may be used in fresh and sea-water cooling systems. In the case of sea-water systems, where failure of the hoses could give rise to the danger of flooding, the hoses are to be suitably enclosed, as indicated in Ch 13,2.7.

7.2.3 Rubber hoses, with single, double or more closely woven integral wire braid or other suitable material reinforcement, or convoluted metal pipes with wire braid protection, may be used in bilge, ballast, compressed air, fresh water, sea-water, oil fuel, lubricating oil, Class III steam, hydraulic and thermal oil systems. Flexible hoses of plastics materials for the same purposes, such as Teflon or Nylon, which are unable to be reinforced by incorporating closely woven integral wire braid are to have suitable material reinforcement as far as practicable. Where rubber or plastics hoses are used for oil fuel supply to burners, the hoses are to have external wire braid protection in addition to the integral wire braid. Flexible hoses for use in steam systems are to be of metallic construction.

7.2.4 Flexible hoses are not to be used in high pressure fuel oil injection systems.

7.2.5 The requirements in this Section for flexible hose assemblies are not applicable to hoses intended to be used in fixed fire-extinguishing systems.

7.3 Design requirements

7.3.1 Flexible hose assemblies are to be designed and constructed in accordance with recognised National or International Standards acceptable to LR.

7.3.2 Flexible hoses are to be complete with approved end fittings in accordance with manufacturer's specification. End connections which do not have flanges are to comply with 2.12 as applicable and each type of hose/fitting combination is to be subject to prototype testing to the same standard as that required by the hose with particular reference to pressure and impulse tests.

7.3.3 Flexible hose assemblies intended for installation in piping systems where pressure pulses and/or high levels of vibration are expected to occur in service, are to be designed for the maximum expected impulse peak pressure and forces due to vibration. The tests required by 7.4 are to take into consideration the maximum anticipated in-service pressures, vibration frequencies and forces due to installation.

7.3.4 Flexible hose assemblies constructed of non-metallic materials intended for installation in piping systems for flammable media, and sea-water systems where failure may result in flooding, are to be of fire-resistant type. Fire resistance is to be demonstrated by testing to ISO 15540 and ISO 15541.

7.3.5 Flexible hose assemblies are to be suitable for the intended location and application, taking into consideration ambient conditions, compatibility with fluids under working pressure and temperature conditions consistent with the manufacturer's instructions and any other applicable requirements in the Rules.

7.4 Testing

7.4.1 Acceptance of flexible hose assemblies is subject to satisfactory prototype testing. Prototype test programmes for flexible hose assemblies are to be submitted by the manufacturer and are to be sufficiently detailed to demonstrate performance in accordance with the specified Standards.

7.4.2 For a particular hose type complete with end fittings, the tests, as applicable, are to be carried out on different nominal diameters for pressure, burst, impulse and fire resistance in accordance with the requirements of the relevant Standard. The following Standards are to be used as applicable:

- ISO 6802 – *Rubber and plastics hoses and hose assemblies – Hydraulic pressure impulse test without flexing.*
- ISO 6803 – *Rubber and plastics hoses and hose assemblies – Hydraulic pressure impulse test with flexing.*
- ISO 15540 – *Ships and marine technology – Fire resistance of hose assemblies – Test methods.*
- ISO 15541 – *Ships and marine technology – Fire resistance of hose assemblies – Requirements for test bench.*
- ISO 10380 – *Pipework – Corrugated metal hoses and hose assemblies.*

Other Standards may be accepted where agreed by LR.

Piping Design Requirements

Part 5, Chapter 12

Sections 7 & 8

7.4.3 All flexible hose assemblies are to be satisfactorily prototype burst tested to an International Standard* to demonstrate they are able to withstand a pressure of not less than four times the design pressure without indication of failure or leakage.

NOTE

* The International Standards, e.g. EN or SAE for burst testing of non-metallic hoses, require the pressure to be increased until burst without any holding period at 4 x Maximum Working Pressure.

Section 8 Hydraulic tests on pipes and fittings

8.1 Hydraulic tests before installation on board

8.1.1 All Class I and II pipes and their associated fittings are to be tested by hydraulic pressure to the Surveyor's satisfaction. Further, all steam, feed, compressed air and oil fuel pipes, together with their fittings, are to be similarly tested where the design pressure is greater than 3,5 bar (3,6 kgf/cm²). The test is to be carried out after completion of manufacture and before installation on board and, where applicable, before insulating and coating.

8.1.2 Where the design temperature does not exceed 300°C, the test pressure is to be 1,5 times the design pressure, as defined in 1.3.

8.1.3 Where testing of systems or sub-systems following final assembly is specified, in addition to the requirements of 8.1.2 the lowest applicable pressure as defined in this sub-Section is to be used for testing.

8.1.4 For steel pipes and integral fittings for use in systems where the design temperature exceeds 300°C, the test pressure is to be as follows:

- For carbon and carbon-manganese steel pipes, the test pressure is to be twice the design pressure, as defined in 1.3.
- For alloy steel pipes, the test pressure is to be determined by the following formula, but need not exceed 2p:

$$p_t = 1,5 \frac{\sigma_{100}}{\sigma} p \text{ bar (kgf/cm}^2\text{)}$$

where

p_t and p are as defined in 1.2.1

σ = permissible stress for the design temperature, in N/mm² (kgf/cm²), as stated in Table 12.2.2

σ_{100} = permissible stress for 100°C, in N/mm² (kgf/cm²), as stated in Table 12.2.2.

8.1.5 Where alloy steels not included in Table 12.2.2 are used, the permissible stresses will be specially considered, as indicated in 2.2.2.

8.1.6 Consideration will be given to the reduction of the test pressure to not less than 1,5p, where it is necessary to avoid excessive stress in way of bends, branches, etc.

8.1.7 Valves and fittings non-integral with the piping system, intended for Classes I and II, are to be tested in accordance with recognised standards, but to not less than 1,5 times the design pressure. Where design features are such that modifications to the test requirements are necessary, alternative proposals for hydraulic tests are to be submitted for special consideration.

8.1.8 For requirements relating to valves and cocks intended to be fitted on the ship's side below the load water line, see Ch 13,2.5.10.

8.1.9 In no case is the membrane stress to exceed 90 per cent of the yield stress at the testing temperature.

8.2 Testing after assembly on board

8.2.1 Heating coils in tanks, gas fuel and oil fuel piping are to be tested by hydraulic pressure, after installation on board, to 1,5 times the design pressure but in no case to less than 4 bar (4,1 kgf/cm²).

8.2.2 Where pipes specified in 8.1.1 are butt welded together during assembly on board, they are to be tested by hydraulic pressure in accordance with the requirements of 8.1 after welding. The pipe lengths may be insulated, except in way of the joints made during installation and before the hydraulic test is carried out.

8.2.3 The hydraulic test required by 8.2.2 may be omitted provided non-destructive tests by ultrasonic or radiographic methods are carried out on the entire circumference of all butt welds with satisfactory results. Where ultrasonic tests have been carried out, the manufacturer is to provide the Surveyor with a signed statement confirming that ultrasonic examination has been carried out by an approved operator and that there were no indications of defects which could be expected to have a prejudicial effect on the service performance of the piping.

8.2.4 Where bilge pipes are accepted in way of double bottom tanks or deep tanks, see Ch 13,7.9 and 7.10, the pipes after fitting are to be tested by hydraulic pressure to the same pressure as the tanks through which they pass.

Cross-reference

See also Ch 13,2.10 for testing after installation.

Piping Design Requirements

Part 5, Chapter 12

Section 9

■ Section 9 Piping for LPG/LNG carriers, gas fuelled ships and classed refrigeration systems

9.1 Scope

9.1.1 This Section is applicable to piping systems installed in LPG/LNG carriers, gas fuelled ships and classed refrigeration systems for the following pipes and piping system components:

- (a) Pipework – stainless steel, carbon steel and copper.
- (b) Valves – normal and cryogenic service (below minus 55°C).
- (c) Bellows – normal and cryogenic service (below minus 55°C).
- (d) Pipe fittings – elbows, reducers, tee connections, etc.
- (e) Ancillary fittings – weldolets, threadolets, thermo-pockets.

9.1.2 The following piping systems are covered by this Section:

- (a) LPG/LNG cargo systems – normal cargo operations.
- (b) LPG/LNG cargo systems – cargo gas to reliquefaction system.
- (c) LNG cargo systems – gas burning and use of cargo as fuel.
- (d) LNG Regasification system – high and low pressure.
- (e) Cargo Reliquefaction system – nitrogen or mixed refrigerant.
- (f) Refrigeration – independent plant used in cascade systems.
- (g) Gas storage and supply systems for gas fuelled ships.

9.2 Application

9.2.1 The requirements of this Section apply to pipes and piping system components, such as valves, elbows and bellows, which are to be used on gas carriers, gas fuelled ships or classed refrigeration/reliquefaction systems. The requirements are also applicable to other gas cargo services such as regasification systems and gas combustion units, and are in addition to those contained in both the Rules for Ships for Liquefied Gases and relevant Sections of this Chapter where appropriate.

9.3 Classes of pipe

9.3.1 The material requirements for piping systems vary depending on the Class of the piping system. The Class of the piping system is dependent on the design pressure or temperature of the system and the pipe material used as shown in Table 12.1.1.

9.3.2 Table 12.1.1 piping systems containing LPG/LNG, cargo or fuel gas as the conveyed medium are to be treated as 'Flammable liquids'. These piping systems are to be categorised as Class II. Vapour lines are also to be categorised as Class II systems but the upper limit on pressure may be increased to 40 bar in accordance with the 'Other media'. Where higher design pressures are applied, such as in a regasification system, liquid lines above 16 bar and vapour lines above 40 bar are to be categorised as Class I. All open ended pipes, such as vent lines and pipes inside the cargo tanks may be categorised as Class III.

9.3.3 For reliquefaction and refrigeration systems Table 12.1.1 is to be applied. Nitrogen and non-toxic or non-flammable refrigerants are to be considered under the 'Other media' heading. Refrigeration systems containing ammonia are to be considered as Class I systems irrespective of the operational pressure.

9.4 Materials

9.4.1 Stainless steel pipes, valves and fittings are to be grades 304L, 316L, 321 or 347 in accordance with Ch 6,5 of the Rules for Materials.

9.4.2 The materials used in Class I and Class II systems are to be produced at a works approved by LR. Testing is to be in accordance with the Rules for Materials and Tables 6.1 and 6.4 in chapter 6 of the Rules for Ships for Liquefied Gases.

9.4.3 For stainless steel pipes, valve castings and forgings intended for service temperatures down to minus 55°C, a LR materials certificate is required unless the nominal diameter is less than 50 mm, or the nominal diameter is less than 150 mm and working pressure, in bar g, multiplied by nominal diameter, in mm, is less than 2500, where a manufacturer's material certificate is acceptable.

9.4.4 For pipe systems operating at cryogenic temperatures lower than minus 55°C, a LR materials certificate is required.

9.5 Valves and piping components independent of temperature

9.5.1 For valves and piping components fitted in the cargo piping system of LPG/LNG gas carriers, each type of valve and piping component is to have evidence of satisfactory type testing.

9.6 Valves for cryogenic temperature service

9.6.1 The tightness test required by 5.3.2.1 of the Rules for Ships for Liquefied Gases is to be conducted in accordance with a recognised National or International Code or Standard.

Piping Design Requirements

Part 5, Chapter 12

Section 9

9.7 Valves for refrigeration service

9.7.1 For valves intended for installation in a refrigeration system with a nominal diameter of less than 150 mm, a manufacturer's certificate is acceptable. The certificate is to include details of the maximum working pressure and test pressure, and sufficient information for the LR Surveyor to assess the suitability of the equipment for the intended use. Each size and type of valve is to be supplied with its own certificate and is to be signed by a responsible person in the manufacturer's quality control department.

9.7.2 Valves with nominal diameters above 150 mm are to be supplied with a LR materials certificate in accordance with the Rules for Materials.

9.7.3 Where valves are fitted to pressure vessels, the requirements of Chapters 10 and 11 are applicable for the Class of pressure vessel. Mountings for liquefied gas pressure vessels are to comply with the Rules for Ships for Liquefied Gases. Any acceptance of manufacturer's certification in other Sections of this Chapter is not applicable to the valves fitted to pressure vessels in chapters 10 and 11 of the Rules for Ships for Liquefied Gases.

9.7.4 Any valve fitted directly onto a pressure vessel is to be considered a mounting and is required to be hydraulically pressure tested to twice the approved design pressure. See Ch 11,10.2.1.

9.8 Expansion bellows

9.8.1 The following plans and particulars are to be submitted:

- Dimensioned drawings of each type of bellows.
- Design calculations to show that the bellows are suitable for the intended design conditions, carried out to EJMA (Expansion Joint Manufacturers Association) standards (latest edition) or equivalent.
- A proposed prototype test program covering the tests detailed in 5.3.2.2 of the Rules for Ships for Liquefied Gases.
- Calculations to EJMA standards may be accepted, together with sample testing detailed above, in order to cover the entire size range for the type.

9.8.2 In accordance with 5.3 of the Rules for Ships for Liquefied Gases, the requirements for type testing in 9.8.3 to 9.8.7 are to be performed on each type of expansion bellows intended for use on LPG/LNG piping.

9.8.3 For each type of expansion bellows, an element of the bellows, not pre-compressed, is to be pressure tested at not less than five times the design pressure without bursting. This test is to be conducted at room temperature on each 'type' of element and need not be the complete bellows unit. A test on one element can cover other sized bellows with the same cross-sectional bellows form. The design pressure is to be at least 10 bar; bellows fitted to safety valves and vent lines may have a minimum design pressure of 5 bar in accordance with 5.2.3.3 of the Rules for Ships for Liquefied Gases. The required test duration is not to be less than 5 minutes.

9.8.4 A pressure test is to be performed on each type of expansion joint complete with all the accessories such as flanges, stays and articulations, at twice the design pressure at the extreme displacement conditions recommended by the manufacturer without permanent deformation. The test is to be undertaken at the minimum design temperature, unless the bellows material is stainless steel for which this test may be carried out at ambient temperature. The test duration is to be 30 minutes unless otherwise agreed with LR.

9.8.5 A cyclic thermal movement test, replicating the cooling down and warming up cycle which occurs during cargo loading and discharge, is to be performed on a complete expansion joint, by the application of representative external deflection resulting in bellow movement. This is to successfully withstand at least as many cycles, under the conditions of pressure, temperature, axial movement, rotational movement and transverse movement, as it will encounter in actual service. The number of cycles is to be estimated by the builder and depends on the ship's intended trading pattern and life expectancy. As a minimum, testing to 7000 cycles is to be carried out. The test is to be carried out at between 2-5 cycles per second. Testing at ambient temperature is permitted when this testing is at least as severe as testing at the service temperature. The maximum movements on the horizontal and vertical axis are to be provided by the builders and obtained from their stress analysis; however, the test can be extended to any value which is greater than that expected, or to the maximum deflection for which the bellows unit is suitable. Movements in the test need not be in both horizontal and vertical directions; but the horizontal-vertical box diagonal distance may be used. NDE testing is required after cyclic testing.

9.8.6 A cyclic fatigue test, representing ship deformation, is to be performed on a complete expansion joint, without internal pressure, by simulating the bellows movement corresponding to a compensated pipe length, for at least 2,000,000 cycles at a frequency not higher than 5 cycles per second. The test may be waived if the piping arrangement, experiences ship deformation loads. NDE is required after cyclic testing.

9.8.7 The cyclic thermal movement test and cyclic fatigue test may be waived by LR if satisfactory documentation is provided to establish the suitability of the expansion joints to withstand the expected working conditions. Where the maximum internal pressure exceeds 1,0 bar gauge, this documentation is to include sufficient test data to justify the design method used, with particular reference to correlation between calculation and test results.

9.9 Pressure testing of piping and other piping components

9.9.1 Pressure testing is to be undertaken in accordance with specific Rule requirements relating to the system in which the component is to be located.

9.9.2 The duration for which pressure tests are to be held is to be in conjunction with an applicable and recognised code or standard acceptable to LR.

Piping Design Requirements

Part 5, Chapter 12

Section 9 & Appendix Section 10

9.10 Equipment documentation

9.10.1 A certificate is required for each piping component supplied to be fitted in a Class I or Class II system. This certification is required for each size and type of equipment delivered. A single certificate may cover a number of valves, provided that they are of the same type and size, and serial numbers have been included on the certificate. If the piping components are part of a system fitted to a skid or packaged unit, then the complete skid may be supplied with a single certificate stating that the package has been constructed using approved materials, approved and tested in accordance with LR Rule requirements.

APPENDIX

■ Section 10 Guidance notes on metal pipes for water services

10.1 General

10.1.1 These guidance notes, except where it is specifically stated, apply to sea-water piping systems.

10.1.2 In addition to the selection of suitable materials, careful attention should be given to the design details of the piping system and the workmanship in fabrication, construction and installation of the pipework in order to obtain maximum life in service.

10.2 Materials

10.2.1 Materials used in sea-water piping systems include:

- Galvanised steel.
- Steel pipes lined with rubber, plastics or stoved coatings.
- Copper.
- 90/10 copper-nickel-iron.
- 70/30 copper-nickel.
- Aluminium brass.

10.2.2 Selection of materials should be based on:

- the ability to resist general and localised corrosion, such as pitting, impingement attack and cavitation throughout all the flow velocities likely to be encountered;
- compatibility with the other materials in the system, such as valve bodies and casings, (e.g. in order to minimise bimetallic corrosion);
- the ability to resist selective corrosion, e.g. dezincification of brass, dealuminification of aluminium brass and graphitisation of cast iron;
- the ability to resist stress corrosion and corrosion fatigue; and
- the amenability to fabrication by normal practices.

10.3 Steel pipes

10.3.1 Steel pipes should be protected against corrosion, and protective coatings should be applied on completion of all fabrication, i.e. bending, forming and welding of the steel pipes.

10.3.2 Welds should be free from lack of fusion and crevices. The surfaces should be dressed to remove slag and spatter and this should be done before coating. The coating should be continuous around the ends of the pipes and on the faces of flanges.

10.3.3 Galvanising the bores and flanges of steel pipes as protection against corrosion is common practice, and is recommended as the minimum protection for pipes in sea-water systems, including those for bilge and ballast service.

10.3.4 Austenitic stainless steel pipes are not recommended for salt-water services as they are prone to pitting, particularly in polluted waters.

10.3.5 Rubber lined pipes are effective against corrosion and suitable for higher water velocities. The rubber lining should be free from defects, e.g. discontinuities, pinholes, etc., and it is essential that the bonding of the rubber to the bore of the pipe and flange face is sound. Rubber linings should be applied by firms specialising in this form of protection.

10.3.6 The foregoing comments on rubber lined pipes also apply to pipes lined with plastics.

10.3.7 Stove coating of pipes as protection against corrosion should only be used where the pipes will be efficiently protected against mechanical damage.

10.4 Copper and copper alloy pipes

10.4.1 Copper pipes are particularly susceptible to perforation by corrosion/erosion and should only be used for low water velocities and where there is no excessive local turbulence.

10.4.2 Aluminium brass and copper-nickel-iron alloy pipes give good service in reasonably clean sea-water. For service with polluted river or harbour waters, copper-nickel-iron alloy pipes with at least 10 per cent nickel are preferable. Alpha-brasses, i.e. those containing 70 per cent or more copper, must be inhibited effectively against dezincification by suitable additions to the composition. Alpha beta-brasses, (i.e. those containing less than 70 per cent copper), should not be used for pipes and fittings.

10.4.3 New copper alloy pipes should not be exposed initially to polluted water. Clean sea-water should be used at first to allow the metals to develop protective films. If this is not available the system should be filled with inhibited town mains water.

Piping Design Requirements

Part 5, Chapter 12

Section 10

10.5 Flanges

10.5.1 Where pipes are exposed to sea-water on both external and internal surfaces, flanges should be made, preferably, of the same material. Where sea-water is confined to the bores of pipes, flanges may be of the same material or of less noble metal than that of the pipe, *see also* 2.3.

10.5.2 Fixed or loose type flanges may be used. The fixed flanges should be attached to the pipes by fillet welds or by capillary silver brazing. Where welding is used, the fillet weld at the back should be a strength weld and that in the face, a seal weld.

10.5.3 Inert gas shielded arc welding is the preferred process but metal arc welding may be used on copper-nickel-iron alloy pipes.

10.5.4 Mild steel flanges may be attached by argon arc welding to copper-nickel-iron pipes and give satisfactory service, provided that no part of the steel is exposed to the sea-water.

10.5.5 Where silver brazing is used, strength should be obtained by means of the bond in a capillary space over the whole area of the mating surfaces. A fillet braze at the back of the flange or at the face is undesirable. The alloy used for silver brazing should contain not less than 49 per cent silver.

10.5.6 The use of a copper-zinc brazing alloy is not permitted.

10.6 Water velocity

10.6.1 Water velocities should be carefully assessed at the design stage and the materials of pipes, valves, etc., selected to suit the conditions.

10.6.2 The water velocity in copper pipes should not exceed 1 m/s.

10.6.3 The water velocity in the pipes of the materials below should normally be not less than about 1 m/s in order to avoid fouling and subsequent pitting, but should not be greater than the following:

- Galvanised steel 3,0 m/s
- Aluminium brass 3,0 m/s
- 90/10 copper-nickel-iron 3,5 m/s
- 70/30 copper-nickel 5,0 m/s

10.7 Fabrication and installation

10.7.1 Attention should be given to ensuring streamlined flow and reducing entrained air in the system to a minimum. Abrupt changes in the direction of flow, protrusions into the bores of pipes and other restrictions of flow should be avoided. Branches in continuous flow lines should be set at a shallow angle to the main pipe, and the junction should be smooth.

10.7.2 Pipe bores should be smooth and clean.

10.7.3 Jointing should be flush with the bore surfaces of pipes and misalignment of adjacent flange faces should be reduced to a minimum.

10.7.4 Pipe bends should be of as large a radius as possible, and the bore surfaces should be smooth and free from puckering at these positions. Any carbonaceous films or deposits formed on the bore surfaces during the bending processes should be carefully removed. Organic substances are not recommended for the filling of pipes for bending purposes.

10.7.5 The position of supports should be given special consideration in order to minimise vibration and ensure that excessive bending moments are not imposed on the pipes.

10.7.6 Systems should not be left idle for long periods, especially where the water is polluted.

10.7.7 Strainers should be provided at the inlet to sea-water systems.

10.8 Metal pipes for fresh water services

10.8.1 Mild steel or copper pipes are normally satisfactory for service in fresh water applications. Hot fresh water, however, may promote corrosion in mild steel pipes unless the hardness and pH of the water are controlled.

10.8.2 Water with a slight salt content should not be left stagnant for long periods in mild steel pipes. Low salinity and the limited supply of oxygen in such conditions promote the formation of black iron oxide, and this may give rise to severe pitting. Where stagnant conditions are unavoidable, steel pipes should be galvanised, or pipes of suitable non-ferrous material used.

10.8.3 Copper alloy pipes should be treated to remove any carbonaceous films or deposits before the tubes are put into service.

10.8.4 Brass fittings and flanges in contact with water should be made of an alpha-brass effectively inhibited against dezincification by suitable additions to the composition.

10.8.5 Aluminium brass has been widely used as material for heat exchanger and condenser tubes, but its use in 'once through' systems is not recommended since, under certain conditions, it is prone to pitting and cracking.

Ship Piping Systems

Part 5, Chapter 13

Section 1

Section

- 1 **General requirements**
- 2 **Construction and installation**
- 3 **Drainage of compartments, other than machinery space**
- 4 **Bilge drainage of machinery space**
- 5 **Sizes of bilge suction pipes**
- 6 **Pumps on bilge service and their connections**
- 7 **Piping systems and their fittings**
- 8 **Additional requirements for bilge drainage and cross-flooding arrangements for passenger ships**
- 9 **Additional requirements relating to fixed pressure water spray fire-extinguishing systems**
- 10 **Drainage arrangements for ships not fitted with propelling machinery**
- 11 **Ballast system**
- 12 **Air, overflow and sounding pipes**

■ Section 1 General requirements

1.1 Application

1.1.1 The requirements of this Chapter apply to piping systems on all types of ship except where otherwise stated.

1.1.2 Whilst the requirements satisfy the relevant regulations of the *International Convention for the Safety of Life at Sea, 1974*, and applicable amendments, attention should be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.

1.1.3 Consideration will be given to special cases or to arrangements which are equivalent to those required by these Rules. Consideration will also be given to the pumping arrangements of small ships and ships to be assigned class notations for restricted or special services.

1.2 Prevention of progressive flooding in damage condition

1.2.1 For ships to which subdivision and damage stability requirements apply, precautions are to be taken to prevent progressive flooding between compartments resulting from damage to piping systems. For this purpose, piping systems are to be located inboard of the assumed extent of damage applicable to the ship type.

1.2.2 Where it is not practicable to locate piping systems as required by 1.2.1, the following precautions are to be taken:

- (a) Bilge suction pipes are to be provided with non-return valves of approved type.
- (b) Other piping systems are to be provided with shut-off valves capable of being operated from positions accessible in the damage condition, or from above the bulkhead deck where required by the Rules.

These valves are to be located in the compartment containing the open end or in a suitable position such that the compartment may be isolated in the event of damage to the piping system.

1.2.3 Where subdivision and damage stability requirements apply and where penetration of watertight divisions by pipes, ducts, trunks or other penetrations is necessary, arrangements are to be made to maintain the watertight integrity.

1.3 Plans and particulars

1.3.1 The following plans (in diagrammatic form) and particulars are to be submitted for approval. Additional plans should not be submitted unless the arrangements are of a novel or special character affecting classification:

- (a) Arrangements of air pipes and closing devices for all tanks and enclosed spaces.
- (b) Sounding arrangements for all tanks, enclosed spaces and cargo holds.
- (c) Arrangements of level alarms fitted in tanks, cargo holds, machinery spaces, pump rooms and any other spaces.
- (d) Arrangements of any cross flooding or heeling tank systems.
- (e) Bilge drainage arrangements for all compartments which are to include details of location, number and capacity of pumping units on bilge service. In the case of passenger ships, the bilge pump numeral, as defined in the *International Convention for the Safety of Life at Sea, 1974*, and applicable amendments are to be stated, together with the number of flooded compartments which the ship is required to withstand under damage conditions.
- (f) Ballast filling and drainage arrangements.
- (g) Oil fuel filling, transfer, relief and spill/drainage arrangements.
- (h) Tank overflow arrangements.
- (i) Blanking arrangements for bilge and ballast piping systems for bulk carriers having floodable holds.
- (k) Isolation arrangements for bilge systems where cargo holds are intended for the carriage of dangerous goods.
- (l) Details verifying compliance with the sizing of air pipes required by 12.8.
- (m) Arrangements of oil fuel piping in connection with oil burning installations and oil fired galleys.
- (n) Arrangements of oil fuel burning units for boilers and thermal fluid heaters.
- (o) Arrangement of boiler feed system.
- (p) Arrangements of thermal fluid circulation systems.
- (q) Arrangement of compressed air systems for main and auxiliary services.
- (r) Arrangements of lubricating oil systems.
- (s) Arrangements of flammable liquids used for power transmission, control and heating systems.

Ship Piping Systems

Part 5, Chapter 13

Sections 1 & 2

- (t) Arrangements of cooling water systems for main and auxiliary services.
- (u) Oil fuel settling service and other oil fuel tanks not forming part of the ship's structure.
- (v) Arrangements and dimensions of all steam pipes where the design pressure or temperature exceeds 16,0 bar (16,3 kgf/cm²) or 300°C, respectively, and the outside diameter exceeds 76,1 mm, with details of flanges, bolts and weld attachments, and particulars of the material of pipes, flanges, bolts and electrodes.
- (w) Details verifying compliance with the capacity of the oil fuel treatment plant required by Ch 14,3.9.1.
- (x) Details verifying compliance of demands on low pressure air systems by essential users as required by Ch 14,10.1.3.

Section 2

Construction and installation

2.1 Materials

2.1.1 Except where otherwise stated in this Chapter, pipes, valves and fittings are to be made of steel, cast iron, copper, copper alloy, or other approved material suitable for the intended service.

2.1.2 Where applicable, the materials are to comply with the relevant requirements of Chapter 12.

2.1.3 Materials sensitive to heat, such as aluminium, lead or plastics, are not to be used in systems essential to the safe operation of the ship, or for containing combustible liquids or sea-water where leakage or failure could result in fire or in the flooding of watertight compartments, see Chapter 12 for plastics pipes.

2.1.4 Aluminium alloy pipes are not acceptable for fire extinguishing pipes unless they are suitably protected against the effect of heat. The proposed use of aluminium alloy with appropriate insulation will be considered when it has been demonstrated that the arrangements provide equivalent structural and integrity properties compared to steel. In open and exposed locations where the insulation material is likely to suffer from mechanical damage suitable protection is to be provided.

2.2 Pipe wall thickness

2.2.1 The minimum nominal wall thickness of steel, copper and copper alloy pipes are to be in accordance with Chapter 12.

2.2.2 Special consideration will be given to the wall thickness of pipes made of materials other than steel, copper and copper alloy.

2.3 Valves – Installation and control

2.3.1 Valves and cocks are to be fitted in places where they are at all times readily accessible, unless otherwise specifically mentioned in the Rules. Valves in cargo oil and ballast systems may be fitted inside tanks, subject to 2.3.2.

2.3.2 All valves which are provided with remote control are to be arranged for local manual operation, independent of the remote operating mechanism. For shipside valves and valves on the collision bulkhead, the means for local manual operation are to be permanently attached. For submerged valves in cargo oil and ballast systems, as permitted by 2.3.1, local manual operation may be by extended spindle or a portable hand pump. Where manual operation is by hand pump, the control lines to each submerged valve are to incorporate quick coupling connections, as close to the valve actuator as practicable, to allow easy connection of the hand pump. Not less than two hand pumps are to be provided.

2.3.3 In case of valves which are required by the Rules to be provided with remote control, opening and/or closing of the valves by local manual means are not to render the remote control system inoperable.

2.4 Attachment of valves to watertight plating

2.4.1 Valve chests, cocks, pipes or other fittings attached direct to the plating of tanks, and to bulkheads, flats or tunnels which are required to be of watertight construction, are to be secured by means of studs screwed through the plating or by tap bolts, and not by bolts passing through clearance holes. Alternatively, the studs or the bulkhead piece may be welded to the plating.

2.4.2 For requirements relating to valves on the collision bulkhead, see 3.5.4.

2.5 Ship-side valves and fittings (other than those on scuppers and sanitary discharges)

2.5.1 All sea inlet and overboard discharge pipes are to be fitted with valves or cocks secured direct to the shell plating, or to the plating of fabricated steel water boxes attached to the shell plating. These fittings are to be secured by bolts tapped into the plating and fitted with countersunk heads, or by studs screwed into heavy steel pads fitted to the plating. The stud holes are not to penetrate the plating.

2.5.2 Valves for ship-side applications are to be installed such that the section of piping immediately inboard of the valve can be removed without affecting the watertight integrity of the hull.

2.5.3 Distance pieces of short, rigid construction, and made of approved material, may be fitted between the valves and shell plating. Distance pieces of steel may be welded to the shell plating. Details of the welded connections and of fabricated steel water boxes are to be submitted.

Ship Piping Systems

Part 5, Chapter 13

Section 2

2.5.4 Gratings are to be fitted at all openings in the ship's side for sea inlet valves and inlet water boxes. The net area through the gratings is to be not less than twice that of the valves connected to the sea inlets, and provision is to be made for clearing the gratings by use of low pressure steam or compressed air, see 2.5.9.

2.5.5 All suction and discharge valves and cocks secured direct to the shell plating of the ship are to be fitted with spigots passing through the plating, but the spigots on the valves or cocks may be omitted if these fittings are attached to pads or distance pieces which themselves form spigots in way of the shell plating. Blow-down valves or cocks are also to be fitted with a protection ring through which the spigot is to pass, the ring being on the outside of the shell plating. Where alternative forms of attachment are proposed, details are to be submitted for consideration.

2.5.6 Blow-down valves or cocks on the ship's side are to be fitted in accessible positions above the level of the working platform, and are to be provided with indicators showing whether they are open or shut. Cock handles are not to be capable of being removed unless the cocks are shut, and, if valves are fitted, the hand wheels are to be suitably retained on the spindle.

2.5.7 Sea inlet and overboard discharge valves and cocks are in all cases to be fitted in easily accessible positions and, so far as practicable, are to be readily visible. Indicators are to be provided local to the valves and cocks, showing whether they are open or shut. Provision is to be made for preventing any discharge of water into lifeboats. The valve spindles are to extend above the lower platform, and the hand wheels of the main cooling water sea inlet and emergency bilge suction valves are to be situated not less than 460 mm above this platform.

2.5.8 Ship-side valves and fittings, if made of steel or other approved material with low corrosion resistance, are to be suitably protected against wastage.

2.5.9 The scantlings of valves and valve stools fitted with steam or compressed air clearing connections are to be suitable for the maximum pressure to which the valves and stools may be subjected.

2.5.10 Valves, cocks and distance pieces, intended for installation on the ship's side below the load waterline, are to be tested by hydraulic pressure to not less than 5 bar.

2.5.11 For sea connections for ships having notation for ice navigation, see Ch 9,2.13 and Ch 9,3.5.

2.6 Piping systems – Installation

2.6.1 Bilge, ballast and cooling water suction and discharge pipes are to be permanent pipes made in readily removable lengths with flanged joints, except as mentioned in 7.10, and are to be efficiently secured in position to prevent chafing or lateral movement. For joints in oil fuel piping systems, see Ch 14,4.5 and 4.6.

2.6.2 Where lack of space prevents the use of normal circular flanges, details of the alternative methods of joining the pipes are to be submitted.

2.6.3 Long or heavy lengths of pipes are to be supported by bearers so that no undue load is carried by the flanged connections of the pumps or fittings to which they are attached.

2.7 Provision for expansion

2.7.1 Suitable provision for expansion is to be made, where necessary, in each range of pipes.

2.7.2 Where expansion pieces are fitted, they are to be of an approved type and are to be protected against over extension and compression. The adjoining pipes are to be suitably aligned, supported, guided and anchored. Where necessary, expansion pieces of the bellows type are to be protected against mechanical damage.

2.7.3 Expansion pieces of an approved type incorporating special quality oil resistant rubber or other suitable synthetic material may be used in cooling water lines in machinery spaces. Where fitted in sea- water lines, they are to be provided with guards which will effectively enclose, but not interfere with, the action of the expansion pieces and will reduce to the minimum practicable any flow of water into the machinery spaces in the event of failure of the flexible elements. Proposals to use such fittings in water lines for other services, including:

- ballast lines in machinery spaces, in duct keels and inside double bottom water ballast tanks, and
 - bilge lines inside duct keels only,
- will be specially considered when plans of the pumping systems are submitted for approval.

2.7.4 For requirements relating to flexible hoses, see Chapter 12.

2.8 Piping in way of refrigerated chambers

2.8.1 All pipes, including scupper pipes, air pipes and sounding pipes which pass through chambers intended for the carriage or storage of refrigerated produce are to be well insulated.

2.8.2 Where the pipes referred to in 2.8.1 pass through chambers intended for temperatures of 0°C or below, they are also to be insulated from the steel structure, except in positions where the temperature of the structure is mainly controlled by the external temperature and will normally be above freezing point. Pipes passing through a deckplate within the ship side insulation, where the deck is fully insulated below and has an insulation ribband on top, are to be attached to the deck plating. In the case of pipes adjacent to the shell plating, metallic contact between the pipes and the shell plating or frames is to be arranged so far as practicable.

2.8.3 The air refreshing pipes to and from refrigerated compartments need not, however, be insulated from the steel work.

Ship Piping Systems

Part 5, Chapter 13

Sections 2 & 3

2.9 Miscellaneous requirements

2.9.1 All pipes situated in cargo spaces, fish holds, chain lockers or other positions where they are liable to mechanical damage are to be efficiently protected.

2.9.2 Wash deck pipes and discharge pipes from the pumps to domestic water tanks are not to be led through cargo holds. Any proposed departure from this requirement is to be submitted for consideration.

2.9.3 So far as practicable, pipelines, including exhaust pipes from oil engines, are not to be led in the vicinity of switchboards or other electrical appliances in positions where the drip or escape of liquid, gas or steam from joints or fittings could cause damage to the electrical installation. Where it is not practicable to comply with these requirements, drip trays or shields are to be provided as found necessary. Short sounding pipes to tanks are not to terminate near electrical appliances, see 12.13.2.

2.10 Testing after installation

2.10.1 After installation on board, all steam, hydraulic, compressed air and other piping systems covered by 1.3.1, together with associated fittings which are under internal pressure, are to be subjected to a running test at the intended maximum working pressure.

■ Cross-reference

For guidance on metal pipes for water services, see Ch 12,10.

■ Section 3 Drainage of compartments, other than machinery space

3.1 General

3.1.1 All ships are to be provided with efficient pumping plant having the suctions and means for drainage so arranged that any water within any compartment of the ship, or any watertight section of any compartment, can be pumped out through at least one suction when the ship is on an even keel and is either upright or has a list of not more than 5°. For this purpose, wing suctions will generally be necessary, except in short, narrow compartments where one suction can provide effective drainage under the above conditions.

3.1.2 In passenger ships, the pumping plant is to be capable of draining any watertight compartment under all practicable conditions after a casualty, whether the ship is upright or listed.

3.1.3 In the case of dry compartments, the suctions required by 3.1.1 are, except where otherwise stated, to be branch bilge suctions, i.e. suctions connected to a main bilge line.

3.1.4 For drainage arrangements of non-self-propelled ships, see Section 10.

3.1.5 For additional drainage arrangements on ferries and Roll on-Roll off ships, see Pt 4, Ch 2,9.9.

3.2 Cargo holds

3.2.1 In ships having only one hold, and this over 30 m in length, bilge suctions are to be fitted in suitable positions in the fore and after sections of the hold.

3.2.2 Where close ceiling or continuous gusset plates are fitted over the bilges, arrangements are to be made whereby water in a hold compartment may find its way to the suction pipes.

3.2.3 Where the inner bottom plating extends to the ship's side, the bilge suctions are to be led to wells placed at the wings. If the tank top plating has inverse camber, a well is also to be fitted at the centreline, but in the case of trawlers and fishing vessels, a single well fitted at the centre may be accepted. For capacity and construction of bilge wells, see 7.6.

3.2.4 For drainage arrangements from refrigerated cargo spaces, see Pt 6, Ch 3,4.19.

3.2.5 For cargo holds having non-weathertight hatch covers or where hatch covers have been omitted, drainage arrangements are to take into account the effects of additional water ingress into the hold(s). High level bilge alarms are to be provided in cargo holds having non-weathertight hatch covers or where hatch covers have been omitted, see *also* Pt 4, Ch 8,11.

3.2.6 Drainage arrangements of cargo holds intended for the carriage of flammable or toxic liquids are to be designed to prevent inadvertent drainage of such products through machinery space piping systems.

3.3 Holds and deep tanks for alternative carriage of liquid or dry cargo

3.3.1 Where holds and deep tanks are intended for the alternative carriage of liquid or dry cargo, the drainage arrangements are to be in accordance with the following:

- (a) For dry cargoes, 3.1 and 3.2.
- (b) For water ballast, oil fuel or cargo oil having a flash point of 60°C or above, 3.4.
- (c) For cargo oil having a flash point below 60°C, Chapter 15.

3.3.2 For blanking arrangements of filling and suction pipes, see 7.12.

Ship Piping Systems

Part 5, Chapter 13

Section 3

3.4 Tanks and cofferdams

3.4.1 All tanks (including double bottom tanks), whether used for water ballast, oil fuel or liquid cargoes, are to be provided with suction pipes, led to suitable power pumps, from the after end of each tank.

3.4.2 In general, the drainage arrangements are to be in accordance with 3.1. However, where the tanks are divided by longitudinal watertight bulkheads or girders into two or more tanks, a single suction pipe, led to the after end of each tank, will normally be acceptable.

3.4.3 Similar drainage arrangements are to be provided for cofferdams, except that the suctions may be led to the main bilge line.

3.4.4 The pumping arrangements for tanks that are intended to carry cargo oil having a flash point of 60°C or above, are also to comply with the requirements of Chapter 14, Sections 2, 3 and 4, as far as they are applicable.

3.5 Fore and after peaks

3.5.1 Fuel oil, lubrication oil and other flammable liquids are not to be carried in forepeak tanks.

3.5.2 Where the peaks are used as tanks, a power pump suction is to be led to each tank, except in the case of small tanks used for the carriage of domestic fresh water, where hand pumps may be used.

3.5.3 Where the peaks are not used as tanks, and main bilge line suctions are not fitted, drainage of both peaks may be effected by hand pump suctions, provided that the suction lift is well within the capacity of the pumps and in no case exceeds 7,3 m. In the case of trawlers and fishing vessels, drainage of the after peak may be effected by means of a self-closing cock fitted in a well lighted and readily accessible position.

3.5.4 Except as permitted by 3.5.5, the collision bulkhead is not to be pierced below the bulkhead deck by more than one pipe for dealing with the contents of the fore peak. The pipe is to be provided with a screw-down valve capable of being operated from an accessible position above the bulkhead deck, the chest being secured to the bulkhead inside the fore peak. An indicator is to be provided to show whether the valve is open or closed. The valves may be fitted on the after side of the collision bulkhead, provided that the valve is readily accessible under all service conditions and the space in which it is located is not a cargo space.

3.5.5 Where the fore peak is divided into two compartments, the collision bulkhead may be pierced below the bulkhead deck by two pipes (i.e. one for each compartment) provided there is no practical alternative to the fitting of a second pipe. Each pipe is to be provided with a screw-down valve, fitted and controlled as in 3.5.4.

3.6 Spaces above fore peaks, after peaks and machinery spaces

3.6.1 Provision is to be made for the drainage of the chain locker and watertight compartments above the fore peak tank by hand or power pump suctions.

3.6.2 Steering gear compartments or other small enclosed spaces situated above the after peak tank are to be provided with suitable means of drainage, either by hand or power pump bilge suctions.

3.6.3 Subject to special approval of any applicable subdivision requirements, compartments referred to in 3.6.2 that are adequately isolated from the adjacent 'tween decks, may be drained by scuppers of not less than 38 mm bore, discharging to the tunnel (or machinery space in the case of ships with machinery aft) and fitted with self-closing cocks situated in well lighted and visible positions.

3.6.4 In case of trawlers and fishing vessels, accommodation spaces which overhang the machinery space, may also be drained as in 3.6.3.

3.6.5 For drainage of the fore and after peaks, see 3.5.

3.7 Maintenance of integrity of bulkheads

3.7.1 The intactness of the machinery space bulkheads, and of tunnel plating required to be of watertight construction, is not to be impaired by the fitting of scuppers discharging to machinery space or tunnels from adjacent compartments which are situated below the bulkhead deck. These scuppers may, however, be led into a strongly constructed scupper drain tank situated in the machinery space or tunnel, but closed to these spaces and drained by means of a suction of appropriate size led from the main bilge line through a screw-down non-return valve.

3.7.2 The scupper tank air pipe is to be led to above the bulkhead deck, and provision is to be made for ascertaining the level of water in the tank.

3.7.3 Where one tank is used for the drainage of several watertight compartments, the scupper pipes are to be provided with screw-down non-return valves.

3.7.4 No drain valve or cock is to be fitted to the collision bulkhead. Drain valves or cocks are not to be fitted to other watertight bulkheads if alternative means of drainage are practicable.

3.7.5 Where drain valves or cocks are fitted to bulkheads other than the collision bulkhead, as permitted by 3.7.4, the drain valves or cocks are to be at all times readily accessible and are to be capable of being shut off from positions above the bulkhead deck. Indicators are to be provided to show whether the drains are open or shut. These arrangements are not permissible in passenger ships.

3.7.6 Bilge drain valves or cocks may be used for draining accommodation spaces and the after dry peak of trawlers and fishing vessels as stated in 3.6.4 and 3.5.3.

Ship Piping Systems

Part 5, Chapter 13

Sections 3 & 4

3.7.7 For drainage of stern compartment, see 3.6.

■ Section 4 Bilge drainage of machinery space

4.1 General

4.1.1 The bilge drainage arrangements in the machinery space are to comply with 3.1, except that the arrangements are to be such that any water which may enter this compartment can be pumped out through at least two bilge suction when the ship is on an even keel, and is either upright or has a list of not more than 5°. One of these suction is to be a branch bilge suction, i.e. a suction connected to the main bilge line, and the other is to be a direct bilge suction, i.e. a suction led direct to an independent power pump. Examples of the necessary arrangements are detailed in 4.2 and 4.3.

4.1.2 In passenger ships, the drainage arrangements are to be such that machinery spaces can be pumped out under all practical conditions after a casualty, whether the ship is upright or listed.

4.2 Machinery space with double bottom

4.2.1 Where the double bottom extends the full length of the machinery space and forms bilges at the wings, it will be necessary to provide one branch and one direct bilge suction at each side.

4.2.2 Where the double bottom plating extends the full length and breadth of the compartment, one branch bilge suction and one direct bilge suction are to be led to each of two bilge wells, situated one at each side.

4.2.3 For capacity and construction of bilge wells, see 7.6.

4.3 Machinery space without double bottom

4.3.1 Where there is no double bottom and the rise of floor is not less than 5°, one branch and one direct bilge suction are to be led to accessible positions as near the centreline as practicable.

4.3.2 In ships where the rise of floor is less than 5°, and in all passenger ships, additional bilge suction are to be provided at the wings.

4.4 Additional bilge suction

4.4.1 Additional bilge suction may be required for the drainage of depressions in the tank top formed by crankpits, or other recesses, by tank tops having inverse camber or by discontinuity of the double bottom.

4.4.2 In ships in which the propelling machinery is situated at the after end of the ship, it will generally be necessary for bilge suction to be fitted in the forward wings as well as in the after end of the machinery space, but each case will be dealt with according to the size and structural arrangements of the compartment.

4.4.3 In ships propelled by electrical machinery, special means are to be provided to prevent the accumulation of bilge water under the main propulsion generators and motors.

4.5 Separate machinery spaces

4.5.1 Where the machinery space is divided by watertight bulkheads to separate the boiler room(s), or auxiliary engine room(s) from the main engine room, the number and position of the branch bilge suction in the boiler room(s) or auxiliary engine room(s) are to be the same as for cargo holds.

4.5.2 In addition to the branch bilge suction, required by 4.5.1, at least one independent power pump direct bilge suction is to be fitted in each compartment. Similar provision is to be made in separate motor rooms of electrically propelled ships.

4.5.3 In passenger ships, each independent bilge pump is to have a direct bilge suction from the space in which it is situated, but not more than two such suction are required in any one space. Where two or more such suction are provided, there is to be at least one suction on each side of the space.

4.6 Machinery space – Emergency bilge drainage

4.6.1 In addition to the bilge suction detailed in 4.1 to 4.5, an emergency bilge suction is to be provided in each main machinery space. This suction is to be led to the main cooling water pump from a suitable low level in the machinery space and is to be fitted with a screw-down non-return valve having the spindle so extended that the hand wheel is not less than 460 mm above the bottom platform.

4.6.2 Where two or more cooling water pumps are provided, each capable of supplying cooling water for normal power, only one pump need be fitted with an emergency bilge suction.

4.6.3 In ships with steam propelling machinery, the suction is to have a diameter of at least two-thirds that of the pump suction. In other ships, the suction is to be the same size as the suction branch of the pump.

4.6.4 Where main cooling water pumps are not suitable for bilge pumping duties, the emergency bilge suction is to be led to the largest available power pump, which is not a bilge pump detailed in 6.1 and 6.2. This pump is to have a capacity not less than that required for a bilge pump and the bilge suction is to be the same size as that of the pump suction branch.

Ship Piping Systems

Part 5, Chapter 13

Sections 4, 5 & 6

4.6.5 Where the pump to which the emergency bilge suction is connected is of the self-priming type, the direct bilge suction on the same side of the ship as the emergency suction may be omitted, except in passenger ships.

4.6.6 Emergency bilge suction valve nameplates are to be marked 'For emergency use only'.

4.7 Tunnel drainage

4.7.1 The tunnel well is to be drained by a suction from the main bilge line. In all ships, including passenger ships, this well may extend to the outer bottom.

4.7.2 Where the tank top in the tunnel slopes down from aft to forward, a bilge suction is to be provided at the forward end of the tunnel, in addition to the tunnel well suction required by 4.7.1.

Section 5 Sizes of bilge suction pipes

5.1 Main bilge line

5.1.1 The diameter, d_m , of the main bilge line is to be not less than required by the following formula, to the nearest 5 mm, but in no case is the diameter to be less than that required for any branch bilge suction:

$$d_m = 1,68 \sqrt{L (B + D)} + 25 \text{ mm}$$

where

- d_m = internal diameter of main bilge line, in mm
- B = greatest moulded breadth of ship, in metres
- D = moulded depth to bulkhead deck, in metres
- L = Rule length of ship as defined in Pt 3, Ch 1,6.1, in metres, for ships other than passenger ships
= length between perpendiculars at the extremities of the deepest subdivision load line, in metres, for passenger ships.

5.2 Branch bilge suction to cargo and machinery spaces

5.2.1 The diameter, d_b , of branch bilge suction pipes to cargo and machinery spaces is to be not less than required by the following formula, to the nearest 5 mm, but in no case is the diameter of any suction to be less than 50 mm:

$$d_b = 2,15 \sqrt{C (B + D)} + 25 \text{ mm}$$

where

- d_b = internal diameter of branch bilge suction, in mm
- C = length of compartment, in metres, and
- B and D are as defined in 5.1.1.

5.3 Direct bilge suction, other than emergency suction

5.3.1 The direct bilge suction in the main engine room, and the direct bilge suction in large separate boiler rooms, motor rooms of electrically propelled ships and auxiliary engine rooms are not to be of a diameter less than that required for the main bilge line.

5.3.2 Where the separate machinery spaces are of small dimensions, the sizes of the direct bilge suction to these spaces will be specially considered.

5.3.3 For sizes of emergency bilge suction, see 4.6.

5.4 Main bilge line – Tankers and similar ships

5.4.1 In oil tankers and similar ships, where the engine room pumps do not deal with bilge drainage outside the machinery space, the diameter of the main bilge line may be less than that required by the formula in 5.1.1, provided that the cross-sectional area is not less than twice that required for the branch bilge suction in the machinery space.

5.5 Distribution chest branch pipes

5.5.1 The area of each branch pipe connecting the bilge main to a distribution chest is to be not less than the sum of the areas required by the Rules for the two largest branch bilge suction pipes connected to that chest, but need not be greater than that required for the main bilge line.

5.6 Tunnel suction

5.6.1 The bilge suction pipe to the tunnel well is to be not less than 65 mm bore, except in ships not exceeding 60 m in length, in which case it may be 50 mm bore.

Section 6 Pumps on bilge service and their connections

6.1 Number of pumps

6.1.1 For ships other than passenger ships, at least two power bilge pumping units are to be provided in the machinery space. In ships of 90 m in length and under, one of these units may be worked from the main engines and the other is to be independently driven. In larger ships both units are to be independently driven.

6.1.2 Each unit may consist of one or more pumps connected to the main bilge line, provided that their combined capacity is adequate.

Ship Piping Systems

Part 5, Chapter 13

Sections 6 & 7

6.1.3 In ships other than passenger ships, a bilge ejector in combination with a high pressure sea-water pump may be accepted as a substitute for an independent bilge pump as required by 6.1.1.

6.1.4 Special consideration will be given to the number of pumps for small ships and, in general, if there is a class notation restricting a small ship to harbour or river service, a hand pump may be accepted in lieu of one of the bilge pumping units.

6.1.5 For passenger ships, at least three power bilge pumps are to be provided, one of which may be operated from the main engines. Where the bilge pump numeral as derived from Regulation 35-1 of Chapter II-1 of the *International Convention for the Safety of Life at Sea, 1974*, and applicable amendments, is 30 or more, one additional independent power pump is to be provided.

6.1.6 For location of pumps on passenger ships, see 8.1.

6.2 General service pumps

6.2.1 The bilge pumping units, or pumps, required by 6.1 may also be used for ballast, fire or general service duties of an intermittent nature, but they are to be immediately available for bilge duty when required, see *also* SOLAS 1974 as amended Reg. II-2/C, 10, as applicable.

6.3 Capacity of pumps

6.3.1 Each bilge pumping unit, or bilge pump in the case of passenger ships, is to be connected to the main bilge line and is to be capable of giving a speed of water through the Rule size of main bilge pipe of not less than 122 m/min.

6.3.2 The capacity of each bilge pumping unit or bilge pump is to be not less than required by the following formula:

$$Q = \frac{5,75}{10^3} d_m^2$$

where

d_m = Rule internal diameter of main bilge line, in mm

Q = capacity, in m³/hour.

6.3.3 In ships other than passenger ships, where one bilge pumping unit is of slightly less than Rule capacity, the deficiency may be made good by an excess capacity of the other unit. In general, the deficiency is to be limited to 30 per cent.

6.4 Self-priming pumps

6.4.1 All power pumps which are essential for bilge services are to be of the self-priming type, unless an approved central priming system is provided for these pumps. Details of this system are to be submitted.

6.4.2 Cooling water pumps having emergency bilge suction need not be of the self-priming type.

6.4.3 For requirements regarding emergency bilge suction, see 4.6.

6.5 Pump connections

6.5.1 The connections at the bilge pumps are to be such that one unit may continue in operation when the other unit is being opened up for overhaul.

6.5.2 Pumps required for essential services are not to be connected to a common suction or discharge chest or pipe unless the arrangements are such that the working of any pumps so connected is unaffected by the other pumps being in operation at the same time.

6.6 Direct bilge suction

6.6.1 The direct bilge suction in the machinery space(s) are to be led to independent power pump(s), and the arrangements are to be such that these direct suction can be used independently of the main bilge line suction.

Section 7 Piping systems and their fittings

7.1 Main bilge line suction

7.1.1 Suctions from the main bilge line, i.e. branch bilge suction, are to be arranged to draw water from any hold or machinery compartment of the ship, excepting small spaces such as those mentioned in 3.5 and 3.6, where manual pump suction are accepted, and are not to be of smaller diameter than that required by the formula in 5.2.1. For special arrangements for oil tankers, see Chapter 15.

7.1.2 Where passenger or cargo ships are of a design having enclosed car decks or cargo spaces located on the bulkhead deck or on the freeboard deck, special consideration will be given to the drainage arrangements where any fixed pressure water spray system is fitted, see *also* Pt 3, Ch 12, 4.1 and 9.1.

7.2 Prevention of communication between compartments

7.2.1 The arrangement of valves, cocks and their connections is to be such as to prevent the possibility of one watertight compartment being placed in communication with another, or of dry cargo spaces, machinery spaces or other dry compartments being placed in communication with the sea or with tanks. For this purpose, screw-down non-return valves are to be provided in the following fittings:

- Bilge valve distribution chests.
- Bilge suction hose connections, whether fitted direct to the pump or on the main bilge line.
- Direct bilge suction and bilge pump connections to main bilge line.

Ship Piping Systems

Part 5, Chapter 13

Section 7

7.3 Isolation of bilge system

7.3.1 Bilge pipes which are required for draining cargo or machinery spaces are to be entirely distinct from sea inlet pipes or from pipes which may be used for filling or emptying spaces where water or oil is carried. This does not, however, exclude a bilge ejection connection, a connecting pipe from a pump to its suction valve chest, or a deep tank suction pipe suitably connected through a changeover device to a bilge, ballast or oil line.

7.4 Machinery space suction – Mud boxes

7.4.1 Suctions for bilge drainage in machinery spaces and tunnels, other than emergency suction, are to be led from easily accessible mud boxes fitted with straight tail pipes to the bilges and having covers secured in such a manner as to permit their being expeditiously opened or closed. Strum boxes are not to be fitted to the lower ends of these tail pipes or to the emergency bilge suction.

7.5 Hold suction – Strum boxes

7.5.1 The open ends of bilge suction in holds and other compartments outside machinery spaces and tunnels are to be enclosed in strum boxes having perforations of not more than 10 mm diameter, whose combined area is not less than twice that required for the suction pipe. The boxes are to be so constructed that they can be cleared without breaking any joint of the suction pipe.

7.6 Bilge wells

7.6.1 Bilge wells required by 3.2.3 and 4.2.2 are to be formed of steel plates and are to be not less than 0,15 m³ capacity. In small compartments, steel bilge hats of reasonable capacity may be fitted.

7.6.2 In passenger ships, the depth of bilge wells in double bottom tanks will be specially considered.

7.6.3 Where access manholes to bilge wells are necessary, they are to be fitted as near to the suction strums as practicable.

7.7 Tail pipes

7.7.1 The distance between the foot of all bilge tail pipes and the bottom of the bilge well is to be adequate to allow a full flow of water and to facilitate cleaning.

7.8 Location of fittings

7.8.1 Bilge valves, cocks and mud boxes are to be fitted at, or above, the machinery space and tunnel platforms. Where it is not practicable to avoid the fittings being situated at the starting platform or in passageways, they may be situated just below the platform, provided readily removable traps or covers are fitted and nameplates indicate the presence of these fittings.

7.8.2 Where relief valves are fitted to pumps having sea connections, these valves are to be fitted in readily visible positions above the platform. The arrangements are to be such that any discharge from the relief valves will also be readily visible.

7.9 Bilge pipes in way of double bottom tanks

7.9.1 Bilge suction pipes are not to be led through double bottom tanks if it is possible to avoid doing so.

7.9.2 Bilge pipes which have to pass through these tanks are to have a wall thickness in accordance with Table 12.2.4 in Chapter 12. (The thickness of pipes made from material other than steel will be specially considered).

7.9.3 Expansion bends, not glands, are to be fitted to these pipes within the tanks, and the pipes are to be tested, after installation, to the same pressure as the tanks through which they pass.

7.10 Bilge pipes in way of deep tanks

7.10.1 In way of deep tanks, bilge pipes should preferably be led through pipe tunnels but, where this is not done, the pipes are to be of steel, having a wall thickness in accordance with Table 12.2.4 in Chapter 12, with welded joints or heavy flanged joints. The number of joints is to be kept to a minimum.

7.10.2 Expansion bends, not glands, are to be fitted to these pipes within the tanks, and the open ends of the bilge suction pipes in the holds are to be fitted with non-return valves of the special type approved for use in holds, see 7.11.1.

7.10.3 The pipes are to be tested, after installation, to a pressure not less than the maximum head to which the tanks can be subjected in service.

7.11 Hold bilge non-return valves

7.11.1 Where non-return valves are fitted to the open ends of bilge suction pipes in cargo holds in order to decrease the risk of flooding, they are to be of an approved type which does not offer undue obstruction to the flow of water.

7.12 Blanking arrangements

7.12.1 In case of deep tanks and cargo holds which may be used for either water ballast or dry cargo, provision is to be made for blank flanging the water ballast filling and suction pipes when the tank or hold is being used for the carriage of dry cargo, and for blank flanging the bilge suction pipes when the tank or hold is being used for the carriage of water ballast. Change-over devices may be used for this purpose.

7.12.2 For arrangements when oil fuel or cargo oil (having a flash point of 60°C or above) is carried in deep tanks, see Ch 14, 4.14.

Ship Piping Systems

Part 5, Chapter 13

Sections 7, 8 & 9

7.12.3 Where a ship is designed for the alternative carriage of dry cargo or oil having a flash point below 60°C, the blanking arrangements will be specially considered.

Section 8 Additional requirements for bilge drainage and cross-flooding arrangements for passenger ships

8.1 Location of bilge pumps and bilge main

8.1.1 In passenger ships, the power bilge pumps required by 6.1.5 are to be placed, if practicable, in separate watertight compartments which will not readily be flooded by the same damage. If the engines and boilers are in two or more watertight compartments, the bilge pumps are to be distributed throughout these compartments so far as is possible.

8.1.2 In passenger ships of 91,5 m or more in length, or having a bilge pump numeral of 30 or more (see 6.1.5), the arrangements are to be such that at least one power pump will be available for use in all ordinary circumstances in which the ship may be flooded at sea. This requirement will be satisfied if:

- one of the pumps is an emergency pump of a submersible type having a source of power situated above the bulkhead deck, or
- the pumps and their sources of power are so disposed throughout the length of the ship that, under any conditions of flooding which the ship is required by statutory regulation to withstand, at least one pump in an undamaged compartment will be available.

8.1.3 The bilge main is to be so arranged that no part is situated nearer the side of the ship than $\frac{B}{5}$, measured at right angles to the centreline at the level of the deepest subdivision load line, where B is the breadth of the ship.

8.1.4 Where any bilge pump or its pipe connection to the bilge main is situated outboard of the $\frac{B}{5}$ line, then a non-return valve is to be provided in the pipe connection at the junction with the bilge main. The emergency bilge pump and its connections to the bilge main are to be so arranged that they are situated inboard of the $\frac{B}{5}$ line.

8.2 Prevention of communication between compartments in the event of damage

8.2.1 Provision is to be made to prevent the compartment served by any bilge suction pipe being flooded, in the event of the pipe being severed, or otherwise damaged by collision or grounding in any other compartment. For this purpose, where the pipe is at any part situated nearer the side of the ship than $\frac{B}{5}$ or in a duct keel, a non-return valve is to be fitted to the pipe in the compartment containing the open end.

8.3 Arrangement and control of bilge valves

8.3.1 All the distribution boxes, valves and cocks in connection with the bilge pumping arrangements are to be so arranged that, in the event of flooding, one of the bilge pumps may be operative on any compartment. If there is only one system of pipes common to all pumps, the necessary valves or cocks for controlling the bilge suctions must be capable of being operated from the bulkhead deck. Where, in addition to the main bilge pumping system, an emergency bilge pumping system is provided, it is to be independent of the main system and so arranged that a pump is capable of operating on any compartment under flooding conditions; in this case, only the valves and cocks necessary for the operation of the emergency system need be capable of being operated from above the bulkhead deck.

8.3.2 All valves and cocks mentioned in 8.3.1 which can be operated from above the bulkhead deck are to have their controls at their place of operation clearly marked and provided with means to indicate whether they are open or closed.

8.4 Cross-flooding arrangements

8.4.1 Where divided deep tanks or side tanks are provided with cross-flooding arrangements to limit the angle of heel after side damage, the arrangements are to be self-acting where practicable. In any case, where controls to cross flooding fittings are provided, they are to be operable from above the bulkhead deck.

Section 9 Additional requirements relating to fixed pressure water spray fire-extinguishing systems

9.1 Bilge drainage requirements

9.1.1 Where arrangements for cooling underdeck cargo spaces, or fire-fighting by means of fixed spraying nozzles or by flooding of the cargo space with water are provided, the following provisions are to apply:

- (a) The drainage system is to be sized to remove no less than 125 per cent of the combined capacity of both the water spraying system pumps and the required number of fire hose nozzles.
- (b) The drainage system valves are to be operable from outside the protected space at a position in the vicinity of the extinguishing system controls.
- (c) Adequately sized bilge wells are to be located at the side shell of the ship at a distance of not more than 40 m in each watertight compartment, see also Pt 3, Ch 12, 4.1.4 and Pt 4, Ch 2, 11.2. For cargo ships only, if this is not possible, the free surface effect on the ship's stability is to be determined and submitted to the flag administration for appraisal.

Ship Piping Systems

Part 5, Chapter 13

Sections 9 to 12

9.1.2 If drainage of vehicle or cargo spaces is by gravity, the drainage is to be led directly overboard or to a closed drain tank. If led overboard the scuppers are to comply with Pt 3, Ch 12, 4.1.3(a) and (b). If led to a closed drain tank, this tank is to be located outside the machinery spaces and provided with a vent pipe leading to a safe location on the open deck. *See also* Pt 4, Ch 2, 11.2.

9.1.3 Drainage from a cargo space into bilge wells in a lower space is only permitted if that space satisfies the same requirements as the cargo space above.

■ Section 10 Drainage arrangements for ships not fitted with propelling machinery

10.1 Hand pumps

10.1.1 Where auxiliary power is not provided, hand pumps are to be fitted, in number and position, as may be required for the efficient drainage of the ship.

10.1.2 In general, one hand pump is to be provided for each compartment. Alternatively, two pumps connected to a bilge main, having at least one branch to each compartment, are to be provided.

10.1.3 The pumps are to be capable of being worked from the upper deck or from positions above the load waterline which are at all times readily accessible. The suction lift is not to exceed 7,3 m and is to be well within the capacity of the pump.

10.1.4 The sizes of the hand pumps are to be not less than those given in Table 13.10.1. Where the ship is closely subdivided into small watertight compartments, 50 mm bore suctions will be accepted.

Table 13.10.1 Sizes of hand pumps

Tonnage under upper deck	Diameter of barrel of bucket pump mm	Bore of suction pipe of bucket pumps and semi-rotary pumps mm
Not exceeding 500 tons	100	50
Above 500 tons but not exceeding 1000 tons	115	57
Above 1000 tons but not exceeding 2000 tons	125	65
Above 2000 tons	140	70

10.2 Ships with auxiliary power

10.2.1 In ships in which auxiliary power is available on board, power pump suctions are to be provided for dealing with the drainage of tanks and of the bilges of the principal compartments.

10.2.2 The pumping arrangements are to be as required for self-propelled ships, so far as these requirements are applicable, duly modified to suit the size and service of the ship.

10.2.3 Details of the pumping arrangements are to be submitted for special consideration.

■ Section 11 Ballast system

11.1 Stand-by arrangements for ballast pumping

11.1.1 Where ballasting/de-ballasting is required for ship operation or trading purposes stand-by ballast pumping arrangements are to be provided, *see also* 6.2.1 and Ch 15, 2.4.4.

■ Section 12 Air, overflow and sounding pipes

12.1 Definitions

12.1.1 Reference to cargo oil in this Section is to be taken to mean cargo oil which has a flash point 60°C or above (closed cup test).

12.2 Materials

12.2.1 Air, overflow and sounding pipes are to be made of steel or other approved material. For use of plastics pipes of approved type, *see* Chapter 12.

12.2.2 The portions of air, overflow and sounding pipes fitted above the weather deck are to be of steel or equivalent material.

12.3 Nameplates

12.3.1 Nameplates are to be affixed to the upper ends of all air and sounding pipes.

12.4 Air pipes

12.4.1 Air pipes are to be fitted to all tanks, cofferdams, tunnels and other compartments which are not fitted with alternative ventilation arrangements.

Ship Piping Systems

Part 5, Chapter 13

Section 12

12.4.2 The air pipes are to be fitted at the opposite end of the tank to that which the filling pipes are placed and/or at the highest part of the tank. Where the tank top is of unusual or irregular profile, special consideration will be given to the number and position of the air pipes.

12.5 Termination of air pipes

12.5.1 Air pipes to double bottom tanks, deep tanks extending to the shell plating, or tanks which can be run up from the sea are to be led to above the bulkhead deck. Air pipes to oil fuel and cargo oil tanks, cofferdams and all tanks which can be pumped up are to be led to the open. For height of air pipes above deck, see Pt 3, Ch 12,3.

12.5.2 Air pipes from storage tanks containing lubricating or hydraulic oil may terminate in the machinery space, provided that the open ends are so situated that issuing oil cannot come into contact with electrical equipment or heated surfaces. Air pipes from heated lubricating oil tanks are to be led to the open.

12.5.3 The open ends of air pipes to oil fuel and cargo oil tanks are to be situated where no danger will be incurred from issuing oil vapour when the tank is being filled.

12.5.4 The location and arrangement of air pipes for oil fuel service, settling and lubricating oil tanks are to be such that in the event of a broken vent pipe, this does not directly lead to the risk of ingress of sea-water or rainwater.

12.5.5 For special requirements for the termination of air pipes on ferries, see Pt 3, Ch 12,3 and Pt 4, Ch 2,10.

12.6 Gauze diaphragms

12.6.1 The open ends of air pipes to oil fuel and cargo oil tanks are to be furnished with a wire gauze diaphragm of incorrodible material which can be readily removed for cleaning or renewal.

12.6.2 Where wire gauze diaphragms are fitted at air pipe openings, the area of the opening through the gauze is to be not less than the cross-sectional area required for the pipe, see 12.8.

12.7 Air pipe closing appliances

12.7.1 The closing appliances fitted to tank air pipes in accordance with Pt 3, Ch 12,3 are to be of an automatic opening type which will allow the free passage of air or liquid to prevent the tanks being subjected to a pressure or vacuum greater than that for which they are designed.

12.7.2 Air pipe closing devices are to be of a type acceptable to Lloyd's Register (hereinafter referred to as 'LR') and are to be tested in accordance with a National or International Standard recognised by LR. The flow characteristic of the closing device is to be determined using water, see 12.8.1 and 12.8.2.

12.7.3 Wood plugs and other devices which can be secured closed are not to be fitted at the outlets.

12.8 Size of air pipes

12.8.1 For every tank which can be filled by the ship's pumps, the total cross-sectional area of the air pipes and the design of the air pipe closing devices are to be such that when the tank is overflowing at the maximum pumping capacity available for the tank, it will not be subjected to a pressure greater than that for which it is designed.

12.8.2 In all cases, whether a tank is filled by ship's pumps or other means, the total cross-sectional area of the air pipes is to be not less than 25 per cent greater than the effective area of the respective filling pipe.

12.8.3 Where tanks are fitted with cross flooding connections, the air pipes are to be of adequate area for these connections.

12.8.4 Air pipes are to be not less than 50 mm bore.

12.9 Overflow pipes

12.9.1 For all tanks which can be filled by the ship's pumps or by shore pumps, overflow pipes are to be fitted where:

- (a) The total cross-sectional area of the air pipe is less than that required by 12.8.
- (b) The pressure head corresponding to the height of the air pipe is greater than that for which the tank is designed.

12.9.2 In the case of oil fuel and lubricating oil tanks, the overflow pipe is to be led to an overflow tank of adequate capacity or to a storage tank having a space reserved for overflow purposes. Suitable means are to be provided to indicate when overflow is occurring, or when the contents reach a predetermined level in the tanks.

12.9.3 Overflow pipes are to be self draining under normal conditions of trim.

12.9.4 Where overflow sight glasses are provided, they are to be in a vertically dropping line and designed such that the oil does not impinge on the glass. The glass is to be of heat resisting quality, adequately protected from mechanical damage and well lit.

12.10 Air and overflow systems

12.10.1 Where a combined air or overflow system is fitted, the arrangement is to be such that in the event of any one of the tanks being bilged, tanks situated in other watertight compartments of the ship cannot be flooded from the sea through combined air pipes or the overflow main. For this purpose, it will normally be necessary to lead the overflow pipe to a point close to the bulkhead deck.

Ship Piping Systems

Part 5, Chapter 13

Section 12

12.10.2 In the case of trawlers and fishing vessels, the arrangement is to be such that in the event of any one of the tanks being bilged, the other tanks cannot be flooded from the sea through the combined air pipes or the overflow main.

12.10.3 Where overflow from tanks which are used for the alternative carriage of oil and water ballast is connected to an overflow system, arrangements are to be made to prevent water ballast overflowing into tanks containing oil, see *also* Ch 14.4.14.

12.10.4 Where a common overflow main is provided, the main is to be sized to allow any two tanks connected to that main to overflow simultaneously.

12.11 Sounding arrangements

12.11.1 Provision is to be made for sounding all tanks and the bilges of those compartments which are not at all times readily accessible. The soundings are to be taken as near the suction pipes as practicable.

12.11.2 Bilges of compartments which are not at all times readily accessible are to be provided with sounding pipes.

12.11.3 Where fitted, sounding pipes are to be as straight as practicable, and if curved to suit the structure of the ship, the curvature must be sufficiently easy to permit the ready passage of the sounding rod or chain.

12.11.4 Sounding devices of approved type may be used in lieu of sounding pipes for sounding tanks. These devices are to be tested, after fitting on board, to the satisfaction of the Surveyors.

12.11.5 Where gauge glasses are used for indicating the level of liquid in tanks containing lubricating oil, oil fuel or other flammable liquid, the glasses are to be of the flat type of heat-resisting quality, adequately protected from mechanical damage, and fitted with self-closing valves at the lower ends and at the top ends if these are connected to the tanks below the maximum liquid level.

12.11.6 If means of sounding, other than a sounding pipe, is fitted in any ship for indicating the level of liquid in tanks containing oil fuel, lubricating oil or other flammable liquid, failure of such means or over filling of the tank should not result in the release of tank contents.

12.11.7 In passenger ships, sounding devices for oil fuel tanks, lubricating oil tanks and other tanks which may contain flammable liquids are to be of a type which does not require penetration below the top of the tank.

12.12 Termination of sounding pipes

12.12.1 Sounding pipes are to be led to positions above the bulkhead deck which are at all times accessible and, in the case of oil fuel tanks, cargo oil tanks, lubricating oil tanks and tanks containing other flammable oils, the sounding pipes are to be led to safe positions on the open deck.

12.12.2 For closing requirements, see *also* Pt 3, Ch 12.3.

12.13 Short sounding pipes

12.13.1 In machinery spaces and tunnels, in circumstances where it is not practicable to extend the sounding pipes as mentioned in 12.12, short sounding pipes extending to well lighted readily accessible positions above the platform may be fitted to double bottom tanks. Where such pipes serve tanks containing oil fuel or other flammable liquid, an additional sounding device of approved type is to be fitted. An additional sounding device is not required for lubricating oil tanks. Any proposal to terminate in the machinery space, sounding pipes to tanks, other than double bottom tanks, will be the subject of special consideration.

12.13.2 Short sounding pipes to oil fuel, cargo oil (flash point not less than 60°C), lubricating oil tanks and other flammable oil tanks (flash point not less than 60°C) are to be fitted with cocks having parallel plugs with permanently attached handles, so loaded that, on being released, they automatically close the cocks. In addition, a small diameter self-closing test cock is to be fitted below the cock mentioned above in order to ensure that the sounding pipe is not under a pressure of oil before opening-up the sounding cock. Provision is to be made to ensure that discharge of oil through this test cock does not present an ignition hazard. An additional small diameter self-closing test cock is not required for lubricating oil tanks.

12.13.3 As a further precaution against fire, such sounding pipes are to be located in positions as far removed as possible from any heated surface or electrical equipment and, where necessary, effective shielding is to be provided in way of such surfaces and/or equipment.

12.13.4 In ships that are required to be provided with a double bottom, short sounding pipes, where fitted to double bottom tanks, are in all cases to be provided with self-closing cocks as described in 12.13.2.

12.13.5 Where a double bottom is not required to be fitted, short sounding pipes to tanks other than oil tanks are to be fitted with shut-off cocks or with screw caps attached to the pipes by chains.

12.13.6 In passenger ships, short sounding pipes are permissible only for sounding cofferdams and double bottom tanks situated in a machinery space, and are in all cases to be fitted with self-closing cocks as described in 12.13.2.

12.14 Elbow sounding pipes

12.14.1 Elbow sounding pipes are not to be used for deep tanks unless the elbows and pipes are situated within closed cofferdams or within tanks containing similar liquids. They may, however, be fitted to other tanks and may be used for sounding bilges, provided that it is not practicable to lead them direct to the tanks or compartments, and subject to any subdivision and damage stability requirements that may apply, see 1.2.1.

12.14.2 The elbows are to be of heavy construction and adequately supported.

12.14.3 In passenger ships, elbow sounding pipes are not permissible.

12.15 Striking plates

12.15.1 Striking plates of adequate thickness and size are to be fitted under open-ended sounding pipes.

12.15.2 Where slotted sounding pipes having closed ends are employed, the closing plugs are to be of substantial construction.

12.16 Sizes of sounding pipes

12.16.1 Sounding pipes are to be not less than 32 mm bore.

12.16.2 All sounding pipes, whether for compartments or tanks, which pass through refrigerated spaces or the insulation thereof, in which the temperatures contemplated are 0°C or below, are to be not less than 65 mm bore, see also 2.8.1 for insulation.

- 8 **Lubricating oil systems**
- 9 **Hydraulic systems**
- 10 **Low pressure compressed air systems**
- 11 **Multi-engined ships**

■ Section 1 General requirements

1.1 General

1.1.1 In addition to the requirements detailed in this Chapter, the requirements of Ch 13,1 and 2 are to be complied with, where applicable.

1.1.2 The requirements of Ch 13,3 are also to be complied with, so far as they are applicable, for the drainage of tanks, oily bilges and cofferdams, etc.

1.1.3 The requirements of Sections 2 and 4 are to be complied with, as far as they are applicable, for all flammable liquids.

■ Section 2 Oil fuel – General requirements

2.1 Flash point

2.1.1 The flash point (closed cup test) of oil fuel for use in ships classed for unrestricted service is, in general, to be not less than 60°C. For emergency generator engines a flash point of not less than 43°C is permissible.

2.1.2 The use of oil fuel having a flash point of less than 60° but not less than 43° may be permitted for emergency generators, emergency fire pumps, engines and auxiliary machines which are not located in machinery spaces subject to the requirements of 4.19.

2.1.3 The use of fuel having a lower flash point than specified in 2.1.1 or 2.1.2 may be permitted in cargo ships provided that such fuel is not stored in any machinery space and the arrangements for the complete installation are specially approved.

2.1.4 In general, oil fuel in storage and service tanks is not to be heated to a temperature exceeding 10°C below its flash point. Higher temperatures will be considered where:

- (a) The tanks are vented to a safe position outside the engine room and, as in the case of all oil fuel tanks, the ends of the ventilation pipes are fitted with gauze diaphragms.
- (b) Openings in the drainage systems of tanks containing heated oil fuel are located in spaces where no accumulation of oil vapours at temperatures close to the flash point can occur.
- (c) There is no source of ignition in the vicinity of the ventilation pipes or near the openings in the drainage systems or in the tanks themselves.

2.1.5 The temperature of any heating medium is not to exceed 220°C.

2.1.6 Tanks containing oil fuel are to be separated from crew, passenger and baggage compartments by either:

- a gastight steel division additional to the division which retains the oil, or
- a division of all-welded steel construction capable of withstanding a head of water at least 1,5 m greater than the maximum service head.

2.2 Special fuels

2.2.1 When it is desired to carry a quantity of fuel having a flash point below 43°C for special services, e.g. aviation spirit for use in helicopters, full particulars of the proposed arrangements are to be submitted for special consideration. For helicopter refuelling, as a minimum, the requirements of SOLAS 1974 as amended II-2/G, 18-7 will apply.

2.2.2 For the burning of methane gas in methane tankers, see the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk* (hereinafter referred to as the Rules for Ships for Liquefied Gases).

2.2.3 Where it is proposed to use gaseous fuels for main or auxiliary engines in ships other than methane tankers, the relevant requirements of the Rules for Ships for Liquefied Gases are to be complied with. Full particulars of the proposed arrangements are to be submitted for special consideration. Attention is to be given to any relevant statutory requirements of the National Authority of the country in which the ships are to be registered.

2.3 Oil fuel sampling

2.3.1 Sampling points are to be provided at locations within the oil fuel system that enable samples of oil fuel to be taken in a safe manner.

Machinery Piping Systems

Part 5, Chapter 14

Section 2

2.3.2 The position of a sampling point is to be such that the sample of the oil fuel is representative of the oil fuel quality at that location within the system.

NOTE:

Samples taken from sounding pipes are not considered to be representative of the tank's contents.

2.3.3 The sampling arrangements within the machinery space are to be capable of safely providing samples when machinery is running and are to be provided with isolating valves and cocks of the self-closing type. The sampling points are to be located in positions as far removed as possible from any heated surface or electrical equipment so as to preclude impingement of oil fuel onto such surfaces on equipment under all operating conditions, see Ch 1,3.7.

2.4 Ventilation

2.4.1 The spaces in which the oil fuel burning appliances and the oil fuel settling and service tanks are fitted are to be well ventilated and easy of access.

2.5 Boiler insulation and air circulation in boiler room

2.5.1 The boilers are to be suitably lagged. The clearance spaces between the boilers and tops of the double bottom tanks, and between the boilers and the sides of the storage tanks in which oil fuel and cargo oil is carried, are to be adequate for the free circulation of the air necessary to keep the temperature of the stored oil sufficiently below its flash point.

2.5.2 Where water tube boilers are installed, there is to be a space of at least 760 mm between the tank top and the underside of the pans forming the bottom of the combustion spaces.

2.5.3 Smoke-box doors are to be shielded and well fitting, and the uptake joints made gastight. Where the surface temperature of the uptakes may exceed 220°C, they are to be efficiently lagged to minimise the risk of fire and to prevent damage by heat. Where lagging covering the uptakes, including flanges, is oil-absorbing or may permit penetration of oil, the lagging is to be encased in sheet metal or equivalent. In locations where the Surveyor is satisfied that oil impingement could not occur, the lagging need not be encased.

2.6 Funnel dampers

2.6.1 Dampers which are capable of completely closing the gas passages are not to be fitted to inner funnels of ships equipped for burning oil fuel only. In ships burning oil or coal alternatively, dampers may be retained, if they are provided with a suitable device whereby they may be securely locked in the fully open position.

2.7 Heating arrangements

2.7.1 Where steam is used for heating oil fuel, cargo oil or lubricating oil, in bunkers, tanks, heaters or separators, the exhaust drains are to discharge the condensate into an observation tank in a well lighted and accessible position where it can be readily seen whether or not it is free from oil, see Ch 15,6.4.

2.7.2 Where hot water is used for heating, means are to be provided for detecting the presence of oil in the return lines from the heating coils.

2.7.3 Where it is proposed to use any heating medium other than steam or hot water, full particulars of the proposed arrangements are to be submitted for special consideration.

2.7.4 The heating pipes in contact with oil are to be of iron, steel, approved aluminium alloy or approved copper alloy, and, after being fitted on board, are to be tested by hydraulic pressure in accordance with the requirements of Ch 12,8.1.

2.7.5 Where electric heating elements are fitted means are to be provided to ensure that all elements are submerged at all times when electric current is flowing and that their surface temperature cannot exceed 220°C.

2.8 Temperature indication

2.8.1 Tanks and heaters in which oil is heated are to be provided with suitable means for ascertaining the temperature of the oil. Where thermometers or temperature sensing devices are not fitted in blind pockets, a warning notice, in raised letters, is to be affixed adjacent to the fittings stating 'Do not remove unless tank/heater is drained'.

2.8.2 Controls are to be fitted to limit oil temperatures in oil storage and service tanks in accordance with 2.1.4 and in oil heaters to the maximum approved operating temperature, see Pt 6, Ch 1.

2.9 Precautions against fire

2.9.1 Oil fuel tanks and oil fuel filters are not to be situated immediately above boilers or other highly heated surfaces, see *also* Ch 1,4.5.

2.9.2 Oil fuel pipes are not to be installed above or near high temperature equipment. Oil fuel pipes should also be installed and screened or otherwise suitably protected to avoid oil spray or oil leakages onto hot surfaces, into machinery air intakes, or other sources of ignition such as electrical equipment. Pipe joints are to be kept to a minimum, and where provided are to be of a type acceptable to LR. Pipes are to be led in well lit and readily visible positions, see *also* Ch 2,7.

Machinery Piping Systems

Part 5, Chapter 14

Sections 2 & 3

2.9.3 Pumps, filters and heaters are to be located to avoid oil spray or oil leakages onto hot surfaces or other sources of ignition, or onto rotating machinery parts. Where necessary, shielding is to be provided and the arrangements are to allow easy access for routine maintenance. The design of filter and strainer arrangements is to be such as to avoid the possibility of them being opened inadvertently when under pressure. This may be achieved by either mechanically preventing the pressurised filter from being opened or by providing pressure gauges which clearly indicate which filter is under pressure. In either case, suitable means for pressure release are to be provided, with drain pipes led to a safe location.

2.9.4 The arrangement and location of short sounding pipes to oil tanks are to be in accordance with Ch 13,12.13. For alternative sounding arrangements, see Ch 13,12.11.

2.9.5 Water service pipes and hoses are to be fitted in order that the floor plates and tank top or shell plating in way of boilers, oil fuel apparatus or deep storage tanks in the engine and boiler spaces can at any time be flushed with sea-water.

2.9.6 So far as is practicable, the use of wood is to be avoided in the engine rooms, boiler rooms and tunnels of ships burning oil fuel.

2.9.7 Drip trays are to be fitted at the furnace mouths to intercept oil escaping from the burners, and under all other oil fuel appliances which are required to be opened up frequently for cleaning or adjustment.

2.9.8 Oil-tight drip trays of ample size having suitable drainage arrangements are to be provided at pipes, pumps, valves and other fittings where there is a possibility of leakage. Valves should be located in well lighted and readily visible positions. Drip trays will not be required where pumps, valves and other fittings are placed in special compartments either inside or outside the machinery space with approved overall drainage arrangements or for valves which are so positioned that any leakage will drain directly into the bilges see 2.9.2.

2.9.9 Where drainage arrangements are provided from collected leakages, they are to be led to a suitable oil drain tank not forming part of an overflow system.

2.9.10 Separate oil fuel tanks are to be placed in an oil-tight spill tray of ample size having drainage arrangements leading to a drain tank of suitable size, see 4.17.

2.10 Oil fuel contamination

2.10.1 The materials and/or their surface treatment used for the storage and distribution of oil fuel are to be selected such that they do not introduce contamination or modify the properties of the fuel. The use of copper or zinc compounds in oil fuel distribution and utilisation piping is not permitted except for small diameter pipes in low pressure systems, see 4.6.1.

2.10.2 For prevention of ingress of water into oil fuel tanks via air pipes, see Ch 13,10.5.4.

2.10.3 The piping arrangements for oil fuel are to be separate and distinct from those intended for lubricating oil systems to prevent contamination of fuel oil by lubricating oil.

2.10.4 The piping arrangements for gas oil, distillate and diesel grades are to be separate and distinct from those intended for residual grades, up to the service tanks required by 4.18, to prevent cross-contamination. Cross-connection is permitted between separate arrangements in the event of failure of a designated item of equipment.

■ Cross-reference

For requirements regarding refrigerated cargo spaces in way of oil storage tanks, see Pt 6, Ch 3,4.

■ Section 3 Oil fuel burning arrangements

3.1 Oil burning units

3.1.1 Where steam is required for the main propelling engines, or where steam or thermal oil is required for auxiliary machinery for essential services, or for heating of heavy oil fuel and is generated by burning oil fuel under pressure, there are to be not less than two oil burning units. For auxiliary boilers, a single oil burning unit may be accepted, provided that alternative means, such as an exhaust gas boiler or composite boiler, are available for supply of essential services. Where the oil burning unit is not of the monobloc type (i.e. separate register and oil supply unit), each oil burning unit is to comprise a pressure pump, suction filter, discharge filter and, when required, a heater.

3.1.2 In installations consisting of two or more oil burning units, the number, arrangement and capacity of such units is to be capable of supplying sufficient fuel to allow the steam to be generated or thermal oil heated, as applicable to provide essential services with any one unit out of action.

3.1.3 Unit pressure pumps are to be entirely separate from the feed, bilge or ballast systems.

3.1.4 In dual oil fuel burning systems for boilers which are primarily designed for operation with residual fuel oil grades, arrangements are to be such that atomising steam cannot be used in combination with distillate fuel oil grades where the burner arrangements have not been designed for such use.

Machinery Piping Systems

Part 5, Chapter 14

Section 3

3.1.5 Whenever the oil fuel burning units are stopped, shut-off arrangements for oil fuel to the units are to be provided as follows:

- (a) If the supply oil fuel is under pressure during shut-off to oil burning units, duplicated shut-off valves in series are to be fitted. Arrangements are to be such to allow manual testing for leakage from each of the valves in the installed condition, the test arrangement is to be such to prevent inadvertent operation, and any discharges are to be led to a safe position to ensure that discharge of leakage oil does not present an ignition hazard.
- (b) If arrangements are such that oil fuel pressure is released through drainage during oil fuel shut-off to oil burning units, a single shut-off device may be accepted subject to approval by LR.

3.1.6 When combined air and fuel/steam/air combustion systems are used for multiple boiler installations, they are to be such that single boiler operation will not be adversely affected by the operation of another boiler system at any time.

3.1.7 Arrangements are to be such that furnace pre-purging is completed prior to any burner ignition sequence. The purge time is to be based on a minimum of 4 air changes of the combustion chamber, furnace and uptake spaces. The purge timing is to take account of the air flow rate and the sequence is not to commence until all air registers and dampers, as applicable, are fully open and the forced draft fans are operating.

3.1.8 The effect of multiple light-off failures is to be assessed and the need to lock out further ignition sequences established. The manufacturer's recommended procedures are to be followed before further attempts to ignite the boiler are made. These procedures are to be displayed at the ignition control positions and included in the warning notice required by 3.1.11.

3.1.9 Means are to be provided so that, in the event of flame failure, the oil fuel supply to the burner(s) is shut-off automatically, and an alarm is given, see Pt 6, Ch 1,3.5 to 3.8, as applicable.

3.1.10 It is to be demonstrated to the Surveyor's satisfaction during trials that burner shut-off times due to flame failure comply with the following requirements, and details of the procedures and means used to set this time interval are to be submitted for consideration:

- (a) The time interval at burner start up between the burner oil fuel valve(s) being opened and then closed in the event of flame failure is to be long enough to allow a stable flame to be established and detected under normal operational circumstances, but is to be set to minimise the quantity of oil fuel delivered to the furnace and the possibility of subsequent damage as a result of unintended ignition.
- (b) The time interval between flame failure detection and closing of burner oil fuel valve(s) is to be long enough to prevent shutdown due to incorrect detection of a flame failure under normal operational circumstances, but is to be set to minimise the quantity of unburned oil fuel delivered to the furnace and the possibility of subsequent damage as a result of unintended ignition.

3.1.11 A warning notice is to be fitted in a prominent position at every oil burning unit local manual control station which specifies that burners operated with manual or local overrides in use are only to be ignited after sufficient purging of the furnace and of any additional precautions required when operating in this condition.

3.2 Gravity feed

3.2.1 In systems where oil is fed to the burners by gravity, duplex filters are to be fitted in the supply pipeline to the burners and so arranged that one filter can be opened up when the other is in use.

3.3 Starting-up unit

3.3.1 A starting-up oil fuel unit, including an auxiliary heater and hand pump, or other suitable starting-up device, which does not require power from shore, is to be provided.

3.3.2 Alternatively, where auxiliary machinery requiring compressed air or electric power is used to bring the boiler plant into operation, the arrangements for starting such machinery are to comply with Ch 2,8.1.

3.4 Steam connections to burners

3.4.1 Where burners are provided with steam purging and/or atomising connections, the arrangements are to be such that oil fuel cannot find its way into the steam system in the event of valve leakage.

3.5 Burner arrangements

3.5.1 The burner arrangements are to be such that a burner cannot be withdrawn unless the oil fuel supply to that burner is shut-off, and that the oil cannot be turned on unless the burner has been correctly coupled to the supply line.

3.6 Quick-closing valve

3.6.1 A quick-closing master valve is to be fitted to the oil supply to each boiler manifold, suitably located so that the valve can be readily operated in an emergency, either directly or by means of remote control, having regard to the machinery arrangements and location of controls.

3.7 Spill arrangements

3.7.1 Provision is to be made, by suitable non-return arrangements, to prevent oil from spill systems being returned to the burners when the oil supply to these burners has been shut-off.

Machinery Piping Systems

Part 5, Chapter 14

Sections 3 & 4

3.8 Alternately-fired furnaces

3.8.1 For alternately-fired furnaces of boilers using exhaust gases and oil fuel, the exhaust gas inlet pipe is to be provided with an isolating device and interlocking arrangements whereby oil fuel can only be supplied to the burners when the isolating device is closed to the boiler.

3.9 Oil fuel treatment for supply to main and auxiliary oil engines and gas turbines

3.9.1 A suitable fuel treatment plant that may include filtration, centrifuging and/or coalescing is to be provided to reduce the level of water and particulate contamination of the oil fuel to within the engine or gas turbine manufacturer's limits for inlet to the combustion system. The capacity and arrangements of the treatment plant is to be suitable for ensuring availability of treated oil fuel for the maximum continuous demand of the propulsion and electrical generating plant.

3.9.2 Two or more treatment systems are to be provided as part of the fuel treatment plant such that failure of one system will not render the other system(s) inoperative. Arrangements are to ensure that the failure of a treatment system will not interrupt the supply of clean oil fuel to oil engines or gas turbines used for propulsion and electrical generating purposes where treatment plant is installed between oil fuel service tanks and the inlet to the combustion system. Any treatment equipment in the system is to be capable of being cleaned without interrupting the flow of treated fuel to supply the combustion system.

3.9.3 Centrifuges used for oil fuel treatment are to be type tested for their intended usage when installed on board a ship in accordance with a standard acceptable to LR.

3.9.4 Where heating of the oil fuel is required for the efficient functioning of the oil fuel treatment plant, a minimum of two heating units are to be provided. Each heating unit is to be of sufficient capacity to raise and maintain the required temperature of the oil fuel for the required delivery flow rate.

3.9.5 Heating units may be in circuit with separate treatment systems or provided with connections such that any heating unit can be connected to any treatment system.

3.9.6 Where heating of the oil fuel is required for combustion, not less than two pre-heaters are to be provided, each with sufficient capacity to raise the temperature of the fuel to provide a viscosity suitable for combustion.

3.9.7 Filters and/or coalescers are to be fitted in the oil fuel supply lines to each oil engine and gas turbine to ensure that only suitably filtered oil is fed to the combustion system. The arrangements are to be such that any unit can be cleaned without interrupting the supply of filtered oil to the combustion system.

3.10 Booster pumps

3.10.1 Where an oil fuel booster pump is fitted, which is essential to the operation of the main engine, a standby pump is to be provided.

3.10.2 The standby pump is to be connected ready for immediate use but where two or more main engines are fitted, each with its own pump, a complete spare pump may be accepted provided that it is readily accessible and can easily be installed.

3.11 Fuel valve cooling pumps

3.11.1 Where pumps are provided for fuel valve cooling, the arrangements are to be in accordance with 3.10.

3.12 Oil-fired galleys

3.12.1 The oil fuel tank is to be located outside the galley and is to be fitted with approved means of filling and venting.

3.12.2 The fuel supply to the burners is to be controlled from a position which will always be accessible in the event of a fire occurring in the galley.

3.12.3 The galley is to be well ventilated.

3.12.4 When liquefied petroleum gas is used, bottles are to be stored on the open deck or in a well ventilated space which only opens to the open deck.

Section 4 Oil fuel pumps, pipes, fittings, tanks, etc.

4.1 Transfer pumps

4.1.1 Where a power driven pump is necessary for transferring oil fuel, a standby pump is to be provided and connected ready for use, or, alternatively, emergency connections may be made to one of the unit pumps or to another suitable power driven pump.

4.2 Control of pumps

4.2.1 The power supply to all independently-driven oil fuel transfer and pressure pumps is to be capable of being stopped from a position outside the space which will always be accessible in the event of fire occurring in the compartment in which they are situated, as well as from the compartment itself.

4.3 Relief valves on pumps

4.3.1 All pumps which are capable of developing a pressure exceeding the design pressure of the system are to be provided with relief valves. Each relief valve is to be in close circuit, i.e. arranged to discharge back to the suction side of the pump and to effectively limit the pump discharge pressure to the design pressure of the system.

Machinery Piping Systems

Part 5, Chapter 14

Section 4

4.4 Pump connections

4.4.1 Valves or cocks are to be interposed between the pumps and the suction and discharge pipes, in order that any pump may be shut-off for opening-up and overhauling.

4.5 Pipes conveying oil

4.5.1 Pipes conveying oil under pressure are to be of seamless steel or other approved material having flanged or welded joints, and are to be placed in sight above the platform in well lighted and readily accessible parts of the machinery spaces. The number of flanged joints is to be kept to a minimum.

4.5.2 Where pipes convey heated oil under pressure the flanges are to be machined, and the jointing material, which is to be impervious to oil heated to 150°C, is to be the thinnest possible, so that flanges are practically metal to metal. The scantlings of the pipes and their flanges are to be suitable for a pressure of at least 13,7 bar (14 kgf/cm²) or for the design pressure, whichever is the greater.

4.5.3 The short joining lengths of pipes to the burners from the control valves at the boiler may have cone unions, provided these are of specially robust construction.

4.5.4 Flexible hoses of approved material and design may be used for the burner pipes, provided that spare lengths, complete with couplings, are carried on board.

4.5.5 For requirements relating to flexible hoses, see Ch 12.7.

4.6 Low pressure pipes

4.6.1 Transfer, suction and other low pressure oil pipes and all pipes passing through oil storage tanks are to be made of cast iron or steel, having flanged joints suitable for a working pressure of not less than 6,9 bar (7 kgf/cm²). The flanges are to be machined and the jointing material is to be impervious to oil. Where the pipes are 25 mm bore or less, they may be of seamless copper or copper alloy, except those which pass through oil storage tanks. Oil pipes within the engine and boiler spaces are to be fitted where they can be readily inspected and repaired.

4.6.2 For requirements regarding bilge pipes in way of double bottom tanks and deep tanks, see Ch 13,7.9 and 7.10.

4.7 Valves and cocks

4.7.1 Valves, cocks and their pipe connections are to be so arranged that oil cannot be admitted into tanks which are not structurally suitable for the carriage of oil or into tanks which can be used for the carriage of fresh water.

4.7.2 All valves and cocks forming part of the oil fuel installation are to be capable of being controlled from readily accessible positions which, in the engine and boiler spaces, are to be above the working platform, see also Ch 13,2.3.

4.7.3 Every oil fuel suction pipe from a double bottom tank is to be fitted with a valve or cock.

4.8 Valves on deep tanks and their control arrangements

4.8.1 Every oil fuel suction pipe from a storage, settling and daily service tank situated above the double bottom, and every oil fuel levelling pipe within the boiler room or engine room, is to be fitted with a valve or cock secured to the tank.

4.8.2 The valves and cocks mentioned in 4.8.1 are to be capable of being closed locally and from positions outside the space in which the tank is located. The remote controls are to be accessible in the event of fire occurring in the deep tank's space. Instructions for closing the valves or cocks are to be indicated at the valves and cocks and at the remote control positions.

4.8.3 The control for remote operation of the valve on the emergency generator fuel tank is to be in a separate location from the controls for the remote operation of other valves for tanks located in machinery spaces.

4.8.4 In the case of tanks of less than 500 litres capacity, consideration will be given to the omission of remote controls.

4.8.5 Every oil fuel suction pipe which is led into the engine and boiler spaces, from a tank situated above the double bottom outside these spaces, is to be fitted in the machinery space with a valve controlled as in 4.8.2, except where the valve on the tank is already capable of being closed from an accessible position above the bulkhead deck.

4.8.6 Where the filling pipes to deep oil tanks are not connected to the tanks near the top, they are to be provided with non-return valves at the tanks or with valves or cocks fitted and controlled as in 4.8.2.

4.9 Water drainage from settling tanks

4.9.1 Settling tanks are to be provided with means for draining water from the bottom of the tanks.

4.9.2 If settling tanks are not provided, the oil fuel bunkers or daily service tanks are to be fitted with water drains.

4.9.3 Open drains for removing the water from oil tanks are to be fitted with valves or cocks of self-closing type, and suitable provision is to be made for collecting the oily discharge.

4.10 Relief valves on oil heaters

4.10.1 Relief valves are to be fitted on the oil side of heaters and are to be adjusted to operate at a pressure of 3,4 bar (3,5 kgf/cm²) above that of the supply pump relief valve, see 4.3. The discharge from the relief valves is to be led to a safe position.

Machinery Piping Systems

Part 5, Chapter 14

Section 4

4.11 Filling arrangements

4.11.1 Filling stations are to be isolated from other spaces and are to be efficiently drained and ventilated.

4.11.2 Provision is to be made against over-pressure in the filling pipelines, and any relief valve fitted for this purpose is to discharge to an overflow tank or other safe position.

4.12 Transfer arrangements – Passenger ships

4.12.1 In passenger ships, provision is to be made for the transfer of oil fuel from any oil fuel storage or settling tank to any other oil fuel storage or settling tank in the event of fire or damage.

4.13 Alternative carriage of oil fuel and water ballast

4.13.1 Where it is intended to carry oil fuel and water ballast in the same compartments alternatively, the valves or cocks connecting the suction pipes of these compartments with the ballast pump and those connecting them with the oil fuel transfer pump are to be so arranged that the oil may be pumped from any one compartment by the oil fuel pump at the same time as the ballast pump is being used on any other compartment. In passenger ships the arrangement will require to be specially approved.

4.13.2 Where settling or service tanks are fitted, each having a capacity sufficient to permit 12 hours normal service without replenishment, the above requirement may be dispensed with.

4.13.3 Attention is drawn to the statutory regulations issued by National Authorities in connection with the *International Convention for the Prevention of Pollution of the Sea by Oil, 1973/78*.

4.14 Deep tanks for the alternative carriage of oil, water ballast or dry cargo

4.14.1 In the case of deep tanks which can be used for the carriage of oil fuel, cargo oil, water ballast or dry cargo, provision is to be made for blank flanging the oil and water ballast filling and suction pipes, also the steam heating coils if retained in place, when the tank is used for dry cargo, and for blank flanging the bilge suction pipes when the tanks are used for oil or water ballast.

4.14.2 If the deep tanks are connected to an overflow system, the arrangements are to be such that liquid or vapour from other tanks cannot enter the deep tanks when dry cargo is carried in them.

4.15 Separation of cargo oils from oil fuel

4.15.1 Pipes conveying vegetable oils or similar cargo oils are not to be led through oil fuel tanks, nor are oil fuel pipes to be led through tanks containing these cargo oils. For requirements regarding provision of cofferdams between oil and water tanks, see Pt 3, Ch 3,4.7.

4.16 Fresh water piping

4.16.1 Pipes in connection with compartments used for storing fresh water are to be separate and distinct from any pipes which may be used for oil or oily water, and are not to be led through tanks which contain oil, nor are oil pipes to be led through fresh water tanks.

4.17 Separate oil fuel tanks

4.17.1 Where separate oil fuel tanks are permitted, their construction is to be in accordance with the requirements of 4.17.2 to 4.17.6, see also SOLAS 1974 as amended Reg.II-2/B4.2.2.3.2.

4.17.2 In general, the minimum thickness of the plating of service, settling and other oil tanks, where they do not form part of the structure of the ship, is to be 5 mm, but in the case of very small tanks, the minimum thickness may be 3 mm.

4.17.3 For rectangular steel tanks of welded construction, the plate thicknesses are to be not less than those indicated in Table 14.4.1. The stiffeners are to be of approved dimensions.

Table 14.4.1 Plate thickness of separate oil fuel tanks

Thickness of plate, mm	Head from bottom of tank to top of overflow pipe, metres				
	2,5	3,0	3,7	4,3	4,9
Breadth of panel, mm					
5	585	525	—	—	—
6	725	645	590	—	—
7	860	770	700	650	—
8	1000	900	820	750	700
10	1280	1140	1040	960	900

4.17.4 The dimension given in Table 14.4.1 for the breadth of the panel is the maximum distance allowable between continuous lines of support, which may be stiffeners, wash-plates or the boundary of the tank.

4.17.5 Where necessary, stiffeners are to be provided, and if the length of the stiffener exceeds twice the breadth of the panel, transverse stiffeners are also to be fitted, or, alternatively, tie bars are to be provided between stiffeners on opposite sides of the tank.

4.17.6 On completion, the tanks are to be tested by a head of water equal to the maximum to which the tanks may be subjected, but not less than 2,5 m above the crown of the tank.

Machinery Piping Systems

Part 5, Chapter 14

Sections 4 & 5

4.18 Oil fuel service tanks

4.18.1 An oil fuel service tank is an oil fuel tank which contains only the required quality of fuel ready for immediate use.

4.18.2 Two oil fuel service tanks, for each type of fuel used on board, necessary for propulsion and generator systems, are to be provided. Each tank is to have a capacity for at least eight hours' operation, at sea, at maximum continuous rating of the propulsion plant and/or generating plant associated with that tank.

4.18.3 The arrangement of oil fuel service tanks is to be such that one tank can continue to supply oil fuel when the other is being cleaned or opened up for repair.

4.18.4 For ships of less than 500 gross tonnage, the capacity of each oil fuel service tank required by 4.18.2 may be less than for eight hours operation, where the class notation includes a service restriction.

4.19 Arrangements for fuels with a flash point between 43° and 60°

4.19.1 Fuel oil tanks other than those in double bottom compartments shall be located outside 'Category A' machinery spaces, see also Pt 3, Ch 3,4.7.

4.19.2 Provisions are to be made for the measurement of oil fuel temperature at the pump suction pipe.

4.19.3 Stop valves are to be provided at the inlet and outlet side of oil fuel strainers.

4.19.4 Pipe joints shall be either welded or spherical type union joints.

■ Section 5 Steam piping systems

5.1 Provision for expansion

5.1.1 In all steam piping systems, provision is to be made for expansion and contraction to take place without unduly straining the pipes.

5.1.2 Where expansion pieces are used, particulars are to be submitted.

5.1.3 For installation requirements regarding expansion pieces, see Ch 13,2.7.

5.2 Drainage

5.2.1 The slope of the pipes and the number and position of the drain valves or cocks are to be such that water can be efficiently drained from any portion of the steam piping system when the ship is in normal trim and is either upright or has a list of up to 5°.

5.2.2 Arrangements are to be made for ready access to the drain valves or cocks.

5.3 Pipes in way of holds

5.3.1 In general, steam pipes are not to be led through spaces which may be used for cargo, but where it is impracticable to avoid this arrangement, plans are to be submitted for consideration. The pipes are to be efficiently secured and insulated, and well protected from mechanical damage. Pipe joints are to be as few as practicable and preferably butt welded.

5.3.2 If these pipes are led through shaft tunnels, pipe tunnels in way of cargo holds or through duct keels, they are to be efficiently secured and insulated.

5.4 Reduced pressure lines

5.4.1 Pipelines which are situated on the low pressure side of reducing valves, and which are not designed to withstand the full pressure at the source of supply, are to be fitted with pressure gauges and with relief valves having sufficient discharge capacity to protect the piping against excessive pressure.

5.5 Steam for fire-extinguishing in cargo holds

5.5.1 Where steam is used for fire-extinguishing in cargo holds provision is to be made to prevent damage to cargo by leakage of steam or by drip.

5.5.2 Details of the proposed precautionary measures are to be submitted.

■ Cross-reference

For steam heating arrangements for oil fuel, cargo oil or lubricating oil, see 2.7.

■ Section 6

Boiler feed water and condensate systems

6.1 Feed water piping

6.1.1 Two separate means of feed are to be provided for all main and auxiliary boilers which are required for essential services. In the case of steam/steam generators, one means of feed will be accepted provided steam for essential services is available simultaneously from another source.

6.2 Feed pumps

6.2.1 Two or more feed pumps are to be provided of sufficient capacity to supply the boilers under full load conditions with any one pump out of action.

6.2.2 Feed pumps may be worked from the main engines or may be independently driven, but at least one of the pumps required in 6.2.1 is to be independently-driven.

6.2.3 In twin screw ships in which there is only one independent feed pump, each main engine is to be fitted with a feed pump. Where all the feed pumps are independently driven, the pumps are to be connected to deal with the condensate from both engines or from either engine.

6.2.4 Independent feed pumps required for feeding the main boilers are to be fitted with automatic regulators for controlling their output.

6.3 Harbour feed pumps

6.3.1 Where main-engine driven feed pumps are fitted and there is only one independent feed pump, a harbour feed pump or an injector is to be fitted to provide the second means of feed to the boilers which are in use when the main engines are not working. This requirement need not be complied with in the case of trawlers and fishing vessels.

6.3.2 The harbour feed pump required by 6.3.1 may be used for general service, provided that it is not connected to tanks containing oil, or to tanks, cofferdams and bilges which may contain oily water.

6.3.3 The valves on the suction pipes from the hotwell or condenser and the feed drain tank or filter are to be of the non-return type.

6.4 Condensate pumps

6.4.1 Two or more extraction pumps are to be provided for dealing with the condensate from the main and auxiliary condensers, at least one of which is to be independently driven. Where one of the independent feed pumps is fitted with direct suctions from the condensers and a discharge to the feed tank, it may be accepted for this purpose.

6.5 Valves and cocks

6.5.1 Feed and condensate pumps are to be provided with valves or cocks, interposed between the pumps and the suction and the discharge pipes, so that any pump may be opened-up for overhaul while the others continue in operation.

6.6 Reserve feed water

6.6.1 All ships fitted with boilers are to be provided with storage space for reserve feed water, the structural and piping arrangements being such that this water cannot be contaminated by oil or oily water, see Pt 3, Ch 3,4.7 for structural arrangements.

6.6.2 For main boilers, one or more evaporators, of adequate capacity, are also to be provided.

■ Cross-reference

For feed water level regulators for water tube boilers, see Ch 10,16.8.

■ Section 7

Engine cooling water systems

7.1 Main supply

7.1.1 Provision is to be made for an adequate supply of cooling water to the main propelling machinery and essential auxiliary engines, also to the lubricating oil and fresh water coolers and air coolers for electric propelling machinery, where these coolers are fitted. The cooling water pump(s) may be worked from the engines or be driven independently.

7.1.2 In the case of main steam turbine installations, a sea inlet scoop arrangement may replace the main sea-water circulating pump, subject to the conditions stated in 7.2.2(c).

7.2 Standby supply

7.2.1 Provision is also to be made for a separate supply of cooling water from a suitable independent pump of adequate capacity.

Machinery Piping Systems

Part 5, Chapter 14

Sections 7 & 8

7.2.2 The following arrangements are acceptable depending on the purpose for which the cooling water is intended:

- (a) Where only one main engine is fitted, the standby pump is to be connected ready for immediate use.
- (b) Where more than one main engine is fitted, each with its own pump, a complete spare pump of each type may be accepted.
- (c) Where a sea inlet scoop arrangement is fitted, and there is only one independent condenser circulating pump, a further pump, or a connection to the largest available pump suitable for circulation duties, is to be fitted to provide the second means of circulation when the ship is manoeuvring. The pump is to be connected ready for immediate use.
- (d) Where fresh water cooling is employed for main and/or auxiliary engines, a standby fresh water pump need not be fitted if there are suitable emergency connections from a salt water system.
- (e) Where each auxiliary is fitted with a cooling water pump, standby means of cooling need not be provided. Where, however, a group of auxiliaries is supplied with cooling water from a common system, a standby cooling water pump is to be provided for this system. This pump is to be connected ready for immediate use and may be a suitable general service pump.

7.3 Selection of standby pumps

7.3.1 When selecting a pump for standby purposes, consideration is to be given to the maximum pressure which it can develop if the overboard discharge valve is partly or fully closed and, when necessary, condenser doors, water boxes, etc., are to be protected by an approved device against inadvertent over-pressure. See Ch 3,6.3 for the hydraulic test pressure which condensers are required to withstand.

7.4 Relief valves on main cooling water pumps

7.4.1 Where cooling water pumps can develop a pressure head greater than the design pressure of the system, they are to be provided with relief valves on the pump discharge to effectively limit the pump discharge pressure to the design pressure of the system. For location of relief valves, see Ch 13,7.8.

7.5 Sea inlets

7.5.1 Not less than two sea inlets are to be provided for the pumps supplying the sea-water cooling system, one for the main pump and one for the standby pump. Alternatively, the sea inlets may be connected to a suction line available to main and standby pumps.

7.5.2 Where standby pumps are not connected ready for immediate use, see 7.2.2(b), the main pump is to be connected to both sea inlets.

7.5.3 Cooling water pump sea inlets are to be low inlets and one of them may be the ballast pump or general service pump sea inlet.

7.5.4 The auxiliary cooling water sea inlets are preferably to be located one on each side of the ship.

7.6 Strainers

7.6.1 Where sea-water is used for the direct cooling of the main engines and essential auxiliary engines, the cooling water suction pipes are to be provided with strainers which can be cleaned without interruption to the cooling water supply.

■ Cross-reference

For guidance on metal pipes for water services, see Ch 12,10.

■ Section 8 Lubricating oil systems

8.1 General requirements

8.1.1 In addition to the requirements detailed in this Section, the requirements of Sections 2 and 4 are to be complied with in so far as they are applicable. In all cases 2.9.1 to 2.9.3, 4.2, 4.3, 4.5, 4.8, 4.11 and 4.17 are to apply.

8.2 Pumps

8.2.1 Where lubricating oil for the main engine(s) is circulated under pressure, a standby lubricating oil pump is to be provided where the following conditions apply:

- (a) The lubricating oil pump is independently driven and the total output of the main engine(s) exceeds 370 kW (500 shp).
- (b) One main engine with its own pump is fitted and the output of the engine exceeds 370 kW (500 shp).
- (c) More than one main engine each with its own lubricating oil pump is fitted and the output of each engine exceeds 370 kW (500 shp).

8.2.2 The standby pump is to be of sufficient capacity to maintain the supply of oil for normal conditions with any one pump out of action. The pump is to be fitted and connected ready for immediate use, except that where the conditions referred to in 8.2.1(c) apply a complete spare pump may be accepted. In all cases satisfactory lubrication of the engines is to be ensured while starting and manoeuvring.

8.2.3 Similar provisions to those of 8.2.1 and 8.2.2 are to be made where separate lubricating oil systems are employed for piston cooling, reduction gears, oil operated couplings and controllable pitch propellers, unless approved alternative arrangements are provided.

8.2.4 Independently-driven pumps of rotary type are to be fitted with a non-return valve on the discharge side of the pump.

8.3 Alarms

8.3.1 All main and auxiliary engines and turbines intended for essential services are to be provided with means of indicating the lubricating oil pressure supply to them. Where such engines and turbines are of more than 37 kW (50 shp), audible and visual alarms are to be fitted to give warning of an appreciable reduction in pressure of the lubricating oil supply. Further, these alarms are to be actuated from the outlet side of any restrictions, such as filters, coolers, etc.

8.4 Emergency supply for propulsion turbines and propulsion turbo-generators

8.4.1 A suitable emergency supply of lubricating oil is to be arranged to come automatically into use in the event of a failure of the supply from the pump.

8.4.2 The emergency supply may be obtained from a gravity tank containing sufficient oil to maintain adequate lubrication for not less than six minutes, and, in the case of propulsion turbo-generators, until the unloaded turbine comes to rest from its maximum rated running speed.

8.4.3 Alternatively, the supply may be provided by the standby pump or by an emergency pump. These pumps are to be so arranged that their availability is not affected by a failure in the power supply.

8.4.4 For automatic shutdown arrangements of main turbines in the event of failure of the lubrication system, see Ch 3,5.1 and Pt 6, Ch 1,3.4.

8.5 Maintenance of bearing lubrication

8.5.1 The arrangements for lubricating bearings and for draining crankcase and other oil sumps of main and auxiliary engines, gearcases, electric generators, motors, and other running machinery are to be so designed that lubrication will remain efficient with the ship inclined under the conditions as shown in Ch 1,3.7.

8.5.2 For details of the requirements relating to the lubrication of bearings of electric generators and motors, see Pt 6, Ch 2,1.9.

8.6 Filters

8.6.1 Where the lubricating oil for main propelling engines is circulated under pressure, provision is to be made for the efficient filtration of the oil. The filters are to be capable of being cleaned without stopping the engine or reducing the supply of filtered oil to the engine. Proposals for an automatic by-pass for emergency purposes in high speed engines are to be submitted for special consideration.

8.6.2 In the case of propulsion turbines and their gears, arrangements are to be made for the lubricating oil to pass through magnetic strainers and fine filters. Generally, the openings in the filter elements are to be not coarser than required by the manufacturer of the turbines, especially for the supply to turbine thrust bearings.

8.7 Cleanliness of pipes and fittings

8.7.1 Extreme care is to be taken to ensure that lubricating oil pipes and fittings, before installation, are free from scale, sand, metal particles and other foreign matter.

8.8 Lubricating oil drain tank

8.8.1 Where an engine lubricating oil drain tank extends to the bottom shell plating in ships that are required to be provided with a double bottom, a shut-off valve is to be fitted in the drainpipe between the engine casing and the double bottom tank. This valve is to be capable of being closed from an accessible position above the level of the lower platform.

8.9 Lubricating oil contamination

8.9.1 The materials used in the storage and distribution of lubricating oil are to be selected such that they do not introduce contaminants or modify the properties of the oil. The use of cadmium or zinc in lubricating oil systems where they may normally come into contact with the oil is not permitted.

8.9.2 Arrangements are to be made for each forced lubrication system, renovation system, ready to use tank(s) and their associated rundown lines to drain tanks to be flushed after system installation and prior to running of machinery. The flushing arrangements are to be in accordance with the equipment manufacturer's procedures and recommendations.

8.9.3 For prevention of ingress of water into lubricating oil tanks via air pipes, see Ch 13,12.5.4.

8.9.4 The design and construction of engine and gear box piping arrangements are to prevent contamination of engine lubricating oil systems by leakage of cooling water or from bilge water where engines or gearboxes are partly installed below the lower platform. Where flexibility is required to accommodate movement between the engine and sump tank, any flexible joint assembly is to be of an approved type suitable for its intended application.

8.9.5 Where there is a permanently attached oil filling pipe and cap provided for an engine or other item of machinery, provision is to be made for the topping up oil to safely pass through a suitable strainer to prevent unwanted matter getting into the lubricating oil system. The caps are to be capable of being secured in the closed position.

Machinery Piping Systems

Part 5, Chapter 14

Sections 8, 9 & 10

8.9.6 Sampling points are to be provided that enable samples of lubricating oil to be taken in a safe manner. The sampling arrangements are to have the capability to provide samples when machinery is running and are to be provided with valves and cocks of the self-closing type and located in positions as far removed as possible from any heated surface or electrical equipment.

8.10 Deep tank valves and their control arrangements

8.10.1 The requirements for remote operation of valves on deep tank suction pipes may be waived where the valves are closed during normal operation.

8.10.2 Remotely operated valves on lubricating oil deep tank suction should not be of the quick-closing type where inadvertent use would endanger the safe operation of the main propulsion and essential auxiliary machinery.

■ Cross-references

For air, sounding pipes and gauge glasses, see Ch 13,12. For separation of lubricating oil tanks from fuel tanks, see Pt 3, Ch 3,4,7.

■ Section 9 Hydraulic systems

9.1 General

9.1.1 The arrangements for storage, distribution and utilisation of hydraulic and other flammable oils employed under pressure in power transmission systems, control and actuating systems and heating systems in locations where means of ignition are present are to comply with the provisions of 2.9.1 to 2.9.3, 4.3, 4.5, 4.11 and 4.17 where applicable.

9.2 System arrangements

9.2.1 Hydraulic fluids are to be suitable for the intended purpose under all operating service conditions.

9.2.2 Materials used for all parts of hydraulic seals are to be compatible with the working fluid at the appropriate working temperature and pressure.

9.2.3 Over-pressure protection is to be provided on the discharge side of all pumps. Where relief valves are fitted for this purpose they are to be fitted in closed circuit, i.e. arranged to discharge back to the system oil tank.

9.2.4 Provision is to be made for hand operation of the systems in an emergency, unless an acceptable alternative is available.

9.2.5 Where hydraulic securing arrangements are applied, the system is to be capable of being locked in the closed position so that in the event of hydraulic system failure the securing arrangements will remain locked.

9.2.6 Where pilot operated non-return valves are fitted to hydraulic cylinders for locking purposes, the valves are to be connected directly to the actuating cylinder(s) without intermediate pipes or hoses.

9.2.7 Hydraulic circuits for securing and locking of bow, inner, stern or shell doors are to be arranged such that they are isolated from other hydraulic circuits when securing and locking devices are in the closed position. For requirements relating to hydraulic steering gear arrangements see Ch 19,3.

9.2.8 Suitable oil collecting arrangements for leaks shall be fitted below hydraulic valves and cylinders.

■ Section 10 Low pressure compressed air systems

10.1 General

10.1.1 The requirements of this Section are applicable to low pressure (LP) compressed air systems which are essential for pneumatic control and instrumentation purposes.

10.1.2 Low pressure compressed air systems are to produce and distribute cooled compressed air throughout the ship to supply all pneumatic control and instrumentation systems where the air pressure requirements are typically 3 to 10 bar. LP compressed air systems may include air compressors, oil/water separators, filters, dryers, distribution lines and air receivers.

10.1.3 The design of LP compressed air systems is to be capable of providing a continuous flow of air to meet the demands of all essential users under all ambient conditions. This demand may include the use of intermittently used equipment that is part of the ship's equipment, such as power tools for machinery maintenance, testing equipment and line cleaning. Compressed air systems used for diesel engine or gas turbine starting are to comply with the requirements of Ch 2,8 and Ch 4,6 as applicable.

10.1.4 User equipment requirements for the quality of compressed air in terms of dewpoint (dryness), oil content and solid particle count are to be recognised in the selection and configuration of compressors, equipment, filters and dryers which are included in the system.

10.1.5 Configuration arrangements of LP compressed air systems may consist of:

- (a) Dedicated LP air compressors and LP air receivers with a distribution system for LP users; or
- (b) Supply from the starting air system to dedicated air pressure reducing valves/cross-over stations feeding into a distribution system for LP users.

Machinery Piping Systems

Part 5, Chapter 14

Sections 10 & 11

10.2 Compressors and reducing valves/stations

10.2.1 Where LP air is not derived from the starting air system, at least two LP air compressors are to be provided. The output of any one compressor is to match the total demand of all essential users. The system is to be arranged for auto-start of the compressors and means are to be provided to indicate if any compressor is operating longer and more frequently than the manufacturer's recommended operating periods.

10.2.2 If only one LP air compressor is to be provided, a cross connection to the starting air system is to be made via a reducing valve/cross-connection station.

10.2.3 Where LP air is derived only from the starting air system, at least two means of supplying air to the LP air system are to be provided. Each of the two means of supplying air is to have sufficient capability of supplying the total demand on the LP air system with one of the means out of action. To ensure that LP compressed air users do not cause the starting air compressors to operate the starting air system is to be fitted with an auxiliary compressor which is to be capable of continuous running and which can maintain the stored capacity of starting compressed air in the air receivers as required by Ch 2,8 and Ch 4,6 as applicable, whilst supplying essential LP users.

10.3 Air receivers

10.3.1 The LP air system and any associated air receivers are to be configured to provide sufficient stored energy to supply LP compressed air without the pressure in the system falling below a level that is insufficient for the operation of all essential users. See also Pt 6, Ch 1,2.5.8.

10.3.2 All air receivers are to comply with the requirements of Chapter 11 as applicable.

10.3.3 Stop valves on air receivers are to permit slow opening to avoid sudden pressure rises in the piping system.

10.4 Distribution system

10.4.1 Drain pots with drain valves are to be provided throughout the distribution system at all low points.

10.4.2 Pipelines that are situated on the low pressure side of reducing valves/stations and that are not designed to withstand the full pressure of the source supply, are to be provided with pressure gauges and with relief valves having sufficient capacity to protect the piping against excessive pressure.

10.4.3 In-line filters capable of being cleaned/changed without interrupting the flow of filtered air are to be fitted in the system.

10.5 Pneumatic remote control valves

10.5.1 Where valves, which are required by the Rules to be capable of being closed from outside a machinery space, have pneumatic closing arrangements, a dedicated air receiver is to be fitted to supply compressed air to the valves. This air receiver is to be located outside the machinery space.

10.5.2 The air receiver is to be maintained fully charged from the main LP air system via a non-return valve located at the air receiver inlet which is to be locked in the open position.

10.5.3 In the case of passenger ships, a permanently attached hand-operated air compressor capable of charging the air receiver is to be provided in the space in which the air receiver is located.

10.5.4 The capacity of the air receiver is to be sufficient to operate all valves and any other essential supplies such as ventilation flaps without replenishment.

10.6 Control arrangements

10.6.1 The control, alarm and monitoring systems are to comply with Pt 6, Ch 1.

Section 11 Multi-engined ships

11.1 General

11.1.1 This Section is applicable to ships of less than 500 gross tons and which are not required to comply with the *International Convention for the Safety of Life at Sea, 1974*, as amended (SOLAS 74), and that have multi-engine installations for propulsion purposes.

11.1.2 For vessels in which the propulsion systems are independent and the propulsion system prime movers are also fully independent of each other such that in the event of the failure of one of the sources of propulsion power the vessels will retain the capability of safely manoeuvring under all conditions of service, the following may not be required:

- (a) Spare fuel oil booster pump stipulated in 3.10.2.
- (b) Spare lubricating oil pump stipulated in 8.2.1(c), 8.2.2 and 8.2.3.
- (c) Spare cooling water pump stipulated in 7.2.2(b).

Piping Systems for Oil Tankers

Part 5, Chapter 15

Section 1

Section

- 1 **General requirements**
- 2 **Piping systems for bilge, ballast, oil fuel, etc.**
- 3 **Cargo handling system**
- 4 **Cargo tank venting, purging and gas-freeing**
- 5 **Cargo tank level gauging equipment**
- 6 **Cargo heating arrangements**
- 7 **Inert gas systems**

■ Section 1 General requirements

1.1 Application

1.1.1 The requirements of this Chapter are additional to those of Chapter 13 and are applicable to ships which are intended for the carriage of oil in bulk.

1.1.2 The requirements are based on the assumption that the ships are of normal tanker type having the main propelling machinery aft. Departures from this arrangement will require special consideration.

1.1.3 The requirements are primarily intended for ships which are to carry flammable liquids having a flash point not exceeding 60°C (closed-cup test).

1.1.4 Where ships are intended to carry specific cargoes which are non-flammable or which have a flash point exceeding 60°C, the requirements will be modified, where necessary, to take account of the lesser hazards associated with the cargoes.

1.1.5 For a list of cargoes which can be carried in oil tankers, see Table 9.1.2 in Pt 4, Ch 9.

1.2 Plans and particulars

1.2.1 In addition to the plans and particulars required in Chapter 13, the following plans (in a diagrammatic form) are to be submitted for consideration:

- Pumping arrangement at the fore and aft ends and drainage of cofferdams and pump rooms.
- General arrangement of cargo piping in tanks and on deck.
- General arrangement of cargo tank vents. The plan is to indicate the type and position of the vent outlets from any superstructure, erection, air intake, etc.
- Arrangement of inert gas piping system together with details of inert gas generating plant including all control and monitoring devices.
- Piping arrangements for cargo oil (F.P. 60°C or above, closed cup test).

- Ventilation arrangements of cargo and/or ballast pump rooms and other enclosed spaces which contain cargo handling equipment.
- Arrangements for venting, purging and gas measurement for double hull and double bottom spaces.
- Details of alarms and safety arrangements required by 1.6, *see also* Pt 6, Ch 1,2.

1.3 Materials

1.3.1 All materials used in the cargo pumping and piping systems are to be suitable for use with the intended cargoes and, where applicable, they are to comply with the requirements of Chapter 12.

1.3.2 The requirements of 1.3.1 are also applicable to other piping systems which may come into contact with cargo.

1.4 Design

1.4.1 All piping, valves and fittings are to be suitable for the maximum pressure to which the system can be subjected.

1.4.2 Piping subject to pressure is to be of seamless or other approved type, and is to comply with the requirements of Chapter 12.

1.5 Dangerous spaces

1.5.1 Oil engines, or any other equipment which could constitute a possible source of ignition, are not to be situated within cargo tanks, pump rooms, cofferdams or other spaces liable to contain petroleum or other explosive vapours, or in spaces or zones immediately adjacent to cargo oil or slop tanks. The temperature of steam, or other fluid, in pipes (or heating coils) in these spaces is not to exceed 220°C. On gas tankers and chemical tankers, the maximum temperature is not to exceed that of the required temperature class of electrical equipment in the cargo area.

1.5.2 For definition of dangerous zones or spaces and requirements for electrical equipment within such spaces, see Pt 6, Ch 2,13.4.

1.5.3 For the requirements for earthing and bonding of pipework for the control of static electricity, see Pt 6, Ch 2,1.12.

1.6 Cargo pump room

1.6.1 Cargo pump rooms are to be totally enclosed and are to have no direct communication with machinery spaces. For bilge drainage arrangements in pump room, see 2.2.

1.6.2 Pump rooms are to be situated within, or adjacent to the cargo tank area and are to be provided with ready means of access from the open deck, *see also* Pt 4, Ch 9,13.

Piping Systems for Oil Tankers

Part 5, Chapter 15

Section 1

1.6.3 In cargo pump rooms any drain pipes from steam or exhaust pipes from the steam cylinders of the pumps are to terminate well above the level of the bilges.

1.6.4 Alarms and safety arrangements are to be provided as indicated in 1.6.5 and Table 15.1.1. These requirements are applicable to pump rooms where pumps for cargo, such as cargo pumps, stripping pumps, pumps for slop tanks, pumps for COW or similar pumps are provided and not for pump rooms intended solely for ballast transfer. See also 1.6.6.

Table 15.1.1 Alarms and safety arrangements

Item	Alarm	Note
Temperature sensing of bulkhead shaft glands, bearings and pump casings	High see Note 1	Cargo, ballast and stripping pumps
Bilge level	High	—
Hydrocarbon concentration	High see Note 2	> 10% LEL
NOTES 1. The alarm signals shall trigger continuous visual and audible alarms in the cargo control room or the pump control station. 2. This alarm signal shall trigger a continuous audible and visual alarm in the pump room, cargo control room, engine control room and bridge.		

1.6.5 A system for continuously monitoring the concentrations of hydrocarbon gases within the cargo pump room is to be fitted. Monitoring points are to be located in positions where potentially dangerous concentrations may be readily detected. Gas analysing units with non-safe-type measuring equipment may be located outside cargo areas (e.g. in cargo control room, navigation bridge or engine room when mounted on the forward bulkhead) provided that:

- sampling lines do not pass through gas safe spaces, except where permitted by (e);
- the gas sampling pipes are fitted with flame arresters. Sample gas is to be led to the atmosphere with outlets arranged in a safe location, in the open atmosphere;
- bulkhead penetrations of sample pipes between safe and dangerous areas are of an approved type. A manual isolating valve is to be fitted in each of the sampling lines at the bulkhead in the safe area;
- the gas detection equipment including sampling piping, sampling pumps, solenoid valves and analysing units, are located in a fully enclosed steel cabinet, with a gasketed door, monitored by its own sampling point. At gas concentrations above 30 per cent LEL inside the steel cabinet, the entire gas-analysing unit is to be automatically shutdown; and
- where the cabinet cannot be arranged on the bulkhead, sample pipes are to be of steel or other equivalent material and without detachable connections, except for the connection points for isolating valves at the bulkhead and analysing units. The sample pipes are to be led by their shortest route.

Sequential sampling is acceptable as long as it is dedicated for the pump room only, including exhaust ducts, and the detection equipment is capable of monitoring from each sampling head location at intervals not exceeding 30 minutes.

1.6.6 Where items of equipment other than described in Table 15.1.1 are located in the pump room and are driven by shafts passing through bulkheads, the potential risk of ignition of hydrocarbon gas is to be assessed and proposals for mitigation submitted to LR for consideration.

1.7 Cargo pump room ventilation

1.7.1 Cargo pump rooms and other closed spaces which contain cargo handling equipment, and to which regular access is required during cargo handling operations, are to be provided with permanent ventilation systems of the mechanical extraction type.

1.7.2 The ventilation system is to be capable of being operated from outside the compartment being ventilated and a notice to be fixed near the entrance stating that no person is to enter the space until the ventilation system has been in operation for at least 15 minutes.

1.7.3 The ventilation systems are to be capable of 20 air changes per hour, based on the gross volume of the pump room or space.

1.7.4 The ventilation ducting is to be arranged to permit extraction from the vicinity of the pump room bilges, immediately above the transverse floor plates or bottom longitudinals. An emergency intake is also to be arranged in the ducting at a height of 2 m above the pump room lower platform and is to be provided with a damper capable of being opened or closed from the weather deck and lower platform level. An arrangement involving a specific ratio of areas of upper emergency and lower main ventilation openings, which can be shown to result in at least the required number of air changes through the lower inlets, can be accepted without the use of dampers. When the lower inlets are sealed off, owing to flooding of the bilges, then at least 75 per cent of the required number of air changes is to be obtainable through the upper inlets. Means are to be provided to ensure the free flow of gases through the lower platform to the duct intakes.

1.7.5 Protection screens of not more than 13 mm square mesh are to be fitted in outside openings of ventilation ducts, and ventilation intakes are to be so arranged as to minimise the possibility of re-cycling hazardous vapours from any ventilation discharge opening. Vent exits are to be arranged to discharge to a safe place on the open deck and comply with the requirements of 1.7.6.

1.7.6 The vent exits from pump rooms are to discharge at least 3 m above deck, and from the nearest air intakes or openings to accommodation and enclosed working spaces, and from possible sources of ignition.

Piping Systems for Oil Tankers

Part 5, Chapter 15

Section 1

1.7.7 The ventilation is to be interlocked to the lighting system (except emergency lighting) such that the cargo pump room lighting may only come on when the ventilation is in operation. Failure of the ventilation system shall not cause the lighting to go out.

1.8 Non-sparking fans for hazardous areas

1.8.1 The air gap between impeller and housing of the fan is to be not less than 0,1 of the impeller shaft bearing diameter or 2 mm whichever is the larger, subject also to compliance with 1.8.2(e). Generally, however, the air gap need be no more than 13 mm.

1.8.2 The following combinations of materials are permissible for the impeller and the housing in way of the impeller:

- (a) impellers and/or housings of non-metallic material, due regard being paid to the elimination of static electricity,
- (b) impellers and housings of non-ferrous metals,
- (c) impellers and housings of austenitic stainless steel,
- (d) impellers of aluminium alloys or magnesium alloys and a ferrous housing provided that a ring of suitable thickness of non-ferrous material is fitted in way of the impeller,
- (e) any combination of ferrous impellers and housings with not less than 13 mm tip clearance,
- (f) any combination of materials for the impeller and housing which are demonstrated as being spark proof by appropriate rubbing tests.

1.8.3 The following combinations of materials for impellers and housing are not considered spark proof and are not permitted:

- (a) impellers of an aluminium alloy or magnesium alloy and a ferrous housing, irrespective of tip clearance,
- (b) impellers of a ferrous material and housings made of an aluminium alloy, irrespective of tip clearance,
- (c) any combination of ferrous impeller and housing with less than 13 mm tip clearance, other than permitted by 1.8.2(c).

1.8.4 Electrostatic charges both in the rotating body and the casing are to be prevented by the use of antistatic materials (i.e. materials having an electrical resistance between 5×10^4 ohms and 10^8 ohms), or special means are to be provided to avoid dangerous electrical charges on the surface of the material.

1.8.5 Type tests on the complete fan are to be carried out to the Surveyor's satisfaction.

1.8.6 Protection screens of not more than 13 mm square mesh are to be fitted in the inlet and outlet of ventilation ducts to prevent the entry of objects into the fan housing.

1.8.7 The installation of the ventilation units on board is to be such as to ensure the safe bonding to the hull of the units themselves.

1.9 Slop tanks

1.9.1 The requirements in 1.9.2 to 1.9.7 are applicable to ships intended for the carriage of ore or oil when oil residues are to be retained in the slop tanks and the ship is otherwise gas free, see also Pt 4, Ch 9,11.3.

1.9.2 Slop tanks are to be provided with an approved independent venting system, see Section 4.

1.9.3 At least two portable instruments are to be available on board for gas detection.

1.9.4 Means are to be provided for isolating the piping connecting the pump room with the slop tanks. The means of isolation is to consist of a valve followed by a spectacle flange or a spool piece with appropriate blank flanges. This arrangement is to be located adjacent to the slop tanks, but where this is unreasonable or impracticable it may be located within the pump room directly after the piping penetrates the bulkhead. A separate permanently installed pumping and piping arrangement is to be provided for discharging the contents of the slop tanks directly to the open deck for transfer to shore reception facilities when the ship is in the dry cargo mode. When this transfer system is used for slop transfer in dry cargo mode, it shall have no connection to other systems. Separation by means of removal of spool pieces may be accepted.

1.9.5 Adequate ventilation is to be provided for spaces surrounding slop tanks, see also Pt 4, Ch 9,11.3.

1.9.6 Warning notices are to be erected at suitable points detailing precautions to be observed prior to the ship loading or unloading, or when the ship is carrying dry cargo with liquid in the slop tanks.

1.9.7 In order to satisfy the requirements of certain National and/or Terminal Authorities, it may be necessary to provide an inert gas system for blanketing the slop tank contents.

1.10 Steam connections to cargo tanks

1.10.1 Where steaming out and/or fire-extinguishing connections are provided for cargo tanks or cargo pipe lines, they are to be fitted with valves of the screw-down non-return type. The main supply to these connections is to be fitted with a master valve placed in a readily accessible position clear of the cargo tanks.

■ Cross-reference

See Pt 6, Ch 1,3 for alarm system requirements.

Piping Systems for Oil Tankers

Part 5, Chapter 15

Section 2

■ Section 2

Piping systems for bilge, ballast, oil fuel, etc.

2.1 Pumping arrangements at ends of ship outside dangerous zones and spaces

2.1.1 The pumping arrangements in the machinery space and at the forward end of the ship are to comply with the requirements for general cargo ships, in so far as they are applicable, and with the special requirements detailed in this Section.

2.1.2 Bilge, ballast and oil fuel lines, etc., which are connected to pumps, tanks or compartments at the ends of the ship outside dangerous zones and spaces, are not to pass through cargo tanks or have any connections to cargo tanks, or cargo piping. No objection will be made to these lines being led through ballast tanks or void spaces within the range of the cargo tanks.

2.1.3 The oil fuel bunkering system is to be entirely separate from the cargo handling system.

2.1.4 Where non-permanent connections are required in piping systems between non-dangerous and dangerous spaces, two means of isolation are to be provided. One of these means is to provide positive separation by means of a removable spool piece or flexible hose, and blank flanges are to be fitted. The other is to be a non-return valve, or similar, in accordance with an acceptable National or International Standard that is appropriate for the design conditions of the piping system. The non-return valve and removable piece are to be located outside the non-dangerous space. A notice is also to be provided located in a prominent position adjacent to the means of isolation, clearly indicating that the spool piece or flexible hose is to be removed, and blanking flanges are to be fitted, when the piping is not in use. The removable spool piece is to be clearly identified (labeled/painted in a distinctive colour) and stowed close to its working position.

2.2 Cargo pump room drainage

2.2.1 Provision is to be made for the bilge drainage of the cargo pump rooms by pump or bilge ejector suction. The cargo pumps or cargo stripping pumps may be used for this purpose, provided that the bilge suction is fitted with screw-down non-return valves and, in addition, an isolating valve or cock is fitted on the pump connection to the bilge chest. The pump room bilges of small tankers may be drained by means of a hand pump having a 50 mm bore suction. Pump room suction is not to enter machinery spaces.

2.3 Deep cofferdam drainage

2.3.1 Cofferdams, which are required to be provided at the fore and aft ends of the cargo spaces in accordance with Pt 4, Ch 9, 1.2 are to be provided with suitable drainage arrangements. Examples of acceptable arrangements are detailed in 2.3.2 and 2.3.3.

2.3.2 Where deep cofferdams can be filled with water ballast, a ballast pump in the main engine room may be used for emptying the after cofferdam. Where fitted, a ballast pump in a forward pump room may be used for emptying the forward cofferdam. In each case, the suction is to be led direct to the pump and not to a pipe system.

2.3.3 Where intended to be dry compartments, after cofferdams adjacent to the pump room may be drained by a cargo pump, provided that isolating arrangements are fitted in the bilge system as required by 2.2.1; forward cofferdams may be drained by a bilge and ballast pump in a forward pump room. Alternatively, cofferdams may be drained by bilge ejectors or, in the case of small ships, by hand pumps.

2.3.4 Cofferdams are not to have any direct connections to the cargo tanks or cargo lines.

2.4 Drainage of ballast tanks and void spaces within the range of the cargo tanks

2.4.1 Ballast tanks and void spaces within the range of the cargo tanks are not to be connected to cargo pumps, or have any connections to the cargo system. A separate ballast/bilge pump is to be provided for dealing with the contents of these spaces. This pump is to be located in the cargo pump room or other suitable space within the range of the cargo tanks.

2.4.2 Ballast pumps shall be provided with suitable arrangements to ensure efficient suction from ballast tanks.

2.4.3 Where submerged water ballast pumps are fitted, they are to be located in separate compartments on opposite sides of the ship such that, in the event of hull damage due to grounding or collision, the risk of total loss of ballast pumping capability is minimised.

2.4.4 Ballast piping is not to pass through cargo tanks and is not to be connected to cargo oil piping. Provision may, however, be made for emergency discharge of water ballast by means of a portable spool connection to a cargo oil pump and where this is arranged, a non-return valve is to be fitted in the ballast suction to the cargo oil pump.

2.4.5 Consideration will be given to connecting double bottom and/or wing tanks, which are in the range of the cargo tanks, to pumps in the machinery space where the tanks are completely separated from the cargo tanks by cofferdams, heating ducts or containment spaces, etc.

2.5 Air and sounding pipes

2.5.1 Deep cofferdams at the fore and aft ends of the cargo spaces and other tanks or cofferdams within the range of the cargo tanks, which are not intended for cargo, are to be provided with air and sounding pipes led to the open deck. The air pipes are to be fitted with gauze diaphragms at their outlets.

2.5.2 The air and sounding pipes required by 2.5.1 are not to pass through cargo tanks.

Piping Systems for Oil Tankers

Part 5, Chapter 15

Sections 2 & 3

2.5.3 On oil tankers of less than 5000 tonnes dead-weight, where wing ballast tanks or spaces are not required, the sounding and air pipes to double bottom spaces below cargo tanks may pass through the cargo tanks. However, the pipes are to be of heavy gauge steel, and are to be in continuous lengths or with welded joints.

2.6 Ballast piping in pump room double bottoms

2.6.1 Ballast piping is permitted to be located within the cargo pump room double bottom provided any damage to that piping does not render the ship's ballast and cargo pumps, located in the cargo pump room, ineffective.

Section 3 Cargo handling system

3.1 General

3.1.1 A complete system of piping and pumps is to be fitted for dealing with the cargo.

3.1.2 Standby means for pumping out each cargo tank are to be provided.

3.1.3 Where cargo tanks are provided with single deep well pumps, or submerged pumps, it will be necessary to provide alternative means for emptying the tanks in the event of the failure of a pump. Portable submersible pumps may be provided on board for this purpose, but the arrangements are to be such that a portable pump could be safely introduced into a full or part-full tank. Details of the arrangements are to be submitted.

3.1.4 Provision is to be made for the gas freeing of the cargo oil tanks when the cargo has been discharged, and for the ventilation and gas freeing of all compartments adjacent to cargo oil tanks. It is recommended that arrangements be provided to enable double bottom tanks situated below cargo tanks to be filled with water ballast to assist in the gas freeing of these tanks, see also 7.6.2.

3.1.5 At least two portable instruments are to be available on board for gas detection.

3.1.6 Cargo tank access hatches and all other openings to cargo tanks, such as ullage and tank cleaning openings and restricted sounding devices, see 5.2, are to be located on the weather deck.

3.2 Cargo pumps

3.2.1 Pumps for the purpose of filling or emptying the cargo oil tanks are to be used exclusively for this purpose, except as provided in 2.2.1. They are not to have any connections to compartments outside the range of cargo oil tanks.

3.2.2 Means are to be provided for stopping the cargo oil pumps from a position outside the pump rooms, as well as at the pumps.

3.2.3 The pumps are to be provided with effective relief valves which are to be in close-circuit, i.e. discharging to the suction side of the pumps. Alternative proposals to safeguard against over-pressure on the discharge side of the pump will be specially considered.

3.2.4 Where cargo pumps are driven by shafting which passes through a pump room bulkhead or deck, gastight glands are to be fitted to the shaft at the pump room plating. The glands are to be efficiently lubricated from outside the pump room. The seal parts of the glands are to be of materials that will not initiate sparks. The glands are to be of an approved type and are to be attached to the bulkhead in accordance with Ch 13,2.4. Where a bellows piece is incorporated in the design, it is to be hydraulically tested to 3,4 bar (3,5 kgf/cm²) before fitting.

3.2.5 Where cargo pumps are driven by hydraulic motors which are located inside cargo tanks, the design is to be such that contamination of the operating medium with cargo liquid cannot take place under normal operating conditions. The arrangements are to comply with 3.7.7 and 3.7.8, in so far as they are applicable.

3.3 Cargo piping system

3.3.1 Cargo piping and similar piping to cargo tanks are not to pass through ballast tanks.

3.3.2 Cargo pipes are not to pass through tanks or compartments which are outside the cargo tank area.

3.3.3 Means are to be provided to enable the contents of the cargo lines pumps to be drained to a cargo tank or other suitable tank. Where drain tanks are fitted in pump rooms, they are to be of the closed type with air and sounding pipes led to the open deck.

3.3.4 Expansion joints of approved type or bends are to be provided, where necessary, in the cargo pipe lines.

3.3.5 Expansion pieces of an approved type, incorporating oil resistant rubber or other suitable material, may be accepted in cargo piping, see also Ch 13,2.7.2.

3.3.6 In combination carriers where cargo wing tanks are provided, cargo oil lines below deck are to be installed inside these tanks. However, Lloyd's Register (hereinafter referred to as 'LR') may permit cargo oil lines to be placed in special ducts which are to be capable of being adequately cleaned and ventilated to the satisfaction of LR's Surveyors. Where cargo wing tanks are not provided cargo oil lines below deck are to be placed in special ducts.

3.3.7 Means are to be provided for keeping deck spills away from accommodation and service areas. This may be accomplished by means of a 300 mm coaming extending from side to side. Special consideration shall be given to the arrangements associated with stern loading.

Piping Systems for Oil Tankers

Part 5, Chapter 15

Section 3

3.4 Terminal fittings at cargo loading stations

3.4.1 Terminal pipes, valves and other fittings in the cargo loading and discharging lines to which shore installation hoses are directly connected, are to be of steel or approved ductile material. They are to be of robust construction and strongly supported, see *also* 1.3 and 1.4.

3.4.2 A manually operated shut-off valve is to be fitted to each shore loading/discharging connection.

3.4.3 Drip pans for collecting cargo residues in cargo lines and hoses are to be provided beneath pipe and hose connections in the manifold area.

3.5 Bow or stern loading and discharge arrangements

3.5.1 Where a ship is arranged for bow and/or stern loading and discharge of cargo outside the cargo tank area, the pipe lines and related piping and equipment forward and/or aft of the cargo area are to have only welded joints and are to be provided with spectacle flanges or removable spool pieces, where branched off from the main line, and a blank flange at the bow and/or stern end connections, irrespective of the number and type of valves in the line.

3.5.2 The spaces within 3 m of discharge manifolds are to be considered as dangerous spaces with regard to electrical or incandive equipment, see *also* Pt 6, Ch 2, 13.9.

3.6 Connections to cargo tanks

3.6.1 Where cargo tanks are provided with direct filling connections, the loading pipes are to be led to as low a level as practicable inside the tank.

3.6.2 Where cargo suction and/or filling lines are led through cargo tanks, or through other spaces situated below the weather deck, the connection to each tank is to be provided with a valve situated inside the tank, and capable of being operated from the deck. In the case of cargo tanks which are located adjacent to below-deck pump rooms, or pipe tunnels, the deck operated valves may be located in these spaces at the bulkhead. In any case, not less than two isolating shut-off valves are to be provided in the pipe lines between the tanks and the cargo pumps.

3.7 Remote control valves

3.7.1 Valves on deck and in pump rooms which are provided with remote control, are, in general, to be arranged for local manual operation independent of the remote operating mechanism, see *also* Ch 13, 2.3.2 and 2.3.3.

3.7.2 Where the valves and their actuators are located inside the cargo tanks, two separate suctions are to be provided in each tank, or alternative means of emptying the tank, in the event of a defective actuator, are to be provided.

3.7.3 All actuators are to be of a type which will prevent the valves from opening inadvertently in the event of the loss of pressure in the operating medium. Indication is to be provided at the remote control station showing whether the valve is open or shut.

3.7.4 Materials of construction of the actuators and piping inside the cargo tanks are to be suitable for use with the intended cargo.

3.7.5 Compressed air is not to be used for operating actuators inside cargo tanks.

3.7.6 The actuator operating medium in hydraulic systems is to have a flash point of 60°C or above (closed cup test) and is to be compatible with the intended cargoes.

3.7.7 The design of the actuators is to be such that contamination of the operating medium with cargo liquid cannot take place under normal operating conditions.

3.7.8 Where the operating medium is oil, or other fluid, the supply tank is to be located as high as practicable above the level of the top of the cargo tanks, and all actuator supply lines are to enter the cargo tanks through the highest part of the tanks. Furthermore, the supply tank is to be of the closed type with an air pipe led to a safe space on the open deck and fitted with a flameproof wire gauze diaphragm at its open end. This tank is also to be fitted with a high and low level audible and visual alarm. The requirements of this paragraph need not be complied with if the actuators and piping are located external to the cargo tanks.

3.7.9 It is recommended that for remote control valves not arranged for manual operation, emergency means be provided for operating the valve actuators in the event of damage to the main hydraulic circuits on deck. In the case of valves located inside cargo tanks, this could be achieved by ensuring that the supply lines to the actuators are led vertically inside the tanks from deck, and that connections, with necessary isolating valves, are provided on deck for coupling to a portable pump carried on board.

3.8 Cargo handling controls

3.8.1 Electrical measuring, monitoring control and communication circuits located in dangerous spaces are to be intrinsically-safe.

3.8.2 The handling controls and instruments are to be arranged for safe and easy operation. They may be grouped at a number of control stations or at one main control station.

3.8.3 A satisfactory means of communication is to be provided between cargo handling stations, open deck, the bridge and the machinery space.

3.8.4 The cargo handling controls and instrumentation are, so far as possible, to be separate from the propulsion and auxiliary machinery controls and instrumentation.

Piping Systems for Oil Tankers

Part 5, Chapter 15

Section 4

■ Section 4 Cargo tank venting, purging and gas-freeing

4.1 Cargo tank venting

4.1.1 The venting systems of cargo tanks are to be entirely distinct from the air pipes of the other compartments of the ship. The arrangements and position of openings in the cargo tank deck from which emission of flammable vapours can occur are to be such as to minimise the possibility of flammable vapours being admitted to enclosed spaces containing a source of ignition, or collecting in the vicinity of deck machinery and equipment which may constitute an ignition hazard.

4.1.2 The venting arrangements are to be so designed and operated as to ensure that neither pressure nor vacuum in cargo tanks exceeds design parameters and are to be such as to provide for:

- (a) the flow of the small volumes of vapour, air or inert gas mixtures caused by thermal variations in a cargo tank in all cases through pressure/vacuum valves; and
- (b) the passage of large volumes of vapour, air or inert gas mixtures during cargo loading and ballasting, or during discharging.
- (c) a secondary means of allowing full flow relief of vapour, air or inert gas mixtures to prevent overpressure or underpressure in the event of failure of the arrangements in 4.1.2(b). Alternatively, pressure sensors may be fitted to monitor the pressure in each tank protected by the arrangement required in 4.1.2(b), with a monitoring system in the ship's cargo control room or the position from which cargo operations are normally carried out. Such monitoring equipment is also to provide an alarm facility which is activated by detection of overpressure or underpressure conditions within a tank.

4.1.3 The venting arrangements in each cargo tank may be independent or combined with other cargo tanks and may be incorporated into the inert gas piping.

4.1.4 Where the arrangements are combined with other cargo tanks either stop valves or other acceptable means are to be provided to isolate each cargo tank. Where stop valves are fitted, they are to be provided with locking arrangements which are to be under the control of the responsible ship's officer.

4.1.5 There is to be a clear visual indication of the operational status of the valves, or other acceptable means. Where tanks have been isolated, it is to be ensured that the relevant isolating valves are opened before cargo loading or ballasting or discharging of those tanks is commenced. Any isolation is to continue to permit the flow caused by thermal variations in a cargo tank in accordance with 4.1.2(a).

4.1.6 If cargo loading and ballasting or discharging of a cargo tank or cargo tank group, which is isolated from a common venting system is intended, that cargo tank or cargo tank group is to be fitted with a means for overpressure or underpressure protection as required in 4.1.2(c).

4.1.7 The venting arrangements are to be connected to the top of each cargo tank and are to be self-draining to the cargo tanks under all normal conditions of trim and list of the ship. Where it may not be possible to provide self-draining lines permanent arrangements are to be provided to drain the vent lines to a cargo tank.

4.1.8 The venting system is to be provided with devices to prevent the passage of flame into the cargo tanks. The design, testing and locating of these devices are to comply with recognised International Standards.

4.1.9 Ullage openings are not to be used for pressure equalisation and they should be fitted with self-closing tightly sealing covers. Flame arrestors and screens are not permitted in these openings.

4.1.10 Provision is to be made to guard against liquid rising in the venting system to a height which would exceed the design head of cargo tanks. This is to be accomplished by overflow control systems, or other equivalent means, e.g. overfill alarms, together with gauging devices and cargo tank filling procedures but not spill valves which are not considered equivalent to an overflow system. The system for guarding against liquid rising to a height which would exceed the design head of cargo tanks is to be independent of the gauging devices.

4.1.11 Openings for pressure release required by 4.1.2(a) are to:

- (a) have as great a height as is practicable above the cargo tank deck to obtain maximum dispersal of flammable vapours but in no case less than 2 m above the cargo tank deck, and
- (b) be arranged at the furthest distance practicable but not less than 5 m from the nearest air intakes and openings to enclosed spaces containing a source of ignition and from deck machinery, chain locker openings and equipment which may constitute an ignition hazard.

4.1.12 Pressure/vacuum valves required by 4.1.2(a) may be provided with a by-pass arrangement when they are located in a vent main or masthead riser. Where such an arrangement is provided there are to be suitable indicators to show whether the by-pass is open or closed.

4.1.13 Vent outlets for cargo loading, discharging and ballasting required by 4.1.2(b) are to:

- (a) permit the free flow of vapour mixtures or alternatively, permit the throttling of the discharge of the vapour mixtures to achieve a velocity of not less than 30 m/sec;
- (b) be so arranged that the vapour mixture is discharged vertically upwards;
- (c) where the method is by free flow of vapour mixtures, be such that the outlet is not less than 6 m above the cargo tank deck or fore and aft gangway if situated within 4 m of the gangway and located not less than 10 m measured horizontally from the nearest air intakes and openings to enclosed spaces containing a source of ignition and from deck machinery, chain locker openings and equipment which may constitute an ignition hazard;

Piping Systems for Oil Tankers

Part 5, Chapter 15

Section 4

- (d) where the method is by high velocity discharge, be located at a height not less than 2 m above the cargo tank deck and not less than 10 m measured horizontally from the nearest air intakes and openings to enclosed spaces containing a source of ignition and from deck machinery, chain locker openings and equipment which may constitute an ignition hazard. These outlets are to be provided with high velocity devices of an approved type; and
- (e) be designed on the basis of the maximum designed loading rate multiplied by a factor of at least 1,25 to take account of gas evolution, in order to prevent the pressure in any cargo tank from exceeding the design pressure. The master is to be provided with information regarding the maximum permissible loading rate for each cargo tank and in the case of combined venting systems, for each group of cargo tanks.

4.1.14 Pressure/vacuum valves are to be set at a positive pressure of not more than 0,2 bar (0,2 kgf/cm²) above atmospheric and a negative pressure of not more than 0,07 bar (0,07 kgf/cm²) below atmospheric. Higher positive pressures not exceeding 0,7 bar (0,7 kgf/cm²) gauge may be permitted in specially designed integral tanks.

4.1.15 In combination carriers the arrangements to isolate slop tanks containing oil or residues from other cargo tanks are to consist of blank flanges which will remain in position at all times when cargoes other than liquid cargoes referred to in 7.5.16 are carried.

4.2 Cargo tank purging and/or gas-freeing

4.2.1 Arrangements for purging and/or gas-freeing are to be such as to minimise the hazards due to the dispersal of flammable vapours in the atmosphere and to flammable mixtures in cargo tank, thus the requirements of 4.2.2 to 4.2.4 are to be complied with, as applicable.

4.2.2 When the ship is provided with an inert gas system the cargo tanks are first to be purged in accordance with the provisions of 7.6.2 until the concentration of hydrocarbon vapours in the cargo tanks has been reduced to less than two per cent by volume. Thereafter gas freeing may take place at the cargo tank deck level.

4.2.3 When the ship is not provided with an inert gas system, the operation is to be such that the flammable vapour is initially discharged either:

- (a) through the vent outlets as specified in 4.1.13, or
- (b) through outlets at least 2 m above the cargo tank deck level with a vertical efflux velocity of at least 30 m/sec. maintained during gas freeing operation, or
- (c) through outlets at least 2 m above the cargo tank deck level with a vertical efflux velocity of at least 20 m/sec. and which are protected by suitable devices to prevent the passage of flame.

4.2.4 When the flammable vapour concentration at the outlet has been reduced to 30 per cent of the lower flammable limit, gas-freeing may thereafter be continued at the cargo tank deck level.

4.3 Venting, purging and gas measurement of double hull and double bottom spaces

4.3.1 Double hull and double bottom spaces are to be fitted with suitable connections for the supply of air.

4.3.2 On tankers required to be fitted with inert gas systems:

- (a) double hull spaces are to be fitted with suitable connections for the supply of inert gas;
- (b) where such spaces are connected to a permanently fitted inert gas distribution system means are to be provided to prevent hydrocarbon gases from the cargo tanks entering the double hull spaces through the system;
- (c) where such spaces are not permanently connected to an inert gas distribution system, appropriate means are to be provided to allow connection to the inert gas main.

4.3.3 When selecting portable instruments for measuring oxygen and flammable vapour, due attention is to be given to their use in combination with the fixed gas sampling line systems referred to in paragraph 4.3.4.

4.3.4 Where the atmosphere in double hull spaces cannot be reliably measured using flexible gas sampling hoses, such spaces are to be fitted with permanent gas sampling lines. The configuration of such line systems is to be adapted to the design of such spaces.

4.3.5 The materials of construction and the dimensions of gas sampling lines are to be such as to prevent restriction. Where plastics materials are used, they are to be electrically conductive.

4.4 Gas measurement

4.4.1 All tankers are to be equipped with at least two portable instruments for measuring per cent LEL of hydrocarbon concentrations in air.

4.4.2 All tankers are to be equipped with at least two portable oxygen analysers.

4.4.3 For tankers fitted with an inert gas system two portable gas detectors capable of measuring flammable vapour concentrations in inerted atmospheres are to be provided, see 7.7.5.

4.4.4 Suitable means are to be provided for the calibration of gas measurement instruments.

Piping Systems for Oil Tankers

Part 5, Chapter 15

Sections 5, 6 & 7

■ Section 5 Cargo tank level gauging equipment

5.1 General

5.1.1 Each cargo tank is to be fitted with suitable means for ascertaining the liquid level in the tank in accordance with the requirements of 5.2 and 5.3.

5.2 Restricted sounding device

5.2.1 Sounding pipes or other approved devices, which may permit a limited amount of vapour to escape to atmosphere when being used, would be accepted for those tanks which are not required to be fitted with closed sounding devices, see 5.3. The devices are to be so designed as to minimise the sudden release of vapour or liquid under pressure and the possibility of liquid spillage on deck. Means are also to be provided for relieving tank pressure before the device is operated.

5.2.2 Separate ullage openings may be fitted as a reserve means for sounding cargo tanks.

5.2.3 Arrangements which permit the escape of vapour to the atmosphere are not to be fitted in enclosed spaces.

5.3 Closed sounding devices

5.3.1 In all tankers fitted with a fixed inert gas system, the cargo tanks are to be fitted with closed sounding devices of an approved type, which do not permit the escape of cargo to the atmosphere when being used.

5.3.2 Proposals to use indirect sounding or measuring devices which do not penetrate the tank plating will be specially considered.

■ Section 6 Cargo heating arrangements

6.1 General

6.1.1 Where heating systems are provided for the cargo tanks, the arrangements are to comply with the requirements of 6.2 to 6.5.

6.2 Blanking arrangements

6.2.1 Spectacle flanges of spool pieces are to be provided in the heating medium supply and return pipes to the cargo heating system, at a suitable position within the cargo area, so that lines can be blanked off in circumstances where the cargo does not require to be heated or where the heating coils have been removed from the tanks. Alternatively, blanking arrangements may be provided for each tank heating circuit.

6.3 Heating medium

6.3.1 Where a combustible liquid is used as the heating medium it is to have a flash point of 60°C or above (closed-cup test).

6.3.2 In general, the temperature of the heating medium is not to exceed 220°C, see 1.5.

6.4 Heating circuits

6.4.1 The heating medium supply and return lines are not to penetrate the cargo tank plating, other than at the top of the tank, and the main supply lines are to be run above the weather deck.

6.4.2 Isolating shut-off valves or cocks are to be provided at the inlet and outlet connections to the heating circuit(s) of each tank, and means are to be provided for regulating the flow.

6.4.3 Where steam or water is employed in the heating circuits, the returns are to be led to an observation tank which is to be in a well ventilated and well lighted part of the machinery space remote from the boilers.

6.4.4 Where a thermal oil is employed in the heating circuits, the arrangements will be specially considered but, in any case, they are to be such that contamination of the thermal oil with cargo liquid cannot take place under normal operating conditions. In general, the arrangements are, at least, to comply with 3.7.8, in so far as they are applicable.

6.4.5 In any heating system, a higher pressure is to be maintained within the heating circuit than the maximum pressure head which can be exerted by the contents of the cargo tank on the circuit. Alternatively, when the heating circuit is not in use, it may be drained and blanked.

6.5 Temperature indication

6.5.1 Means are to be provided for measuring the cargo temperature. Where overheating could result in a dangerous condition, an alarm system which monitors the cargo temperature is to be provided.

■ Section 7 Inert gas systems

7.1 General

7.1.1 The following requirements apply where an inert gas system, based on flue gas, is fitted on board ships intended for the carriage of oil in bulk having a flash point not exceeding 60°C (closed-cup test). For inert gas systems utilising nitrogen, additional requirements contained in 7.9 are to be applied.

Piping Systems for Oil Tankers

Part 5, Chapter 15

Section 7

7.1.2 Ships complying with these requirements will be eligible for the additional notation **IGS** in the *Register Book*, see Pt 1, Ch 2.

7.1.3 Throughout this Section the term 'cargo tank' includes also 'slop tanks'. For definition of Machinery spaces of Category 'A', see SOLAS Reg. II-2/A.

7.1.4 The inert gas system is to comply with the requirements of Chapter 15 of the FSS Code, insofar as they are applicable, to new ships only. For the purposes of classification any use of the word 'Administration' in the Regulation is to be taken as meaning LR.

7.1.5 Those parts of scrubbers, blowers, non-return devices, scrubber effluent and other drain pipes which may be subjected to corrosive action by the gases and/or liquids, are to be either constructed of corrosion resistant material or lined with rubber, glass fibre epoxy resin or other equivalent coating material.

7.1.6 The compartment in which any oil fired inert gas generator is situated is to be treated as a machinery space of Category A with respect to fire protection, see also Ch 1,4.8.

7.1.7 Arrangements are to be made to vent the inert gas from oil fired inert gas generators to the atmosphere when predetermined limits are reached, see 7.7.7(a) to (d), e.g., during start-up or in the event of equipment failure.

7.1.8 Automatic shut-down of the oil fuel supply to inert gas generators is to be arranged on predetermined limits being reached with respect to low water pressure or low water flow rate to the cooling and scrubbing arrangement and with respect to high gas temperature.

7.1.9 Automatic shut-down of the gas regulating valve is to be arranged with respect to failure of the power supply to the oil fired inert gas generators.

7.2 Gas supply

7.2.1 The inert gas may be treated flue gas from the main or auxiliary boiler(s), gas turbine(s), or from a separate inert gas generator. In all cases, automatic combustion control, capable of producing suitable inert gas under all service conditions, is to be fitted.

7.2.2 Two oil fuel pumps are to be fitted to the inert gas generator. One fuel pump only may be accepted provided sufficient spares for the oil fuel pump and its prime mover are carried on board to enable any failure of the oil fuel pump and its prime mover to be rectified by the ship's crew.

7.2.3 The inert gas system is to be capable of:

- (a) inerting empty cargo tanks by reducing the oxygen content of the atmosphere in each tank to a level at which combustion cannot be supported;
- (b) maintaining the atmosphere in any part of any cargo tank with an oxygen content not exceeding eight per cent by volume and at a positive pressure at all times in port and at sea except when it is necessary for such a tank to be gas free;

- (c) eliminating the need for air to enter a tank during normal operations except when it is necessary for such a tank to be gas free;
- (d) purging empty cargo tanks of hydrocarbon gas, so that subsequent gas freeing operations will at no time create a flammable atmosphere within the tank.

7.2.4 The system is to be capable of delivering inert gas to the cargo tanks at a rate of at least 125 per cent of the maximum rate of discharge capacity of the ship expressed as a volume to time rate.

7.2.5 The system is to be capable of delivering inert gas with an oxygen content of not more than five per cent by volume in the inert gas supply main to the cargo tanks at any required rate of flow.

7.2.6 Flue gas isolating valves are to be fitted in the inert gas supply mains between the boiler uptakes and the flue gas scrubber. These valves are to be provided with indicators to show whether they are open or shut, and precautions are to be taken to maintain them gastight and keep the seatings clear of soot. Arrangements are to be made to ensure that boiler soot blowers cannot be operated when the corresponding flue gas valve is open.

7.3 Gas scrubber

7.3.1 A flue gas scrubber is to be fitted which will effectively cool the volume of gas specified in 7.2.4 and remove solids and sulphur combustion products. The cooling water arrangements are to be such that an adequate supply of water will always be available without interfering with any essential services on the ship. Provision is also to be made for alternative supply of cooling water.

7.3.2 Filters or equivalent devices are to be fitted to minimise the amount of water carried over to the inert gas blowers.

7.3.3 The scrubber is to be located aft of all cargo tanks, cargo pump rooms and cofferdams separating these spaces from machinery spaces of Category A.

7.4 Gas blowers

7.4.1 At least two blowers are to be fitted which together are capable of delivering to the cargo tanks at least the volume of gas required by 7.2.4. In no case is one of these blowers to have a capacity less than one-third of the total capacity required. In a system with gas generators one blower only may be accepted if that system is capable of delivering the total volume of gas required by 7.2.4 to the protected cargo tanks, provided that sufficient spares for the blower and its prime mover are carried on board to enable any failure of the blower and its prime mover to be rectified by the ship's crew.

Piping Systems for Oil Tankers

Part 5, Chapter 15

Section 7

7.4.2 The inert gas system is to be so designed that the maximum pressure which it can exert on any cargo tank will not exceed the test pressure of any cargo tank. Suitable shut-off arrangements are to be provided on the suction and discharge connections of each blower. Arrangements are to be provided to enable the functioning of the inert gas plant to be stabilised before commencing cargo discharge. If the blowers are to be used for gas freeing, their air inlets are to be provided with blanking arrangements.

7.4.3 The blowers are to be located aft of all cargo tanks, cargo pump rooms and cofferdams separating these spaces from machinery spaces of Category A.

7.5 Gas distribution lines

7.5.1 Special consideration is to be given to the design and location of scrubber and blowers with relevant piping and fittings in order to prevent flue gas leakages into enclosed spaces.

7.5.2 To permit safe maintenance, an additional water seal or other effective means of preventing flue gas leakage is to be fitted between the flue gas isolating valves and scrubber or incorporated in the gas entry to the scrubber.

7.5.3 A gas regulating valve is to be fitted in the inert gas supply main. This valve is to be automatically controlled to close as required in 7.7.9 and 7.7.10. It is also to be capable of automatically regulating the flow of inert gas to the cargo tanks unless means are provided to automatically control the speed of the inert gas blowers required in 7.4.1.

7.5.4 The valve referred to in 7.5.3 is to be located at the forward bulkhead of the forwardmost gas safe space through which the inert gas supply main passes.

7.5.5 At least two non-return devices, one of which is to be a water seal, are to be fitted in the inert gas supply main, in order to prevent the return of hydrocarbon vapour to the machinery space uptakes or to any gas safe spaces under all normal conditions of trim, list and motion of the ship. They are to be located between the automatic valve required by 7.5.3 and the aftermost connection to any cargo tank or cargo pipeline.

7.5.6 The devices referred to in 7.5.5 are to be located in the cargo area on deck.

7.5.7 The water seal referred to in 7.5.5 is to be capable of being supplied by two separate pumps, each of which is to be capable of maintaining an adequate supply at all times.

7.5.8 The arrangement of the seal and its associated fittings is to be such that it will prevent backflow of hydrocarbon vapours and will ensure the proper functioning of the seal under operating conditions.

7.5.9 Provision is to be made to ensure that the water seal is protected against freezing in such a way that the integrity of seal is not impaired by overheating.

7.5.10 A water loop or other approved arrangement is also to be fitted to each associated water supply and drain pipe and each venting or pressure-sensing pipe leading to gas safe spaces. Means are to be provided to prevent such loops from being emptied by vacuum.

7.5.11 The deck water seal and all loop arrangements are to be capable of preventing return of hydrocarbon vapours at a pressure equal to the test pressure of the cargo tanks.

7.5.12 The second non-return device is to be a non-return valve or equivalent capable of preventing the return of vapours or liquids and fitted forward of the deck water seal required in 7.5.5. It is to be provided with positive means of closure. As an alternative to positive means of closure, an additional valve having such means of closure may be provided forward of the non-return valve to isolate the deck water seal from the inert gas main to the cargo tanks.

7.5.13 As an additional safeguard against the possible leakage of hydrocarbon liquids or vapours back from the deck main, means are to be provided to permit this section of the line between the valve having positive means of closure referred to in 7.5.12 and the valve referred to in 7.5.3 to be vented in a safe manner when the first of these valves is closed.

7.5.14 The inert gas main may be divided into two or more branches forward of the non-return devices required by 7.5.5.

7.5.15 The inert gas supply mains are to be fitted with branch piping leading to each cargo tank. Branch piping for inert gas is to be fitted with either stop valves or equivalent means of control for isolating each tank. Where stop valves are fitted, they are to be provided with locking arrangements, which are to be under the control of a responsible ship's officer. The method of control is to provide positive indication of the operational status of such valves.

7.5.16 In combination carriers, the arrangement to isolate the slop tanks containing oil or oil residues from other tanks is to consist of blank flanges which will remain in position at all times other than when cargoes other than oil are being carried except as provided for in 1.9.

7.5.17 Means are to be provided to protect cargo tanks against the effect of overpressure or vacuum caused by thermal variations when the cargo tanks are isolated from the inert gas mains.

7.5.18 Piping systems are to be so designed as to prevent the accumulation of cargo or water in the pipelines under all normal conditions.

7.5.19 Arrangements are to be provided to enable the inert gas main to be connected to an external supply of inert gas. The arrangement is to consist of a 250 mm nominal size pipe bolted flange connection, isolated from the inert gas main by a valve and connected to the system forward of the non-return valve referred to in 7.5.12.

Piping Systems for Oil Tankers

Part 5, Chapter 15

Section 7

7.6 Venting arrangements

7.6.1 The arrangements for the venting of all vapours displaced from the cargo tanks during loading and ballasting are to comply with Section 4 and are to consist of either one or more mast risers, or a number of high velocity vents. The inert gas supply mains may be used for such venting.

7.6.2 The arrangements for inerting, purging or gas freeing of empty tanks as required in 7.2.3 are to be such that the accumulation of hydrocarbon vapours in pockets formed by the internal structural members in a tank is minimised and that:

- (a) on individual cargo tanks the gas outlet pipe, if fitted, is to be positioned as far as practicable from the inert gas/air inlet and in accordance with Section 4. The inlet of such outlet pipes may be located either at deck level or at not more than 1 m above the bottom of the tank;
- (b) the cross sectional area of such gas outlet pipes referred to in (a) is to be such that an exit velocity of at least 20 m/s can be maintained when any three tanks are being simultaneously supplied with inert gas. Their outlets are to extend not less than 2 m above deck level;
- (c) each gas outlet referred to in (b) is to be fitted with suitable blanking arrangements;
- (d) if a connection is fitted between the inert gas supply mains and the cargo piping system, arrangements are to be made to ensure an effective isolation having regard to the large pressure difference which may exist between the systems. This is to consist of two shut-off valves with an arrangement to vent the space between the valves in a safe manner or an arrangement consisting of a spool-piece with associated blanks. The valve separating the inert gas supply main from the cargo main and which is on the cargo main side is to be a non-return valve with a positive means of closure.

7.6.3 One or more pressure-vacuum breaking devices are to be provided to prevent the cargo tanks from being subject to:

- (a) a positive pressure in excess of the test pressure of the cargo tank if the cargo were to be loaded at the maximum rated capacity and all other outlets were left shut; and
- (b) a negative pressure in excess of 700 mm water gauge if cargo were to be discharged at the maximum rated capacity of the cargo pumps and the inert gas blowers were to fail.

Such devices shall be installed on the inert gas main unless they are installed in the venting system required by Section 4 or on individual cargo tanks.

7.6.4 The location and design of the devices referred to in 7.6.3 are to be in accordance with Section 4.

7.7 Instrumentation and alarms

7.7.1 Means are to be provided for continuously indicating the temperature and pressure of the inert gas at the discharge side of the gas blowers, whenever the gas blowers are operating.

7.7.2 Instrumentation is to be fitted for continuously indicating and permanently recording, when the inert gas is being supplied:

- (a) the pressure of the inert gas supply mains forward of the non-return devices required by 7.5.5; and
- (b) the oxygen content of the inert gas in the inert gas supply mains on the discharge side of the gas blowers.

7.7.3 The devices referred to in 7.7.2 are to be placed in the cargo control room where provided. But where no cargo control room is provided, they are to be placed in a position easily accessible to the officer in charge of cargo operations.

7.7.4 In addition to 7.7.2, meters are to be fitted:

- (a) in the navigating bridge to indicate at all times the pressure referred to in 7.7.2(a) and the pressure in the slop tanks of combination carriers, whenever those tanks are isolated from the inert gas supply main; and
- (b) in the machinery control room or in the machinery space to indicate the oxygen content referred to in 7.7.2(b).

7.7.5 Portable instruments for measuring oxygen and flammable vapour concentration are to be provided. In addition, suitable arrangement is to be made on each cargo tank such that the condition of the tank atmosphere can be determined using these portable instruments.

7.7.6 Suitable means are to be provided for the zero and span calibration of both fixed and portable gas concentration measurement instruments, referred to in 7.7.2, 7.7.4 and 7.7.5.

7.7.7 For inert gas systems of both flue gas type and the inert gas generator type audible and visual alarms are to be provided to indicate:

- (a) low water pressure or low water flow rate to the flue gas scrubber as referred to in 7.3.1;
- (b) high water level in the flue gas scrubber as referred to in 7.3.1;
- (c) high gas temperature as referred to in 7.7.1;
- (d) failure of the inert gas blowers referred to in 7.4;
- (e) oxygen content in excess of eight per cent by volume as referred to in 7.7.2(b);
- (f) failure of the power supply to the automatic control system for the gas regulating valve and to the indicating devices as referred to in 7.5.3 and 7.7.2;
- (g) low water level in the water seal as referred to in 7.5.5;
- (h) gas pressure less than 100 mm water gauge as referred to in 7.7.2(a). The alarm arrangements is to be such as to ensure that pressure in slop tanks in combination carriers can be monitored at all times; and
- (j) high gas pressure as referred to in 7.7.2(a).

7.7.8 For inert gas systems of the inert gas generator type additional audible and visual alarms are to be provided to indicate:

- (a) insufficient oil fuel supply,
- (b) failure of the power supply to the generator,
- (c) failure of the power supply to the automatic control system for the generator.

See also Pt 6, Ch 1 for requirements for control, alarm and safety systems, and additional requirements for unattended operation.

Piping Systems for Oil Tankers

Part 5, Chapter 15

Section 7

7.7.9 Automatic shutdown of the inert gas blowers and gas regulating valve is to be arranged on predetermined limits being reached in respect of (a), (b) and (c) of 7.7.7.

7.7.10 Automatic shutdown of the gas regulating valve is to be arranged in respect of 7.7.7(d).

7.7.11 In respect of 7.7.7(e), when the oxygen content of the inert gas exceeds eight per cent by volume, immediate action is to be taken to improve the gas quality. Unless the quality of the gas improves, all cargo tank operations are to be suspended so as to avoid air being drawn into the tanks and the isolation valve referred to in 7.5.12 is to be closed.

7.7.12 The alarms required in (e), (f) and (h) of 7.7.7 are to be fitted in the machinery space and cargo control room, where provided, but in each case in such a position that they are immediately received by responsible members of the crew.

7.7.13 In respect of 7.7.7(g), where a semi-dry or dry water seal is fitted, the arrangements are to be such that the maintenance of an adequate reserve of water will be ensured at all times and that the water seal will be automatically formed when the gas flow ceases. The audible and visual alarm on the low level of water in the water seal is to operate when the inert gas is not being supplied.

7.7.14 An audible alarm system independent of that required in 7.7.7(h) or automatic shutdown of cargo pumps is to be provided to operate on predetermined limits of low pressure in the inert gas mains being reached.

7.7.15 Detailed instruction manuals are to be provided on board, covering the operations, safety and maintenance requirements and occupational health hazards relevant to the inert gas system and its application to the cargo tank system. The manuals are to include guidance on procedures to be followed in the event of a fault or failure of the inert gas system.

7.8 Installation and tests

7.8.1 The inert gas system, including alarms and safety devices, is to be installed on board and tested under working conditions to the satisfaction of the Surveyors.

7.9 Nitrogen generator systems

7.9.1 The following requirements are specific only to the gas generator system and apply where inert gas is produced by separating air into its component gases by passing compressed air through a bundle of hollow fibres, semi-permeable membranes or adsorber materials.

7.9.2 Where nitrogen generator systems are provided in place of boiler flue gas or oil fired inert gas generators referred to in 7.1, the following requirements of Chapter 15 of the FSS Code remain applicable for the piping arrangements, alarms and instrumentation downstream of the gas generator: 2.3.1.3.1, 2.3.1.3.2, 2.3.1.5, 2.3.2, 2.4.2, 2.4.3.1.6, 2.4.3.1.8, 2.4.3.1.9, 2.4.3.3, 2.4.3.4, 2.4.4, as well as SOLAS Reg.II-2/4.5.3.4.2, 4.5.6.3 and 11.6.3.4.

7.9.3 A nitrogen generator consisting of a feed air treatment system and any number of membrane or adsorber modules in parallel is to be capable of delivering nitrogen to the cargo tanks at a rate of at least 125 per cent of the maximum discharge capacity of the ship expressed as a volume to time rate.

7.9.4 The air compressor and the nitrogen generator may be installed in the engine room or in a separate compartment, which may be treated as an 'other machinery space' with respect to fire protection.

7.9.5 Where a separate compartment is provided, it is to be positioned outside the cargo area and is to be fitted with an independent mechanical extraction ventilation system providing at least 6 air changes per hour. The compartment is to have no direct access to accommodation spaces, service spaces and control stations, and is to be provided with oxygen level detection equipment with a low oxygen level alarm.

7.9.6 The nitrogen generator is to be capable of delivering high purity nitrogen with oxygen content not exceeding 5 per cent by volume. The system is to be fitted with automatic means to discharge gas to the atmosphere during start-up and abnormal operation when predetermined limits are reached, see 7.9.16(a) to (e).

7.9.7 The system is to be provided with two air compressors. The total required capacity of the system is preferably to be divided equally between the two compressors, and in no case is one compressor to have a capacity less than 1/3 of the total capacity required. A system with one air compressor only may be accepted provided that sufficient spares for the air compressor and its prime mover are carried on board to enable their failure to be rectified by the ship's crew.

7.9.8 A feed air treatment system is to be fitted to remove free water, particles and traces of oil from the compressed air, and to maintain the specification temperature.

7.9.9 Where a nitrogen receiver/buffer tank is required to be fitted it may be installed in a dedicated compartment or in the separate compartment containing the air compressor and the generator or may be located in the cargo area. Where the nitrogen receiver/buffer tank is installed in an enclosed space, the access is to be arranged from the open deck only and the access door is to open outwards. Permanent ventilation and alarm arrangements are to be fitted as required by 7.9.5.

Piping Systems for Oil Tankers

Part 5, Chapter 15

Section 7

7.9.10 The oxygen-enriched air from the nitrogen generator and the nitrogen-product enriched gas from the protective devices of the nitrogen receiver are to be arranged to discharge to a safe location on the open deck.

7.9.11 In order to permit maintenance, means of isolation are to be fitted between the generator and the receiver.

7.9.12 At least two non-return devices are to be fitted in the inert gas supply main, one of which is to be of the double block and bleed arrangement. The second non-return device is to be equipped with positive means of closure.

7.9.13 Instrumentation is to be provided for continuously indicating the temperature and pressure of air:

- (a) at the discharge of the compressor,
- (b) at the inlet to the nitrogen generator.

7.9.14 Instrumentation is to be fitted for continuously indicating and permanently recording the oxygen content of the inert gas downstream of the nitrogen generator when inert gas is being supplied.

7.9.15 The instrumentation referred to in 7.9.14 is to be placed in the cargo control room where provided. Where no cargo control room is provided, the instrumentation is to be placed in a position easily accessible to the officer in charge of cargo operations.

7.9.16 Audible and visual alarms are to be provided to indicate:

- (a) low feed-air pressure from compressor as referred to in 7.9.13(a),
- (b) high air temperature as referred to in 7.9.13(a),
- (c) high condensate level at automatic drain of water separator as referred to in paragraph 7.9.8,
- (d) failure of electrical heater, if fitted,
- (e) oxygen content in excess of that required in 7.9.6,
- (f) failure of power supply to the instrumentation as referred to in 7.9.14.

7.9.17 Automatic shut-down of the system is to be arranged upon alarm conditions as required by 7.9.16(a) to (e).

7.9.18 The alarms required by 7.9.16(a) to (f) are to be fitted in the machinery space and cargo control room, where provided, but in each case in such a position that they are immediately received by responsible members of the crew.

7.10 Nitrogen/inert gas systems fitted for purposes other than inerting required by SOLAS Reg. II-2/4.5.5.1.1

7.10.1 This section applies to systems fitted on oil tankers of less than 20000 DWT.

7.10.2 The requirements of 7.9 apply except paragraphs 7.9.1, 7.9.2, 7.9.3 and 7.9.7.

7.10.3 Where the connections to the cargo tanks, to the hold spaces or to cargo piping are not permanent, the non-return devices required by 7.9.12 may be substituted by two non-return valves.

■ Cross-reference

For vapour detection, see also Ch 13,2 of the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk*.

*Section***1 General**

**■ Section 1
General****1.1 Application**

1.1.1 Adequate spare parts for the propelling and essential auxiliary machinery together with the necessary tools for maintenance and repair shall be readily available for use.

1.1.2 The spare parts to be supplied and their location are to be the responsibility of the Owner but must take into account the design and arrangements of the machinery and the intended service and operation of the ship. Account should also be taken of the recommendations of the manufacturers and any applicable statutory requirement of the country of registration of the ship.

1.2 Tables of spare parts

1.2.1 For general guidance purposes, spare parts for main and auxiliary machinery installations are shown in the following Tables:

- Table 16.1.1 Spare parts for main oil engines
- Table 16.1.2 Spare parts for auxiliary oil engines
- Table 16.1.3 Spare parts for main steam turbines
- Table 16.1.4 Spare parts for auxiliary steam turbines
- Table 16.1.5 Spare parts for auxiliary air compressors
- Table 16.1.6 Spare parts for boilers supplying steam propulsion and for essential services.

Spare Gear for Machinery Installations

Part 5, Chapter 16

Section 1

Table 16.1.1 Spare parts for main oil engines (see continuation)

Item	Spare parts	Number	
		Ships for unrestricted service	Ships for restricted service
Main bearings	Main bearings or shells for one bearing of each size and type fitted, complete with shims, bolts and nuts	1	—
Main thrust block	Pads for one face of Michell-type thrust block	1 set or 1	1 set
	Inner and outer race with rollers where roller thrust bearings are fitted	1	1
Cylinder liner	Cylinder liner complete with joint rings and gaskets	1	—
Cylinder cover	Cylinder cover, complete with valves, joint rings and gaskets. For engines without covers, the respective valves for one cylinder unit	1	—
	Cylinder cover studs or bolts, with nuts, as applicable for one cylinder	1/2 set	—
Cylinder valves	Exhaust valves, complete with casings, seats, springs and other fittings for one cylinder	2 sets	1 set
	Air inlet valves, complete with casings, seats, springs and other fittings for one cylinder	1 set	1 set
	Starting air valve, complete with casing, seat, springs and other fittings	1	1
	Relief valve, complete	1	1
	Fuel injection valves of each size and type fitted, complete with all fittings, for one engine	1 set, see Note 1	1/4 set
Connecting rod bearings	Bottom end bearings or shells of each size and type fitted, complete with shims, bolts and nuts, for one cylinder	1 set	—
	Top end bearings or shells of each size and type fitted, complete with shims, bolts and nuts, for one cylinder	1 set	—
Pistons	Crosshead type, piston of each type fitted, complete with piston rod, stuffing box, skirt, rings, studs and nuts	1	—
	Trunk piston type, piston of each type fitted, complete with skirt, rings, studs, nuts, gudgeon pin and connecting rod	1	—
Piston rings	Piston rings, for one cylinder	1 set	—
Piston cooling	Telescopic cooling pipes and fittings or their equivalent, for one cylinder unit	1 set	—

Spare Gear for Machinery Installations

Part 5, Chapter 16

Section 1

Table 16.1.1 Spare parts for main oil engines (*conclusion*)

Item	Spare parts	Number	
		Ships for unrestricted service	Ships for restricted service
Gear and chain for camshaft drives	Chain drive: separate links with pins and rollers of each size and type fitted	6	—
	Bearing bushes of each type fitted	1 set	—
Cylinder lubricators	Lubricator complete, of the largest size, with its chain drive or gear wheels	1	—
Fuel injection pumps	Fuel pump complete, or, when replacement at sea is practicable, a complete set of working parts for one pump (plunger, sleeve, valves, springs, etc.)	1	—
Fuel injection piping	High pressure fuel pipe of each size and shape fitted, complete with couplings	1	—
Scavenge blowers (including turbo-chargers)	Rotors, rotor shafts, bearings, nozzle rings and gear wheels or equivalent working parts if of other types, see Note 2	1 set	—
Scavenging system	Suction and delivery valves for one pump of each type fitted	1 set	—
Reduction and/or reverse gear	Complete bearing bush, of each size fitted in the gearcase assembly	1 set	—
	Roller or ball race, of each size fitted in the gearcase assembly	1 set	—
Main engine-driven air compressors	Piston rings of each size fitted	1 set	—
	Suction and delivery valves complete of each size fitted	1/2 set	—
Gaskets and packings	Special gaskets and packings of each size and type fitted for cylinder covers and cylinder liners for one cylinder	1 set	—
NOTES 1. Engines with three or more fuel injection valves per cylinder: two fuel injection valves complete per cylinder and a sufficient number of valve parts, excluding the body, to provide, with those fitted, a full engine set. 2. The spare parts may be omitted where it has been demonstrated at the Enginebuilder's Works, or during sea trials, for an engine of the type concerned, that the engine can be manoeuvred satisfactorily with one blower out of action. The requisite blanking and/or blocking arrangements, applicable for running with one blower out of action as demonstrated, are to be available on board.

Requirements for Fusion Welding of Pressure Vessels and Piping

Part 5, Chapter 17

Sections 1 & 2

Section

- 1 **General**
- 2 **Manufacture and workmanship of fusion welded pressure vessels**
- 3 **Repairs to welds on fusion welded pressure vessels**
- 4 **Post-weld heat treatment of pressure vessels**
- 5 **Welded pressure pipes**
- 6 **Non-Destructive Examination**

■ Section 1 General

1.1 Scope

1.1.1 The requirements of this Chapter apply to the welding of pressure vessels and process equipment, heating and steam raising boilers and pressure pipes. The allocation of Class is determined from the design criteria referenced in Chapters 10, 11 and 12.

1.1.2 Fusion welded pressure vessels will be accepted only if manufactured by firms equipped and competent to undertake the quality of welding required for the Class of vessel proposed. The manufacturer's works are to be approved in accordance with the requirements specified in *Materials and Qualification Procedures for Ships*, Book A Procedure MQPS 0-4.

1.1.3 For pressure vessels which only have circumferential seams, see Ch 10, 1.5.4 and Ch 11, 1.5.5.

1.2 General requirements for welding plant and welding quality

1.2.1 In the first instance, and before work is commenced, the Surveyors are to be satisfied that the required quality of welding is attainable with the proposed welding plant, equipment and procedures in accordance with the guidelines specified in *Materials and Qualification Procedures for Ships Book A, Procedure 0-4*.

1.2.2 All welding is to be in accordance with the requirements specified in Chapter 13 of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

1.3 Manufacture and workmanship of fusion welded pressure vessels

1.3.1 Pressure vessels are to be constructed and examined in accordance with the requirements specified in Chapter 13 of the Rules for Materials, unless more stringent requirements are specified.

■ Section 2 Manufacture and workmanship of fusion welded pressure vessels

2.1 General requirements

2.1.1 Prior to commencing construction, the design of the vessel is to be approved where required by Ch 10, 1.6 and Ch 11, 1.6.

2.1.2 Pressure vessels will be accepted only if manufactured by firms that have been assessed and approved in accordance with MQPS 0-4.

2.2 Materials of construction

2.2.1 Where the construction requires post weld heat treatment, consideration should be given to certifying the material after subjecting the test pieces to a simulated heat treatment.

2.3 Tolerances for cylindrical shells

2.3.1 Measurements are to be made to the surface of the parent plate and not to a weld, fitting or other raised part.

2.3.2 In assessing the out-of-roundness of pressure vessels, the difference between the maximum and minimum internal diameters measured at one cross-section is not to exceed the amount given in Table 17.2.1.

Table 17.2.1 Tolerances for cylindrical shells

Nominal internal diameter of vessel in mm	Difference between maximum and minimum diameters	Maximum departure from designed form
≤ 300 $> 300 \leq 460$ $> 460 \leq 600$ $> 600 \leq 900$ $> 900 \leq 1200$ $> 1220 \leq 1520$ $> 1520 \leq 1900$	1,0 per cent of internal diameter	1,2 mm 1,6 mm 2,4 mm 3,2 mm 4,0 mm 4,8 mm 5,6 mm
$> 1900 \leq 2300$ $> 2300 \leq 2670$ $> 2670 \leq 3950$	19 mm	6,4 mm 7,2 mm 8,0 mm
$> 3950 \leq 4650$ > 4650	19 mm 0,4 per cent of internal diameter	0,2 per cent of internal diameter

2.3.3 The profile measured on the inside or outside of the shell, by means of a gauge of the designed form of the shell, and having a chord length equal to one-quarter of the internal diameter of the vessel, is not to depart from the designed form by more than the amount given in Table 17.2.1. This amount corresponds to x in Fig. 17.2.1.

Requirements for Fusion Welding of Pressure Vessels and Piping

Part 5, Chapter 17

Sections 2 to 5

Fig. 17.2.1 Tolerances for cylindrical shells

2.3.4 Shell sections are to be measured for out-of-roundness, either when laid flat on their sides or when set up on end. When the shell sections are checked while lying on their sides, each measurement for diameter is to be repeated after turning the shell through 90° about its longitudinal axis. The two measurements for each diameter are to be averaged, and the amount of out-of-roundness calculated from the average values so determined.

2.3.5 Where there is any local departure from circularity due to the presence of flats or peaks at welded seams, the departure from designed form shall not exceed that of Table 17.2.1.

2.3.6 The external circumference of the completed shell is not to depart from the calculated circumference (based upon nominal inside diameter and the actual plate thickness) by more than the amounts given in Table 17.2.2.

Table 17.2.2 Circumferential tolerances

Outside diameter (nominal inside diameter plus twice actual plate thickness), in mm	Circumferential tolerance
300 to 600 inclusive	±5 mm
Greater than 600	±0,25 per cent

Section 3
Repairs to welds on fusion welded pressure vessels

3.1 General

3.1.1 Repairs to welds on fusion welded pressure vessels are to be in accordance with the requirements of Chapter 13 of the Rules for Materials.

Section 4
Post-weld heat treatment of pressure vessels

4.1 General

4.1.1 Post-weld heat treatment of fusion welded pressure vessels are to be in accordance with the requirements of Chapter 13 of the Rules for Materials.

Section 5
Welded pressure pipes

5.1 General

5.1.1 Fabrication of pipework is to be carried out in accordance with the requirements of Ch 13,5 of the Rules for Materials.

5.2 Welding workmanship

5.2.1 Preheating is to be effected by a method which ensures uniformity of temperature at the joint. The method of heating and the means adopted for temperature control are to be to the satisfaction of the Surveyors.

5.2.2 All welding is to be performed in accordance with the approved welding procedures in this Section by welders who are qualified for the materials, joint types and welding processes employed.

5.2.3 Welding without filler metal is generally not permitted for welding of duplex stainless steel materials.

5.2.4 All welds in high pressure and high temperature pipelines are to have a smooth surface finish and even contour; if necessary, they are to be made smooth by grinding.

5.2.5 Check tests of the quality of the welding are to be carried out periodically at the discretion of the Surveyors.

Requirements for Fusion Welding of Pressure Vessels and Piping

Part 5, Chapter 17

Section 6

■ Section 6 Non-Destructive Examination

6.1 General

6.1.1 Non-Destructive Examination (NDE) of pressure vessels and piping is to be performed in accordance with the requirements of Ch 13,4 and 5 of the Rules for Materials.

Integrated Propulsion Systems

Part 5, Chapter 18

Sections 1 & 2

Section

- 1 **General requirements**
- 2 **Machinery arrangements**
- 3 **Control arrangements**

■ Section 1 General requirements

1.1 General

1.1.1 This Chapter applies to both cargo ships and passenger ships and is in addition to other relevant Chapters of the Rules.

1.1.2 The Rules contained in this Chapter cover machinery arrangements and control systems necessary for operating essential machinery from a (centralised) control station on the bridge under normal sea-going and manoeuvring conditions, but do not signify that the machinery space may be operated unattended.

1.1.3 In general, ships complying with the requirements of this Chapter will be eligible for the machinery class notation IP, see Pt 1, Ch 2.2.4.

1.1.4 The details of control systems will vary with the type of machinery being controlled, and special consideration will be given to each case.

1.2 Plans

1.2.1 **Control systems.** Where control systems are applied to essential machinery or equipment the following plans are to be submitted in triplicate:

- Details of operating medium, i.e. pneumatic, hydraulic or electric including standby sources of power.
- Description of operation with explanatory diagrams.
- Line diagrams of control circuits.
- List of monitored points.
- List of control points.
- List of alarm points.
- Test schedule including test facilities provided.

1.2.2 Plans for the control systems of the following machinery are to be submitted:

- Main propelling machinery, including all auxiliaries essential for propulsion.
- Controllable pitch propellers.
- Electric generating plant.
- Evaporating and distilling systems for use with main steam machinery.
- Steam raising plant for essential services.

1.2.3 **Alarm systems.** Details of the overall alarm system linking the machinery space control station with the bridge control station are to be submitted.

1.2.4 **Control stations.** Details of bridge and machinery space control stations are to be submitted, e.g. control panels and consoles.

1.2.5 **Machinery configurations.** Plans showing the general arrangement of the machinery space, together with the layout and configuration of the main propulsion and essential machinery, are to be submitted.

■ Section 2 Machinery arrangements

2.1 Main propulsion machinery

2.1.1 The main propulsion machinery may be oil engines, turbines or electric motors but the configuration of the propulsion system and its relationship with other essential equipment is to comply with the remaining requirements of this Section.

2.1.2 The main propulsion machinery is to drive one of the generators required by 2.2.2. This generator is to be capable of supplying the essential electrical load under all normal sea-going and manoeuvring conditions.

2.1.3 Standby machinery is to be provided capable of being readily connected to the main propulsion system so as to provide emergency propulsion. This standby machinery is to be capable of connection so as to provide an alternative drive to the generator required in 2.1.2. It need not provide power to both systems simultaneously, see also 2.2.2.

2.2 Supply of electric power and essential services

2.2.1 Continuity of electrical power supply and essential services are to be ensured under all normal sea-going and manoeuvring conditions without manual intervention in the machinery space. Methods by which this may be achieved include automatic start-up of generating sets and essential pumps or manual start-up of these services from the bridge.

2.2.2 Generating sets and converting sets are to be sufficient to ensure the operation of services essential for the propulsion and safety of the ship even when one generating set or converting set is out of service.

2.3 Controllable pitch propellers

2.3.1 For propulsion systems with controllable pitch propellers a standby or alternative power source for the actuating medium for controlling the pitch of the propeller blades is to be provided.

Integrated Propulsion Systems

Part 5, Chapter 18

Section 3

Section 3 Control arrangements

3.1 Bridge control

3.1.1 Means are to be provided to ensure satisfactory control of propulsion from the bridge in both the ahead and astern directions when operating on either the main or standby engine(s).

3.1.2 Instrumentation to indicate the following is to be fitted on the bridge and at any other station from which the propulsion machinery may be controlled:

- (a) Propeller speed.
- (b) Direction of rotation of the propeller for a fixed pitch propeller.
- (c) Pitch position for a controllable pitch propeller.
- (d) Direction and magnitude of thrust.
- (e) Clutch position, where applicable.

3.1.3 An alarm is to operate in the event of a failure of the power supply to the bridge control system.

3.1.4 Means, independent of the bridge control system, are to be provided on the bridge to enable the watchkeeping officer to stop the main propulsion machinery in an emergency.

3.2 Alarm system

3.2.1 An alarm system is to be provided to indicate faults in essential machinery and control systems in accordance with this Chapter.

3.2.2 Machinery faults are to be indicated at the control stations on the bridge and in the machinery space.

3.2.3 In the event of a machinery fault occurring, the alarm system is to be such that the watchkeeping officer on the bridge is made aware of the following:

- (a) A machinery fault has occurred.
- (b) The machinery fault is being attended to, and
- (c) The machinery fault has been rectified. (Alternative means of communication between the bridge control station and the machinery control station may be used for this function.)

3.2.4 The alarm system should be designed with self-monitoring properties. As far as practicable, any fault in the alarm system should cause it to fail to the alarm condition.

3.2.5 The alarm system should be capable of being tested during normal machinery operation.

3.2.6 Failure of the power supply to the alarm system is to be indicated as a separate fault alarm.

3.2.7 Alarm indication is to be both audible and visual. If arrangements are made to silence audible alarms they are not to extinguish visual alarms.

3.2.8 The acceptance of an alarm on the bridge is not to silence the audible alarm in the machinery space.

3.2.9 Machinery alarms should be distinguishable from other audible alarms, e.g. fire, carbon dioxide.

3.2.10 Acknowledgement of visual alarms is to be clearly shown.

3.2.11 If the audible alarm has been silenced and a second fault occurs before the first has been rectified, the audible alarm is again to operate. To assist in the detection of transient faults which are subsequently self-correcting, fleeting alarms should lock-in until accepted.

3.2.12 Arrangements should be made to enable alarm lights on the bridge to be dimmed as required.

3.3 Communication

3.3.1 Two means of communication are to be provided between the bridge and the control station in the machinery space. One of these means may be the bridge control system; the other is to be independent of the main electrical power supply.

3.3.2 The bridge, machinery space control station and any other control position from which the propulsion machinery can be controlled are to be fitted with means to indicate which station is in command.

3.3.3 Change-over between control stations is to be possible under all normal sea-going and manoeuvring conditions without affecting the speed or direction of propulsion. This changeover may be effected only with the acceptance of the station taking control.

3.4 Engine starting safeguards

3.4.1 Where it is possible to start a main propulsion or auxiliary oil engine from the bridge, an indication that sufficient starting air pressure is available is to be provided on the bridge.

3.4.2 The number of automatic consecutive attempts which fail to produce a start is to be limited to safeguard sufficient starting air pressure, or, in the case of electric starting, a sufficient charge level in the batteries.

3.4.3 An alarm is to be provided for low starting air pressure, set at a limit which will still permit engine starting operations.

3.4.4 Where propulsion or auxiliary engines are started from the bridge, interlocks are to be provided to prevent starting of the engine under conditions which could hazard the machinery. These are to include 'turning gear engaged', 'low lubricating oil pressure' and 'shaft brake engaged'.

3.5 Operational safeguards

3.5.1 Means are to be provided to prevent the machinery and shafting being subjected to excessive torque or other detrimental mechanical and thermal overloads.

Integrated Propulsion Systems

Part 5, Chapter 18

Section 3

3.5.2 Prolonged running in a restricted speed range is to be prevented automatically or, alternatively, an indication of restricted speed ranges is to be provided at each control station.

3.5.3 For ships propelled by steam turbines the risk of thermal distortion of the turbines is to be prevented by automatic steam spinning when the shaft is stopped in the manoeuvring mode. An audible and visual alarm is to operate on the bridge and in the machinery space when the shaft has been stopped for two minutes.

3.5.4 In the case of lubricating oil systems for main propulsion and standby engine(s), the engine(s) is to be stopped automatically on failure of the lubricating oil supply. The circuit and sensor employed for this automatic shutdown are to be additional to the alarm circuit and sensor required by Ch 14.8. Where means are provided to over-ride the automatic shutdown required by this paragraph, the arrangements are to be such as to preclude inadvertent operation. Visual indication of operation of the over-ride is to be fitted.

3.5.5 In the case of oil engines, oil mist monitoring is to be provided for crankcase protection where arrangements are fitted to over-ride the automatic stop for failure of the lubricating oil supply.

3.5.6 Boilers with automatic controls which under normal operating conditions do not require any manual intervention by the operators are to be provided with safety arrangements which automatically shut-off the oil fuel to all the burners in the event of either low water level or combustion air failure. Oil fuel is to be shut-off automatically to any burner in the event of flame failure.

3.5.7 Arrangements are to be provided to automatically stop propulsion gas turbines for the following fault conditions:

- (a) Overspeed, see Ch 4,4.
- (b) High exhaust temperature, see Ch 4,3.
- (c) Flame failure, or
- (d) Excessive vibration.

3.5.8 Where standby pumps are arranged to start automatically in the event of low discharge pressure from the working pump an alarm is to be given to indicate when the standby pump has started.

3.6 Automatic control of essential services

3.6.1 All control systems for essential services are to be stable throughout the operating range of the main propulsion machinery.

3.6.2 The temperature of the following is to be automatically controlled within normal operating limits:

Oil engines:

- (a) Lubricating oil to the main engine and/or auxiliary engines.
- (b) Oil fuel – temperature or viscosity.
- (c) Piston coolant, where applicable.
- (d) Cylinder coolant main and auxiliary engines, where applicable.
- (e) Fuel valve coolant, where applicable.

Steam plant:

- (a) Lubricating oil to main engine and/or auxiliary engines.
- (b) Oil fuel to burners – temperature or viscosity.
- (c) Superheated steam.
- (d) External de-superheated steam.

Gas turbines:

- (a) Lubricating oil to main engine and auxiliary engines.
- (b) Oil fuel – temperature or viscosity.
- (c) Exhaust gas.

3.6.3 The pressure of the following is to be automatically controlled within normal operating limits:

Steam plant:

- (a) Superheated steam.
- (b) Oil fuel.
- (c) External de-superheated steam system(s).
- (d) Gland steam.
- (e) Reduced steam ranges.

3.6.4 The level of the following is to be automatically controlled within normal operating limits:

Steam plant:

- (a) Boiler drum level.
- (b) De-aerator level.
- (c) Condenser level.

3.6.5 Boilers essential for the propulsion of the vessel are to be provided with an automatic combustion control system.

3.7 Local control

3.7.1 The arrangements are to be such that essential machinery can be operated with the system of bridge control or any automatic controls out of action. Alternatively, the control systems should have sufficient redundancy so that failure of the control equipment in use does not render essential machinery inoperative.

■ Section 1 General

1.1 Application

1.1.1 The requirements of this Chapter apply to the design and construction of steering gear.

1.1.2 Whilst the requirements satisfy the relevant regulations of the *International Convention for the Safety of Life at Sea 1974* as amended, and the IMO Protocol of 1978, attention should be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.

1.1.3 Consideration will be given to other cases, or to arrangements which are equivalent to those required by the Rules.

1.2 Definitions

1.2.1 **Steering gear control system** means the equipment by which orders are transmitted from the navigating bridge to the steering gear power units. Steering gear control systems comprise transmitters, receivers, hydraulic control pumps and their associated motors, motor controllers, piping and cables.

1.2.2 **Main steering gear** means the machinery, rudder actuator(s), the steering gear power units, if any, and ancillary equipment and the means of applying torque to the rudder stock (e.g. tiller or quadrant) necessary for effecting movement of the rudder for the purpose of steering the ship under normal service conditions.

1.2.3 **Steering gear power unit** means:

- (a) in the case of electric steering gear, an electric motor and its associated electrical equipment;
- (b) in the case of electrohydraulic steering gear, an electric motor and its associated electrical equipment and connected pump;
- (c) in the case of other hydraulic steering gear, a driving engine and connected pump.

1.2.4 **Auxiliary steering gear** means the equipment other than any part of the main steering gear necessary to steer the ship in the event of failure of the main steering gear but not including the tiller, quadrant or components serving the same purpose.

1.2.5 **Power actuating system** means the hydraulic equipment provided for supplying power to turn the rudder stock, comprising a steering gear power unit or units, together with the associated pipes and fittings, and a rudder actuator. The power actuating systems may share common mechanical components, i.e. tiller quadrant and rudder stock, or components serving the same purpose.

1.2.6 **Maximum ahead service speed** means the maximum service speed which the ship is designed to maintain, at the summer load waterline at maximum propeller RPM and corresponding engine MCR.

1.2.7 **Rudder actuator** means the components which converts directly hydraulic pressure into mechanical action to move the rudder.

1.2.8 **Maximum working pressure** means the maximum expected pressure in the system when the steering gear is operated to comply with 2.1.2(b).

1.3 General

1.3.1 The steering gear is to be secured to the seating by fitted bolts, and suitable chocking arrangements are to be provided. The seating is to be of substantial construction.

1.3.2 The steering gear compartment is to be:

- (a) readily accessible and, as far as practicable, separated from machinery spaces; and
- (b) Provided with suitable arrangements to ensure working access to steering gear machinery and controls. These arrangements are to include handrails and gratings or other non-slip surfaces to ensure suitable working conditions in the event of hydraulic fluid leakage.

1.4 Plans

1.4.1 Before starting construction, the steering gear machinery plans, specifications and calculations are to be submitted. The plans are to give:

- (a) Details of scantlings and materials of all load bearing and torque transmitting components and hydraulic pressure retaining parts together with proposed rated torque and all relief valve settings.
- (b) Schematic of the hydraulic system(s), together with pipe material, relief valves and working pressures.
- (c) Details of control and electrical aspects.

Steering Gear

Part 5, Chapter 19

Section 1

1.5 Materials

1.5.1 All the steering gear components and the rudder stock are to be of sound reliable construction to the Surveyor's satisfaction.

1.5.2 All components transmitting mechanical forces to the rudder stock are to be tested according to the requirements of the *Rules for the Manufacture, Testing and Certification of Materials* (hereinafter referred to as the Rules for Materials).

1.5.3 Ram cylinders; pressure housings of rotary vane type actuators, hydraulic power piping, valves, flanges and fittings; and all steering gear components transmitting mechanical forces to the rudder stock (such as tillers, quadrants, or similar components) are to be of steel or other approved ductile material, duly tested in accordance with the requirements of the Rules for Materials. In general, such material is to have an elongation of not less than 12 per cent nor a tensile strength in excess of 650 N/mm². Special consideration will be given to the acceptance of grey cast iron for valve bodies and redundant parts with low stress levels.

1.5.4 Where appropriate, consideration will be given to the acceptance of non-ferrous material.

1.6 Rudder, rudder stock, tiller and quadrant

1.6.1 For the requirements of rudder and rudder stock, see Pt 3, Ch 13,2.

1.6.2 For the requirements of tillers and quadrants including the tiller to stock connection, see Table 19.1.1.

1.6.3 In bow rudders having a vertical locking pin operated from the deck above, positive means are to be provided to ensure that the pin can be lowered only when the rudder is exactly central. In addition, an indicator is to be fitted at the deck to show when the rudder is exactly central.

1.6.4 The factor of safety against slippage, S (i.e. for torque transmission by friction) is generally based on

$$S = \frac{\text{the torque transmissible by friction}}{M}$$

where

M is the maximum torque at the relief valve pressure which is generally equal to the design torque as specified by the steering gear manufacturer.

1.6.5 For conical sections, S is based on the following equation:

$$S = \frac{\mu A \sigma_r}{\sqrt{(W + A \sigma_r \theta)^2 + Q^2}}$$

where

A = interfacial surface area, in mm²

W = weight of rudder and stock, if applicable, when tending to separate the fit, in N

Q = shear force = $\frac{2M}{d_m}$ in N

where

d_m in mm is the mean contact diameter of tiller/stock interface and M in Nmm is defined in 1.6.4

θ = cone taper half angle in radians (e.g. for cone taper 1:10, $\theta = 0,05$)

μ = coefficient of friction

σ_r = radial interfacial pressure or grip stress, in N/mm².

Steering Gear

Part 5, Chapter 19

Section 1

Table 19.1.1 Connection of tiller to stock

Item	Requirements
(1) Dry fit – tiller to stock, see also 1.6.4 and 1.6.5	<p>(a) For keyed connection, factor of safety against slippage, $S = 1,0$ The maximum stress in the fillet radius of the tiller keyway should not exceed the yield stress For conical sections, the cone taper should be $\leq 1:10$</p> <p>(b) For keyless connection, factor of safety against slippage, $S = 2,0$ The maximum equivalent von Mises stress should not exceed the yield stress For conical sections, the cone taper should be $\leq 1:15$</p> <p>(c) Coefficient of friction (maximum) = 0,17</p> <p>(d) Grip stress not to be less than 20 N/mm²</p>
(2) Hydraulic fit - tiller to stock, see also 1.6.4 and 1.6.5	<p>(a) For keyed connection, factor of safety against slippage, $S = 1,0$ The maximum stress in the fillet radius of the tiller keyway should not exceed the yield stress For conical sections, the cone taper should be $\leq 1:10$</p> <p>(b) For keyless connection, factor of safety against slippage, $S = 2,0$ The maximum equivalent von Mises stress should not exceed the yield stress For conical sections, the cone taper should be $\leq 1:15$</p> <p>(c) Coefficient of friction (maximum) = 0,14</p> <p>(d) Grip stress not to be less than 20 N/mm²</p>
(3) Ring locking assemblies fit – tiller to stock, see also 1.6.3	<p>(a) Factor of safety against slippage, $S = 2,0$ The maximum equivalent von Mises stress should not exceed the yield stress</p> <p>(b) Coefficient of friction = 0,12</p> <p>(c) Grip stress not to be less than 20 N/mm²</p>
(4) Bolted tiller and quadrant (this arrangement could be accepted provided the proposed rudder stock diameter in way of tiller does not exceed 350 mm diameter), see symbols	<p>Shim to be fitted between two halves before machining to take rudder stock, then removed prior to fitting</p> <p>Minimum thickness of shim, For 4 connecting bolts: $t_s = 0,0014 \delta_t$ mm For 6 connecting bolts: $t_s = 0,0012 \delta_t$ mm</p> <p>Key(s) to be fitted</p> <p>Diameter of bolts, $\delta_{tb} = \frac{0,60 \delta_{su}}{\sqrt{n_{tb}}}$ mm</p> <p>A predetermined setting-up load equivalent to a stress of approximately 0,7 of the yield strength of the bolt material should be applied to each bolt on assembly. A lower stress may be accepted provided that two keys, complying with item (5), are fitted.</p> <p>Distance from centre of stock to centre of bolts should generally be equal to $\delta_t \left(1,0 + \frac{0,30}{\sqrt{n_{tb}}}\right)$ mm</p> <p>Thickness of flange on each half of the bolted tiller $\geq \frac{0,66 \delta_t}{\sqrt{n_{tb}}}$ mm</p>
(5) Key/keyway, see symbols	<p>Effective sectional area of key in shear $\geq 0,25 \delta_t^2$ mm²</p> <p>Key thickness $\geq 0,17 \delta_t$ mm</p> <p>Keyway is to extend over full depth of tiller and is to have a rounded end. Keyway root fillets are to be provided with suitable radii to avoid high local stress</p>
(6) Section modulus – tiller arm (at any point within its length about vertical axis), see symbols	<p>To be not less than the greater of:</p> <p>(a) $Z_{TA} = \frac{0,15 \delta_t^3 (b_T - b_s)}{1000 b_T}$ cm³</p> <p>(b) $Z_{TA} = \frac{0,06 \delta_t^3 (b_T - 0,9 \delta_t)}{1000 b_T}$ cm³</p> <p>If more than one arm fitted, combined modulus is to be not less than the greater of (a) or (b)</p> <p>For solid tillers, the breadth to depth ratio is not to exceed 2</p>
(7) Boss, see symbols	<p>Depth of boss $\geq \delta_t$</p> <p>Thickness of boss in way of tiller $\geq 0,4 \delta_t$</p>
Symbols	
b_s = distance between the section of the tiller arm under consideration and the centre of the rudder stock, in mm NOTE: b_T and b_s are to be measured with zero rudder angle b_T = distance from the point of application of the load on the tiller to the centre of the rudder stock, in mm n_{tb} = number of bolts in the connection flanges, but generally not to be taken greater than six	t_s = thickness of shim for machining bolted tillers and quadrants, in mm Z_{TA} = section modulus of tiller arm, in cm ³ δ_t = Rule rudderstock diameter in way of tiller, see Pt 3, Ch 13 δ_{tb} = diameter of bolts securing bolted tillers and quadrants, in mm

Steering Gear

Part 5, Chapter 19

Sections 2 & 3

■ Section 2 Performance

2.1 General

2.1.1 Unless the main steering gear comprises two or more identical power units, in accordance with 2.1.4 or 8.1.1, every ship is to be provided with a main steering gear and an auxiliary steering gear in accordance with the requirements of the Rules. The main steering gear and the auxiliary steering gear is to be so arranged that the failure of one of them will not render the other one inoperative.

2.1.2 The main steering gear and rudder stock is to be:

- (a) Of adequate strength and capable of steering the ship at maximum ahead service speed which shall be demonstrated in accordance with 7.2;
- (b) Capable of putting the rudder over from 35° on one side to 35° on the other side with the ship at its deepest sea-going draught and running ahead at maximum ahead service speed and under the same conditions, from 35° on either side to 30° on the other side in not more than 28 seconds.
- (c) Operated by power where necessary to meet the requirements of (b) and in any case when the Rules excluding strengthening for navigation in ice, require a rudder stock over 120 mm diameter in way of the tiller; and
- (d) So designed that they will not be damaged at maximum astern speed; however, this design requirement need not be proved by trials at maximum astern speed and maximum rudder angle.

2.1.3 The auxiliary steering gear is to be:

- (a) Of adequate strength and capable of steering the ship at navigable speed and of being brought speedily into action in an emergency;
- (b) Capable of putting the rudder over from 15° on one side to 15° on the other side in not more than 60 seconds with the ship at its deepest sea-going draught and running ahead at one half of the maximum ahead service speed or 7 knots, whichever is the greater; and
- (c) Operated by power where necessary to meet the requirements of (b) and in any case when the Rules, excluding strengthening for navigation in ice, require a rudder stock over 230 mm diameter in way of the tiller.

2.1.4 Where the main steering gear comprises two or more identical power units, an auxiliary steering gear need not be fitted, provided that:

- (a) In a passenger ship, the main steering gear is capable of operating the rudder as required by 2.1.2(b) while any one of the power units is out of operation;
- (b) In a cargo ship, the main steering gear is capable of operating the rudder as required by 2.1.2(b) while operating with all power units;
- (c) The main steering gear is arranged so that after a single failure in its piping system or in one of the power units the defect can be isolated so that steering capability can be maintained or speedily regained.

2.1.5 Main and auxiliary steering gear power units are to be:

- (a) Arranged to re-start automatically when power is restored after power failure;
- (b) Capable of being brought into operation from a position on the navigating bridge. In the event of a power failure to any one of the steering gear power units, an audible and visual alarm is to be given on the navigating bridge;
- (c) Arranged so that transfer between units can be readily effected.

2.1.6 Where the steering gear is so arranged that more than one power or control system can be simultaneously operated, the risk of hydraulic locking caused by a single failure is to be considered.

2.1.7 A means of communication is to be provided between the navigating bridge and the steering gear compartment.

2.1.8 Steering gear, other than of the hydraulic type, will be accepted provided the standards are considered equivalent to the requirements of this Section.

2.1.9 Manually operated gears are only acceptable when the operation does not require an effort exceeding 16 kg under normal conditions.

2.2 Rudder angle limiters

2.2.1 Power-operated steering gears are to be provided with positive arrangements, such as limit switches, for stopping the gear before the rudder stops are reached. These arrangements are to be synchronised with the gear itself and not with the steering gear control.

■ Section 3 Construction and design

3.1 General

3.1.1 Rudder actuators other than those covered by 8.3 and the 'Guidelines' are to be designed in accordance with the relevant requirements of Chapter 11 for Class I pressure vessels (notwithstanding any exemptions for hydraulic cylinders).

3.1.2 Accumulators, if fitted, are to comply with the relevant requirements of Chapter 11.

3.1.3 The welding details and welding procedures are to be approved. All welded joints within the pressure boundary of a rudder actuator or connecting parts transmitting mechanical loads are to be of full penetration type or of equivalent strength.

3.1.4 The construction is to be such as to minimise local concentrations of stress.

Steering Gear

Part 5, Chapter 19

Section 3

3.1.5 The design pressure for calculations to determine the scantlings of piping and other steering gear components subjected to internal hydraulic pressure shall be at least 1,25 times the maximum working pressure to be expected under the operational conditions specified in 2.1.2(b) taking into account any pressure which may exist in the low pressure side of the system. Fatigue criteria may be applied for the design of piping and components, taking into account pulsating pressures due to dynamic loads, see Section 9.

3.1.6 For the rudder actuator, the permissible primary general membrane stress is not to exceed the lower of the following values:

$$\frac{\sigma_B}{A} \text{ or } \frac{\sigma_y}{B}$$

where

σ_B = specified minimum tensile strength of material at ambient temperature

σ_y = specified minimum yield stress or 0,2 per cent proof stress of the material, at ambient temperature

A and B are given by the following Table:

	<i>Wrought steel</i>	<i>Cast steel</i>	<i>Nodular cast iron</i>
A	3,5	4	5
B	1,7	2	3

3.2 Components

3.2.1 Special consideration is to be given to the suitability of any essential component which is not duplicated. Any such essential component shall, where appropriate, utilise anti-friction bearings such as ball bearings, roller bearings or sleeve bearings which shall be permanently lubricated or provided with lubrication fittings.

3.2.2 All steering gear components transmitting mechanical forces to the rudder stock, which are not protected against overload by structural rudder stops or mechanical buffers, are to have a strength at least equivalent to that of the rudder stock in way of the tiller.

3.2.3 Actuator oil seals between non-moving parts, forming part of the external pressure boundary, are to be of the metal upon metal type or of an equivalent type.

3.2.4 Actuator oil seals between moving parts, forming part of the external pressure boundary, are to be duplicated, so that the failure of one seal does not render the actuator inoperative. Alternative arrangements providing equivalent protection against leakage may be accepted.

3.2.5 Piping, joints, valves, flanges and other fittings are to comply within the requirements of Chapter 12 for Class I piping systems components. The design pressure is to be in accordance with 3.1.5.

3.2.6 Hydraulic power operated steering gear are to be provided with the following:

(a) Arrangements to maintain the cleanliness of the hydraulic fluid taking into consideration the type and design of the hydraulic system;

(b) A fixed storage tank having sufficient capacity to recharge at least one power actuating system including the reservoir, where the main steering gear is required to be power operated. The storage tank is to be permanently connected by piping in such a manner that the hydraulic systems can be readily recharged from a position within the steering gear compartment and provided with a contents gauge.

3.3 Valve and relief valve arrangements

3.3.1 For vessels with non-duplicated actuators, isolating valves are to be fitted at the connection of pipes to the actuator, and are to be directly fitted on the actuator.

3.3.2 Arrangements for bleeding air from the hydraulic system are to be provided, where necessary.

3.3.3 Relief valves are to be fitted to any part of the hydraulic system which can be isolated and in which pressure can be generated from the power source or from external forces. The settings of the relief valves is not to exceed the design pressure. The valves are to be of adequate size and so arranged as to avoid an undue rise in pressure above the design pressure.

3.3.4 Relief valves for protecting any part of the hydraulic system which can be isolated, as required by 3.3.3 are to comply with the following:

(a) The setting pressure is not to be less than 1,25 times the maximum working pressure.

(b) the minimum discharge capacity of the relief valve(s) is not to be less than 110 per cent of the total capacity of the pumps which can deliver through it (them). Under such conditions the rise in pressure is not to exceed 10 per cent of the setting pressure. In this regard, due consideration is to be given to extreme foreseen ambient conditions in respect of oil viscosity.

3.4 Flexible hoses

3.4.1 Hose assemblies approved by Lloyd's Register (hereinafter referred to as 'LR') may be installed between two points where flexibility is required but are not to be subjected to torsional deflection (twisting) under normal operating conditions. In general, the hose should be limited to the length necessary to provide for flexibility and for proper operation of machinery, see also Ch 12,7.

3.4.2 Hoses should be high pressure hydraulic hoses according to recognised standards and suitable for the fluids, pressures, temperatures and ambient conditions in question.

3.4.3 Burst pressure of hoses is to be not less than four times the design pressure.

Steering Gear

Part 5, Chapter 19

Sections 4 & 5

■ Section 4 Steering control systems

4.1 General

4.1.1 Steering gear control is to be provided:

- (a) For the main steering gear, both on the navigating bridge and in the steering gear compartment;
- (b) Where the main steering gear is arranged according to 2.1.4, by two independent control systems, both operable from the navigating bridge. This does not require duplication of the steering wheel or steering lever. Where the control system consists of a hydraulic telemotor, a second independent system need not be fitted, except in a tanker, chemical tanker or gas carrier of 10 000 gross tonnage and upwards;
- (c) For the auxiliary steering gear, in the steering gear compartment and, if power operated, it shall also be operable from the navigating bridge and is to be independent of the control system for the main steering gear.
- (d) Where the steering gear is so arranged that more than one control system can be simultaneously operated, the risk of hydraulic locking caused by single failure is to be considered.

4.1.2 Any main and auxiliary steering gear control system operable from the navigating bridge is to comply with the following:

- (a) Means are to be provided in the steering gear compartment for disconnecting any control system operable from the navigating bridge from the steering gear it serves;
- (b) The system is to be capable of being brought into operation from a position on the navigating bridge.

4.1.3 The angular position of the rudder shall:

- (a) If the main steering gear is power-operated, be indicated on the navigating bridge. The rudder angle indication is to be independent of the steering gear control system;
- (b) Be recognisable in the steering gear compartment.

4.1.4 Appropriate operating instructions with a block diagram showing the changeover procedures for steering gear control systems and steering gear actuating systems are to be permanently displayed in the wheelhouse and in the steering gear compartment.

4.1.5 Where the system failure alarms for hydraulic lock, see Table 19.5.1, are provided, appropriate instructions shall be placed on the navigating bridge to shutdown the system at fault.

■ Section 5 Electric power circuits, electric control circuits, monitoring and alarms

5.1 Electric power circuits

5.1.1 Short circuit protection, an overload alarm and, in the case of polyphase circuits, an alarm to indicate single phasing is to be provided for each main and auxiliary motor circuit. Protective devices are to operate at not less than twice the full load current of the motor or circuit protected and are to allow excess current to pass during the normal accelerating period of the motors.

5.1.2 The alarms required by 5.1.1 are to be provided on the bridge and in the main machinery space or control room from which the main machinery is normally controlled.

5.1.3 Indicators for running indication of each main and auxiliary motor are to be installed on the navigating bridge and at a suitable main machinery control position.

5.1.4 A low-level alarm is to be provided for each power actuating system hydraulic fluid reservoir to give the earliest practicable indication of hydraulic fluid leakage. Alarms are to be given on the navigation bridge and in the machinery space where they can be readily observed.

5.1.5 Two exclusive circuits are to be provided for each electric or electrohydraulic steering gear arrangement consisting of one or more electric motors.

5.1.6 Each of these circuits is to be fed from the main switchboard. One of these circuits may pass through the emergency switchboard.

5.1.7 One of these circuits may be connected to the motor of an associated auxiliary electric or electrohydraulic power unit.

5.1.8 Each of these circuits is to have adequate capacity to supply all the motors which can be connected to it and which can operate simultaneously.

5.1.9 These circuits are to be separated throughout their length as widely as is practicable.

5.1.10 In ships of less than 1600 gross tonnage, if an auxiliary steering gear is not electrically powered or is powered by an electric motor primarily intended for other services, the main steering gear may be fed by one circuit from the main switchboard. Consideration would be given to other protective arrangements than described in 5.1.1, for such a motor primarily intended for other services.

5.2 Electric control circuits

5.2.1 Electric control systems are to be independent and separated as far as is practicable throughout their length.

Steering Gear

Part 5, Chapter 19

Sections 5, 6 & 7

5.2.2 Each main and auxiliary electric control system which is to be operated from the navigating bridge is to comply with the following:

- (a) It is to be served with electric power by a separate circuit supplied from the associated steering gear power circuit, from a point within the steering gear compartment, or directly from the same section of switchboard busbars, main or emergency, to which the associated steering gear power circuit is connected.
- (b) Each separate circuit is to be provided with short-circuit protection only.

5.3 Monitoring and alarms

5.3.1 Alarms and monitoring requirements are indicated in 5.3.2 and Table 19.5.1.

Table 19.5.1 Alarm requirements

Item	Alarm	Note
Rudder position	—	Indication, see 4.1.3
Steering gear power units, power	Failure	—
Steering gear motors	Overload, Single phase	For alarm and running indication locations, see 5.1.2 and 5.1.3
Control system power	Failure	—
Steering gear hydraulic oil level	Low	Each reservoir to be monitored. For alarm locations, see 5.1.4
Auto pilot	Failure	Running indication
Hydraulic oil temperature	High	Where oil cooler is fitted
Hydraulic lock	Fault	Where more than one system (either power or control) can be operated simultaneously each system is to be monitored, see Note
Hydraulic oil filter differential pressure	High	When oil filters are fitted
NOTE This alarm is to identify the system at fault and to be activated when (for example): <ul style="list-style-type: none"> • position of the variable displacement pump control system does not correspond with given order; or • incorrect position of 3-way full flow valve or similar in constant delivery pump system is detected. 		

5.3.2 The alarms described in Table 19.5.1 are to be indicated on the navigating bridge and the additional locations described and are to be in accordance with the alarm system specified by Pt 6, Ch 1,2,3.

Section 6 Emergency power

6.1 General

6.1.1 Where the rudder stock is required to be over 230 mm diameter in way of the tiller, excluding strengthening for navigation in ice, an alternative power supply, sufficient at least to supply the steering gear power unit which complies with the requirements of 2.1.3 and also its associated control system and the rudder angle indicator, shall be provided automatically, within 45 seconds, either from the emergency source of electrical power or from an independent source of power located in the steering gear compartment. This independent source of power shall be used only for this purpose.

6.1.2 In every ship of 10 000 gross tonnage and upwards, the alternative power supply shall have a capacity for at least 30 minutes of continuous operation and in any other ship for at least 10 minutes.

6.1.3 Where the alternative power source is a generator, or an engine driven pump, starting arrangements are to comply with the requirements relating to the starting arrangements of emergency generators.

Section 7 Testing and trials

7.1 Testing

7.1.1 The requirements of the Rules relating to the testing of Class 1 pressure vessels, piping, and related fittings including hydraulic testing apply.

7.1.2 After installation on board the vessel the steering gear is to be subjected to the required hydrostatic and running tests.

7.1.3 Each type of power unit pump is to be subjected to a type test. The type test shall be for a duration of not less than 100 hours, the test arrangements are to be such that the pump may run in idling conditions, and at maximum delivery capacity at maximum working pressure. During the test, idling periods are to be alternated with periods at maximum delivery capacity at maximum working pressure. The passage from one condition to another should occur at least as quickly as on board. During the whole test no abnormal heating, excessive vibration or other irregularities are permitted. After the test, the pump is to be opened out and inspected. Type tests may be waived for a power unit which has been proven to be reliable in marine service.

Steering Gear

Part 5, Chapter 19

Sections 7 & 8

7.2 Trials

7.2.1 The steering gear is to be tried out on the trial trip in order to demonstrate to the Surveyor's satisfaction that the requirements of the Rules have been met. The trial is to include the operation of the following:

- (a) The steering gear, including demonstration of the performances required by 2.1.2(b) and 2.1.3(b):
 - For the main steering gear trial, the propeller pitch of controllable pitch propellers is to be at the maximum design pitch approved for the maximum continuous ahead RPM;
 - If the ship cannot be tested at the deepest draught, alternative trial conditions may be specially considered. In this case, for the main steering gear trial, the speed of the ship corresponding to the maximum continuous revolutions of the main engine should apply;
- (b) The steering gear power units, including transfer between steering gear power units;
- (c) The isolation of one power actuating system, checking the time for regaining steering capability;
- (d) The hydraulic fluid recharging system;
- (e) The emergency power supply required by 6.1.1;
- (f) The steering gear controls, including transfer of control and local control;
- (g) The means of communication between the steering gear compartment and the wheelhouse, also the engine room, if applicable;
- (h) The alarms and indicators;
- (j) Where the steering gear is designed to avoid hydraulic locking this feature shall be demonstrated.

Test items (d), (g), (h) and (j) may be effected at the dockside.

- (b) The main steering gear is to comprise either:
 - (i) two independent and separate power actuating systems, each capable of meeting the requirements of 2.1.2(b); or
 - (ii) at least two identical power actuating systems which, acting simultaneously in normal operation, are capable of meeting the requirements of 2.1.2(b). Where necessary to comply with these requirements, inter-connection of hydraulic power actuating systems is to be provided. Loss of hydraulic fluid from one system is to be capable of being detected and the defective system automatically isolated so that the other actuating system or systems remain fully operational.
- (c) Steering gears other than of the hydraulic type are to achieve equivalent Standards.

8.3 For tankers, chemical tankers or gas carriers of 10 000 tons gross and upwards but of less than 100 000 tons deadweight

8.3.1 Solutions other than those set out in 8.2.1 which need not apply the single failure criterion to the rudder actuator or actuators, may be permitted provided that an equivalent safety Standard is achieved and that:

- (a) Following loss of steering capability due to a single failure of any part of the piping system or in one of the power units, steering capability is regained within 45 seconds; and
- (b) Where the steering gear includes only a single rudder actuator special consideration is given to stress analysis for the design including fatigue analysis and fracture mechanics analysis, as appropriate, the material used, the installation of sealing arrangements and the testing and inspection and provision of effective maintenance. In consideration of the foregoing, regard will be given to the 'Guidelines' in Section 9.

8.3.2 Manufacturers of steering gear who intend their product to comply with the requirements of the 'Guidelines' are to submit full details when plans are forwarded for approval.

Section 8 Additional requirements

8.1 For tankers, chemical tankers or gas carriers of 10 000 tons gross and upwards and every other ship of 70 000 tons gross and upwards

8.1.1 The main steering gear is to comprise two or more identical power units complying with provisions of 2.1.4.

8.2 For tankers, chemical tankers or gas carriers of 10 000 tons gross and upwards

8.2.1 Subject to 8.3 the following are to be complied with:

- (a) The main steering gear is to be so arranged that in the event of loss of steering capability due to a single failure in any part of one of the power actuating systems of the main steering gear, excluding the tiller, quadrant or components serving the same purpose, or seizure of the rudder actuators, steering capability is to be regained in not more than 45 seconds after the loss of one power actuating system.

■ Section 9 'Guidelines' for the acceptance of non-duplicated rudder actuators for tankers, chemical tankers and gas carriers of 10 000 tons gross and upwards but of less than 100 000 tons deadweight

9.1 Materials

9.1.1 Parts subject to internal hydraulic pressure or transmitting mechanical forces to the rudder-stock are to be made of duly tested ductile materials complying with recognised Standards. Materials for pressure retaining components are to be in accordance with recognised pressure vessel Standards. These materials are not to have an elongation less than 12 per cent nor a tensile strength in excess of 650 N/mm².

9.2 Design

9.2.1 **Design pressure.** The design pressure should be assumed to be at least equal to the greater of the following:

- 1,25 times the maximum working pressure to be expected under the operating conditions required in 2.1.2(b).
- The relief valve(s) setting.

9.2.2 **Analysis.** In order to analyse the design the following are required:

- The manufacturers of rudder actuators should submit detailed calculations showing the suitability of the design for the intended service.
- A detailed stress analysis of pressure retaining parts of the actuator should be carried out to determine the stresses at the design pressure.
- Where considered necessary because of the design complexity or manufacturing procedures, a fatigue analysis and fracture mechanics analysis may be required. In connection with these analyses, all foreseen dynamic loads should be taken into account. Experimental stress analysis may be required in addition to, or in lieu of, theoretical calculations depending upon the complexity of the design.

9.2.3 **Dynamic loads for fatigue and fracture mechanics analysis.** The assumption for dynamic loading for fatigue and fracture mechanics analysis where required by 3.1.5, 8.3 and 9.2.2 are to be submitted for appraisal. Both the case of high cycle and cumulative fatigue are to be considered.

9.2.4 **Allowable stresses.** For the purpose of determining the general scantlings of parts of rudder actuators subject to internal hydraulic pressure the allowable stresses should not exceed:

$$\begin{aligned}\sigma_m &\leq f \\ \sigma_1 &\leq 1,5f \\ \sigma_b &\leq 1,5f \\ \sigma_1 + \sigma_b &\leq 1,5f \\ \sigma_m + \sigma_b &\leq 1,5f\end{aligned}$$

where

$$f = \text{the lesser of } \frac{\sigma_B}{A} \text{ or } \frac{\sigma_y}{B}$$

σ_b = equivalent primary bending stress

σ_m = equivalent primary general membrane stress

σ_y = specified minimum yield stress or 0,2 per cent proof stress of material at ambient temperature

σ_B = specified minimum tensile strength of material at ambient temperature

σ_1 = equivalent primary local membrane stress

A and B are as follows:

	Wrought steel	Cast steel	Nodular cast iron
A	4	4,6	5,8
B	2	2,3	3,5

9.2.5 **Burst test.** Pressure retaining parts not requiring fatigue analysis and fracture mechanics analysis may be accepted on the basis of a certified burst test and the detailed stress analysis required by 9.2.2 need not be provided. The minimum bursting pressure should be calculated as follows:

$$P_b = P A \frac{\sigma_{Ba}}{\sigma_B}$$

where

A = as from table in 9.2.4

P = design pressure as defined in 9.2.1

P_b = minimum bursting pressure

σ_B = tensile strength as defined in 9.2.4

σ_{Ba} = actual tensile strength.

9.3 Construction details

9.3.1 **General.** The construction should be such as to minimise local concentrations of stress.

9.3.2 Welds.

- The welding details and welding procedures should be approved.
- All welded joints within the pressure boundary of a rudder actuator or connection parts transmitting mechanical loads should be full penetration type or of equivalent strength.

9.3.3 **Oil seals.** Oil seals forming part of the external pressure boundary are to comply with 3.2.3 and 3.2.4.

9.3.4 **Isolating valves** are to be fitted at the connection of pipes to the actuator, and should be directly mounted on the actuator.

9.3.5 **Relief valves** for protecting the rudder actuator against over-pressure as required in 3.3.3 are to comply with the following:

- The setting pressure is not to be less than 1,25 times the maximum working pressure expected under operating conditions required by 2.1.2(b).

- (b) The minimum discharge capacity of the relief valve(s) is to be not less than 110 per cent of the total capacity of all pumps which provided power for the actuator. Under such conditions the rise in pressure should not exceed 10 per cent of the setting pressure. In this regard due consideration should be given to extreme foreseen ambient conditions in respect of oil viscosity.

9.4 Non-destructive testing

9.4.1 The rudder actuator should be subjected to suitable and complete non-destructive testing to detect both surface flaws and volumetric flaws. The procedure and acceptance criteria for non-destructive testing should be in accordance with requirements of recognised Standards. If found necessary, fracture mechanics analysis may be used for determining maximum allowable flaw size.

9.5 Testing

9.5.1 Tests, including hydrostatic tests, of all pressure parts at 1,5 times the design pressure should be carried out subject to any limitations imposed by valves and other components. Where additional testing of systems or sub-systems following final assembly is required, the test pressure may be subject to any limitations imposed by valves and other components.

9.5.2 When installed on board the ship, the rudder actuator should be subjected to a hydrostatic test at the pressure defined in 9.5.1 and a running test.

9.6 Additional requirements for steering gear fitted to ships with Ice Class notations

9.6.1 See Pt 3, Ch 9.

Azimuth Thrusters

Part 5, Chapter 20

Sections 1, 2 & 3

Section

- 1 **General requirements**
- 2 **Performance**
- 3 **Construction and design**
- 4 **Control engineering arrangements**
- 5 **Electrical equipment**
- 6 **Testing and trials**

■ Section 1 General requirements

1.1 Application

1.1.1 This Chapter applies to azimuth or rotatable thruster units, for propulsion or D.P. duty which transmit a power greater than 220 kW used as the sole means of steering and are in addition to the relevant requirements of Chapter 19.

1.1.2 In general, for a vessel to be assigned an unrestricted service notation a minimum of two azimuth thruster units are to be provided where these form the sole means of propulsion. Where a single thruster installation is proposed, it will be subject to special consideration.

1.2 Plans

1.2.1 The following additional plans are to be submitted for consideration together with particulars of materials and the maximum shaft power and revolutions per minute:

- Sectional assembly including nozzle ring structure, nozzle support struts, etc.
- Shafts, gears and couplings.
- Steering mechanisms with details of ratings.
- Bearing specifications.
- Schematic piping systems.

■ Section 2 Performance

2.1 General

2.1.1 The arrangement of thrusters is to be such that the ship can be satisfactorily manoeuvred.

2.1.2 In addition to the requirements of Chapter 19, the azimuthing mechanism is to be capable of a maximum rotational speed of not less than 1,5 rev/min.

■ Section 3 Construction and design

3.1 Materials

3.1.1 Specification for materials of gears, shafts, couplings and propeller, giving chemical composition, heat treatment and mechanical properties are to be submitted for approval.

3.1.2 Specification for materials for the stock, struts, etc., are to be submitted for approval.

3.1.3 Where an ice class notation is included in the class of a ship, additional requirements are applicable as detailed in Chapter 9 and Pt 3, Ch 9.

3.2 Design

3.2.1 The requirements detailed in Chapters 1, 5, 6, 7, 8, 9, 14 and 19 are to be complied with where applicable.

3.2.2 For steerable thrusters with a nozzle, the equivalent rudder stock diameter in way of tiller, used in Table 19.1.1 in Chapter 19, is to be determined as follows:

$$\delta_t = 26,03 \sqrt[3]{(V + 3)^2 A_N x_P} \text{ mm}$$

where

V = maximum service speed, in knots, which the ship is designed to maintain under thruster operation

A_N = projected nozzle area, in m², and is equal to the length of the nozzle multiplied by the mean external vertical height of the nozzle

and

x_P = horizontal distance from the centreline of the steering tube to the centre of pressure, in metres. The position of the centre of pressure is determined for both ahead and astern cases from Pt 3, Ch 13, 2.2.1.

The corresponding maximum turning moment, M_T , is to be determined as follows:

M_T = turning moment for conical couplings and is to be taken as the greatest of M_F , M_A or M_W

M_F = $P_L x_P \times 10^6$ N mm (kgf mm) in the ahead condition

M_A = $P_L x_P \times 10^6$ N mm (kgf mm) in the astern condition

M_W = the torque generated by the steering gear at the maximum working pressure supplied by the manufacturer, in N mm (kgf mm). M_W is not to exceed the greater of $3,0M_F$ or $3,0M_A$

P_L = lateral force on rudder acting at centre of pressure, as defined in Pt 3, Ch 13, 2.1.1 (where A_R equals $2A_N$), in kN (tonne-f).

3.2.3 The nozzle structure is to be in accordance with Pt 3, Ch 13, 3.

Azimuth Thrusters

Part 5, Chapter 20

Sections 3 & 4

3.2.4 In addition to the requirements of Table 13.3.1, in Pt 3, Ch 13, the scantlings of the nozzle stock or steering tube are to be such that the section modulus against transverse bending at any section xx is not less than:

$$Z = 1,73 \sqrt{(V + 3)^4 A_N^2 x_P^2 + \frac{a^2}{4} T_M^2 10^4} \text{ cm}^3$$

where

a = dimension, in metres, as shown in Fig. 20.3.1

T_M = maximum thrust of the thruster unit in tonnes.

Fig. 20.3.1 Steerable thruster

3.2.5 The scantlings of nozzle connections or struts will be specially considered. In the case of certain high powered ships, direct calculation may be required.

3.2.6 For steerable thrusters without a nozzle the scantlings in way of the tiller will be specially considered.

3.3 Steering gear elements

3.3.1 These gears are to be considered for the following conditions:

- a design maximum dynamic duty steering torque;
- a static duty ($\leq 10^3$ load cycles) steering torque, and the static duty steering torque should be not less than M_T . Values for the above should be submitted together with the plans.

3.4 Components

3.4.1 The hydraulic power operating systems for each azimuth thruster are to be provided with the following:

- (a) arrangements to maintain the cleanliness of the hydraulic fluid, taking into consideration the type and design of the hydraulic system;

- (b) a fixed storage tank having sufficient capacity to recharge at least one azimuth power actuating system including the reservoir. The piping from the storage tank is to be permanent and arranged in such a manner as to allow recharging from within the thruster space.

Section 4

Control engineering arrangements

4.1 General

4.1.1 Except where indicated in this Section the control engineering systems are to be in accordance with Pt 6, Ch 1.

4.1.2 Steering control is to be provided for the azimuth thrusters from the navigating bridge, the main machinery control station and locally.

4.1.3 An indication of the angular position of the thruster(s) and the magnitude of the thrust are to be provided at each station from which it is possible to control the direction of thrust.

4.1.4 Means are to be provided at the remote control station(s) to stop each thrust unit.

4.2 Monitoring and alarms

4.2.1 Alarms and monitoring requirements are indicated in 4.2.2 and Table 20.4.1.

4.2.2 The alarms described in Table 20.4.1 are to be indicated individually on the navigating bridge and in accordance with the alarm system specified by Pt 6, Ch 1,2,3.

Table 20.4.1 Alarms for control systems

Item	Alarm	Note
Thruster azimuth	–	Indicator, see 4.1.3
Steering motor	Power failure, single phase	Also running indication on bridge and at machinery control station
Propulsion motor	Overload, power failure	Also running indication on bridge and at machinery control station
Control system power	Failure	
Hydraulic oil supply tank level	Low	
Hydraulic oil system pressure	Low	
Hydraulic oil system temperature	High	Where oil cooler is fitted
Hydraulic oil filters differential pressure	High	Where oil filters are fitted
Lubricating oil supply	Low	If separate forced lubrication

■ Section 5 Electrical equipment

5.1 General

5.1.1 The electrical installation is to be designed, constructed and installed in accordance with the requirements of 5.2 to 5.4.

5.1.2 Where the thruster units are electrically driven the relevant requirements, including surveys, of Pt 6, Ch 2 are to be complied with.

5.2 Generating arrangements

5.2.1 Where a central power generation system is employed, the requirements of Pt 6, Ch 2, 15.2.5 are to be complied with.

5.2.2 The generating and distribution system is to be so arranged that after any single failure, steering capability can be maintained or regained within a period not exceeding 45 seconds, and the effectiveness of the steering after such a fault will not be reduced by more than 50 per cent. This may be achieved by the parallel operation of two or more generating sets, or alternatively when the electrical requirements may be met by one generating set in operation, on loss of power, the automatic starting and connection to the switchboard of a standby set, provided that this set can restart and run a thruster with its auxiliaries.

5.2.3 The failure of one thruster unit or its control system is not to render any other thruster inoperative.

5.3 Distribution arrangements

5.3.1 Thruster auxiliaries and controls are to be served by individual circuits. Services that are duplicated are to be separated throughout their length as widely as is practicable and without the use of common feeders, transformers, converters, protective devices or control circuits.

5.4 Auxiliary supplies

5.4.1 Where the auxiliary services and thruster units are supplied from a common source, the following requirements are to be complied with:

- (a) the voltage regulation and current sharing requirements defined in Pt 6, Ch 2, 8.4.2 and 8.4.7 are to be maintained over the full range of power factors that may occur in service,
- (b) auxiliary equipment and services are to operate with any waveform distortion introduced by converters without deleterious effect. (This may be achieved by the provision of suitably filtered/converted supplies).

■ Section 6 Testing and trials

6.1 General

6.1.1 The requirements detailed in Chapters 1, 5 and 19 are to be complied with and, in addition, the performance specified in 2.1.2 is to be demonstrated to the Surveyor's satisfaction.

6.1.2 The actual values of steering torque should be verified during sea trials to confirm that the design maximum dynamic duty torque has not been exceeded.

ShipRight Procedures for Machinery Planned Maintenance and Condition Monitoring

Part 5, Chapter 21

Sections 1 to 4

Section

- 1 **General**
- 2 **Machinery Planned Maintenance Scheme**
- 3 **Machinery Condition Monitoring**
- 4 **Turbine Condition Monitoring**
- 5 **Screwshaft Condition Monitoring**
- 6 **Reliability Centred Maintenance**

■ Section 1 General

1.1 Application

1.1.1 This Chapter is applicable to all machinery, and the requirements are to be applied in conjunction with the relevant Chapters of Parts 5 and 6 and the ShipRight procedures.

1.1.2 Details of LR's ShipRight procedures are given in LR's *ShipRight Procedures Overview* and in this Chapter, where related to particular items and notes.

1.1.3 Details of hull ShipRight procedures are to be found in Pt 3, Ch 16.

1.2 Classification notations and descriptive notes

1.2.1 In addition to the machinery class notations defined in Pt 1, Ch 2, ships complying with the requirements of this Chapter will be eligible to be assigned the descriptive notes as defined in Pt 1, Ch 2,2.6 and associated with the ShipRight procedures.

1.3 Information and plans required to be submitted

1.3.1 The information and plans required to be submitted are as specified in the relevant Chapters of Parts 5 and 6 applicable to the particular machinery and in this Chapter where related to particular items and notes.

■ Section 2 Machinery Planned Maintenance Scheme

2.1 Descriptive note MPMS

2.1.1 Where an Owner operates an approved Planned Maintenance Scheme as part of the Continuous Survey Machinery (CSM) cycle, the descriptive note **MPMS** will, at the Owner's request, be entered in column 6 of the *Register Book*.

2.1.2 The descriptive note will indicate that procedures and documentation are in place to control and record the inspection and maintenance routines of all machinery and equipment in the ship.

2.1.3 For the requirements and approval procedures, see the appropriate procedures in the *ShipRight Procedures Overview*.

■ Section 3 Machinery Condition Monitoring

3.1 Descriptive note MCM

3.1.1 Where an Owner operates an Approved Planned Maintenance Scheme as part of the Continuous Survey Machinery (CSM) cycle, and monitoring techniques and equipment are used to record the condition against agreed acceptable limits, the descriptive note **MCM** will, at the Owner's request, be entered in column 6 of the *Register Book*.

3.1.2 The descriptive note will indicate that equipment, procedures and documentation are in place to monitor, control and record the physical and operational condition of the equipment on the ship and control the maintenance routines accordingly.

3.1.3 For the requirements and approval procedures, see the appropriate procedures in the *ShipRight Procedures Overview*.

■ Section 4 Turbine Condition Monitoring

4.1 Descriptive note TCM

4.1.1 Where an Owner adopts the requirements for monitoring of the main steam turbine, the descriptive note **TCM** will, at the Owner's request, be entered in column 6 of the *Register Book*.

ShipRight Procedures for Machinery Planned Maintenance and Condition Monitoring

Part 5, Chapter 21

Sections 4, 5 & 6

4.1.2 The descriptive note will indicate that equipment and procedures are in place, in order to determine the physical and operational condition of that equipment.

4.1.3 For the requirements, see the appropriate procedure in the *ShipRight Procedures Overview*.

■ Section 5 Screwshaft Condition Monitoring

5.1 Descriptive note SCM

5.1.1 Where an Owner adopts the requirements for monitoring of the screwshaft, the descriptive note **SCM** will, at the Owner's request, be entered in column 6 of the *Register Book*.

5.1.2 The descriptive note will indicate that equipment and procedures are in place, in order to determine the physical and operational condition of that equipment.

5.1.3 For the requirements, see Pt 1, Ch 3, 17.3 and the appropriate procedure in the *ShipRight Procedures Overview*.

■ Section 6 Reliability Centred Maintenance

6.1 Descriptive note RCM

6.1.1 Where an Owner operates an Approved Planned Maintenance Scheme based on the use of Reliability Centred Maintenance as part of the Continuous Survey Machinery (CSM) cycle, the descriptive note **RCM** will, at the Owner's request, be entered in column 6 of the *Register Book*.

6.1.2 The descriptive note will indicate that procedures and documentation are in place to control and record the inspection and maintenance routines of all machinery and equipment in the ship, and that they are based on acceptable and applicable methodology.

6.1.3 For the requirements and approval procedures, see the appropriate procedures in the *ShipRight Procedures Overview*.

Section

- 1 **General requirements**
- 2 **Failure Mode and Effects Analysis (FMEA)**
- 3 **Machinery arrangements**
- 4 **Control arrangements**

- 6 **Testing and trials**

■ Section 1 General requirements

1.1 General

1.1.1 This Chapter states the requirements for ships having machinery redundancy, and are in addition to the relevant requirements in other relevant Sections of these Rules.

1.1.2 The requirements, which are optional, cover machinery arrangements and control systems necessary for ships which have propulsion and steering systems configured such that, in the event of a single failure of a system or item of active equipment, see 1.1.3, the ship will retain the ability to use available installed prime mover capacity and installed propulsion systems that are unaffected by the failure. The ship is also to retain steering capability at a service speed of not less than seven knots. The requirements also cover machinery arrangements where the propulsion and steering systems are installed in separate compartments such that, in the event of a loss of one compartment, the ship will retain availability of propulsion power and manoeuvring capability.

1.1.3 For the purpose of this Chapter, items of active equipment are those which have a defined function for operation of a propulsion or steering system, such as but not limited to:

- Prime movers, i.e. diesel engines, electric motors, steam turbines and gas turbines;
- Generators and their excitation equipment;
- Transformers and converters;
- Gearing and shafting systems;
- Propulsion devices, i.e. propellers, water-jets and thrusters;
- Pumps;
- Valves (where power actuated);
- Fuel treatment plant;
- Coolers/heaters;
- Filters;

Piping and electrical cables connecting items of active equipment are not considered to be active.

1.1.4 Requirements additional to these Rules may be imposed by the Flag State with whom the ship is registered and/or by the Administration within whose territorial jurisdiction the ship is intended to operate.

1.1.5 Sections 2, 3 and 4 state the applicable requirements for arrangements necessary to maintain availability of propulsion and manoeuvring capability, in the event of a single failure in equipment. Ships complying with the applicable requirements of Sections 2 to 4 will be eligible for the machinery class notation **PMR** or **PMRL** (Propulsion Machinery Redundancy), **SMR** or **SMRL** (Steering Machinery Redundancy) or **PSMR** or **PSMRL** (Propulsion and Steering Machinery Redundancy), which will be recorded in the *Register Book*.

NOTE

The additional **L** character to **PMR**, **SMR** and **PSMR** notations indicates a limited capability.

1.1.6 Section 5 states the additional requirements necessary to maintain availability of propulsion and manoeuvring capability where machinery is installed in separate compartments and the loss of any one compartment due to fire or flooding has been addressed. Ships complying with the applicable requirements of Sections 2 to 5 of this Chapter will be eligible for the machinery class notation **PMR★** or **PMRL★** (Propulsion Machinery Redundancy in separate machinery spaces), **SMR★** or **SMRL★** (Steering Machinery Redundancy in separate machinery spaces) or **PSMR★** or **PSMRL★** (Propulsion and Steering Machinery Redundancy in separate machinery spaces) which will be recorded in the *Register Book*.

1.1.7 For assignment of **PSMR** or **PSMR★** machinery class notations, the ship is to retain the ability to use not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and retain steering capability at a service speed of not less than seven knots in the event of a single failure of a system or item of equipment.

1.1.8 Where the ship does not comply with 1.1.7 but can retain a service speed of not less than seven knots using available installed prime mover capacity and propulsion systems (which may be less than 50 per cent) following a failure of a system or item of equipment, machinery class notations **PSMRL** or **PSMRL★** may be assigned. The available installed prime mover capacity and installed propulsion systems are to be identified and included in 1.2.7.

1.2 Plans and information

1.2.1 In addition to the plans and information required by Parts 5 and 6, the information detailed in 1.2.2 to 1.2.6 is also to be submitted.

1.2.2 **Machinery spaces.** Plans showing the general arrangement of the machinery spaces, together with a description of the propulsion system, main and emergency electrical power supply systems and steering arrangements are to be submitted. The plans are to indicate segregation and access arrangements for machinery spaces and associated control rooms/stations.

Propulsion and Steering Machinery Redundancy

Part 5, Chapter 22

Sections 1 & 2

1.2.3 Failure Mode and Effects Analysis (FMEA). For the propulsion systems, electrical power supplies, essential services, control systems and steering arrangements, a FMEA report is to be submitted and is to address the requirements identified in Sections 2 and 5.

1.2.4 Manoeuvring capability. An assessment of the ship's ahead and astern manoeuvring capability, under the following operating conditions, is to be submitted:

- (a) Where only 50 per cent or less of the installed prime mover capacity and 50 per cent or less of the installed propulsion systems are available.
- (b) Where the steering capability requirements described in 3.2.1 are available.

IMO Resolution MSC 137(76) – *Standards for Ship Manoeuvrability*, provides guidance, on standard manoeuvres required in an assessment of the manoeuvrability of ships.

1.2.5 Testing and trials procedures. A schedule of testing and trials to demonstrate that the ship is capable of being operated with machinery functioning as described in 4.2 is to be submitted. In addition, any testing programme that may be necessary to prove the conclusions of the FMEA is to be submitted.

1.2.6 Operating Manuals. Operating Manuals are to be submitted for information and provided on board. The manuals are to include the following information:

- (a) Particulars of machinery and control systems.
- (b) General description of systems for propulsion and steering.
- (c) Operating instructions for all machinery and control systems used for propulsion and steering.
- (d) Procedures for dealing with the situations identified in the FMEA report.

1.2.7 Installed prime mover capacity and installed propulsion systems. A schedule of the propulsion systems and their operating capacity and capability under normal and foreseeable failure conditions is to be submitted.

Section 2

Failure Mode and Effects Analysis (FMEA)

2.1 General

2.1.1 An FMEA is to be carried out in accordance with 2.1.2 to 2.1.7 for the propulsion systems, electrical power supply systems and steering systems to demonstrate that a single failure in active equipment or loss of an associated sub-system, see 1.1.3, will not cause loss of all propulsion and/or steering capability as required by a class notation. Typical sub-systems include associated control and monitoring arrangements, data communications, power supplies (electrical, hydraulic or pneumatic), fuel, lubricating, cooling, etc.

2.1.2 The FMEA is to be carried out using the format presented in Table 22.2.1 or an equivalent format that addresses the same safety issues. Analyses in accordance with IEC 60812, *Analysis techniques for system reliability – Procedure for failure mode and effects analysis (FMEA)* or IMO MSC Resolution 36(63) Annex 4 – *Procedures for Failure Mode and Effects Analysis*, would be acceptable.

2.1.3 The FMEA is to be organised in terms of equipment and function. The effects of item failures at a stated level and at higher levels are to be analysed to determine the effects on the system as a whole. Actions for mitigation are to be determined.

2.1.4 The FMEA is to:

- (a) identify the equipment or sub-system, mode of operation and the equipment;
- (b) identify potential failure modes and their causes;
- (c) evaluate the effects on the system of each failure mode;
- (d) identify measures for reducing the risks associated with each failure mode; and
- (e) identify trials and testing necessary to prove conclusions.

Table 22.2.1 Failure Mode and Effects Analysis

Project: Failure Mode and Effects Analysis											
System:				Element:							Sheet No:
Item No.	Component Description	Function	Mode of Operation	Failure Mode	Failure Cause	Failure Detection	Effect of Failure		Severity	Corrective Action	Remarks
							On Item	On System			
NOTE The 'severity category' is to be in accordance with the following: (a) Catastrophic; (b) Hazardous; (c) Major; or (d) Minor.											

2.1.5 At sub-system level it is acceptable, for the purpose of these Rules, to consider failure of equipment items and their functions, e.g. failure of a pump to produce flow or pressure head. It is not required that the failure of components within that pump be analysed. In addition, their failure need only be dealt with as a cause of failure of the pump.

2.1.6 Where FMEA is used for consideration of systems that depend on software-based functions for control or co-ordination, the analysis is to investigate failure of the functions rather than a specific analysis of the software code itself.

2.1.7 The FMEA is to establish that in the event of a single component failure:

- (a) for **PSMR** and **PSMR★** notations, that the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems and retain steering capability;
- (b) for **PMR** and **PMR★** notations, that the ship will retain not less than 50 per cent of the installed prime mover capacity and not less than 50 per cent of the installed propulsion systems;
- (c) for **SMR** and **SMR★** notations, that the steering capability remains available;
- (d) For **PSMRL★** notation, that the ship will retain the ability to use available installed prime mover capacity and installed propulsion systems that are not directly affected by the failure and retain steering capability at a service speed of not less than seven knots; and
- (e) For **PMRL★** notation, that the ship will retain the ability to use available installed prime mover capacity and installed propulsion systems that are not directly affected by the failure.

3.1.2 For **PMRL**, **PSMRL**, **PMRL★** and **PSMRL★** notations, independent main propulsion systems are to be provided so that there remains the ability to use the remaining available installed prime mover capacity and installed propulsion systems following a single failure of a system or item of equipment. In the event of a single failure in equipment, the remaining system(s) is to be capable of maintaining a manoeuvring speed and, for **PSMRL** and **PSMRL★** notations, give adequate manoeuvring capability, see 1.2.4.

3.2 Steering machinery

3.2.1 For **PSMR**, **PSMR★**, **SMR** and **SMR★** notations, independent steering systems for manoeuvring the ship are to be installed, such that steering capability will continue to be available in the event of any of the following:

- (a) Single failure in the steering gear equipment.
- (b) Loss of power supply or control system to any steering system.

3.3 Electrical power supply

3.3.1 The main busbars of the switchboard supplying the propulsion machinery and essential services are to be capable of being isolated by a multi-pole linked circuit breaker, disconnecter, or switch-disconnector into at least two independent sections.

3.3.2 In the event of the loss of one section or failure of the power supply from one generator, there is to be continuity of sufficient electrical power to supply essential services such that the available installed prime mover capacity and installed propulsion systems will continue to have the ability of functioning at their operational capability where **PSMRL**, **PSMRL★**, **PMRL** and **PMRL★** notations are required. See 3.2.1 for steering machinery requirements.

3.3.3 In the event of the loss of one section or failure of the power supply from one generator, there is to be continuity of sufficient electrical power to supply essential services such that the ship will retain not less than 50 per cent of the prime mover capacity and not less than 50 per cent of the installed propulsion systems where **PSMR**, **PSMR★**, **PMR** and **PMR★** notations are required. See 3.2.1 for steering machinery requirements.

3.3.4 For ships capable of operating with one service generator connected to the switchboard, arrangements are to be such that a standby generator will automatically start and connect to the switchboard on loss of the service generator. Sequential starting of essential services is to be provided.

■ Section 3 Machinery arrangements

3.1 Main propulsion machinery

3.1.1 For **PSMR**, **PSMR★**, **PMR** and **PMR★** notations, independent main propulsion systems are to be provided so that the ship will retain not less than 50 per cent of the prime mover capacity and not less than 50 per cent of the installed propulsion systems in the event of a single failure of a system or active item of equipment, see 1.1.3. In the event of a single failure in equipment, the remaining system(s) is to be capable of maintaining a service speed of not less than seven knots and, for **PSMR** and **PSMR★** notations, give adequate manoeuvring capability, see 1.2.4.

Propulsion and Steering Machinery Redundancy

Part 5, Chapter 22

Sections 3, 4 & 5

3.3.5 For ships operating with two or more generator sets in service connected to the switchboard, arrangements are to be such that, in the event of loss of one generator, the remaining set(s) is to be adequate for the continuity of essential services supplied from that switchboard. This may be achieved by preferential tripping of non-essential services. Alternatively, arrangements can be such that a standby generator will start automatically and connect to the switchboard on loss of one of the generator sets in service.

3.4 Essential services for machinery

3.4.1 Services essential for the operation of the propulsion machinery, steering and the supply of electrical power are to be arranged so that the ship will retain not less than 50 per cent of the prime mover capacity and 50 per cent of the installed propulsion systems and retain steering capability in the event of a single failure in any of the services, where required by the respective class notations.

3.5 Oil fuel storage and transfer systems

3.5.1 The arrangements for the storage of oil fuel bunkers are to ensure that there is an adequate supply of existing oil fuel on board to allow sufficient time for a shore-based quality analysis of new bunkers, in accordance with ISO 8217 *Petroleum Products – Fuels (Class F) Specification of Marine Fuels* prior to use.

3.5.2 Provision is to be made to enable samples of oil fuel to be taken at the bunkering manifolds.

Section 4 Control arrangements

4.1 General

4.1.1 This Section states the requirements for the installation of control, alarm and safety systems but does not signify that machinery spaces may be operated unattended. For unattended machinery space operation, compliance with Pt 6, Ch 1,4 is also required.

4.1.2 The control, alarm and safety systems required in 4.2 are to comply with Pt 6, Ch 1,2.

4.2 Bridge control

4.2.1 The controls, alarms, instrumentation and safeguards required in 4.2.2 to 4.2.6 are to be provided on the bridge.

4.2.2 For **PSMR**, **PSMR★**, **PMR** and **PMR★** notations, means are to be provided to ensure satisfactory control of propulsion in both the ahead and astern directions when all main propulsion systems are functioning and when one propulsion system is not available.

4.2.3 For **PSMR**, **PSMR★**, **SMR** and **SMR★** notations, means are to be provided to ensure satisfactory control of steering when all steering systems are functioning and when any one steering system is not available.

4.2.4 Where required by 5.4.3, isolation of essential services is to be carried out either automatically or manually from the bridge. Indication of the status of isolation arrangements is to be provided.

4.2.5 Instrumentation to indicate the operational status of running and standby machinery is to be provided for the propulsion systems, the supply of electrical power, steering systems and other essential services.

4.2.6 Alarms are to be provided in the event of:

- (a) A fire in any machinery compartment.
- (b) A high bilge level in any machinery compartment. Irrespective of the assignment of the **UMS** notation, the bilge level detection system and arrangements for automatically pumping bilges, if applicable, are to comply with Pt 6, Ch 1,4.6.

Section 5 Separate machinery spaces ★ (star) Enhancement

5.1 General

5.1.1 This Section states the additional requirements where propulsion and steering machinery are installed in separate compartments such that, in the event of the loss of one compartment, the ship will retain availability of propulsion power and manoeuvring capability.

5.1.2 The machinery arrangements, control arrangements and FMEA required by Sections 2 to 4, together with testing and trials requirements in Section 6, are to be complied with in addition to 5.2 to 5.7.

5.2 Machinery arrangements

5.2.1 The main propulsion machinery is to be arranged in not less than two compartments such that, in the event of the loss of one compartment, propulsion power and/or manoeuvring capability will continue to be available, where required by the respective class notations.

5.2.2 The steering systems are to be arranged in not less than two separate compartments, such that steering capability will continue to be available in the event of the loss of one compartment, where required by the respective class notations.

5.3 Electrical power supply

5.3.1 The generating sets and converting sets required by Pt 6, Ch 2,2 are to be arranged so that they are located in at least two separate machinery compartments.

5.3.2 The independent sections of the switchboard required by 3.3.1 are to be arranged in not less than two separate compartments.

5.3.3 In the event of the loss of one compartment, there is to be continuity of sufficient electrical power to supply essential services, such that propulsion power and steering capability will continue to be available.

5.4 Essential services for machinery

5.4.1 Services essential for the operation of the propulsion machinery, steering and the supply of electrical power are to be arranged, so that propulsion power and steering capability are maintained in the event of the loss of one machinery compartment.

5.4.2 The design of systems which may have a common source, such as those used for supplying oil fuel, lubricating oil, fresh and sea-water cooling, ventilation of compartments and engine starting energy, is to ensure continuous availability of supply in the event of the loss of any one compartment. Where applicable, continuous availability of heating services, oil fuel and water treatments is also to be provided. See 3.5 and 5.6 for oil fuel storage and transfer systems.

5.4.3 Where essential services are arranged so that they may supply machinery in another compartment, means of isolation from that compartment is to be provided.

5.4.4 Where pumps for essential services are arranged to supply more than one compartment, standby pumps for the same supplies are to be provided in a different compartment. The standby pumps are to be arranged to start automatically if the discharge pressure from the working pumps falls below a predetermined value.

5.5 Bilge drainage arrangements

5.5.1 The independent power pumps for bilge drainage are to be located in two separate watertight compartments. Each pump is to be capable of draining any compartment. Means of isolation from other compartments is to be provided.

5.5.2 In addition to the independent power pumps installed to comply with 5.5.1, an emergency bilge drainage arrangement is to be provided in each main propulsion machinery space.

5.5.3 Each separate machinery compartment is to be provided with at least one independent power pump direct bilge suction.

5.6 Oil fuel storage

5.6.1 The oil fuel service tanks required by Ch 14.4.18 are to be located in separate compartments.

5.6.2 Provision is to be made to ensure that oil fuel preparation and transfer arrangements to the oil fuel service tanks are continuously available in the event of the loss of any one compartment, see also 5.4.2.

5.7 FMEA

5.7.1 The FMEA required by 2.1.1 for the propulsion systems, electrical power supplies, essential services, control systems and steering arrangements is also to address the following:

- (a) Fire in a machinery space or control room.
- (b) Flooding of any watertight compartment which could affect propulsion or steering capability.
- (c) Separation of machinery spaces.

Section 6 Testing and trials

6.1 Sea trials

6.1.1 In addition to the requirements for sea trials in Ch 1.5.2, trials are to be carried out to demonstrate that when the ship is operating 50 per cent of the prime mover capacity and 50 per cent of the installed propulsion systems, a speed of not less than 7 knots can be maintained with adequate steering capability, where required by the respective class notations.

6.1.2 Trials are to be carried out to demonstrate the ship's steering capability in accordance with the assessment required by 1.2.4 with one steering system out of action.

6.1.3 Where the FMEA report has identified the need to prove the conclusions, testing and trials are to be carried out as necessary to investigate the following:

- (a) The effect of a specific component failure.
- (b) The effectiveness of automatic/manual isolation systems.
- (c) The behaviour of any interlocks that may inhibit operation of essential systems.

6.1.4 During sea trials, the operational envelope(s) is to be determined under the conditions detailed in 3.1.1 and/or 3.2.1, as required for the class notation.

Control Engineering Systems

Part 6, Chapter 1

Section 1

Section

- 1 **General requirements**
- 2 **Essential features for control, alarm and safety systems**
- 3 **Control and supervision of unattended machinery**
- 4 **Unattended machinery space(s) – UMS notation**
- 5 **Machinery operated from a centralised control station – CCS notation**
- 6 **Integrated computer control – ICC notation**
- 7 **Trials**

■ Section 1 General requirements

1.1 General

1.1.1 This Chapter applies to all ships intended to be classed with Lloyd's Register (hereinafter referred to as 'LR'), and is in addition to other relevant Sections of the Rules.

1.1.2 Whilst these requirements satisfy the regulations of the *International Convention for the Safety of Life at Sea*, 1974, and applicable amendments, attention should also be given to any relevant statutory requirements of the National Administration of the country in which the ship is to be registered.

1.1.3 Section 2 of this Chapter states requirements for alarm systems, safety systems and automatic or remote controls where fitted.

1.1.4 Section 3 of this Chapter states the essential alarms and safeguards which are required for unattended machinery as defined in 1.2.3, which under normal operating conditions is remotely controlled or is automatic in operation.

1.1.5 Section 4 of this Chapter states requirements which shall apply where it is intended to operate the ship with machinery spaces unattended. In general, ships complying with the requirements of Section 4 will be eligible for the class notation **UMS**, see Pt 1, Ch 2,2.

1.1.6 Section 5 of this Chapter states requirements which shall apply where it is intended to operate the ship with machinery spaces under continuous supervision from a centralised control station. In general, ships complying with the requirements of Section 5 will be eligible for the class notation **CCS**, see Pt 1, Ch 2,2.

1.1.7 Section 6 of this Chapter states requirements which shall apply where it is intended that the control and supervision of ship operational functions are computer based. In general ships complying with the requirements of Section 6 will be eligible for the class notation **ICC**, see Pt 1, Ch 2,2.

1.1.8 LR will be prepared to give consideration to special cases or to arrangements which are equivalent to the Rules.

1.2 Plans

1.2.1 Plans required by 1.2.2 to 1.2.7 are to be submitted in triplicate.

1.2.2 Where control, alarm and safety systems are intended for the machinery or equipment as defined in 1.2.3 the following are to be submitted:

- Description of operation with explanatory diagrams.
- Line diagrams of control circuits.
- List of monitored points.
- List of control points.
- List of alarm points.
- Test schedules (for both works testing and sea trials) which should include methods of testing and test facilities provided, see 1.3.1.
- Failure Mode and Effects Analysis (FMEA) where required by other sections of the Rules.
- List of safety functions and details of any overrides, including consequences of use, see 2.4.9 and 2.6.9.

1.2.3 Plans for the control, alarm and safety systems of the following are to be submitted:

- Air compressors.
- Bilge and ballast systems.
- Cargo pumping systems for tankers.
- Cargo and ballast pumps in hazardous areas.
- Controllable pitch propellers.
- Electric generating plant.
- Fixed water based local application fire-fighting systems, see 2.9.
- Incinerators.
- Inert gas generators.
- Main propelling machinery including essential auxiliaries.
- Miscellaneous machinery or equipment (where control, alarm and safety systems are specified by other Sections of the Rules).
- Oil fuel transfer and storage systems.
- Steam raising plant. (Boilers and their ancillary equipment).
- Steering gear.
- Thermal fluid heaters.
- Transverse thrust units.
- Valve position indicating systems.
- Waste-heat boiler.
- Waterjets for propulsion purposes.
- Cargo tank, ballast tank and void space instrumentation where such arrangements are specified by other sections of the Rules (e.g. water ingress detection, gas detection).

1.2.4 **Alarm systems.** Details of the overall alarm system linking the main control station, subsidiary control stations, the bridge area and accommodation are to be submitted.

Control Engineering Systems

Part 6, Chapter 1

Sections 1 & 2

1.2.5 Programmable electronic systems. In addition to the documentation required by 1.2.2 the following is to be submitted:

- System requirements specification.
- System integration plan, see 2.13.2.
- Failure Mode and Effects Analysis (FMEA), see 2.13.5
- Details of the hardware configuration in the form of a system block diagram, including input/output schedules.
- Hardware certification details, see 2.10.5 and 2.12.3.
- Software quality plans, including applicable procedures, see 2.10.21.
- Factory acceptance, integration and sea trial test schedules for hardware and software.

1.2.6 Control station. Location and details of control stations are to be submitted, e.g. control panels and consoles.

1.2.7 Fire detection systems. Plans showing the system operation and the type and location of all machinery space fire detector heads, manual call points and the fire detector indicator panel(s) are to be submitted. The plans are to indicate the position of the fire detectors in relation to significant items of machinery, ventilation and extraction openings.

1.2.8 Approved system. Where it is intended to employ a standard system which has been previously approved, plans are not required to be submitted, providing there have been no changes in the applicable Rule requirements. The building port, where applicable, and date of the previous approval is to be advised.

1.2.9 Cables. For details of instrumentation and control system cabling requirements, see Ch 2,10.

1.3 Control, alarm and safety equipment

1.3.1 Major units of equipment associated with control, alarm and safety systems as defined in 1.2.3 are to be surveyed at the manufacturers' works in accordance with the approved test schedule (see 1.2.2), and the inspection and testing are to be to the Surveyor's satisfaction.

1.3.2 Equipment used in control, alarm and safety systems is to be suitable for its intended purpose, and accordingly, whenever practicable, be selected from the *List of Type Approved Products* published by LR. A copy of the *Procedure for LR Type Approval System* will be supplied on application. For fire detection alarm systems, see 2.8.8 and for programmable electronic systems, see 2.10.5 and 2.12.3.

1.3.3 Where equipment requires a controlled environment, an alternative means is to be provided to maintain the required environment in the event of a failure of the normal air conditioning system, see also Table 1.3.12.

1.3.4 Assessment of performance parameters, such as accuracy, repeatability, etc., are to be in accordance with an acceptable National or International Standard, e.g. IEC 60051, Direct acting indicating analogue electrical measuring instruments and their accessories.

1.3.5 Special consideration will be given to arrangements that comply with a relevant and acceptable national or international standard, such as IEC 60092-504, *Electrical Installation on Ships – Special Features: Control and Instrumentation*.

1.4 Alterations and additions

1.4.1 When an alteration or addition to the approved system(s) is proposed, plans are to be submitted for approval. The alterations or additions are to be carried out under survey and the installation and testing are to be to the Surveyor's satisfaction.

1.4.2 Details of proposed software modifications are to be submitted for consideration. Where the modification may affect compliance with these Rules, proposals for verification and validation are also to be submitted.

1.4.3 Software versions are to be uniquely identified by number, date or other appropriate means. Modifications are not to be made without also changing the version identifier. A record of changes to the system since the original issue (and their identification) is to be maintained and made available to the LR Surveyor on request.

Section 2 Essential features for control, alarm and safety systems

2.1 General

2.1.1 Where it is proposed to install control, alarm and safety systems to the equipment defined in 1.2.3 the applicable features contained in this Section are to be incorporated in the system design.

2.1.2 Systems complying with ISO 17894, *Ships and marine technology – Computer applications – General principles for the development and use of programmable electronic systems in marine applications*, may be accepted as meeting the requirements of this Section, in which case evidence of compliance is to be submitted for consideration.

2.2 Control stations for machinery

2.2.1 A system of alarm displays and controls is to be provided which readily ensures identification of faults in the machinery and satisfactory supervision of related equipment. This may be provided at a main control station or, alternatively at subsidiary control stations. In the latter case, a master alarm display is to be provided at the main control station showing which of the subsidiary control stations is indicating a fault condition.

2.2.2 At the main control station (if provided) or close to the subsidiary stations (if fitted) means of communication with the bridge area, the accommodation for engineering personnel and, if necessary, the machinery space are to be provided.

Control Engineering Systems

Part 6, Chapter 1

Section 2

2.2.3 Provision is to be made at the main control station, or subsidiary control stations as appropriate, for the operation of an engineers' alarm which is to be clearly audible in the engineers' accommodation.

2.2.4 Provision is to be made at the main control station and any other subsidiary control station from which the main propulsion and auxiliary machinery or associated equipment may be controlled to indicate which station is in control.

2.2.5 Control of machinery and associated equipment is to be possible only from one station at a time.

2.2.6 Changeover between control stations is to be arranged so that it may only be effected with the acceptance of the station taking control. The system is to be provided with interlocks or other suitable means to ensure effective transfer of control.

2.2.7 For additional requirements where control stations incorporate visual display units and keyboard input facilities, see 2.10.

2.3 Alarm systems, general requirements

2.3.1 Where an alarm system, which will provide warning of faults in the machinery and the safety and control systems, is to be installed, the requirements of 2.3.2 to 2.3.18 are to be satisfied.

2.3.2 Machinery, safety and control system faults are to be indicated at the relevant control stations to advise duty personnel of a fault condition. The presence of unrectified faults is to be clearly indicated at all times.

2.3.3 Alarms associated with machinery, safety and control system faults are to be clearly distinguishable from other alarms (e.g. fire, general alarm).

2.3.4 Where alarms are displayed as group alarms provision is to be made to identify individual alarms at the main control station (if fitted) or alternatively at subsidiary control stations.

2.3.5 All alarms are to be both audible and visual. If arrangements are made to silence audible alarms they are not to extinguish visual alarms.

2.3.6 Acknowledgement of visual alarms is to be clearly indicated.

2.3.7 Acknowledgement of alarms at positions outside a machinery space is not to silence the audible alarm or extinguish the visual alarm in that machinery space.

2.3.8 If an alarm has been acknowledged and a second fault occurs prior to the first being rectified, audible and visual alarms are again to operate. Where alarms are displayed at a local panel adjacent to the machinery and with arrangements to provide a group or common fault alarm at the main control room alarm display, then the occurrence of a second fault prior to the first alarm being rectified need only be displayed at the local panel, however, the group alarm is to be

re-initiated. Unacknowledged alarms on monitors are to be distinguished by either flashing text or a flashing marker adjacent to the text. A change of colour will not in itself be sufficient to distinguish between acknowledged and unacknowledged alarms.

2.3.9 For the detection of transient faults which are subsequently self-correcting, alarms are required to lock in until accepted.

2.3.10 The alarm system is to be arranged with automatic changeover to a standby power supply in the event of a failure of the normal power supply. Where an alarm system could be adversely affected by an interruption in power supply, changeover to the standby power supply is to be achieved without a break.

2.3.11 Failure of any power supply to the alarm system is to operate an audible and visual alarm.

2.3.12 The alarm system should be designed with self-monitoring properties. Insofar as practicable, any fault in the alarm system should cause it to fail to the alarm condition.

2.3.13 The alarm system is to be capable of being tested during normal machinery operation, see 7.1.2.

2.3.14 The alarm system is to be designed as far as practicable to function independently of control and safety systems such that a failure or malfunction in these systems will not prevent the alarm system from operating.

2.3.15 Disconnection or manual overriding of any part of the alarm system should be clearly indicated.

2.3.16 When alarm systems are provided with means to adjust their set point, the arrangements are to be such that the final settings can be readily identified.

2.3.17 Where monitors are provided at the station in control and, if fitted, in the duty engineer's accommodation, they are to provide immediate display of new alarm information regardless of the information display page currently selected. This may be achieved by provision of a dedicated alarm monitor, a dedicated area of screen for alarms or other suitable means.

2.3.18 Where practicable, alarms displayed on monitors are to be displayed in the order in which they occur. Alarms requiring shutdown or slowdown action are to be given visual prominence.

2.4 Safety systems, general requirements

2.4.1 Where safety systems are provided the requirements of 2.4.2 to 2.4.13 are to be satisfied. The requirements of this sub-Section apply, where relevant, to the safety systems installed on the equipment defined in 1.2.3, including those provided in addition to those safeguards required by Section 3 or other Sections of the Rules.

Control Engineering Systems

Part 6, Chapter 1

Section 2

2.4.2 Safety systems are to operate automatically in case of serious faults endangering the machinery, so that:

- (a) normal operating conditions are restored, e.g. by the starting of standby machinery, or
- (b) the operation of the machinery is temporarily adjusted to the prevailing conditions, e.g. by reducing the output of the machinery, or
- (c) the machinery is protected from critical conditions by shutting off the fuel or power supplies thereby stopping the machinery.

2.4.3 The safety system required by 2.4.2(c) is to be designed as far as practicable to operate independently of the control and alarm systems, such that a failure or malfunction in the control and alarm systems will not prevent the safety system from operating, see 3.1.4.

2.4.4 For safety systems required by 2.4.2(a) and (b) complete independence from other control systems is not necessary.

2.4.5 Safety systems for different items of the machinery plant are to be arranged so that failure of the safety system of one part of the plant will not interfere with the operation of the safety system in another part of the plant.

2.4.6 The safety system is to be designed to 'fail-safe'. The characteristics of the 'fail-safe' operation are to be evaluated on the basis not only of the safety system and its associated machinery, but also the complete installation. Failure of a safety system is to initiate an audible and visual alarm.

2.4.7 When a safety system is activated, an audible and visual alarm is to be provided to indicate the cause of the safety action.

2.4.8 The safety system is to be manually reset before the relevant machinery can be restarted.

2.4.9 Where arrangements are provided for overriding a safety system, they are to be such that inadvertent operation is prevented. Visual indication is to be given at the relevant control station(s) when a safety override is operated. The consequences of overriding a safety system are to be established and documented.

2.4.10 The safety system is to be arranged with automatic changeover to a standby power supply in the event of a failure of the normal power supply.

2.4.11 Failure of any power supply to a safety system is to operate an audible and visual alarm.

2.4.12 When safety systems are provided with means to adjust their set point, the arrangements are to be such that the final settings can be readily identified.

2.4.13 As far as practicable, the safety system required by 2.4.2(b) is to be arranged to effect a rapid reduction in speed or power.

2.5 Control systems, general requirements

2.5.1 Where control systems are provided, the requirements of 2.5.2 to 2.5.8 are to be satisfied.

2.5.2 Control systems for machinery operations are to be stable throughout their operating range.

2.5.3 Failure of any power supply to a control system is to operate an audible and visual alarm.

2.5.4 Control systems should be designed to 'fail-safe'. The characteristics of the 'fail-safe' operation are to be evaluated on the basis not only of the control system and its associated machinery, but also the complete installation.

2.5.5 The control system is to be designed such that normal operation of the controls cannot induce detrimental mechanical or thermal overloads in the machinery.

2.5.6 Remote or automatic controls are to be provided with sufficient instrumentation at the relevant control stations to ensure effective control and indicate that the system is functioning correctly.

2.5.7 When control systems are provided with means to adjust their sensitivity or set point, the arrangements are to be such that the final settings can be readily identified.

2.5.8 Failure of a control system is not to result in the loss of ability to provide essential services by alternative means. This may be achieved by manual control or redundancy within the control system or redundancy in machinery and equipment, see *also* 2.12.2. Instrumentation is to be provided at local manual control stations to ensure effective operation of the machinery.

2.6 Bridge control for main propulsion machinery

2.6.1 Where a bridge control system for main propulsion machinery is to be fitted, the requirements of 2.6.2 to 2.6.8 are to be satisfied.

2.6.2 Means are to be provided to ensure satisfactory control of propulsion from the bridge in both the ahead and astern directions.

2.6.3 The following indications are to be provided on the bridge:

- (a) Propeller speed.
- (b) Direction of rotation of propeller for a fixed pitch propeller or pitch position for a controllable pitch propeller, see *also* 3.10.
- (c) Direction and magnitude of thrust.
- (d) Clutch position, where applicable.
- (e) Shaft brake position, where applicable.

2.6.4 The propeller speed, direction of rotation and, if applicable, the propeller pitch are to be controlled from the bridge under all sea-going and manoeuvring conditions.

Control Engineering Systems

Part 6, Chapter 1

Section 2

2.6.5 Remote control of the propulsion machinery is to be from one control station at any one time, *see also* 2.2.5. Main propulsion control units on the navigating bridge may be interconnected. Means are to be provided at the main machinery control station to ensure smooth transfer of control between the bridge and machinery control stations.

2.6.6 Means of control, independent of the bridge control system, are to be provided on the bridge to enable the watch-keeper to stop the propulsion machinery in an emergency.

2.6.7 Audible and visual alarms are to operate on the bridge and in the alarm system required by 4.2 if any power supply to the bridge control system fails. Where practicable, the preset speed and direction of thrust are to be maintained until corrective action is taken.

2.6.8 Two means of communication are to be provided between the bridge and the main control station in the machinery space. One of these means may be the bridge control system; the other is to be independent of the main electrical power supply, *see also* 2.2.2 and Pt 5, Ch 1,4.

2.6.9 Automation systems are to be designed in a manner such that a threshold warning of impending or imminent slowdown or shutdown of the propulsion system is given to the officer in charge of the navigational watch in time to assess navigational circumstances in an emergency. In particular, the systems are to control, monitor, report, alert and take safety action to slow down or stop propulsion while providing the officer in charge of the navigational watch an opportunity to manually intervene, except for those cases where manual intervention will result in total failure of the engine and/or propulsion equipment within a short time, for example in the case of overspeed.

2.7 Valve control systems

2.7.1 Where cargo, bilge, ballast, oil fuel transfer and sea valves for engine services are operated by remote or automatic control, the requirements of 2.7.2 to 2.7.5 are to be satisfied.

2.7.2 Failure of control system power or actuator power is not to permit a valve to move to an unsafe condition.

2.7.3 Positive indication is to be provided at the remote control station for the service to show the actual valve position or alternatively that the valve is fully open or closed.

2.7.4 Equipment located in places which may be flooded is to be capable of operating when submerged.

2.7.5 A secondary means of operating the valves, which may be by local manual control, is to be provided.

2.7.6 For requirements applicable to closing appliances on scuppers and sanitary discharges, *see* Pt 3, Ch 12,4.2. For power supplies on passenger ships, *see* Ch 2,3.2.

2.8 Fire detection alarm systems

2.8.1 Where an automatic fire detection system is to be fitted in a machinery space the requirements of 2.8.2 to 2.8.14 are to be satisfied. *See also* SOLAS 1974 as amended Reg. II-2/C,7, or Chapter 4 as applicable.

2.8.2 A fire detection control unit is to be located in the navigating bridge area, the fire-control station, or in some other position such that a fire in the machinery spaces will not render it inoperable.

2.8.3 Fire detection indicating panels are to denote the section in which a detector or manually operated call point has operated. At least one indicating panel is to be so located that it is easily accessible to responsible members of the crew at all times. An indicating panel is to be located on the navigating bridge.

2.8.4 An audible fire-alarm is to be provided having a characteristic tone which distinguishes it from the alarm system required by 2.3 or any other alarm system. The audible fire-alarm is to be immediately audible on all parts of the navigating bridge, the fire-control station, the crew accommodation areas and the machinery spaces.

2.8.5 Facilities are to be provided in the fire detection system to manually initiate the fire alarm from the following locations:

- (a) Positions adjacent to all exits from machinery spaces.
- (b) Navigating bridge.
- (c) Control station in engine room.
- (d) Fire control station.

2.8.6 The alarm system is to be designed with self-monitoring properties. Power or system failures are to initiate an audible alarm distinguishable from the fire alarm. This alarm may be incorporated in the machinery alarm system as required by 2.3.

2.8.7 For electrical engineering requirements, *see* Ch 2,16.1.

2.8.8 Fire detection control units (including addressable systems), indicating panels, detector heads, manual call points and short-circuit isolation units are to be Type Approved in accordance with *Test Specification Number 1* given in LR's *Type Approval System* for an environmental category appropriate for the locations in which they are intended to operate. For addressable systems, *see also* 2.10.

2.8.9 Detector heads are to be located in the machinery spaces so that all potential fire outbreak points are guarded. A combination of detectors is to be provided in order that the system will react to all possible fire characteristics.

2.8.10 When fire detectors are provided with means to adjust their sensitivity, the arrangements are to be such that the set point can be fixed and readily identified.

2.8.11 When it is intended that a particular loop is to be temporarily switched off, this state is to be clearly indicated at the fire detection indicating panels.

Control Engineering Systems

Part 6, Chapter 1

Section 2

2.8.12 When it is intended that a particular detector(s) is (are) to be temporarily switched off locally, this state is to be clearly indicated at the local position. Reactivation of the detector(s) is to be performed automatically after a preset time.

2.8.13 The fire detector heads are to be of a type which can be tested and reset without the renewal of any component. Facilities are to be provided on the fire-control panel for functional testing and reset of the system.

2.8.14 It is to be demonstrated to the Surveyor's satisfaction that detector heads are so located that air currents will not render the system ineffective at sea and in port.

2.9 Fixed water-based local application fire-fighting systems

2.9.1 Where fixed water-based local application fire-fighting systems are installed in accordance with SOLAS as amended Ch. II-2/C, Reg. 10.5.6, arrangements are to be in accordance with this sub-Section.

2.9.2 Systems are to be available for immediate use and arranged for manual activation from inside and outside the protected space. See also Ch 2,16.3.4.

2.9.3 The activation of a system is not to result in loss of electrical power or reduction of the manoeuvrability of the ship and is not to require confirmation of space evacuation or sealing, see also Ch 2,16.3.12.

2.9.4 System zones and protected areas are to be arranged to allow essential services to be provided by machinery and/or equipment located outside areas affected by direct spray or extended water in the event of a system activation, where the machinery and/or equipment is duplicated or otherwise replicated to provide redundancy.

2.9.5 A control panel is to be provided for managing actions such as opening of valves, starting of pumps and sounding of alarms and processing information from detectors. This panel is to be independent of the fire detection control unit required by 2.8.

2.9.6 Alarms are to be initiated upon activation of a system and are to indicate the specific zone activated at the control panel. Alarms are to be provided in each protected space, at an attended machinery control station and in the wheelhouse. The audible alarm is to be distinguishable from other safety system alarms.

2.9.7 A failure in a manual system activation switch circuit is not to prevent system activation using other installed manual system activation switches or, where installed, automatic activation. The means of activation are to be provided with self-monitoring facilities which will activate an alarm at an attended control station in the event of failure detection.

2.9.8 Where SOLAS requires the system to, additionally, be capable of automatic release, the arrangements are to be in accordance with 2.9.9 to 2.9.12.

2.9.9 A minimum of two fire detectors are to be provided for each protected area. One is to be a flame detector and the other is to be a smoke or heat detector, as considered appropriate to the nature of the risk and ambient conditions. The system is to be activated upon detection by two of the detectors. A fault in one detector is to initiate an alarm at an attended control station and is not to inhibit activation of the system under the control of the other detector or manually.

2.9.10 The fire detectors are to be arranged (located, oriented, guarded, etc.) to ensure that a fire in one protected area will not result in the inadvertent automatic activation of a system for another protected area. Guards or barriers provided to comply with this requirement are not to reduce the ability to detect a fire in the protected area.

2.9.11 A fire detection alarm system panel in accordance with 2.8 may be used for receiving fire detection signals. Separate loops are not required provided that the address of the initiating device can be identified at the control panel. The received signals are then to be sent to the control panel required by 2.9.5 for processing and action.

2.9.12 The system's fire detection systems and control units are to meet the performance criteria of SOLAS Ch II/C, Reg. 7 and are to be Type Approved in accordance with *Test Specification Number 1* given in LR's *Type Approval System* for an environmental category appropriate for the locations in which they are intended to operate.

2.10 Programmable electronic systems – General requirements

2.10.1 The requirements of this sub-Section are to be complied with where control, alarm or safety systems incorporate programmable electronic equipment. Systems for essential services and safety critical applications, systems incorporating shared data communication links and systems which are integrated are to comply with the additional requirements of 2.11, 2.12 and 2.13 as applicable. For systems complying with ISO 17894, *Ships and marine technology – Computer applications – General principles for the development and use of programmable electronic systems in marine applications*, see 2.1.2.

2.10.2 Where programmable electronic systems share resources, any components that can affect the ability to effectively provide required control, alarm or safety functions are to fulfil the requirements of 2.10 to 2.13 related to providing those required functions.

2.10.3 Programmable electronic equipment is to revert to a defined safe state on initial start-up or re-start in the event of failure.

2.10.4 In the event of failure of any programmable electronic equipment, the system, and any other system to which it is connected, is to fail to a defined safe state or maintain safe operation, as applicable.

2.10.5 Programmable electronic equipment is to be certified by a recognised authority as suitable for the environmental conditions in which it is intended to operate, see also 2.12.3.

Control Engineering Systems

Part 6, Chapter 1

Section 2

2.10.6 Emergency stops are to be hard-wired and independent of any programmable electronic equipment. Alternatively, the system providing emergency stop functions is to comply with the requirements of 2.12.2 and/or 2.12.8.

2.10.7 Programmable electronic equipment is to be provided with self-monitoring capabilities such that hardware and functional failures will initiate an audible and visual alarm in accordance with the requirements of 2.3 and, where applicable, 4.2. Hardware failure indications are to enable faults to be identifiable at least down to the level of the lowest replaceable unit and the self-monitoring capabilities are to ensure that diagnostic information is readily available.

2.10.8 System configuration, programs and data are to be protected against loss or corruption in the event of failure of any power supply.

2.10.9 Access to system configuration, programs and data is to be restricted by physical and/or logical means providing effective security against unauthorised alteration.

2.10.10 Where date and time information is required by the equipment, this is to be provided by means of a battery backed clock with restricted access for alteration. Date and time information is to be fully represented and utilised.

2.10.11 Displays and controls are to be protected against liquid ingress due to spillage.

2.10.12 User interfaces are to be designed in accordance with appropriate ergonomic principles to meet user needs and enable timely access to desired information or control of functions. A system overview is to be readily available.

2.10.13 The keyboard is to be divided logically into functional areas. Alphanumeric, paging and specific system keys are to be grouped separately.

2.10.14 Where a function may be accessed from more than one interface, the arrangement of displays and controls is to be consistent.

2.10.15 The size, colour and density of information displayed to the operator are to be such that information may be easily read from the normal operator position under all operational lighting conditions.

2.10.16 Display units are to comply with the requirements of International Electrotechnical Commission Standard IEC 60950:1991, *Safety of information technology equipment, including electrical business equipment*, in respect of emission of ionising radiation.

2.10.17 Symbols used in mimic diagrams are to be visually representative and are to be consistent throughout the systems' displays.

2.10.18 Where systems detect fault conditions, any affected mimic diagrams are to ensure that the status of unreliable and incorrect data is clearly identified.

2.10.19 Multi-function displays and controls are to be duplicated and interchangeable where used for the control or monitoring of more than one system, machinery item or item of equipment. At least one unit at the main control station is to be supplied from an independent uninterruptible power system (UPS).

2.10.20 The number of multi-function display and control units provided at the main control station and their power supply arrangements are to be sufficient to ensure continuing safe operation in the event of failure of any unit or any power supply.

2.10.21 Software lifecycle activities, e.g. design, development, supply and maintenance, are to be carried out in accordance with an acceptable quality management system. Software quality plans are to be submitted. These are to demonstrate that the provisions of ISO/IEC 90003:2004, *Software engineering – Guidelines for the application of ISO 9001:2000 to computer software*, or equivalent, are incorporated. The plans are to define responsibilities for the lifecycle activities, including verification, validation, module testing and integration with other components or systems.

2.11 Data communication links

2.11.1 Where control, alarm or safety systems use shared data communication links to transfer data, the requirements of 2.11.2 to 2.11.10 are to be complied with. The requirements apply to local area networks, fieldbuses and other types of data communication link which make use of a shared medium to transfer control, alarm or safety related data between distributed programmable electronic equipment or systems.

2.11.2 Data communication is to be automatically restored within 45 seconds in the event of a single component failure. Upon restoration, priority is to be given to updating safety critical data and control, alarm and safety related data for essential services. Components comprise all items required to facilitate data communication, including cables, switches, repeaters, software components and power supplies.

2.11.3 Loss of a data communication link is not to result in the loss of ability to operate any essential service by alternative means, see also 2.12.2.

2.11.4 The properties of the data communication link (e.g. bandwidth, access control method, etc.) are to ensure that all connected systems will operate in a safe, stable and repeatable manner under all operating conditions. The latency of control, alarm and safety related data is not to exceed two seconds.

2.11.5 Protocols are to ensure the integrity of control, alarm and safety related data, and provide timely recovery of corrupted or invalid data.

2.11.6 Means are to be provided to monitor performance and identify hardware and functional failures. An audible and visual alarm is to operate in accordance with the requirements of 2.3 and, where applicable, 4.2 in the event of a failure of an active or standby component.

Control Engineering Systems

Part 6, Chapter 1

Section 2

2.11.7 Means are to be provided to prevent unintended connection or disconnection of any equipment where this may affect the performance of any other systems in operation.

2.11.8 Data cables are to comply with the applicable requirements of Ch 2,10. Other media will be subject to special consideration.

2.11.9 The installation is to provide adequate protection against mechanical damage and electromagnetic interference.

2.11.10 Components are to be located with appropriate segregation such that the risk of mechanical damage or electromagnetic interference resulting in the loss of both active and standby components is minimised. Duplicated data communication links are to be routed to give as much physical separation as is practical.

2.12 Programmable electronic systems – Additional requirements for essential services and safety critical systems

2.12.1 The requirements of 2.12.2 to 2.12.10 are to be complied with where control, alarm or safety systems for essential services, as defined by Ch 2,1.5, or safety critical systems, incorporate programmable electronic equipment.

- (a) Safety critical systems are those which provide functions intended to protect persons from physical hazards (e.g. fire, explosion, etc.), or to prevent mechanical damage which may result in the loss of an essential service (e.g. main engine low lubricating oil pressure shutdown).
- (b) Applications that are not essential services may also be considered to be safety critical (e.g. domestic boiler low water level shutdown).

2.12.2 Alternative means of safe and effective operation are to be provided for essential services and, wherever practicable, these are to be provided by a fully independent hard-wired backup system. Where these alternative means are not independent of any programmable electronic equipment, the software is to satisfy the requirements of LR's *Software Conformity Assessment System – Assessment Module GEN1 (1994)*.

2.12.3 Items of programmable electronic equipment used to implement control, alarm and safety functions are to satisfy the requirements of LR's *Type Approval System Test Specification Number 1 (2002)*.

2.12.4 The system is to be configured such that control, alarm and safety function groups are independent. A failure of the system is not to result in the loss of more than one of these function groups. Proposals for alternative arrangements providing an equivalent level of safety will be subject to special consideration.

2.12.5 For essential services, the system is to be arranged to operate automatically from an alternative power supply in the event of a failure of the normal supply.

2.12.6 Failure of any power supply is to initiate an audible and visual alarm in accordance with the requirements of 2.3 and, where applicable, 4.2.

2.12.7 Where it is intended that the programmable electronic system implements emergency stop or safety critical functions, the software is to satisfy the requirements of LR's *Software Conformity Assessment System – Assessment Module GEN1 (1994)*. Alternative proposals providing an equivalent level of system integrity will be subject to special consideration, e.g. fully independent hard-wired backup system, redundancy with design diversity, etc.

2.12.8 Control, alarm and safety related information is to be displayed in a clear, unambiguous and timely manner, and, where applicable, is to be given visual prominence over other information on the display.

2.12.9 Means of access to safety critical functions are to be dedicated to the intended function and readily distinguishable.

2.13 Programmable electronic systems – Additional requirements for integrated systems

2.13.1 The requirements of 2.13.2 to 2.13.7 apply to integrated systems providing control, alarm or safety functions in accordance with the Rules, including systems capable of independent operation interconnected to provide co-ordinated functions or common user interfaces. Examples include integrated machinery control, alarm and monitoring systems, power management systems and safety management systems providing a grouping of fire, passenger, crew or ship safety functions, see Ch 2,16 to 18.

2.13.2 System integration is to be managed by a single designated party, and is to be carried out in accordance with a defined procedure identifying the roles, responsibilities and requirements of all parties involved. This procedure is to be submitted for consideration where the integration involves control functions for essential services or safety functions including fire, passenger, crew, and ship safety.

2.13.3 The system requirements specification, see 1.2.5, is to identify the allocation of functions between modules of the integrated system, and any common data communication protocols or interface standards required to support these functions.

2.13.4 Reversionary modes of operation are to be provided to ensure safe and graceful degradation in the event of one or more failures. In general, the integrated system is to be arranged such that the failure of one part will not affect the functionality of other parts, except those that require data from the failed part.

2.13.5 Where the integration involves control functions for essential services or safety functions, including fire, passenger, crew, and ship safety, a Failure Mode and Effects Analysis (FMEA) is to be carried out in accordance with IEC 60812, or an equivalent and acceptable national or international standard and the report and worksheets submitted for consideration. The FMEA is to demonstrate that

Control Engineering Systems

Part 6, Chapter 1

Sections 2 & 3

the integrated system will 'fail-safe', see 2.4.6 and 2.5.4, and that essential services in operation will not be lost or degraded beyond acceptable performance criteria where specified by these Rules.

2.13.6 The quantity and quality of information presented to the operator are to be managed to assist situational awareness in all operating conditions. Excessive or ambiguous information that may adversely affect the operator's ability to reason or act correctly is to be avoided, but information needed for corrective or emergency actions is not to be suppressed or obscured in satisfying this requirement.

2.13.7 Where information is required by the Rules or by National Administration requirements to be continuously displayed, the system configuration is to be such that the information may be viewed without manual intervention, e.g. the selection of a particular screen page or mode of operation. See also 2.10.19 and 2.10.20.

■ Section 3 Control and supervision of unattended machinery

3.1 General

3.1.1 Where machinery, as listed in 1.2.3, is fitted with automatic or remote controls so that under normal operating conditions it does not require any manual intervention by the operators, it is to be provided with the alarms and safety arrangements required by 3.2 to 3.15 as appropriate. Alternative arrangements which provide equivalent safeguards will be considered.

3.1.2 Where machinery is arranged to start automatically or from a remote control station, interlocks are to be provided to prevent start-up under conditions which could hazard the machinery.

3.1.3 Where machinery specified in this Section is required to be provided with a standby pump, the standby pump is to start automatically if the discharge pressure from the working pumps falls below a predetermined value.

3.1.4 Where a first stage alarm together with a second stage alarm and automatic shutdown of machinery are required in the relevant Tables of this Section, the sensors and circuits utilised for the second stage alarm and automatic shutdown are to be independent of those required for the first stage alarm.

3.1.5 Means are to be provided to prevent leaks from high pressure oil fuel injection piping for main and auxiliary engines dripping or spraying onto hot surfaces or into machinery air inlets. Such leakage is to be collected and, where practicable, led to a collector tank(s) fitted in a safe position. An alarm is to be provided to indicate that leakage is taking place. These requirements may also be applicable to high pressure hydraulic oil piping depending upon the location.

3.1.6 Oil mist monitoring, or engine bearing temperature monitors or alternative methods for crankcase protection are to be provided:

- (a) When arrangements are fitted to override the automatic shutdown for excessive reduction of the lubricating oil supply pressure.
- (b) For engines of 2 250 kW and above or having cylinders of more than 300 mm bore.

NOTES

1. For medium and high speed engines automatic shutdown of the engine is to occur.
2. For slow speed engines, automatic slowdown is to occur.
3. Where arrangements are made to override the automatic slowdown or shutdown due to high oil mist or bearing temperature, the override is to be independent of other overrides.
4. Where the bearing temperature monitoring method is chosen, all bearings in the crankcase are to be monitored where practicable, e.g. main, crankpin, crosshead.
5. Where alternative methods are provided for the prevention of the build-up of oil mist that may lead to a potentially explosive condition within the crankcase, details are to be submitted for consideration. The submission is to demonstrate that the arrangements are equivalent to those provided by oil mist monitoring or engine bearing temperature monitors, see Pt 5, Ch 2,6.9.14.

3.2 Oil engines for propulsion purposes

3.2.1 Alarms and safeguards are indicated in 3.2.2 to 3.2.8 and Tables 1.3.1(a) and (b), see also 3.1.5 and 3.1.6.

3.2.2 Alarms are to operate for the fault conditions shown in Table 1.3.1(a). Where applicable, indication is to be given at the relevant control stations that the speed or power of the main propulsion engine(s) is to be manually reduced or has been reduced automatically.

3.2.3 Alarms are to operate, and automatic shutdown of machinery is to occur for the fault conditions shown in Table 1.3.1(b).

3.2.4 The following engine services are to be fitted with automatic temperature controls so as to maintain steady state conditions throughout the normal operating range of the propulsion engine(s).

- (a) Lubricating oil supply.
- (b) Oil fuel supply, see also 3.2.5.
- (c) Piston coolant supply, where applicable.
- (d) Cylinder coolant supply, where applicable.
- (e) Fuel valve coolant supply, where applicable.

3.2.5 The oil fuel supply may be fitted with an automatic control for viscosity instead of the temperature control required by 3.2.4.

3.2.6 Indication of the starting air pressure is to be provided at each control station from which it is possible to start the main propulsion engine(s).

Control Engineering Systems

Part 6, Chapter 1

Section 3

**Table 1.3.1(a) Oil engines for propulsion purposes:
Alarms and slowdowns**
(see continuation)

Item	Alarm	Note
Lubricating oil sump level	Low	Engines (and gearing if fitted)
Lubricating oil inlet pressure*	1st stage low	Engines (and gearing if fitted). Slowdown
Lubricating oil inlet temperature*	High	Engines (and gearing if fitted)
Lubricating oil filters differential pressure	High	—
Oil mist concentration in crankcase or bearing temperature	High	Automatic slowdown of slow speed engines, see 3.1.6
Cylinder lubricator flow	Low	One sensor per lubricator unit. Slowdown (automatic on medium and high speed engines)
Thrust bearing temperature*	High	Slowdown
Piston coolant inlet pressure	Low	If a separate system. Slowdown
Piston coolant outlet temperature*	High	Per cylinder (if a separate system). Slowdown
Piston coolant outlet flow*	Low	Per cylinder (if a separate system). Slowdown
Cylinder coolant inlet pressure or flow*	Low	Slowdown (automatic on medium and high speed engines)
Cylinder coolant outlet temperature*	1st stage high	Per cylinder (if a separate system). Slowdown (automatic on medium and high speed engines)
Engine cooling water system – oil content	High	Where engine cooling water used in oil/water heat exchangers
Sea water cooling pressure	Low	—
Fuel valve coolant pressure	Low	If a separate system
Fuel valve coolant temperature	High	If a separate system
Oil fuel pressure from booster pump	Low	—
Oil fuel temperature or viscosity*	High and Low	Heavy oil only
Oil fuel high pressure piping*	Leakage	See 3.1.5
Charge air cooler outlet temperature	High and Low	4-stroke medium and high speed engines
Scavenge air temperature (fire)	High	Per cylinder (2-stroke engines). Slowdown
Scavenge air receiver water level	High	—

**Table 1.3.1(a) Oil engines for propulsion purposes:
Alarms and slowdowns**
(conclusion)

Item	Alarm	Note
Exhaust gas temperature*	High	Per cylinder. Slowdown (automatic on medium and high speed engines) See Note 5
Exhaust gas temperature deviation from average*	High	Per cylinder, See Note 5
Turbocharger exhaust gas inlet temperature	High	Each turbocharger See Note 6
Turbocharger exhaust gas outlet temperature*	High	Each turbocharger
Turbocharger lubricating oil inlet pressure	Low	If system not integral with turbocharger
Turbocharger lubricating oil outlet temperature	High	Each bearing, if system not integral with turbocharger
Starting air pressure*	Low	Before engine manoeuvring valve
Control air pressure	Low	—
Direction of rotation	Wrong way	Reversible engines, see also 3.2.7
Overspeed*	High	See also Pt 5, Ch 2,5
Automatic start of engine	Failure	See 3.2.7
Electrical starting battery charge level	Low	—
NOTES 1. Where 'per cylinder' appears in this Table, suitable sensors may be situated on manifold outlets for medium and high speed engines. 2. For engines and gearing of 1500 kW or less only the items marked* are required. 3. Common sensors are acceptable for alarms and slowdown functions. 4. Except where stated otherwise in the Table, slowdown may be effected by either manual or automatic means, by reduction of speed or power as appropriate. 5. For medium and high speed engine power <500 kW/cylinder, a common sensor for exhaust gas manifold temperature may be fitted. 6. May be combined with exhaust gas outlet temperature high alarm where the turbocharger is mounted directly on the exhaust manifold.		

**Table 1.3.1(b) Oil engines for propulsion purposes:
Alarms and shutdowns**

Item	Alarm	Note
Lubricating oil inlet pressure	2nd stage low	Automatic shutdown of engines (and gearing if fitted), see 3.1.4
Oil mist concentration in crankcase or bearing temperature	High	Automatic shutdown of medium and high speed engines, see 3.1.6
Cylinder coolant outlet temperature	2nd stage high	Automatic shutdown of medium and high speed engines, see 3.1.4

Control Engineering Systems

Part 6, Chapter 1

Section 3

3.2.7 The number of automatic consecutive attempts which fail to produce a start is to be limited to three. For reversible engines which are started and stopped for manoeuvring purposes, means are to be provided to maintain sufficient starting air in the air receivers. For electric starting, see Pt 5, Ch 2,8.4.

3.2.8 Prolonged running in a restricted speed range is to be prevented automatically or, alternatively, an indication of restricted speed ranges is to be provided at each control station.

3.3 Steam turbine machinery for propulsion purposes

3.3.1 Alarms and safeguards are indicated in 3.3.2 to 3.3.6 and Table 1.3.2.

Table 1.3.2 Steam turbine machinery: Alarms and safeguards

Item	Alarm	Note
Lubricating oil pressure for turbines and gearing	<div> <div>1st stage low</div> <div>2nd stage low</div> </div>	<div> <div>–</div> <div>Automatic shutdown, see 3.1.4</div> </div>
Lubricating oil temperature for turbines and gearing	High	–
Lubricating oil sump level	Low	–
Lubricating oil filters differential pressure	High	–
Bearing temperatures or bearing oil outlet temperature of turbines and gearing	High	–
Astern turbine temperature	High	–
Gland steam pressure	High and Low	–
Thrust bearing temperature	High	–
Sea water pressure or flow	Low	–
Turbine vibration	High	<div> <div>Shutdown or speed reduction of turbine(s)</div> </div>
Axial movement of turbine rotor	High	
Main condenser vacuum	Low	
Main condenser condensate level	High	
Overspeed	High	See Pt 5, Ch 3,4

3.3.2 Audible and visual alarms are to operate, and indication is to be given at the relevant control stations to stop or reduce the speed of the turbine(s) for the following fault conditions:

- Excessive turbine vibration.
- Excessive axial movement of turbine rotor.
- Low vacuum in main condenser.
- High condensate level in main condenser.

3.3.3 Reduction of speed may be effected by either manual or automatic control.

3.3.4 Means are to be provided to prevent the risk of thermal distortion of the turbines, by automatic steam spinning, when the shaft is stopped in the manoeuvring mode. An audible and visual alarm is to be provided at the relevant control stations when the shaft has been stopped for a predetermined time.

3.3.5 The following turbine services are to be fitted with automatic controls so as to maintain steady state conditions throughout the normal operating range of the propulsion turbine(s):

- Lubricating oil supply temperature.
- Condenser condensate level.
- Gland steam pressure.

3.3.6 Prolonged running in a restricted speed range is to be prevented automatically, or alternatively, indication of restricted speed ranges is to be provided at each control station.

3.4 Gas turbine machinery

3.4.1 Alarms and safeguards are indicated in 3.4.2 to 3.4.4 and Table 1.3.3.

3.4.2 The following turbine services are to be fitted with automatic temperature controls so as to maintain steady state conditions throughout the normal operating range of the turbine:

- Lubricating oil supply.
- Oil fuel supply, see also 3.4.3.
- Exhaust gas.

3.4.3 The oil fuel supply may be fitted with an automatic control for viscosity instead of the temperature control required by 3.4.2.

3.4.4 A means of manually shutting off the fuel in an emergency is to be provided at the manoeuvring station.

3.5 Main, auxiliary and other boilers

3.5.1 Alarms and safeguards are indicated in 3.5.2 to 3.5.9 and Table 1.3.4.

3.5.2 The following boiler services are to be fitted with automatic controls so as to maintain steady state conditions throughout the normal operating range of the boiler:

- Combustion system.
- Oil fuel supply temperature or viscosity, heavy oil only.
- Boiler drum water level.
- De-aerator water level, where applicable.
- Superheated steam pressure, where applicable.
- Superheated steam temperature, where applicable.
- De-superheated steam pressure, where applicable.
- De-superheated steam temperature, where applicable.

3.5.3 Safety systems and overrides are to comply with the requirements of 2.4.9.

Control Engineering Systems

Part 6, Chapter 1

Section 3

Table 1.3.3 Gas turbine machinery: Alarms and safeguards

Item	Alarm	Note
Overspeed	High	Automatic shutdown <i>see also</i> Pt 5, Ch 4,8.2
Power turbine inlet temperature	1st stage high	Automatic power reduction
	2nd stage high	Automatic shutdown, <i>see also</i> Pt 5, Ch 4,8.3
Flame failure	Failure	Automatic shutdown, <i>see also</i> Pt 5, Ch 4,8.4
Failure to ignite	Failure	Automatic shutdown, <i>see also</i> Pt 5, Ch 4,8.4
Lubricating oil pressure	1st stage low	—
	2nd stage low	Automatic shutdown, <i>see also</i> Pt 5, Ch 4,8.5
Lubricating oil temperature	High	<i>See also</i> Pt 5, Ch 4,8.5
Lubricating oil filter differential pressure	High	—
Scavenge oil temperature	High	—
Scavenge oil pressure	Low	Automatic shutdown
Bearing temperature	High	—
Turbine vibration	1st stage high	—
	2nd stage high	Automatic shutdown, <i>see also</i> Pt 5, Ch 4,4.2
Oil fuel supply pressure	Low	—
Oil fuel supply temperature	High	—
Oil fuel leakage	High	<i>See also</i> Pt 5, Ch 4,5.2
Automatic starting	Failure	Automatic shutdown
Control system	Failure	Automatic shutdown
Air intake pressure	Low	<i>See also</i> Pt 5, Ch 4,4.4.4
NOTES 1. For two-stage alarms, <i>see also</i> 3.1.4. 2. For requirements on purging before ignition, <i>see</i> Pt 5, Ch 4,6.2.1. 3. Where a requirement for disabling the automatic protection and safety system devices for machinery and engineering systems has been defined by the Owner, the consequences of using the disabling arrangements are to be established and included in the operations procedures and orders provided onboard ship. Details of any disabling arrangements are to be submitted to LR for consideration in each instance.		

3.5.4 Burner controls are to be arranged such that light off is only possible at the minimum firing rate compatible with flame establishment. If ignition is set to occur at a fuel rich condition then the burner is to revert to the correct operating air/fuel ratio on establishment of a stable flame.

3.5.5 Where water level indicators are dependent upon an external power supply, the oil fuel supply to the burners is to be automatically shut-off in the event of power or signal failure.

Table 1.3.4 Main, auxiliary and other boilers: Alarms and safeguards (*see continuation*)

Item	Alarm	Note
Water level*	Low	Two water level sensors are to be provided each to operate independently, and automatically shut-off the oil fuel to the burners and operate alarms, <i>see</i> Notes 1 to 3, and 5
Water level	1st stage high*	—
	2nd stage high	Where applicable automatic closure of turbine steam inlet valves, <i>see</i> 3.1.4
Steam drum or superheater outlet pressure*	High and Low	—
Superheated steam temperature	High	—
De-superheated steam temperature*	High	—
Feed water forced circulation flow (if fitted)	Low	Oil fuel to burners to be shut-off automatically, <i>see</i> Note 5
Feed water pH	Low	When automatic dosing of feed water fitted
Feed water salinity	High	Fitted in boiler feed system
Feed water temperature	Low	When automatic temperature control fitted
Combustion air pressure*	Low	Oil fuel to burners to be shut-off automatically in operation or not released during start up, <i>see</i> Note 5. Purge sequence to be inhibited, <i>see</i> Pt 5, Ch 14,3.1.7
Oil fuel pressure*	Low	—
Oil fuel temperature or viscosity*	High and Low	Heavy oil only
Oil fuel atomising steam/air pressure	Low	—
Burner flame	Failure	Each burner to be monitored. Oil fuel to burner(s) to be shut-off automatically, <i>see</i> Pt 5, Ch 14,3.1.9, 3.1.10 and Note 5
Flame monitoring device(s)*	Failure	<i>See</i> 3.5.7, and Note 5
Igniter power supply*	Failure	Each igniter to be checked before oil fuel is supplied to burner, <i>see</i> 3.5.6 and Note 5
Forced draft fan*	Power failure	Oil fuel to burners to be shut-off automatically in operation or not released during start up, <i>see</i> Note 5
Air registers and dampers (including those in the uptake)*	Not fully open	Purge sequence to be inhibited, <i>see</i> Pt 5, Ch 14,3.1.7

Control Engineering Systems

Part 6, Chapter 1

Section 3

Table 1.3.4 Main, auxiliary and other boilers: Alarms and safeguards (conclusion)

Item	Alarm	Note
Control system*	Power failure	Oil fuel to burners to be shut-off automatically. Control using alternative arrangements is to remain available, see 2.5.8
Uptake temperature	High	Where economiser and/or gas air heaters are integral with the boiler and also for independent extended surface exhaust gas boilers/economisers, to monitor for soot fires
<p>NOTES</p> <p>1. For dual-evaporation boilers, the primary circuit is to be fitted with two independent low water level detectors which will operate alarms and shut-off the oil fuel to the burners automatically. The secondary circuit is to be fitted with one low water level detector which will operate alarms and shut-off the oil fuel to the burners automatically. Additionally one high water level alarm is to be fitted on the secondary circuit which may be operated by the same detector as that provided for low water level detection.</p> <p>2. Only one independent system of low water level detection, alarm and automatic oil fuel shut-off need be fitted in the case of small forced circulation or re-circulation coiled water tube 'package' type boilers when evaporation is less than 2900 kg/hr or the heating surface is less than 100 m².</p> <p>3. Where two level sensors are provided these may be used for other functions, e.g. high level alarm, level control, trip systems, etc..</p> <p>4. For boilers not supplying steam for propulsion or for services essential for the safety or the operation of the ship at sea, only the items marked* are required.</p> <p>5. These safeguards are to remain operative during automatic, manual and emergency operation.</p>		

3.5.6 Arrangements are to be such that burner oil fuel valve(s) do not open:

- prior to completion of required warm up times for residual fuel oil; or
- when the power supply to the igniter has failed, as applicable; or
- until a pilot flame is established, as applicable; or
- prior to the completion of furnace purging, see Pt 5, Ch 14,3.1.7.

3.5.7 Arrangements for flame failure detection are to be provided with self-monitoring capabilities which ensure that the flame detector is not erroneously indicating the presence of a flame. In the event of failure being detected by these self-monitoring capabilities:

- an alarm is to be activated.

In the event of loss of flame detection capability for a burner;

- oil fuel to the burner is to be shut-off automatically; and
- an alarm is to be activated

3.5.8 Where established as necessary by Pt 5, Ch 14,3.1.8, means are to be provided to prevent starting of the ignition sequence following multiple flame failures until completion of the identified lock out period.

3.5.9 Following burner shutdown, the furnace is to be purged automatically for at least the required pre-purging time. In event of shutdown due to activation of a required safeguard, this purging is to be manually initiated.

3.6 Thermal fluid heaters

3.6.1 Alarms and safeguards are indicated in 3.6.2 to 3.6.8 and Table 1.3.5.

3.6.2 The standby pumps for oil fuel and thermal fluid circulation are to start automatically when the discharge pressure from the working pump falls below a predetermined value. The standby pumps for thermal fluid circulation are to start before the shut-offs due to low thermal fluid pressure, see Table 1.3.5, are activated

3.6.3 The following heater services are to be fitted with automatic controls so as to maintain steady state conditions throughout the operating range of the heater:

- Combustion system.
- Oil fuel supply temperature or viscosity, heavy oil only.
- Thermal fluid temperature.

3.6.4 Burner controls are to be arranged such that light-off is only possible at the minimum firing rate compatible with flame establishment. If ignition is set to occur at a fuel rich condition then the burner is to revert to the correct operating air/fuel ratio on establishment of a stable flame.

3.6.5 Arrangements are to be such that burner oil fuel valve(s) do not open:

- prior to completion of required warm up times for residual fuel oil; or
- when the power supply to the igniter has failed, as applicable; or
- until a pilot flame is established, as applicable; or
- prior to the completion of furnace purging, see Pt 5, Ch 14,3.1.7.

3.6.6 Arrangements for flame failure detection are to be provided with self-monitoring capabilities which ensure that the flame detector is not erroneously indicating the presence of a flame. In the event of failure being detected by these self-monitoring capabilities:

- an alarm is to be activated.

In the event of loss of flame detection capability for a burner;

- oil fuel to the burner is to be shut-off automatically; and
- an alarm is to be activated.

3.6.7 Where established as necessary by Pt 5, Ch 14,3.1.8, means are to be provided to prevent starting of the ignition sequence following multiple flame failures until completion of the identified lock out period.

3.6.8 Following burner shutdown, the furnace is to be purged automatically for at least the required pre-purging time. In event of shutdown due to activation of a required safeguard, this purging is to be manually initiated.

Control Engineering Systems

Part 6, Chapter 1

Section 3

Table 1.3.5 Thermal fluid heaters: Alarms and safeguards

Item	Alarm	Note
Expansion tank level*	Low	Oil fuel burners to be shut-off automatically
Thermal fluid flow	Low	Oil fuel burners to be shut-off automatically
Thermal fluid pressure	Low	Oil fuel burners to be shut-off automatically
Thermal fluid outlet temperature*	1st stage high	—
	2nd stage high	Oil fuel burners to be shut-off automatically, see 3.1.4
Combustion air pressure*	Low	Oil fuel burners to be shut-off automatically in operation or not released during start up, see Note 3. Purge sequence to be inhibited see Pt 5, Ch 14,3.1.7
Oil fuel pressure*	Low	—
Oil fuel temperature or viscosity*	High and Low	Heavy oil only
Oil fuel atomising steam/air pressure	Low	—
Burner flame*	Failure	Each burner to be monitored. Oil fuel to burner to be shut-off automatically, see Pt 5, Ch 14,3.1.9 and 3.1.10, and Note 3
Flame monitoring device(s)*	Failure	See 3.6.6 and Note 3
Igniter power supply*	Failure	Each igniter to be checked before oil fuel is supplied to burner(s), see 3.6.5 and Note 3
Forced draft fan*	Power failure	Oil fuel to burners to be shut-off automatically in operation or not released during start up, see Note 3
Air register and dampers (including those in the uptake)*	Not fully open	Purge sequence to be inhibited, see Pt 5, Ch 14, 3.1.7
Control system*	Power failure	Oil fuel to burners to be shut-off automatically. Control using alternative arrangements is to remain available, see 2.5.8
Uptake temperature	High	Where applicable, to monitor for soot fires
NOTES 1. Special consideration may be given to the requirements for oil-fired hot water heaters. 2. For heaters not supplying thermal oil for services essential for the safety or the operation of the ship at sea, only the items marked* are required. 3. These safeguards are to remain operative during automatic, manual and emergency operation.		

3.7 Inert gas generators

3.7.1 Alarms and safeguards are indicated in 3.7.2 and Table 1.3.6.

Table 1.3.6 Inert gas generators: Alarms and safeguards

Item	Alarm	Note
Inert gas outlet temperature	High	Oil fuel to burner to be shut-off automatically
Combustion air pressure	Low	Oil fuel to burner to be shut-off automatically
Oil fuel pressure	Low	—
Oil fuel temperature or viscosity	High and Low	Heavy oil only
Burner flame and ignition	Failure	Oil fuel to burner to be shut-off automatically, see Note 1
Cooling water pressure or flow	Low	Oil fuel to burner to be shut-off automatically
Cooling water temperature	High	—
Oil fuel supply	Insufficient	—
Power supply to inert gas generator	Failure	Gas regulating valve is to be shutdown automatically
Automatic control system power supply	Failure	—
NOTES 1. Combustion spaces are to be purged automatically before re-ignition takes place in the event of a flame-out on all burners. 2. See also Pt 5, Ch 15.		

3.7.2 Inert gas generators are to be fitted with an automatic combustion control system so as to maintain steady state conditions throughout the operating range of the generator.

3.7.3 For the requirements of flue gas inert gas systems, see Pt 5, Ch 15,7.

3.8 Incinerators

3.8.1 Alarms and safeguards are indicated in 3.8.2, 3.8.3 and Table 1.3.7.

3.8.2 Where arrangements are provided to introduce solid waste into the furnace these are to be such that there is no risk of a fire hazard.

3.8.3 The combustion temperature is to be controlled to ensure that all liquid and solid waste is efficiently burned without exceeding predetermined temperature limits.

Control Engineering Systems

Part 6, Chapter 1

Section 3

Table 1.3.7 Incinerators: Alarms and safeguards

Item	Alarm	Note
Oil fuel temperature or viscosity	High and Low	Heavy oil and sludge
Oil fuel pressure	Low	—
Combustion air pressure	Low	Oil fuel and/or sludge to burners to be shut-off automatically
Burner flame and ignition	Failure	Oil fuel and/or sludge to burners to be shut-off automatically, see Note
Furnace temperature	High	Oil fuel and/or sludge to burners to be shut-off automatically
Furnace temperature	Low	If applicable
Exhaust temperature	High	—
NOTE Combustion spaces are to be purged automatically before re-ignition takes place in the event of a flame-out on all burners.		

3.9 Auxiliary engines and auxiliary steam turbines

3.9.1 Alarms and safeguards are indicated in Table 1.3.8, see also 3.1.5 and 3.1.6.

3.9.2 For engines operating on heavy oil fuel, automatic temperature or viscosity controls are to be provided.

3.10 Controllable pitch propellers and transverse thrust units

3.10.1 Alarms and safeguards are indicated in 3.10.2 to 3.10.6 and Table 1.3.9. For azimuth thrusters, see also Pt 5, Ch 20.

3.10.2 For controllable pitch propellers for main propulsion, a standby or alternative power source of actuating medium for controlling the pitch of the propelling blades is to be provided. Automatic start of the standby pump supplying hydraulic power for pitch control is to be provided.

3.10.3 Controllable pitch propellers for main propulsion are to be provided with indications of shaft speed, direction and magnitude of thrust and propeller pitch as a measure of the propeller blade or actuator movement at each station from which it is possible to control shaft speed or propeller pitch.

3.10.4 Where transverse thrust units are remotely controlled means are to be provided at the remote control station to stop the propulsion unit.

3.10.5 Transverse thrust units are to be provided with indications of direction and magnitude of thrust and propeller pitch at each station from which it is possible to control the propeller pitch.

3.10.6 An indication of the angular position of rotatable thrust units is to be provided at each station from which it is possible to control the direction of thrust.

Table 1.3.8 Auxiliary engines and auxiliary steam turbines: Alarms and safeguards

Item	Alarm	Note
OIL ENGINES		
Lubricating oil inlet temperature	High	—
Lubricating oil inlet pressure	<div> <div>1st stage low</div> <div>2nd stage low</div> </div>	Automatic shutdown of engine, see 3.1.4
Oil mist concentration in crankcase or bearing temperature	High	Automatic shutdown of engine, see 3.1.6
Oil fuel high pressure piping	Leakage	See 3.1.5
Coolant outlet temperature (for engines >220 kW)	<div> <div>1st stage high</div> <div>2nd stage high</div> </div>	Automatic shutdown of engine, see 3.1.4
Coolant pressure or flow	Low	—
Oil fuel temperature or viscosity	High and Low	Heavy oil only
Overspeed	High	See Pt 5, Ch 2,5
Starting air pressure	Low	—
Electrical starting battery charge level	Low	—
Exhaust gas temperature	High	Per cylinder. For engine power <500 kW/cylinder, common sensors for each inlet to the turbo-charger may be accepted
STEAM TURBINES		
Lubricating oil inlet temperature	High	—
Lubricating oil inlet pressure	<div> <div>1st stage low</div> <div>2nd stage low</div> </div>	Automatic shutdown of turbine, see 3.1.4
Condenser vacuum	Low	Automatic shutdown of turbine, see 3.1.4
Axial displacement of rotor	High	
Overspeed	High	See Pt 5, Ch 4,4
NOTES		
1. For emergency diesel engines, including engines used for the emergency source of electrical power required by SOLAS, see Pt 5, Ch 2,16.		
2. The arrangements are to comply with the requirements of the National Authority concerned.		

3.11 Monitoring in cargo pump rooms

3.11.1 Alarms and safeguards are indicated in Pt 5, Ch 15.

3.12 Electric system

3.12.1 Alarms and safeguards are indicated in Table 1.3.10.

Control Engineering Systems

Part 6, Chapter 1

Section 3

Table 1.3.9 Controllable pitch propellers and transverse thrust units: Alarms and safeguards

Item	Alarm	Note
Hydraulic system pressure	Low	—
Hydraulic oil supply tank level	Low	—
Hydraulic oil temperature	High	Where an oil cooler is fitted
Power supply to the control system between the remote control station and hydraulic actuator	Failure	See 2.5.3
Propulsion motor	Overload	See Ch 2,15

Table 1.3.10 Electric system: Alarms and safeguards

Item	Alarm	Note
Bus-bar voltage	High and Low	—
Bus-bar frequency	Low	—
Operation of load shedding	Warning	—
Generator cooling air temperature	High	For closed air circuit water cooled machines

3.13 Steering gear

3.13.1 For the requirements of steering gear, see Pt 5, Ch 19.

3.14 Waterjets

3.14.1 Alarms and safeguards are indicated in 3.14.2 to 3.14.4 and Table 1.3.11.

Table 1.3.11 Waterjets: Alarms and safeguards

Item	Alarm	Note
Hydraulic system pressure	Low	—
Hydraulic oil supply tank level	Low	—
Hydraulic oil temperature	High	Where an oil cooler is fitted
Hydraulic system flow	Low	—
Lubricating oil pressure	Low	—
Control system	Fault	—
Control system power supply	Failure	—

3.14.2 For waterjets used as the only means of propulsion, a standby or alternative power source of actuating medium for controlling the angular position and/or the reversing angle is to be provided. Automatic start of the standby pump supplying hydraulic power for steering and reversing is to be provided.

3.14.3 An indication of the angular position of waterjets is to be provided at each station from which it is possible to control the angular position.

3.14.4 An indication of the bucket position is to be provided at each station from which it is possible to control the reversal of thrust.

3.15 Miscellaneous machinery

3.15.1 Alarms and safeguards are indicated in 3.15.2 to 3.15.6 and Table 1.3.12.

Table 1.3.12 Miscellaneous machinery: Alarms and safeguards

Item	Alarm	Note
Stern tube lubricating oil tank level	Low	—
Stern tube bearing temperature (oil-lubricated)	High	—
Coolant tanks level	Low	—
Oil fuel service tanks level	High and Low	Where a common overflow tank is fitted, a high level alarm in the common overflow tank may be accepted
Oil fuel service tanks temperature	High	Where heating arrangements are fitted
Oil fuel settling tanks temperature	High	Where heating arrangements are fitted
Sludge tanks level	High	—
Feed water tanks level	Low	Service tank only
Purifier water seal broken	Fault	—
Purifier oil inlet temperature	High	—
Air compressor lubricating oil	Failure	Automatic shutdown
Air compressor discharge air temperature	High	—
Hydraulic control system pressure	Low	—
Pneumatic control system pressure	Low	—
Oil heater temperature	High	See also Pt 5, Ch 14
Controlled environmental conditions	Abnormal	See also 1.3.3

3.15.2 **Dual fuel systems.** Oil and gas dual-fired systems for boilers and engines are to be provided with indication to show which fuel is in use.

Control Engineering Systems

Part 6, Chapter 1

Sections 3 & 4

3.15.3 Lifts. For details of alarms and safeguards for lifts classed by LR, reference is to be made to LR's *Code for Lifting Appliances in a Marine Environment*.

3.15.4 Oil heaters. Oil fuel or lubricating oil heaters are to be fitted with a high temperature alarm which may be incorporated in the temperature control system. In addition to the temperature control system, an independent sensor, with manual reset, is to be fitted which will automatically cut off the heating supply in the event of excessively high temperatures or loss of flow, except where the maximum temperature of the heating medium remains limited to a value below 220°C.

3.15.5 Oil tank electric heating. Oil fuel and lubricating oil tanks that are provided with electric heating elements are to be fitted with a high temperature alarm, which may be incorporated in the temperature control system, a low level alarm and an additional low level sensor to cut off the power supply at a level above that at which the heating element would be exposed.

3.15.6 Oil fuel tanks. Means are to be provided to eliminate the possibility of overflow from oil fuel service tanks into the machinery space and to safeguard against overflow of oil from oil fuel service tanks through the air pipe. See Pt 5, Ch 13 regarding the termination of air pipes.

4.2.3 The engineers' alarm required by 2.2.3 is to be activated automatically in the event that a machinery alarm has not been acknowledged in the space within a predetermined time.

4.2.4 Audible and visual indication of machinery alarms is to be relayed to the navigating bridge control station in such a way that the navigating officer of the watch is made aware when:

- (a) a machinery fault has occurred;
- (b) the machinery fault is being attended to; and
- (c) the machinery fault has been rectified.

Alternative means of communication between the bridge area, accommodation for engineering personnel and machinery spaces will be considered.

4.2.5 Group alarms may be arranged on the bridge to indicate machinery faults, but alarms associated with faults requiring speed or power reduction or the automatic shut-down of propulsion machinery are to be identified by separate group alarms or by individual alarm parameters.

4.3 Bridge control for main propulsion machinery

4.3.1 A bridge control system for the main propulsion machinery is to be fitted. The system is to satisfy the requirements of 2.6.

4.4 Control stations for machinery

4.4.1 A control station(s) is to be provided in the space and on the bridge which satisfies the requirements of 2.2.

4.5 Fire detection alarm system

4.5.1 An automatic fire detection system is to be fitted in the space together with an audible and visual alarm system. The system is to satisfy the requirements of 2.8.

4.6 Bilge level detection

4.6.1 An alarm system is to be provided to warn when liquid in machinery space bilges has reached a predetermined level, and is to comply with 2.3. This level is to be sufficiently low to prevent liquid from overflowing from the bilges onto the tank top. The number and location of detectors are to be such that accumulation of liquids will be detected at all angles of heel and trim. In ships above 2000 gross tons there are to be two independent systems of bilge level detection in the machinery space, arranged such that each branch bilge as required by Pt 5, Ch 13 is provided with a level detector.

4.6.2 Local or remote controls of any valve within the space serving a sea inlet, a discharge below the waterline, a bilge injection or a direct bilge system, should be so sited as to be readily accessible and to allow adequate time for operation in case of influx of water to the space, having regard to the time which could be taken to reach and operate such controls, see *also* 2.7 and Pt 5, Ch 13.2.

Section 4 Unattended machinery space(s) – UMS notation

4.1 General

4.1.1 Where it is proposed to operate the following machinery in an unattended space, no matter what period is envisaged, the controls, alarms and safeguards required by Section 3, together with those given in 4.2 to 4.7 are to be provided:

- (a) Air compressors.
- (b) Controllable pitch propellers and transverse thrust units.
- (c) Electric generating plant.
- (d) Inert gas generators.
- (e) Incinerators.
- (f) Main propelling machinery including essential auxiliaries.
- (g) Oil fuel transfer and storage systems (purifiers and oil heaters).
- (h) Steam raising plant (boilers and their ancillary equipment).
- (j) Thermal fluid heaters.
- (k) Waste heat boilers.

4.2 Alarm system for machinery

4.2.1 An alarm system which will provide warning of faults in the machinery is to be installed. The system is to satisfy the requirements of 2.3.

4.2.2 Audible and visual indication of machinery alarms is to be relayed to the engineers' accommodation so that engineering personnel are made aware that a fault has occurred.

Control Engineering Systems

Part 6, Chapter 1

Sections 4, 5 & 6

4.6.3 Where the bilge pumps are arranged to start automatically, means are to be provided to indicate if the influx of liquids is greater than the pump capacity or, if the pump is operating more frequently than would be expected. Special attention should be given to oil pollution prevention requirements.

4.7 Supply of electric power, general

4.7.1 For ships operating with one generator set in service, arrangements are to be such that a standby generator will automatically start and connect to the switchboard in as short a time as practicable, but in any case within 45 seconds, on loss of the service generator. For ships operating with two or more generator sets in service, arrangements are to be such that on loss of one generator the remaining one(s) are to be adequate for continuity of essential services. For the detailed requirements of these arrangements, see Ch 2,2.2.

■ Section 5 Machinery operated from a centralised control station – CCS notation

5.1 General requirements

5.1.1 Where it is proposed to operate the machinery as listed in 4.1.1 with the continuous supervision from a centralised control station, the control station is to be such that the machinery operation will be as effective as it would be under direct supervision.

5.1.2 The arrangements are to be such that corrective actions can be taken at the control station in the event of machinery faults, e.g. stopping of machinery, starting of standby machinery, adjustment of operating parameters, etc. These actions may be effected by either remote manual or automatic control.

5.1.3 The controls, alarms and safeguards required by Section 3 and by 4.6 together with a fire detection system satisfying the requirements of 2.8 are to be provided. However, the automatic operation of machinery and certain safeguards required by Section 3 may be omitted.

5.1.4 Additional requirements for controls, alarms and safeguards are given in 5.2.

5.2 Centralised control station for machinery

5.2.1 A centralised control station which satisfies the requirements of 5.2.2 to 5.2.7 is to be provided at a suitable location.

5.2.2 A system of alarm displays and controls is to be provided which readily ensures identification of faults in the machinery and satisfactory supervision of related equipment. The alarm and control systems are to satisfy the requirements of 2.3 and 2.5, as applicable.

5.2.3 Indication of all essential parameters necessary for the safe and effective operation of the machinery is to be provided, e.g. temperatures, pressures, tank levels, speeds, powers, etc.

5.2.4 Indication of the operational status of running and standby machinery is to be provided.

5.2.5 At the centralised control station, means of communication with the bridge area, the accommodation for engineering personnel and, if necessary, the machinery space are to be provided.

5.2.6 In addition to the communication required by 5.2.5, a second means of communication is to be provided between the bridge and the centralised control station. One of these means is to be independent of the main electrical power supply, see *also* Pt 5, Ch 1.

5.2.7 Arrangements are to be provided in the centralised control station so that the normal supply of electrical power may be restored in the event of failure.

■ Section 6 Integrated computer control – ICC notation

6.1 General

6.1.1 Integrated Computer Control class notation **ICC** may be assigned where an integrated computer system in compliance with 6.1 to 6.3 provides fault tolerant control and monitoring functions for one or more of the following services:

- (a) Propulsion;
- (b) Electrical generation and distribution (power management systems);
- (c) Cargo and ballast.

6.1.2 A Failure Mode and Effects Analysis (FMEA) is to be carried out in accordance with IEC 60812 and the report and worksheets submitted for consideration. See *also* 2.13.5. The FMEA is to demonstrate that control and monitoring functions required by 6.2 will remain available at each operator station in the event of a single fault of the integrated computer control system, including input error, without adverse effect on the service(s).

6.1.3 Special consideration will be given to integrated computer control systems for other applications, except where these are addressed by other control engineering class notations. In particular, see Pt 7, Ch 9 for requirements of the optional class notation **IBS** – Integrated Bridge Navigation Systems, and Pt 7, Ch 12 for the requirements of the optional class notation **IFP** – Integrated Fire Protection.

Control Engineering Systems

Part 6, Chapter 1

Sections 6 & 7

6.2 General requirements

6.2.1 The integrated computer control system is to comply with the programmable electronic system requirements of 2.10 to 2.13 and the control and monitoring requirements of the Rules applicable to particular equipment, machinery or systems.

6.2.2 Alarm displays are to be provided, in compliance with the requirements of 2.3, which ensure ready identification of faults in the equipment under control.

6.2.3 Alarm and indication functions required by 2.4 are to be provided by the integrated computer control system in response to the activation of any safety function for associated machinery. Systems providing the safety functions are in general to be independent of the integrated computer system. *See also* 2.12.7.

6.2.4 Controls are to be provided, in compliance with 2.5, to ensure the safe and effective operation of equipment and response to faults, e.g. stopping, starting, adjustment of parameters, etc. Indication of operational status and other such parameters necessary to satisfy this requirement, is to be provided for all equipment under control by the integrated computer control system.

6.3 Operator stations

6.3.1 Each operator station allowing control of equipment is to be provided with a minimum of two multi-function display and control units. The number of units is to be sufficient to allow simultaneous access to control and monitoring functions required by 6.2.2 to 6.2.4. *See also* 2.10.19 to 2.10.20.

6.3.2 Each multi-function display and control unit is to include a monitor, keyboard and tracker ball. Alternative arrangements will be considered where these enable each unit to be configured by the user to provide required control or monitoring functions.

6.3.3 Where the integrated computer control system is arranged such that control and monitoring functions may be accessed at more than one operator station, the selected mode of operation of each station (e.g. in control, standby, etc.) is to be clearly indicated. *See also* 2.2.

6.3.4 Means of communication are to be provided between operator stations and any other stations from which the equipment may be controlled. The arrangements are to be permanently installed and are to remain operational in the event of failure of the main electrical power supply to the integrated control system.

Section 7 Trials

7.1 General

7.1.1 Before a new installation (or any alteration or addition to an existing installation) is put into service, trials are to be carried out. These trials are in addition to any acceptance tests which may have been carried out at the manufacturers' works and are to be based on the approved test schedules list as required by 1.2.2. In the case of new construction it will be expected that most of these trials will be carried out before the official sea trials of the ship. During sea trials, system dynamic tests are to be carried out to demonstrate overall satisfactory performance of the control engineering installation.

7.1.2 Means are to be provided to facilitate testing during normal machinery operation, e.g. by the provision of three-way test valves or equivalent.

7.1.3 Acceptance tests and trials for programmable electronic systems are to include verification of software lifecycle activities appropriate to the stage in the system's lifecycle at the time of system examination.

7.2 Unattended machinery space operation – UMS notation

7.2.1 In addition to the tests required by 7.1 the suitability of the installation for operation in the unattended mode is to be demonstrated during sea trials over a four to six hour period observing the following:

- (a) Occurring alarms and the frequency of operation both during steady steaming and under manoeuvring conditions using bridge control.
- (b) Any intervention by personnel in the operation of the machinery.

7.3 Operation from a centralised control station – CCS notation

7.3.1 In addition to the tests required by 7.1, the suitability of the installation for operation from the centralised control station is to be demonstrated during sea trials.

7.4 Record of trials

7.4.1 Two copies of the alarm and control equipment test schedules signed by the Surveyor and builder are to be provided on completion of the survey. One copy is to be placed on board the vessel and the other submitted to LR.

Section

- 1 **General requirements**
- 2 **Main source of electrical power**
- 3 **Emergency source of electrical power**
- 4 **External source of electrical power**
- 5 **Supply and distribution**
- 6 **System design – Protection**
- 7 **Switchgear and control gear assemblies**
- 8 **Rotating machines**
- 9 **Converter equipment**
- 10 **Electric cables and busbar trunking systems (busways)**
- 11 **Batteries**
- 12 **Equipment – Heating, lighting and accessories**
- 13 **Electrical equipment for use in explosive gas atmospheres or in the presence of combustible dusts**
- 14 **Navigation and manoeuvring systems**
- 15 **Electric propulsion**
- 16 **Fire safety systems**
- 17 **Crew and passenger emergency safety systems**
- 18 **Ship safety systems**
- 19 **Lightning conductors**
- 20 **Testing and trials**
- 21 **Spare gear**

■ Section 1 General requirements

1.1 General

1.1.1 The requirements of this Chapter apply to passenger ships and cargo ships except where otherwise stated.

1.1.2 Whilst these requirements are considered to meet those of the *International Convention for the Safety of Life at Sea, 1974*, and applicable amendments, attention should also be given to any relevant Statutory Regulations of the National Administration of the country in which the ship is to be registered. Compliance with the Statutory Regulations of the National Administration may be accepted as meeting the requirements of the *International Convention for the Safety of Life at Sea, 1974*, and applicable amendments.

1.1.3 Electrical services required to maintain the ship in a normal sea-going, operational and habitable condition are to be capable of being maintained without recourse to the emergency source of electrical power.

1.1.4 Electrical services essential for safety are to be maintained under various emergency conditions.

1.1.5 The safety of passengers, crew and ship from electrical hazards is to be ensured.

1.1.6 Lloyd's Register (hereinafter referred to as 'LR') will be prepared to give consideration to special cases or to arrangements which are equivalent to the Rules. Consideration will also be given to electrical arrangements of small ships and ships to be assigned class notation for restricted or special services.

1.2 Plans

1.2.1 At least three copies of the plans and particulars in 1.2.2 to 1.2.13 are to be submitted for consideration. Single copies only are required of plans in 1.2.15 to 1.2.18. Additional copies are to be submitted when requested.

1.2.2 Single line diagram of main and emergency power and lighting systems which is to include:

- (a) ratings of machines, transformers, batteries and semi-conductor converters;
- (b) all feeders connected to the main and emergency switchboards;
- (c) section boards and distribution boards;
- (d) insulation type, size and current loadings of cables;
- (e) make, type and rating of circuit-breakers and fuses.
- (f) details of harmonic filters (where fitted).

1.2.3 Simplified diagrams of generator circuits, inter-connector circuits and feeder circuits showing:

- (a) protective devices, e.g. short-circuit, overload, reverse power protection;
- (b) instrumentation and synchronising devices;
- (c) preference tripping;
- (d) remote stops;
- (e) earth fault indication/protection.

1.2.4 Calculations of short-circuit currents at main and emergency switchboards and section boards including those fed from transformers, details of circuit-breaker and fuse operating times and discrimination curves showing compliance with 6.1 and 10.6.2.

Electrical Engineering

Part 6, Chapter 2

Section 1

1.2.5 For ships in which explosive gas atmospheres and/or combustible dusts occur – a general arrangement of the ship showing hazardous zones and spaces is to be submitted.

1.2.6 A schedule of electrical equipment located in hazardous areas giving details of:

- (a) type of equipment;
- (b) type of protection, e.g. Ex 'd';
- (c) apparatus group, e.g. IIB;
- (d) temperature class, e.g. T3;
- (e) enclosure ingress protection, e.g. IP55;
- (f) certifying authority;
- (g) certificate number;
- (h) location of equipment.

1.2.7 Simplified circuit diagram of electrical propulsion system (where fitted) giving details of:

- (a) ratings of electrical machines, transformers, batteries and semiconductor converters;
- (b) insulation type, size and current loadings of cables;
- (c) make, type and rating of circuit-breakers and fuses;
- (d) instrumentation and protective devices;
- (e) earth fault indication/protection;
- (f) explanation of the system with details of the propulsion control systems and the procedures used to ensure that there is satisfactory control of the design in relation to the requirements of Section 15.

1.2.8 Details of electrically-operated fire, ship, crew and passenger emergency safety systems which are to include typical single line diagrams and arrangements, showing main vertical and, where applicable, horizontal fire zones and the location of equipment and cable routes, including identification of relevant high risk fire areas, to be employed for:

- (a) emergency lighting;
- (b) accommodation fire detection, alarm and extinction systems;
- (c) fixed water-based local application fire-fighting systems;
- (d) public address system;
- (e) general alarm;
- (f) watertight doors, bow, stern and shell doors and other electrically operated closing appliances; and
- (g) low location lighting.

NOTE

A general arrangement plan of the complete ship showing the main vertical fire zones and the location of equipment and cable routes, including identification of relevant high risk fire areas, for the above systems, is to be made available for the use of the Surveyor on board.

1.2.9 Evidence of the suitability of electrical and electronic equipment for use in protected areas and adjacent areas, as required by 16.3.11 and 16.3.12, including a schedule of electrical and electronic equipment located in protected areas and adjacent areas, and general arrangement plans showing the coverage of the protected areas and adjacent areas.

1.2.10 A test schedule which is to include the method of testing and the test facilities which are provided for the general emergency alarm system and the public address system.

1.2.11 For battery installations, arrangement plans and calculations are to show compliance with 11.5.

1.2.12 A schedule of batteries fitted for use for emergency and essential services, giving details of:

- type and manufacturer's type designation;
- voltage and ampere-hour rating;
- location;
- equipment and/or system(s) served;
- maintenance/replacement cycle dates;
- date(s) of maintenance and/or replacement; and
- for replacement batteries in storage, the date of manufacture and shelf life; with accompanying battery replacement procedure documentation to show compliance with 11.7.

1.2.13 General arrangement plans showing the location of propulsion generators, motors, transformers, semiconductor converters, dynamic braking equipment, reactors and filters. The information supplied is also to include cable routes to show compliance with 10.8, as applicable.

1.2.14 Plans for all cables that pass through atria or equivalent spaces, and for vertical runs in trunks or other restricted spaces. The information supplied is to show compliance with 10.8.10.

1.2.15 In order to establish compliance with 1.10.2 and 5.1.4 to 5.1.6, a general arrangement plan of the ship showing the location of major items of electrical equipment, for example:

- main and emergency generators;
- switchboards;
- section boards and distribution boards supplying essential and emergency services;
- emergency batteries;
- motors for emergency services; and
- cable routes between these items of equipment.

1.2.16 Arrangement plans of main and emergency switchboards, and section boards.

1.2.17 Schedule of normal and emergency operating loads on the system estimated for the different operating conditions expected.

1.2.18 In order to establish compliance with the requirements of 1.6.3, evidence is to be submitted to demonstrate the suitability of electrical equipment for its intended purpose in the conditions in which it is expected to operate.

1.3 Surveys

1.3.1 Electrical propelling machinery and associated equipment together with auxiliary services essential for the safety of the ship are to be installed in accordance with the relevant requirements of this Chapter, surveyed and have tests witnessed by the Surveyors.

1.3.2 The following equipment, where intended for use for essential and emergency services, is to be surveyed by the Surveyors during manufacture and testing:

- Converting equipment of 100 kW and over;
- Rotating machines of 100 kW and over;
- Switchboards and section boards; and
- UPS units of 50 kVA and over.

1.3.3 For electric propulsion systems, in addition to the equipment listed in 1.3.2, the following equipment is to be surveyed by the Surveyors during manufacture and testing:

- exciters;
- filters;
- reactors;
- dynamic braking assemblies; and
- slip ring assemblies.

1.3.4 For refrigerating cargo installations having an **RMC** notation, motors are to be tested and certificates furnished by the manufacturer. Motors of 100 kW or over are to be surveyed by the Surveyors during manufacture and testing.

1.3.5 For ships having the class notation **OPS**, in addition to the equipment listed in 1.3.2, the following Connection Equipment covered by Pt 7, Ch 15, where applicable, is to be surveyed by the Surveyors during manufacture and testing:

- flexible cables, with assembled plug and socket-outlets, if any;
- busbar trunking;
- filters;
- converters; and
- slip ring assemblies.

1.3.6 All other electrical equipment, not specifically referenced in 1.3.2 to 1.3.4, intended for use for essential or emergency services is to be supplied with a manufacturer's works test certificate showing compliance with the constructional Standard(s) as referenced by the relevant requirements of this Chapter.

1.4 Additions or alterations

1.4.1 No addition, temporary or permanent, is to be made to the approved load of an existing installation until it has been ascertained that the current carrying capacity and the condition of the existing equipment including cables and switchgear are adequate for the increased load.

1.4.2 Plans are to be submitted for consideration, and the alterations or additions are to be carried out under the survey, and to the satisfaction of the Surveyors.

1.4.3 When it is proposed to replace permanently installed secondary valve-regulated sealed batteries with vented batteries, details are to be submitted for consideration to ensure continued safety in the presence of the products of electrolysis and evaporation being allowed to escape freely from the cells to the atmosphere. These details are to demonstrate that there will be adequate ventilation in accordance with 11.5.9 and that the location and installation requirements of 11.3 and 11.4 are complied with.

1.4.4 Where it is intended to replace an existing incandescent lamp type navigation light with a light emitting diode type navigation light, details are to be submitted for consideration that demonstrate compliance with 14.5. Light emitting diode type navigation lights failure detection arrangements are to satisfy the requirements of 14.5.4 and 14.5.5.

1.5 Definitions

1.5.1 Essential services are those necessary for the propulsion and safety of the ship, such as the following:

- air compressors for oil engines;
- air pumps;
- automatic sprinkler systems;
- ballast pumps;
- bilge pumps;
- circulating and cooling water pumps;
- communication systems;
- condenser circulating pumps;
- electric propulsion equipment;
- electric starting systems for oil engines;
- extraction pumps;
- fans for forced draught to boilers;
- feed water pumps;
- fire detection and alarm systems;
- fuel valve cooling pumps;
- hydraulic pumps for controllable pitch propellers and those serving essential services here listed that would otherwise be directly electrically-driven;
- lubricating oil pumps;
- inert gas fans and scrubber and deck seal pumps;
- lighting systems for those parts of the ship normally accessible to and used by personnel and passengers;
- navigational aids where required by Statutory Regulations;
- navigation lights and special purpose lights where required by Statutory Regulations;
- oil fuel pumps and oil fuel burning units;
- oil separators;
- pumps for fire-extinguishing systems;
- scavenge blowers;
- steering gear;
- thrusters for dynamic positioning;
- valves which are required to be remotely operated;
- ventilating fans for engine and boiler rooms;
- watertight doors, shell doors and other electrical operated closing appliances;
- windlasses;
- power sources and supply systems for supplying the above services.

1.5.2 Services such as the following are considered necessary for minimum comfortable conditions of habitability:

- cooking;
- heating;
- domestic refrigeration;
- mechanical ventilation;
- sanitary and fresh water.

1.5.3 Services such as the following, which are additional to those in 1.5.1 and 1.5.2, are considered necessary to maintain the ship in a normal sea-going operational and habitable condition:

- cargo handling and cargo care equipment;
- hotel services, other than those required for habitable conditions;
- thrusters, other than those for dynamic positioning.

1.5.4 A 'high voltage' is a voltage exceeding 1000 V a.c. or 1500 V d.c. between conductors, see also 5.1.3.

1.5.5 A 'switchboard' is a switchgear and control gear assembly for the control of power generated by a source of electrical power and its distribution to electrical consumers.

1.5.6 A 'section board' is a switchgear and control gear assembly for controlling the supply of electrical power from a switchboard and distributing it to other section boards, distribution boards or final sub-circuits.

1.5.7 A 'distribution board' is an assembly of one or more protective devices arranged for the distribution of electrical power to final sub-circuits.

1.5.8 A 'final sub-circuit' is that portion of a wiring system extending beyond the final overcurrent device of a board.

1.5.9 'Special category spaces' are those enclosed spaces above or below the bulkhead deck intended for the carriage of motor vehicles with fuel, for their own propulsion, in their tanks, into and from which such vehicles can be driven, and to which passengers have access. Special category spaces may be accommodated on more than one deck provided that the total overall clear height for vehicles does not exceed 10 m.

1.5.10 'Machinery spaces of Category A' are those spaces and trunks to such spaces which contain:

- (a) internal combustion machinery used for main propulsion; or
- (b) internal combustion machinery used for purposes other than main propulsion where such machinery has in the aggregate a total power output of not less than 375 kW; or
- (c) any oil-fired boiler or oil fuel unit.

1.5.11 'Dead ship condition' means that the entire machinery installation, including the power supply, is out of operation and that the auxiliary services for bringing the main propulsion systems into operation (e.g. compressed air, starting current from batteries, etc.) and for the restoration of the main power supply are not available. Means are to be available to start the emergency generator at all times, see Pt 5, Ch 2,8.5.

1.5.12 Protected space is a machinery space where a fixed water-based local application fire-fighting system is installed.

1.5.13 Protected areas are areas within a protected space which is required to be protected by a fixed water-based local application fire-fighting system.

1.5.14 Adjacent areas are areas, other than protected areas, exposed to direct spray or other areas where water may extend when a fixed water-based local application fire-fighting system is activated.

1.6 Design and construction

1.6.1 Electrical propelling machinery and associated equipment together with equipment for services essential for the propulsion and safety of the ship are to be constructed in accordance with the relevant requirements of this Chapter.

1.6.2 The design and installation of other equipment is to be such that risk of fire due to its failure is minimised. It is, as a minimum, to comply with a National or International Standard revised where necessary for ambient conditions.

1.6.3 Electrical equipment is to be suitable for its intended purpose and accordingly, whenever practicable, be selected from the *List of Type Approved Products* published by LR. A copy of the Procedure for LR Type Approval System will be supplied on application.

1.7 Quality of power supplies

1.7.1 All electrical equipment supplied from the main and emergency sources of electrical power and electrical equipment for essential and emergency services supplied from d.c. sources of electrical power is to be so designed and manufactured that it is capable of operating satisfactorily under normally occurring variations of voltage and frequency.

1.7.2 Unless specified otherwise, a.c. electrical equipment is to operate satisfactorily with the following simultaneous variations, from their nominal value, when measured at the consumer input terminals:

- (a) voltage:
 - permanent variations +6 per cent, -10 per cent
 - transient variations due to step changes in load ±20 per cent
 - recovery time 1,5 seconds
 - (b) frequency:
 - permanent variations ±5 per cent
 - transient variations due to step changes in load ±10 per cent
 - recovery time 5 seconds
- A maximum rate of change of frequency not exceeding ±1,5 Hz per second during cyclic frequency fluctuations.

1.7.3 **Harmonics.** Unless specified otherwise, the total harmonic distortion (THD) of the voltage waveform at any a.c. switchboard or section board is not to exceed 8 per cent of the fundamental for all frequencies up to 50 times the supply frequency and no voltage at a frequency above 25 times supply frequency is to exceed 1,5 per cent of the fundamental of the supply voltage. THD is the ratio of the rms value of the harmonic content to the rms value of the fundamental, expressed in per cent and may be calculated using the expression:

$$THD = \frac{\sqrt{\sum_{h=2}^{\infty} V_h^2}}{V_1} \times 100$$

where

V_h = rms amplitude of a harmonic voltage of order h

V_1 = rms amplitude of the fundamental voltage.

1.7.4 Unless specified otherwise, d.c. electrical equipment, is to operate satisfactorily with the following simultaneous variations, from their nominal value, when measured at the consumer input terminals:

(a) When supplied by d.c. generator(s) or a rectified a.c. supply:

Voltage tolerance (continuous) ±10 per cent

Voltage cyclic variation deviation 5 per cent

Voltage ripple 10 per cent

(a.c. rms over steady state d.c. voltage);

(b) When supplied by batteries:

(i) Equipment connected to the batteries during charging: Voltage tolerance +30 per cent, -25 per cent;

(ii) Equipment not connected to batteries during charging: Voltage tolerance +20 per cent, -25 per cent.

Different voltage variations as determined by the charging/discharging characteristics, including ripple voltage from the charging device, may be considered. When battery chargers/battery combinations are used as d.c. power supply systems adequate measures are to be taken to keep the voltage within the specified limits during charging, boost charging and discharging of the battery.

1.8 Ambient reference and operating conditions

1.8.1 The rating for classification purposes of essential electrical equipment intended for installation in ships to be classed for unrestricted (geographical) service is to be based on an engine room ambient temperature of 45°C, and a sea-water temperature at the inlet of 32°C. The equipment manufacturer is not expected to provide simulated ambient reference conditions at a test bed.

1.8.2 In the case of a ship to be classed for restricted service, the rating is to be suitable for the ambient conditions associated with the geographical limits of the restricted service, see Pt 1, Ch 2.

1.8.3 Main and essential auxiliary machinery and equipment is to operate satisfactorily under the conditions shown in Pt 5, Ch 1,3.6. Electrical equipment satisfying alternative ambient operating condition requirements for installation on ships contained in an acceptable and relevant National or International Standard may be considered to satisfy this requirement.

NOTE

Details of local environmental conditions are stated in Annex B of IEC 60092: *Electrical installations in ships – Part 101: Definitions and general requirements*.

1.8.4 Where electrical equipment is installed within environmentally controlled spaces, the ambient temperature for which the equipment is suitable for operation at its rated capacity may be reduced to a value not less than 35°C provided:

- the equipment is not for use for emergency services and is located outside of machinery space(s);

- temperature control is achieved by at least two cooling units so arranged that, in the event of loss of one cooling unit, for any reason, the remaining unit(s) will be capable of satisfactorily maintaining the design temperature;
- the equipment is able to be initially set to work safely within a 45°C ambient temperature until such a time that the lesser ambient temperature may be achieved; the cooling equipment is to be rated for an ambient temperature of not less than 45°C; and
- alarms are provided, at a continually attended control station, to indicate any malfunction of the cooling units.

See also Pt 6, Ch 1,1.3.3.

1.8.5 Where equipment is to comply with 1.8.4, it is to be ensured that electrical cables for their entire length are adequately rated for the maximum ambient temperature to which they are exposed along their length.

1.8.6 Equipment used for cooling and maintaining the lesser ambient temperature in accordance with 1.8.4 are considered essential services and are to satisfy the requirements of 5.2.

1.9 Inclination of ship

1.9.1 Emergency and essential electrical equipment is to operate satisfactorily under the conditions as shown in Table 2.1.1.

Table 2.1.1 Inclination of ship

Installations, components	Angle of inclination, degrees, see Note 2			
	Athwartships		Fore-and-aft	
	static	dynamic	static	dynamic
Essential electrical equipment	15	22,5	5 see Note 3	7,5
Safety systems, e.g. emergency power installations, crew and passenger safety systems	22,5	22,5	10	10
Switchgear, electrical and electronic appliances see Note 1				
NOTES 1. Up to an angle of 45° no undesired switching operations or operational changes may occur. 2. Athwartships and fore-and-aft inclinations may occur simultaneously. 3. Where the length of the ship exceeds 100 m, the fore-and-aft static angle of inclination may be taken as: $\frac{500}{L} \text{ degrees}$ where L = Rule length, in metres, see Pt 3, Ch 1,6.1.				

Electrical Engineering

Part 6, Chapter 2

Section 1

1.9.2 In ships for the carriage of liquefied gas and of liquid chemicals the emergency source of electrical power is also to remain operable with the ship flooded to a final athwartships inclination up to a maximum of 30°.

1.9.3 Any proposal to deviate from the angles given in Table 2.1.1 will be specially considered taking into account the type, size and service of the ship.

1.9.4 The dynamic angles of inclination in Table 2.1.1 may be exceeded in certain circumstances dependent upon ship type and operation. The Shipbuilder is, therefore, to ensure that the electrical equipment is capable of operating under these angles of inclination.

1.10 Location and construction

1.10.1 All electrical equipment is to be constructed or selected, and installed such that:

- (a) live parts cannot be inadvertently touched, unless they are supplied at the safety voltage specified in 1.11.2(h);
- (b) it does not cause injury when handled or touched in the normal manner; and
- (c) it is unaffected by any water, steam or oil and oil vapour to which it is likely to be exposed.

Electrical equipment having, as a minimum, the degrees of protection as specified in IEC 60092-201: *Electrical installations in ships – Part 201: System design – General* for the relevant location will satisfy these requirements.

1.10.2 Switchboards, section boards and distribution boards supplying essential and emergency services, as well as cables from the respective generators to and between these boards, are to be arranged to avoid areas of high fire risk and elevated temperatures, for example, in close proximity to incinerators and boilers.

1.10.3 Electrical equipment, as far as is practicable, is to be located:

- (a) such that it is accessible for the purpose of maintenance and survey;
- (b) clear of flammable material;
- (c) in spaces adequately ventilated to remove the waste heat liberated by the equipment under full load conditions, at the ambient conditions specified in 1.8;
- (d) where flammable gases cannot accumulate. If this is not practicable, electrical equipment is to be of the appropriate 'safe-type', see Section 13;
- (e) where it is not exposed to the risk of mechanical injury or damage from water, steam or oil.

1.10.4 Equipment design and the choice of materials are to reduce the likelihood of fire, ensuring that:

- (a) where the electrical energised part can cause ignition and fire, it is contained within the bounds of the enclosure of the electrotechnical product;
- (b) the design, material(s) and construction of the enclosure minimises, as far as is practicable, any internal ignition causing ignition of adjacent materials; and
- (c) where surfaces of the electrotechnical products can be exposed to external fire, they do not, as far as practicable, contribute to the fire growth.

NOTE:

Compliance with IEC 60695: *Fire hazard testing*, or an alternative and acceptable Standard, will satisfy this requirement.

1.10.5 Insulating materials and insulated windings are to be resistant to tracking, moisture, sea air, oil and oil vapour unless special precautions are taken to protect them.

1.10.6 The minimum creepage and clearance distances provided for electrical connections, terminals and similar bare live parts are to be in accordance with a relevant International or National Standard for the equipment or apparatus concerned. In cases where the rated voltage is outside that given in the Standard or where no Standard is available, the minimum creepage and clearance distances provided are to be in accordance with 7.5. Details of alternatives proposals including supporting design rationale and demonstration may be submitted for consideration.

1.10.7 Studs, screw-type or spring-type clamp terminations, satisfactory for the normal operating currents and voltages, are to be provided in electrical equipment for the connection of external cable, or bus-bar conductors, as appropriate, see also 10.14. There is to be adequate space and access for the terminations.

1.10.8 Equipment is not to remain alive through the control circuits and/or pilot lamps when switched off by the control switch. This does not apply to synchronising switches and/or plugs.

1.10.9 The operation of all electrical equipment and the lubrication arrangements are to be efficient under such conditions of vibration and shock as arise in normal practice.

1.10.10 All nuts, screws and clamping devices used in connection with current-carrying, supporting and working parts are to be provided with means to ensure that they cannot work loose by vibration and shock as arise in normal practice.

1.10.11 Conductors and equipment are to be placed at such a distance from the magnetic compasses, or are to be so disposed, that the interfering magnetic field is negligible when circuits are switched on and off.

1.10.12 Where electrical power is used for propulsion, the equipment is to be so arranged that it will operate satisfactorily in the event of partial flooding by bilge water above the tank top up to the bottom floor plate level, under the normal angles of inclination given in 1.9 for essential electrical equipment, see Pt 5, Ch 13.

1.11 Earthing of non-current carrying parts

1.11.1 Except where exempted by 1.11.2, all non-current carrying exposed metal parts of electrical equipment and cables are to be earthed for personal protection against electric shock.

1.11.2 The following parts may be exempted from the requirements of 1.11.1:

- (a) lamp-caps, where suitably shrouded;
- (b) shades, reflectors and guards supported on lampholders or light fittings constructed of, or shrouded in, non-conducting material;
- (c) metal parts on, or screws in or through, non-conducting materials, which are separated by such material from current-carrying parts and from earthed non-current carrying parts in such a way that in normal use they cannot become live or come into contact with earthed parts;
- (d) apparatus which is constructed in accordance with the principle of double insulation;
- (e) bearing housings which are insulated in order to prevent circulation of current in the bearings;
- (f) clips for fluorescent lamps;
- (g) cable clips and short lengths of pipes for cable protection;
- (h) apparatus supplied at a safety voltage not exceeding 50 V d.c. or 50 V a.c., between conductors, or between any conductor and earth in a circuit isolated from the supply. Autotransformers are not to be used for the purpose of achieving the alternating current voltage;
- (j) apparatus or parts of apparatus which although not shrouded in insulating material is nevertheless otherwise so guarded that it cannot be touched and cannot come in contact with exposed metal.

1.11.3 Armouring, braiding and other metal coverings of cables are to be effectively earthed. Where the armouring, braiding and other metal coverings are earthed at one end only, they are to be adequately protected and insulated at the unearthed end with the insulation being suitable for the maximum voltage that may be induced. See 13.8.3 for earthing of cables in dangerous zones or spaces.

1.11.4 The electrical continuity of all metal coverings of cables throughout the length of the cable, particularly at joints and tapings, is to be ensured.

1.11.5 Metal parts of portable appliances, other than current-carrying parts and parts exempted by 1.11.2 are to be earthed by means of an earth-continuity conductor in the flexible cable or cord through the associated plug and socket-outlet.

1.11.6 Earthing conductors are to be of copper or other corrosion-resistant material and be securely installed and protected where necessary against damage and also, where necessary, against electrolytic corrosion. Connections are to be so secured that they cannot work loose under vibration.

1.11.7 The nominal cross-section areas of copper earthing conductors for electrical equipment are, in general to be equal to the cross-section of the current-carrying conductor up to 16 mm², with a minimum of 1,5 mm². Above this figure they are to be equal to at least half the cross-section of the current-carrying conductor with a minimum of 16 mm².

1.11.8 The nominal cross-section areas of copper earthing conductors for armouring, braiding and other metal coverings of cables are, in general, to be equal to the equivalent cross-section of the armouring, braiding and other metal coverings with a minimum of 1,5 mm².

1.11.9 Earthing conductors of materials other than copper are to have a conductance not less than that specified for an equivalent copper earthing conductor.

1.11.10 The connection of the earthing conductor to the hull of the ship is to be made in an accessible position, and is to be secured by a screw or stud of diameter not less than 6 mm which is to be used for this purpose only. Bright metallic surfaces at the contact areas are to be ensured immediately before the nut or screw is tightened and, where necessary, the joint is to be protected against electrolytic corrosion. The connection is to remain unpainted.

1.12 Bonding for the control of static electricity

1.12.1 Bonding straps for the control of static electricity are required for cargo tanks, process plant and piping systems, for flammable products and solids liable to release flammable gas and/or combustible dust, which are not permanently connected to the hull of the ship either directly or via their bolted or welded supports and where the resistance between them and the hull exceeds 1 MΩ.

1.12.2 Where bonding straps are required for the control of static electricity, they are to be robust, that is, having a cross-sectional area of about 10 mm², and are to comply with 1.11.6 and 1.11.10.

1.13 Alarms

1.13.1 Where alarms are required by this Chapter they are to be arranged in accordance with Ch 1.2.3. Sound signal equipment, fire and general alarm bells are not required to be supplemented by visual alarms, except in areas having high levels of background noise, such as machinery spaces.

1.13.2 The alarms in this Chapter are additional to those required by Chapter 1. They may however form part of the alarm system that is required by Chapter 1.

1.13.3 Cables for emergency alarms and their power sources are to be in accordance with 1.14.

1.13.4 Electrical equipment and cables for emergency alarms are to be so arranged that the loss of alarms in any one area due to localised fire, collision, flooding or similar damage is minimised, see 1.14.

1.14 Operation under fire conditions

1.14.1 As a minimum, the following emergency services and their emergency power supplies, are required to be capable of being operated under fire conditions:

- Control and power systems to power-operated fire doors and status indication for all fire doors.
- Control and power systems to power-operated watertight doors and their status indication.
- Emergency lighting.
- Fire and general alarms.
- Fire detection systems.
- Fire-extinguishing systems and fire-extinguishing media release alarms.
- Fire safety stops, see also 16.6.
- Low location lighting, see also 17.4.3.
- Public address systems.
- Emergency fire pump.

1.14.2 Where cables for the emergency services listed in 1.14.1 pass through high fire risk areas, main vertical or horizontal fire zones other than those which they serve, they are to be so arranged that a fire in any of these areas or zones does not affect the operation of the emergency service in any other area or zone. This may be achieved either by:

- cables being of a fire resistant type complying with 10.5.3, and at least extending from the main control/monitoring panel to the nearest local distribution panel serving the relevant area or zone; or
- there being at least two-loops/radial distributions run as widely apart as is practicable and so arranged that in the event of damage by fire at least one of the loops/radial distributions remains operational.

1.14.3 Where the cables for the power supplies for the emergency services listed in 1.14.1 pass through high fire risk areas, main vertical or horizontal fire zones other than those which they serve, they are to be of a fire resistant type complying with 10.5.3, extending at least to the local distribution panel serving the relevant area or zone.

1.14.4 Fire resistant electrical cables for the emergency services listed in 1.14.1, including their power supplies, are to be run as directly as is practicable, having regard to any special installation requirements, for example those concerning minimum bend radii.

1.14.5 In addition to 1.10.4, materials used for electrical equipment, cables and accessories within passenger accommodation areas are not to be capable of producing excessive quantities of smoke and toxic products.

NOTE:

Compliance with IEC 60695: Fire hazard testing, or an alternative and acceptable Standard, will satisfy this requirement.

1.15 Protection of electrical equipment against the effects of lightning strikes

1.15.1 Precautions are to be taken to protect essential electronic equipment that may be susceptible to damage from voltage pulses attributable to the secondary effects of lightning. This may be achieved by suitable design and/or the use of additional protective devices, such as surge arrestors. Resultant induced voltages may be further reduced by the use of earthed metallic screened cables. See also Section 19.

Section 2 Main source of electrical power

2.1 General

2.1.1 The main source of electrical power is to comply with the requirements of this section without recourse to the emergency source of electrical power.

2.2 Number and rating of generators and converting equipment

2.2.1 Under sea-going conditions, the number and rating of service generating sets and converting sets, such as transformers and semi-conductor converters, when any one generating set or converting set is out of action, are:

- (a) to be sufficient to ensure the operation of electrical services for essential equipment, habitable conditions, cargo refrigeration machinery of ships having a **RMC** notation and the container socket outlets and ventilation system of container ships having a **CRC** notation. See 15.2.5 for electric propulsion systems;
- (b) to have sufficient reserve capacity to permit the starting of the largest motor without causing any motor to stall or any device to fail due to excessive voltage drop on the system;
- (c) to be capable of providing the electrical services necessary to start the main propulsion machinery from a dead ship condition. The emergency source of electrical power may be used to assist if it can provide power at the same time to those services required to be supplied by Section 3, see also 2.3.2.

2.2.2 The arrangement of the ship's main source of power is to be such that the operation of electrical services for essential equipment, habitable conditions and cargo refrigeration machinery of ships having a **RMC** notation can be maintained regardless of the speed and direction of the propulsion machinery shafting.

2.2.3 Where the electrical power requirement to maintain the ship in a normal operational and habitable condition is usually supplied by one generating set, arrangements are to be provided to prevent overloading of the running generator (see 6.9). On loss of power there is to be provision for automatic starting and connecting to the main switchboard of the standby set in as short a time as practicable, but in any case within 45 seconds, and automatic sequential restarting of essential services (see 1.5.1), in as short a time as is practicable.

NOTE

Where the prime mover starting time will result in exceeding this starting and connection time, details are to be submitted for consideration.

2.3 Starting arrangements

2.3.1 The starting arrangements of the generating sets prime movers are to comply with the requirements of Pt 5, Ch 2,8 as applicable.

2.3.2 Where the emergency source of electrical power is required to be used to restore propulsion from a 'dead ship condition', the emergency generator is to be capable of providing initial starting energy for the propulsion machinery within 30 minutes of the 'dead ship condition'. The emergency generator capacity is to be sufficient for restoring propulsion in addition to supplying those services in Section 3. See Pt 5, Ch 2,8.1.1 for dead ship condition starting arrangements.

2.4 Prime mover governors

2.4.1 The governing accuracy of the generating sets prime movers is to meet the requirements of Pt 5, Ch 2,5.3.

2.4.2 The maximum electrical step load switched on or off is not to cause the frequency variation of the electrical supply to exceed the parameters given in 1.7.2.

2.5 Main propulsion driven generators not forming part of the main source of electrical power

2.5.1 Generators and generator systems, having the ship's propulsion machinery as their prime mover but not forming part of the ship's main source of electrical power may be used whilst the ship is at sea to supply electrical services required for normal operational and habitable conditions provided that the requirements of 2.5.2 to 2.5.4 are satisfied.

2.5.2 Within the declared operating range of the generators and/or generator system, the specified voltage and frequency variations of the Rules are to be met.

2.5.3 Where there is remote control of the propulsion machinery, arrangements are to ensure that essential machinery power supplies are maintained during manoeuvring conditions in order to prevent a blackout situation.

2.5.4 In addition to the requirements of 2.2.3, arrangements are to be fitted to automatically start one of the generators forming the main source of power should the frequency variations exceed those permitted by the Rules.

■ Section 3

Emergency source of electrical power

3.1 General

3.1.1 The requirements of this Section apply to passenger and cargo ships to be classed for unrestricted service. They do not apply to cargo ships of less than 500 tons gross tonnage.

3.1.2 For ships assigned a Service Restriction Notation in accordance with Pt 1, Ch 2, a lesser period than the 36 hour period and 18 hour period specified in 3.2.7 and 3.3.7 respectively may be considered, but not less than 12 hours.

3.1.3 The emergency source of power for cargo ships of less than 500 tons gross tonnage will be the subject of special consideration.

3.2 Emergency source of electrical power in passenger ships

3.2.1 A self-contained emergency source of electrical power is to be provided.

3.2.2 The emergency source of electrical power, associated transforming equipment, if any, transitional source of emergency power, emergency switchboard and emergency lighting switchboard are to be located above the uppermost continuous deck and be readily accessible from the open deck. They are not to be located forward of the collision bulkhead.

3.2.3 The location of:

- the emergency source of electrical power and associated transforming equipment, if any;
- the transitional source of emergency power;
- the emergency switchboard; and
- the emergency lighting switchboard;

in relation to:

- the main source of electrical power, associated transforming equipment, if any; and
- the main switchboard;

is to be such as to ensure that a fire or other casualty in spaces containing:

- the main source of electrical power, associated transforming equipment, if any, and the main switchboard; or
- in any machinery space of Category A;

will not interfere with the supply, control and distribution of emergency electrical power.

Electrical Engineering

Part 6, Chapter 2

Section 3

3.2.4 The space containing:

- the emergency source of electrical power, associated transforming equipment, if any;
- the transitional source of emergency electrical power; and
- the emergency switchboard;

is not to be contiguous to the boundaries of machinery spaces of Category A or those spaces containing:

- the main source of electrical power, associated transforming equipment, if any; or
- the main switchboard.

3.2.5 Where compliance with 3.2.3 or 3.2.4 is not practicable, details of the proposed arrangements are to be submitted.

3.2.6 Provided that suitable measures are taken for safeguarding independent emergency operation under all circumstances, the emergency generator may be used exceptionally, and for short periods, to supply non-emergency circuits.

3.2.7 The electrical power available is to be sufficient to supply all those services that are essential for safety in an emergency, due regard being paid to such services as may have to be operated simultaneously. The emergency source of electrical power is to be capable, having regard to starting currents and the transitory nature of certain loads, of supplying simultaneously at least the following services for the periods specified hereinafter, if they depend upon an electrical source for their operation:

- (a) For a period of 36 hours, emergency lighting:
 - (i) at every lifeboat preparation station, muster and embarkation station and oversides;
 - (ii) in alleyways, stairways and exits, giving access to the muster and embarkation stations;
 - (iii) in all service and accommodation alleyways, stairways and exits, personnel lift cars;
 - (iv) in the machinery spaces and main generating stations including their control positions;
 - (v) in all control stations, machinery control rooms, and at each main and emergency switchboard;
 - (vi) at all stowage positions for fireman's outfits;
 - (vii) at the steering gear; and
 - (viii) at the fire pump, the sprinkler pump and the emergency bilge pump and at the starting position of their motors;
- (b) For a period of 36 hours:
 - (i) the navigation lights and other lights, as required by the *International Regulations for Preventing Collisions at Sea* in force; and
 - (ii) the radiocommunications, as required by Amendments to SOLAS 1974, Chapter IV.
- (c) For a period of 36 hours:
 - (i) all internal communication equipment required in an emergency;
 - (ii) the navigational aids as required by Amendments to SOLAS 1974 Reg V/19; where such provision is unreasonable or impracticable this requirement may be waived for ships of less than 5000 tons gross;
 - (iii) the fire detection, fire alarm and sample extraction smoke detection systems, and the fire door holding and release system; and

- (iv) for intermittent operation of the daylight signalling lamp, the ship's whistle, the manually-operated call points and all internal signals that are required in an emergency;

unless such services have an independent supply for the period of 36 hours from an accumulator battery suitably located for use in an emergency.

- (d) For a period of 36 hours:
 - (i) emergency fire pump;
 - (ii) the automatic sprinkler pump, if any; and
 - (iii) the emergency bilge pump and all the equipment essential for the operation of electrically-powered remote controlled bilge valves.
- (e) The steering gear for the period of time required by Pt 5, Ch 19,6.
- (f) For a period of half an hour:
 - (i) any watertight doors if electrically-operated together with their control, indication and alarm circuits;
 - (ii) the emergency arrangements to bring the lift cars to deck level for the escape of persons. The passenger lift cars may be brought to deck level sequentially in an emergency.
- (g) Where applicable, the services required by 2.3.2.
- (h) Where connected, the supplementary lighting required by 3.2.16.

3.2.8 The emergency source of electrical power may be either a generator or an accumulator battery, which are to comply with the following:

- (a) Where the emergency source of electrical power is a generator it is to be:
 - (i) driven by a suitable prime mover with an independent supply of fuel having a flashpoint (closed-cup test) of not less than 43°C;
 - (ii) started automatically upon failure of the electrical supply from the main source of electrical power and is to be automatically connected to the emergency switchboard; those services referred to in 3.2.7 are then to be transferred automatically to the emergency generating set. The automatic starting system and the characteristics of the prime mover are to be such as to permit the emergency generator to carry its full rated load as quickly as is safe and practicable, subject to a maximum of 45 seconds; and
 - (iii) provided with a transitional source of emergency electrical power according to 3.2.9.
- (b) Where the emergency source of electrical power is an accumulator battery, it is to be capable of:
 - (i) carrying the emergency electrical load without recharging while maintaining the voltage of the battery throughout the discharge period within 12 per cent above or below its nominal voltage;
 - (ii) automatically connecting to the emergency switchboard in the event of failure of the main source of electrical power; and
 - (iii) immediately supplying at least those services specified in 3.2.9.

Electrical Engineering

Part 6, Chapter 2

Section 3

3.2.9 The transitional source of emergency electrical power required by 3.2.8 is to consist of an accumulator battery suitably located for use in an emergency which is to operate without recharging while maintaining the voltage of the battery throughout the discharge period within 12 per cent above or below its nominal voltage and be of sufficient capacity and so arranged as to supply automatically in the event of failure of either the main or emergency source of electrical power at least the following services, if they depend upon an electrical source for their operation:

- (a) For half an hour:
 - (i) the lighting required by 3.2.7(a) and (b);
 - (ii) all services required by 3.2.7(c)(i), (iii) and (iv) unless such services have an independent supply for the period specified from an accumulator battery suitably located for use in an emergency.
 - (iii) Where connected, the supplementary lighting required by 3.2.16.
- (b) Power to operate the watertight doors at least three times, i.e. closed-open-closed against an adverse list of 15°, but not necessarily all of them simultaneously, together with their control, indication and alarm circuits as required by 3.2.7(f)(i).

3.2.10 The emergency switchboard is to be installed as near as is practicable to the emergency source of electrical power.

3.2.11 Where the emergency source of electrical power is a generator, the emergency switchboard is to be located in the same space unless the operation of the emergency switchboard would thereby be impaired.

3.2.12 No accumulator battery except for engine starting, fitted in accordance with this Section is to be installed in the same space as the emergency switchboard. An indicator is to be mounted in a suitable place on the main switchboard or in the machinery control room to indicate when the batteries constituting either the emergency source of electrical power or the transitional source of emergency electrical power are being discharged.

3.2.13 The emergency switchboard is to be supplied during normal operation from the main switchboard by an interconnector feeder which is to be adequately protected at the main switchboard against overload and short-circuit and which is to be disconnected automatically at the emergency switchboard upon failure of the main source of electrical power. Where the system is arranged for feedback operation, the interconnector feeder is also to be protected at the emergency switchboard at least against short-circuit.

3.2.14 In order to ensure the ready availability of the emergency source of electrical power to supply circuits required to provide emergency services, arrangements are to be made, where necessary, to automatically disconnect non-emergency circuits from the emergency switchboard in the event of overloading to ensure that electrical power is available to the emergency circuits.

3.2.15 Provision is to be made for the periodic testing of the complete emergency system and is to include the testing of automatic starting arrangements.

3.2.16 In passenger ships, supplementary lighting is to be provided in all cabins to clearly indicate the exit so that occupants will be able to find their way to the door. Such lighting, which may be connected to an emergency source of power or have a self-contained source of electrical power in each cabin, is to automatically illuminate when power to the normal cabin lighting is lost and remain on for a minimum of half an hour.

3.2.17 In addition to the emergency lighting required by 3.2.7(a) passenger ships with roll on-roll off cargo spaces or special category spaces are to be provided with the following:

- (a) in all passenger public spaces and alleyways supplementary electric lighting that can operate for at least three hours when all other sources of electric power have failed and under any condition of heel. The illumination provided is to be such that the approach to the means of escape can be readily seen. The source of power for the supplementary lighting is to consist of accumulator batteries within the lighting units that are continuously charged where practicable, from the emergency switchboard. Consideration may be given to other means of lighting which is at least as effective. The supplementary lighting is to be such that any failure of the lamp will be immediately apparent. Any accumulator battery provided is to be replaced at intervals having regard to the specified service life in the ambient conditions that they are subject to in service.
- (b) A portable rechargeable battery operated lamp is to be provided in every crew space alleyway, recreational space and every working space which is normally occupied unless supplementary emergency lighting, as required by (a) is provided.

3.3 Emergency source of electrical power in cargo ships

3.3.1 A self-contained emergency source of electrical power is to be provided.

3.3.2 The emergency source of electrical power, associated transforming equipment, if any, transitional source of emergency power, emergency switchboard and emergency lighting switchboard are to be located above the uppermost continuous deck and be readily accessible from the open deck. They are not to be located forward of the collision bulkhead.

Electrical Engineering

Part 6, Chapter 2

Section 3

3.3.3 The location of:

- the emergency source of electrical power and associated transforming equipment, if any;
- the transitional source of emergency power;
- the emergency switchboard; and
- the emergency lighting switchboard;

in relation to:

- the main source of electrical power, associated transforming equipment, if any; and
- the main switchboard;

is to be such as to ensure that a fire or other casualty in spaces containing:

- the main source of electrical power, associated transforming equipment, if any, and the main switchboard; or
- in any machinery space of Category A;

will not interfere with the supply, control and distribution of emergency electrical power.

3.3.4 The space containing:

- the emergency source of electrical power, associated transforming equipment, if any;
- the transitional source of emergency electrical power; and
- the emergency switchboard;

is not to be contiguous to the boundaries of machinery spaces of Category A or those spaces containing:

- the main source of electrical power, associated transforming equipment, if any; or
- the main switchboard.

3.3.5 Where compliance with 3.3.3 or 3.3.4 is not practicable, details of the proposed arrangements are to be submitted.

3.3.6 Provided that suitable measures are taken for safeguarding independent emergency operation under all circumstances, the emergency generator may be used, exceptionally, and for short periods, to supply non-emergency circuits.

3.3.7 The electrical power available is to be sufficient to supply all those services that are essential for safety in an emergency, due regard being paid to such services as may have to be operated simultaneously. The emergency source of electrical power is to be capable, having regard to starting currents and the transitory nature of certain loads, of supplying simultaneously at least the following services for the periods specified hereinafter, if they depend upon an electrical source for their operation:

- (a) For a period of three hours, emergency lighting at every lifeboat preparation station, muster and embarkation station and over the sides.
- (b) For a period of 18 hours, emergency lighting:
 - (i) in all service and accommodation alleyways, stairways and exits, personnel lift cars and personnel lift trunks;
 - (ii) in the machinery spaces and main generating stations including their control positions;
 - (iii) in all control stations, machinery control rooms, and at each main and emergency switchboard;
 - (iv) at all stowage positions for fireman's outfits;
 - (v) at the steering gear; and

- (vi) at the emergency fire pump, at the sprinkler pump, if any, and at the emergency bilge pump, if any, and at the starting positions of their motors;
- (vii) in all cargo pump rooms of tankers.

- (c) For a period of 18 hours:
 - (i) the navigation lights and other lights, as required by the *International Regulations for Preventing Collisions at Sea* in force; and
 - (ii) the radiocommunications, as required by Amendments to SOLAS 1974, Chapter IV.
- (d) For a period of 18 hours:
 - (i) all internal communication equipment as required in an emergency;
 - (ii) the navigational aids as required by Amendments to SOLAS 1974 Reg V/19; where such provision is unreasonable or impracticable this requirement may be waived for ships of less than 5000 tons gross;
 - (iii) the fire detection and fire-alarm system; and
 - (iv) intermittent operation of the daylight signalling lamp, the ship's whistle, the manually operated call points and all internal signals that are required in an emergency;

unless such services have an independent supply for the period of 18 hours from an accumulator battery suitably located for use in an emergency.

- (e) For a period of 18 hours the emergency fire pump if dependent upon the emergency generator for its source of power.
- (f) The steering gear for the period of time required by Pt 5, Ch 19,6.
- (g) Where applicable, the services required by 2.3.2.

3.3.8 The emergency source of electrical power may be either a generator or an accumulator battery, which is to comply with the following:

- (a) Where the emergency source of electrical power is a generator it is to be:
 - (i) driven by a suitable prime mover with an independent supply of fuel, having a flashpoint (closed-cup test) of not less than 43°C;
 - (ii) started automatically upon failure of the main source of electrical power supply unless a transitional source of emergency electrical power in accordance with 3.3.9 is provided; where the emergency generator is automatically started, it is to be automatically connected to the emergency switchboard; those services referred to in 3.3.9 are to be connected automatically to the emergency generator; and
 - (iii) provided with a transitional source of emergency electrical power as specified in 3.3.9 unless an emergency generator is provided capable both of supplying the services mentioned in that paragraph and of being automatically started and supplying the required load as quickly as is safe and practicable subject to a maximum of 45 seconds.

- (b) Where the emergency source of electrical power is an accumulator battery it is to be capable of:
 - (i) carrying the emergency electrical load without recharging while maintaining the voltage of the battery throughout the discharge period within 12 per cent above or below its nominal voltage;
 - (ii) automatically connecting to the emergency switchboard in the event of failure of the main source of electrical power; and
 - (iii) immediately supplying at least those services specified in 3.3.9.

3.3.9 The transitional source of emergency electrical power where required by 3.3.8 is to consist of an accumulator battery suitably located for use in an emergency which is to operate without recharging while maintaining the voltage of the battery throughout the discharge period within 12 per cent above or below its nominal voltage and be of sufficient capacity and is to be so arranged as to supply automatically in the event of failure of either the main or the emergency source of electrical power for half an hour at least the following services if they depend upon an electrical source for their operation:

- (a) the lighting required by 3.3.7(a), (b) and (c). For this transitional phase, the required emergency electric lighting, in respect of the machinery space and accommodation and service spaces may be provided by permanently fixed, individual, automatically charged, relay operated accumulator lamps; and
- (b) all services required by 3.3.7(d)(i), (iii) and (iv) unless such services have an independent supply for the period specified from an accumulator battery suitably located for use in an emergency.

3.3.10 The emergency switchboard is to be installed as near as is practicable to the emergency source of electrical power.

3.3.11 Where the emergency source of electrical power is a generator, the emergency switchboard is to be located in the same space unless the operation of the emergency switchboard would thereby be impaired.

3.3.12 No accumulator battery fitted in accordance with this Section, unless for engine starting, is to be installed in the same space as the emergency switchboard. An indicator shall be mounted in a suitable place on the main switchboard or in the machinery control room to indicate when the batteries constituting either the emergency source of electrical power or the transitional source of electrical power are being discharged.

3.3.13 The emergency switchboard is to be supplied during normal operation from the main switchboard by an interconnector feeder which is to be adequately protected at the main switchboard against overload and short-circuit and which is to be disconnected automatically at the emergency switchboard upon failure of the main source of electrical power. Where the system is arranged for feedback operation, the interconnector feeder is also to be protected at the emergency switchboard at least against short-circuit.

3.3.14 In order to ensure the ready availability of the emergency source of electrical power to supply circuits required to provide emergency services, arrangements are to be made, where necessary, to automatically disconnect non-emergency circuits from the emergency switchboard in the event of overloading to ensure that electrical power is available to the emergency circuits.

3.3.15 Provision is to be made for the periodic testing of the complete emergency system and is to include the testing of automatic starting arrangements.

3.4 Starting arrangements

3.4.1 Where the emergency source of power is a generator, the starting arrangements are to comply with the requirements given in Pt 5, Ch 2,8.5.

3.5 Prime mover governor

3.5.1 Where the emergency source of power is a generator, the governor is to comply with 2.4.

3.6 Radio installation

3.6.1 Every radio installation as required by SOLAS 1974 as amended, Chapter IV, Part C, is to be provided with reliable, permanently arranged electrical lighting, independent of the main and emergency sources of electrical power, for the adequate illumination of the radio controls for operating the radio installation.

3.6.2 A reserve source or sources of energy is to be provided on every ship, for the purpose of conducting distress and safety radiocommunications, in the event of failure of the ship's main and emergency sources of electrical power. The reserve source or sources of energy is to be capable of simultaneously operating the VHF radio installation and, as appropriate for the sea or sea area for which the ship is equipped, either the MF radio installation, the MF/HF radio installation, or the INMARSAT ship earth station and any of the additional loads mentioned in 3.6.4, 3.6.5 and 3.6.7 for a period of at least one hour. The reserve source or sources of energy need not supply independent HF and MF radio installations at the same time.

3.6.3 The reserve source or sources of energy is to be independent of the propelling power of the ship and the ship's electrical system.

3.6.4 Where, in addition to the VHF radio installation, two or more of the other radio installations, referred to in 3.6.2, can be connected to the reserve source or sources of energy, the reserve source or sources are to be capable of simultaneously supplying, for the period specified by 3.6.2, the VHF radio installation and:

- (a) all other radio installations which can be connected to the reserve source or sources of energy at the same time; or

- (b) whichever of the other radio installations will consume the most power, if only one of the other radio installations can be connected to the reserve source or sources of energy at the same time as the VHF radio installation.

3.6.5 The reserve source or sources of energy may be used to supply the electrical lighting required by 3.6.1.

3.6.6 Where a reserve source of energy consists of a rechargeable accumulator battery or batteries a means of automatically charging the batteries is to be provided which is to be capable of recharging them to minimum capacity requirements within 10 hours.

3.6.7 If an uninterrupted input of information from the ship's navigational or other equipment to a radio installation as referred to in 3.6.2 is needed to ensure its proper performance, means are to be provided to ensure the continuous supply of such information in the event of failure of the ship's main or emergency source of electrical power.

Section 4 External source of electrical power

4.1 Temporary external supply

4.1.1 Where arrangements are made for the supply of electricity from a source on shore or elsewhere, a connection box is to be installed in a position suitable for the convenient reception of flexible cables from the external source and containing a circuit-breaker or isolating switch and fuses and terminals including one earthed, of ample size and suitable shape to facilitate a satisfactory connection of three-phase external supplies with earthed neutrals.

4.1.2 Suitable cables, permanently fixed, are to be provided, connecting the terminals in the connection box to a linked switch and/or a circuit-breaker at the main switchboard. An indicator is to be provided at the main switchboard in order to show when the cables are energised.

4.1.3 Means are to be provided for checking the phase sequence of the incoming supply.

4.1.4 At the connection box a notice is to be provided giving full information on the system of supply, the normal voltage and frequency of the installation's system and the procedure for carrying out the connection.

4.1.5 Alternative arrangements may be submitted for consideration. See also Pt 7, Ch 15 for class notation **OPS**.

4.2 Permanent external supply

4.2.1 Details are to be submitted.

Section 5 Supply and distribution

5.1 Systems of supply and distribution

5.1.1 The following systems of generation and distribution are acceptable, other than for tankers intended for the carriage in bulk of oil, liquefied gases and other hazardous liquids having a flash point not exceeding 60°C (closed-cup test):

- (a) d.c., two-wire;
- (b) a.c., single-phase, two-wire;
- (c) a.c., three-phase:
 - (i) three-wire;
 - (ii) four-wire with neutral solidly earthed but without hull return.

5.1.2 For tankers intended for the carriage in bulk of oil, liquefied gases and other hazardous liquids having a flash point not exceeding 60°C (closed-cup test) only the following systems of generation and distribution are acceptable:

- (a) d.c., two-wire, insulated;
- (b) a.c., single-phase, two-wire, insulated;
- (c) a.c., three-phase, three-wire, insulated;
- (d) earthed systems, a.c. or d.c., limited to areas outside any dangerous space or zone, and arranged so that no current arising from an earth-fault in any part of the system could pass through a dangerous space or zone;
- (e) earthed systems, complying with 5.1.1 and 5.5.7, provided the Government of the flag state permits such an arrangement in accordance with the 'Equivalents' provisions of SOLAS Chapter I, Regulation 5, see Ch 1,1.4 of the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquid Chemicals in Bulk* (hereinafter referred to as the Rules for Ships for Liquid Chemicals) and/or the *Rules and Regulations for the Construction and Classification of Ships for the Carriage of Liquefied Gases in Bulk* (hereinafter referred to as the Rules for Ships for Liquefied Gases), as appropriate, see also 13.1.2.

Earthed intrinsically-safe circuits are permitted to pass into and through dangerous spaces and zones.

5.1.3 System voltages for both alternating current and direct current in general are not to exceed:

- 15 000 V for generation and power distribution;
- 500 V for cooking and heating equipment permanently connected to fixed wiring;
- 250 V for lighting, heaters in cabins and public rooms, and other applications not mentioned above.

Voltages above these will be the subject of special consideration.

5.1.4 The arrangement of the main system of supply is to be such that a fire or other casualty in any space containing the main source of electrical power, associated converting equipment, if any, the main switchboard and the main lighting switchboard will not render inoperable any emergency service, other than those located within the space where the fire or casualty has occurred.

5.1.5 The main switchboard is to be so placed relative to the main source of power that, as far as is practicable, the integrity of the main system of supply will be affected only by a fire or other casualty in one space.

5.1.6 The arrangement of the emergency system of supply is to be such that a fire or other casualty in spaces containing the emergency source of electrical power, associated converting equipment, if any, the emergency switchboard and the emergency lighting switchboard, will not cause loss of services required to maintain the propulsion and safety of the ship.

5.1.7 Distribution systems required in an emergency are to be so arranged that a fire in any one main fire zone, as defined by SOLAS 1974 as amended Reg II-2/A, 3.32, will not interfere with the emergency distribution in any other such zone.

5.2 Essential services

5.2.1 Essential services that are required by Part 5 to be duplicated are to be served by individual circuits, separated in their switchboard or section board and throughout their length as widely as is practicable without the use of common feeders, protective devices, control circuits or control gear assemblies, so that any single fault will not cause the loss of both services.

5.2.2 Where 5.2.1 is applicable the main busbars of the switchboard, or section boards, are to be capable of being split, by a multipole linked circuit-breaker, disconnect or switch-disconnector, into at least two independent sections, each supplied by at least one generator, either directly or through a converter. The essential services are to be equally divided, as far as is practicable, between the independent sections.

5.2.3 Where 5.2.2 is applicable provision is to be made to transfer to a temporary circuit those essential services which are not required to be, and have not been, duplicated in the event of loss of their normal section of switchboard or section board.

5.3 Isolation and switching

5.3.1 The incoming and outgoing circuits from every switchboard or section board are to be provided with a means of isolation and switching to permit each circuit to be switched off:

- (a) on load;
- (b) for mechanical maintenance;
- (c) in an emergency to prevent or remove danger.
